Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. High Voltage Disabling
2. Drain the cooling system. Heater Coolant Heater Draining and Filling

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. Battery Negative Cable Disconnection and Connection 2. Remove the heater and air conditioning evaporator and blower module. Heater and Air Conditioning Evaporator and Blower Module Removal and Installation	
1	Heater and Air Conditioning Evaporator and Blower Module Seal
2	Heater Case Screw (Qty: 7) **CAUTION:** Fastener Caution **Tighten** 2.5 N.m (22 lb in)
3	Heater and Air Conditioning Evaporator Case Clip
4	Heater Case **Procedure** Separate the heater case from the module assembly.

DESCRIPTION AND OPERATION

HEATING AND AIR CONDITIONING SYSTEM DESCRIPTION AND OPERATION

Heating

The heating system uses a high voltage heater to provide heat to the passenger compartment. The high voltage heater is used when the passenger compartment heat is requested. The high voltage heater provides different levels of heat depending on the amount of heat needed and outside temperature.

The HVAC Control Module turns on the coolant pump and monitors the temperature sensors in the passenger compartment, outside air and high voltage heater to determine the position of the coolant flow control valve and if the high voltage heater is needed. Passenger compartment heat is provided by air flowing through the heater core. The heater core is heated by coolant from the high voltage heater.

The heating system circulates a 50/50 mixture of Dex-cool and deionized water.

Air Conditioning

The A/C system uses the refrigerant R-1234yf which is a gas at very low temperatures and can transfer heat from the passenger compartment and high voltage battery to the outside air. The A/C system is mechanically protected with the use of a high pressure relief valve on the A/C compressor. If the refrigerant pressure sensor were to fail or if the A/C system becomes restricted and the refrigerant pressure continued to rise, the high pressure relief will open and release refrigerant from the system.

The high voltage electric A/C compressor is a self contained high voltage inverter, electric motor, and direct coupled compressor. The electric A/C compressor has the ability to run and provide cooling performance while the vehicle is not running. The electronic climate control module and the Vehicle Integration Control Module (VICM) will command the electric A/C compressor to a speed necessary to maintain a desired cooling level rather than cycle the electric A/C compressor on and off.

The electric A/C compressor builds pressure and adds heat to the refrigerant gas. The refrigerant gas flows from the electric A/C compressor to the condenser where heat is transferred to the outside air when the refrigerant condenses from a gas to a liquid. The liquid refrigerant then flows to a thermal expansion valve (TXV) on the battery chiller. The TXV lowers the pressure of the liquid refrigerant which makes the refrigerant expand from a liquid to a vapor. The low pressure refrigerant vapor flows into the battery chiller and begins to boil and change into a gas as the refrigerant absorbs heat from the battery coolant also flowing inside the battery chiller. The battery coolant and refrigerant are separated by several plates inside the battery chiller. The liquid refrigerant also flows to a second TXV on the evaporator. The low pressure refrigerant vapor flows from the TXV into the evaporator and begins to boil and change into a gas as the refrigerant absorbs heat from the passenger compartment air that is flowing through the outside of the evaporator. The moister in the passenger compartment air condenses on the outside of the evaporator and flows down to the bottom of the HVAC module where it drains outside the passenger compartment through a drain hose. The low pressure refrigerant gas then flows from the battery chiller and the evaporator back to the electric A/C compressor where the cycle is repeated.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Upper Left Duct Air Temperature Sensor Signal	B0173 02	B0173 05	B0173 05	-
Lower Left Duct Air Temperature Sensor Signal	B0178 02	B0178 05	B0178 05	-
Low Reference	-	B0173 05, B0178 05	-	-

Circuit/System Description

The air temperature sensors are 2-wire negative temperature co-efficient thermistors. The vehicle uses the following air temperature sensors:

- Air temperature sensor left upper
- Air temperature sensor left lower

A signal and low reference circuit enables the sensor to operate. As the air temperature surrounding the sensor increases, the sensor resistance decreases. The sensor signal voltage decreases as the resistance decreases. The sensor operates within a temperature range between -40 to +85Â°C (-40 to +185Â°F). The sensor signal varies between 0 - 5 V. The HVAC control module converts the signal to a range between 0 - 255 counts. As the air temperature increases the count value will decrease. If the HVAC control module detects a malfunctioning sensor, then the control module software will use a default air temperature value. The default action ensures that the HVAC system can adjust the inside air temperature near the desired temperature until the condition is corrected.

Conditions for Running the DTC

The vehicle is turned ON.

Conditions for Setting the DTC

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V or greater than 4.9 V for more than 50 ms.

Action Taken When the DTC Sets

A default value is used when the DTC is set.

Conditions for Clearing the DTC

- The DTC will become history if the HVAC control module no longer detects a failure.
- The history DTC will clear after 100 fault-free ignition cycles.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the appropriate temperature sensor. It may take up to 10 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the appropriate low reference circuit terminal listed below and ground.
    - B7B Air Temperature Sensor - Duct Lower - terminal 3
    - B7F Air Temperature Sensor - Duct Upper - terminal 1
    - **If 10 Ω or greater**
    1. Vehicle OFF, disconnect the X3 harness connector at the K33 HVAC control module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K33 HVAC control module.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the appropriate signal circuit terminal listed below and ground.
    - B7B Air Temperature Sensor - Duct Lower - terminal 1
    - B7F Air Temperature Sensor - Duct Upper - terminal 3
    - **If less than 4.8 V**
    1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K33 HVAC Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF, disconnect the harness connector at the K33 HVAC Control Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K33 HVAC Control Module.
    - **If between 4.8 - 5.2 V**
5. Test or replace the temperature sensor.
6. Verify the DTC or symptom is corrected while operating the HVAC system under the Conditions for Running the DTC.
    - **If the DTC or symptom is not corrected**

      Replace the K33 HVAC Control Module.

    - **If the DTC or symptom is corrected**

7. All OK.

Circuit/System Description

The windshield temperature and inside moisture sensor integrates the relative humidity sensor, windshield temperature sensor and humidity sensing element temperature sensor.

This sensor assembly provides information about:

- Relative humidity level on inside windshield
- Temperature of the inside windshield
- Temperature of the humidity sensor element

The relative humidity sensor measures the relative humidity on the compartment side of the windshield. It also detects the temperature of the windshield surface on the compartment side. Both values are used as control inputs for the HVAC control module application to calculate the fog risk on windshield compartment side and ability to reduce fuel consumption by decreasing A/C compressor power to a minimum without causing any fog. The sensor will also enable partial recirculation mode in order to improve heat-up performance of the passenger compartment under cold ambient temperature conditions without the risk of mist build-up on the windshield. The humidity sensor element temperature sensor supplies the temperature of the humidity sensor element. It is only needed if the thermal contact between the humidity sensing element and the inside windshield surface is not sufficient.

Conditions for Running the DTC

- Vehicle ON or Vehicle in Service Mode.
- The HVAC control module is ON.

Conditions for Setting the DTC

B018A 02, B048C 02, B048C 02 or B1395 03

The HVAC control module detects the sensor signal out of range. The signal voltage is less than 0.1 V for more than 50 ms.

B018A 05, B048C 05, B048C 05 or B1395 07

The HVAC control module detects the sensor signal out of range. The signal voltage is greater than 4.9 V for more than 50 ms.

Action Taken When the DTC Sets

- The system will use the last valid values as default.
- If no value is read at the time of fault, the HVAC control module uses 60% for humidity.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B160 windshield temperature and inside moisture sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 60 Ω between the low reference circuit terminal 3 and ground.
   - **If 60 Ω or greater**
   1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K33 HVAC control module.
   - **If less than 60 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
   2. Test for infinite resistance between the 5 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K33 HVAC control module.
   - **If greater than 5.2 V**
   1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, Vehicle in Service Mode.
   2. Test for less than 1 V between the 5 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K33 HVAC control module.
   - **If between 4.8 - 5.2 V**
5. Verify the scan tool parameters listed below are less than -37Â°C (-35Â°F).
   - Windshield Temperature
   - Passenger Compartment Humidity Sensor Temperature
   - **If -37Â°C (-35Â°F) or greater**
   1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
   2. Test for infinite resistance between the signal circuit terminals listed below and ground:
      - Windshield temperature sensor signal terminal 4
      - Passenger compartment humidity sensor temperature signal terminal 5
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K33 HVAC control module.
   - **If less than -37Â°C (-35Â°F)**
6. Verify the scan tool Passenger Compartment Humidity parameter is greater than 95%.
   - **If 95% or less**
   1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.

    2. Test for infinite resistance between the signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K33 HVAC control module.
    - **If greater than 95%**

7. Install a 3 A fused jumper wire between each signal circuit terminal listed below and the low reference circuit terminal 3 one at a time.
    - Windshield temperature sensor signal terminal 4
    - Passenger compartment humidity sensor temperature signal terminal 5
8. Verify the appropriate scan tool parameter listed below is greater than 114Â°C (238Â°F).
    - Windshield Temperature
    - Passenger Compartment Humidity Sensor Temperature
    - **If 114Â°C (238Â°F) or less**

    1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
    2. Test for less than 1 V between the signal circuit terminals listed below and ground:
        - Windshield temperature sensor signal terminal 4
        - Passenger compartment humidity sensor temperature signal terminal 5
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K33 HVAC control module.

    - **If greater than 114Â°C (238Â°F)**
9. Install a 3 A fused jumper wire between the passenger compartment humidity sensor signal circuit terminal 2 and the low reference circuit terminal 3.
10. Verify the scan tool Passenger Compartment Humidity parameter is less than 5%.
    - **If 5% or greater**

    1. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module.
    2. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K33 HVAC control module.

    - **If less than 5%**
11. Vehicle OFF, disconnect the harness connector at the K33 HVAC control module, Vehicle in Service Mode.
12. Test for less than 1 V between the signal circuit terminal 2 and ground.
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
13. Test or replace the B160 windshield temperature and inside moisture sensor.

Blower Motor Control Module B+	B0193 06	B0193 06	-	-
Blower Motor B+	1	1	-	-
Blower Motor Control Module Control	B0193 06	B0193 06	B0193 01	-
Blower Motor Control	2	1	1	-
Blower Motor Control Module Ground	-	1	-	-
1. Blower Motor Inoperative 2. Blower Motor Always ON				

Circuit/System Description

The blower motor control module is an interface between the HVAC control module and the blower motor. The blower motor control module has 5 circuits: a B+ input, ground, a control circuit from the HVAC control module, a B+ output to the blower motor, and a low side pulse width modulation (PWM) output. The HVAC control module provides a low side (PWM) signal to the blower motor control module in order to request the blower motor speed. The blower motor control module grounds the blower motor using a low side PWM signal in order to vary the blower motor speed.

Conditions for Running the DTC

- Vehicle in Service Mode.
- The HVAC control module is ON.

Conditions for Setting the DTC

B0193 01

The voltage at the HVAC control module output to the blower motor control module is always high.

B0193 06

The voltage at the HVAC control module output to the blower motor control module is always low or fluctuating.

Action Taken When the DTC Sets

The blower motor is inoperative.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

Inspect the motor shaft for rust or other foreign material which may prohibit proper motor operation.

If the motor operates properly please reinstall it and check for Preliminary Information or Technical Service Bulletins.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K8 Blower Motor Control Module. It may take up to 10 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Verify a test lamp illuminates between the B+ circuit terminal 6 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit terminal 6 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Disconnect the X2 harness connector at the K8 Blower Motor Control Module and disconnect the harness connector at the M8 Blower Motor.
    4. Test for infinite resistance between the M8 Blower Motor B+ circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, test or replace the M8 Blower Motor.
    - **If the test lamp illuminates**

4. Vehicle in Service Mode. Test for less than 1 V between the control circuit terminal 3 and ground.
   - **If 1 V or greater**
   1. Vehicle OFF, disconnect the X2 harness connector at the K33 HVAC Control Module. Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K33 HVAC Control Module
   - **If less than 1 V**
5. Vehicle OFF. It may take up to 10 min for all vehicle systems to power down.
6. Test for infinite resistance between the control circuit terminal 3 and ground.
   - **If less than infinite resistance**
   1. Disconnect the X2 harness connector at the K33 HVAC Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K33 HVAC Control Module
   - **If infinite resistance**

NOTE: Verify the ignition is OFF before connecting the blower motor control module or incorrect test results may occur.

7. Vehicle OFF, connect the X1 harness connector at the K8 Blower Motor Control Module. Vehicle in Service Mode.
8. While backprobing terminal 3 at the K8 Blower Motor Control Module, test for greater than 1 V between the control circuit and ground.
   - **If less than 1 V**

     Replace the K8 Blower Motor Control Module.

   - **If 1 V or greater**
9. Verify the voltage decreases and increases while using the controls to change the blower speed selection.
   - **If the voltage does not decrease and increase as the blower speed selection is changed**
   1. Vehicle OFF, disconnect the X2 harness connector at the K33 HVAC Control Module.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K33 HVAC Control Module.
   - **If the voltage decreases and increases as the blower speed selection is changed**
10. Vehicle OFF, disconnect the harness connector at the M8 Blower Motor, Vehicle in Service Mode and blower ON.
11. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the X2 harness connector at the K8 Blower Motor Control Module.
    2. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω replace the K8 Blower Motor Control Module.
    - **If the test lamp illuminates**
12. Connect a test lamp between control circuit terminal 2 and B+ circuit terminal 1.
13. Verify the test lamp becomes progressively brighter as the blower speed is increased and progressively dimmer as the blower speed is decreased.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the X2 harness connector at the K8 Blower Motor Control Module, Vehicle in Service Mode.

        2. Test for less than 1 V between the control circuit and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V
        3. Test for less than 2 Ω in the control circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω replace the K8 Blower Motor Control Module.
    - **If the test lamp illuminates, but does not change in brightness**
        1. Vehicle OFF, disconnect the X2 harness connector at the K8 Blower Motor Control Module.
        2. Test for infinite resistance between the control circuit and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If infinite resistance, replace the K8 Blower Motor Control Module.
    - **If the test lamp changes in brightness as the blower speed is changed**

14. Test or replace the M8 Blower Motor.

1. Actuator door malfunction				

Circuit/System Description

Stepper motors are used for temperature regulation, air distribution control and recirculation flap control.

With the appropriate switches at the HVAC control, the desired door positions can be selected. The selected values are passed to the HVAC control module via serial data. The HVAC control module supplies a 12 V reference voltage to the stepper motors and energizes the stepper motors with a pulsed ground signal. The stepper motors put the appropriate door into the calculated position in order to reach the desired temperature, mode. and recirculation position.

Conditions for Running the DTC

- Vehicle on, or in Service Mode.
- The HVAC control module is ON.

Conditions for Setting the DTC

B023A 02

The stepper motors supply output is shorted to ground.

B0223 01, B0233 01 or B0408 01

At least one control output (of 4 possible outputs) of the appropriate stepper motor is shorted to voltage when motor starts moving. Faults are not detected when motor is already running or target position is already reached.

B0223 06, B0233 06 or B0408 06

At least one control output (of 4 possible outputs) of the appropriate stepper motor is shorted to ground or open when motor starts moving. Faults are not detected when motor is already running or target position is already reached.

Action Taken When the DTC Sets

B023A 02

- The affected output will be switched off for hardware protection.

- All stepper motors are deactivated.

B0223, B0233 or B0408

- The affected output will be switched off for hardware protection.
- The affected stepper motor is deactivated.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

During diagnosis, it is important to verify that the air control door and any associated components (linkage, cams, gears, etc.) operate properly. Inspect for any conditions that may limit or prevent the air control door from moving smoothly or moving through its full range of travel. Any mechanical issues should be corrected first, before proceeding with electrical diagnosis.

Circuit/System Verification

1. Perform the **Actuator Recalibration** procedure.
2. Verify the concern or DTC has been corrected.
    - **If the concern or DTC has not been corrected**
    1. Verify DTC B023A is not set.
        - If DTC B023A is set, refer to Circuit/System Testing - DTC B023A
        - If DTC B023A is not set, refer to Circuit/System Testing - DTC B0223, B0233 or B0408.
    - **If the concern or DTC has been corrected**
3. All OK.

Circuit/System Testing

DTC B023A

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the components listed below. It may take up to 2 min for all vehicle systems to power down.
    - M37 Mode Door Actuator

   - M46 Air Recirculation Door Actuator
   - M6 Air Temperature Door Actuator
2. Disconnect the X3 harness connector at the K33 HVAC Control Module.
3. Test for infinite resistance between the K33 HVAC Control Module circuit terminal 15 X3 and ground.
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**
4. Vehicle OFF, connect the X3 harness connector at the K33 HVAC Control Module, Vehicle in Service Mode.
5. Verify DTC B023A is not set.
   - **If the DTC is set.**

     Replace the K33 HVAC Control Module.

   - **If the DTC is not set.**
6. Verify DTC B023A does not set after connecting each of the components listed below one at a time and operating them through their full range.
   - M37 Mode Door Actuator
   - M46 Air Recirculation Door Actuator
   - M6 Air Temperature Door Actuator
   - **If the DTC sets after connecting one of the components**

     Replace the actuator that was connected immediately before the DTC set.

   - **If the DTC does not set**
7. All OK.

DTC B0223, B0233 or B0408

1. Vehicle OFF, disconnect the harness connector at the appropriate door actuator, It may take up to 2 min for all vehicle systems to power down. Vehicle in Service Mode.

   NOTE: **If more than one actuator is affected, test the B+ circuit at each actuator.**

2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the X3 harness connector at the K33 HVAC control module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K33 HVAC control module.
   - **If the test lamp illuminates**
3. Command the appropriate actuator with a scan tool.
4. Verify a test lamp is flashing on and off when connected between the B+ circuit terminal 2 and each control circuit terminal listed below:
   - Control Circuit - terminal 1
   - Control Circuit - terminal 3
   - Control Circuit - terminal 4
   - Control Circuit - terminal 6

    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X3 harness connector at the K33 HVAC control module. Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K33 HVAC Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X3 harness connector at the K33 HVAC control module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K33 HVAC Control Module.
    - **If the test lamp is flashing On and Off**
5. Test or replace the actuator.

DTC B048E: AUXILIARY HEATER SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B048E 00

Auxiliary Heater System Malfunction

DTC B048E 39

Auxiliary Heater System Internal Malfunction

DTC B048E 58

Auxiliary Heater System Incorrect Reaction After Event

DTC B048E 5A

Auxiliary Heater System Plausibility Failure

Circuit/System Description

The coolant heater control module is a high voltage electric heater. High voltage is supplied from the hybrid/EV battery pack. A fused battery input, ground, and LIN serial data from the HVAC control module are used to control the operation of the coolant heater control module.

The HVAC control module requests heater operation if the coolant temperature is low and additional heat is required to meet the desired settings of the HVAC system.

The coolant heater control module monitors itself during operation, and if a fault is detected a message is sent to the HVAC control module. The HVAC control module then sets the DTC.

Conditions for Running the DTC

- 12 V battery system voltage is greater than 10.2 V.
- The HVAC control module is ON.
- The electrical auxiliary heater is commanded ON.

Conditions for Setting the DTC

B048E 00

- The coolant heater control module reports a recoverable fault for greater than 30 seconds.
- The condition is present for 3 consecutive ignition cycles
- The HVAC control module sets the DTC on the fourth ignition cycle

B048E 39

- The coolant heater control module reports an internal malfunction for greater than 30 seconds.
- The condition is present for 3 consecutive ignition cycles
- The HVAC control module sets the DTC on the fourth ignition cycle

B048E 58

- The coolant heater control module reports a limited operation status for greater than 10 minutes.
- The condition is present for 3 consecutive ignition cycles
- The HVAC control module sets the DTC on the fourth ignition cycle

B048E 5A

- The HVAC control module determines the coolant temperature reported by the coolant heater control module is not rational based on the vehicle operating conditions for greater than 10 minutes.
- The condition is present for 3 consecutive ignition cycles
- The HVAC control module sets the DTC on the fourth ignition cycle

Action Taken When the DTC Sets

- The DIC displays the Service Heater Soon message
- The coolant heater is inoperative, or operates in a limited state.

Conditions for Clearing the DTC

The condition for setting the DTC is no longer present.

Diagnostic Aids

- Verify the cooling system is full before performing diagnostics. A low or aerated coolant condition may cause this DTC to set.
- Insufficient or no coolant flow through the coolant heater due to a restriction, blockage, or coolant pump malfunction may cause this DTC to set.
- Insufficient or no voltage from the Hybrid/EV battery may cause this DTC to set.

Circuit/System Verification

NOTE: **Check for bulletins before proceeding.**

1. Verify that no other DTCs are set.
    - **If any other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no other DTCs are set**
2. Verify that DTC B048E 39 is not set.
    - **If DTC B048E 39 is set**

      Replace the K10 Coolant Heater Control Module

    - **If DTC B048E 39 is not set**
3. Verify that DTC B048E 00 is not set.
    - **If DTC B048E 00 is set**

      Refer to Circuit/System Testing

    - **If DTC B048E 00 is not set**
4. Verify the cooling system is filled to the proper level.
    - **If the cooling system is not filled to the proper level**
    1. Diagnose and correct the cause of the improper coolant level.
    2. Fill the cooling system to the proper level. Refer to .
    3. Clear DTCs and re-evaluate the concern.
    - **If the cooling system is filled to the proper level**
5. Verify the Coolant Heater Control Module Inlet Coolant Temperature sensor parameter is within 5Â°C (9Â°F) of the Ambient Air Temperature sensor parameter.
    - **If the Coolant Heater Control Module Inlet Coolant Temperature sensor parameter is NOT within 5Â°C (9Â°F) of the Ambient Air Temperature sensor parameter**

      Allow the system to cool until the Coolant Heater Control Module Inlet Coolant Temperature sensor parameter is within 5Â°C (9Â°F) of the Ambient Air Temperature sensor parameter.

    - **If the Coolant Heater Control Module Inlet Coolant Temperature sensor parameter is within 5Â°C (9Â°F) of the Ambient Air Temperature sensor parameter**
6. Verify the G36 Auxiliary Heater Coolant Pump operates when commanding the Auxiliary Coolant Pump On and Off with a scan tool.
    - **If the G36 Auxiliary Heater Coolant Pump does not operate**

    Refer to Auxiliary Heater Coolant Pump Malfunction.

  - **If the G36 Auxiliary Heater Coolant Pump operates**

7. Vehicle ON, HVAC system set to hot, blower set to high.
8. Verify the scan tool parameter Coolant Heater Control Module Status displays only Normal Running.
    - **If the scan tool parameter Coolant Heater Control Module Status displays only Limited Operation**
    1. Verify the scan tool parameter Coolant Heater Control Module Inlet Coolant Temperature is less than 60Â°C (140Â°F) and the parameter Coolant Heater Current is greater than 15 A.
        - If the scan tool parameter Coolant Heater Control Module Inlet Coolant Temperature is less than 60Â°C (140Â°F) and the parameter Coolant Heater Current is less than 15 A, replace the K10 Coolant Heater Control Module
        - If the scan tool parameter Coolant Heater Control Module Inlet Coolant Temperature is less than 60Â°C (140Â°F) and the parameter Coolant Heater Current is greater than 15 A, refer to step 9.
    - **If the scan tool parameter Coolant Heater Control Module Status switches between Limited Operation and Normal Running.**

      Refer to step 10.

    - **If the scan tool parameter Coolant Heater Control Module Status displays only Normal Running**
9. Continue to operate the system for 10 min.
10. Verify the scan tool parameter Coolant Heater Control Module Inlet Coolant Temperature is within 5Â°C (9Â°F) of parameter Desired Heater Core Outlet Coolant temperature.
    - **If the scan tool parameter Coolant Heater Control Module Inlet Coolant Temperature is not within 5Â°C (9Â°F) of parameter Desired Heater Core Outlet Coolant temperature.**

      Replace the K10 Coolant Heater Control Module

    - **If the scan tool parameter Coolant Heater Control Module Inlet Coolant Temperature is within 5Â°C (9Â°F) of parameter Desired Heater Core Outlet Coolant temperature.**
11. Vehicle OFF. Inspect the cooling system for restrictions or blockages in coolant flow. Refer to Heating Performance Diagnostic .
    - **If restrictions or blockages in coolant flow are found.**
    1. Diagnose and correct the cause of the restrictions or blockage.
    2. Verify the G36 Auxiliary Heater Coolant Pump operates.
    3. Clear DTCs and re-evaluate the concern.
    - **If no restrictions or blockages are found**
12. All OK.

Circuit/System Testing

NOTE: **Perform Circuit/System Verification before Circuit/System Testing.**

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must**

be followed.

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the K10 Coolant Heater Control Module. Refer to **High Voltage Disabling** .
2. Disconnect the X2 harness connector at the K10 Coolant Heater Control Module and the X4 harness connector at the T24 Battery Charger - DC. Refer to **High Voltage Connectors** .
3. Test for less than 2 Ω end to end between the 300-Volt Positive and Negative Cable circuit terminals listed below:
   - K10 Coolant Heater Control Module harness connector terminal A X2 and T24 Battery Charger - DC harness connector terminal A X4.
   - K10 Coolant Heater Control Module harness connector terminal B X2 and T24 Battery Charger - DC harness connector terminal B X4.
   - **If 2 Ω or greater**

     Replace the 300-Volt Positive and Negative Cable.
   - **If less than 2 Ω**
4. Disconnect the X3 harness connector at the T24 Battery Charger - DC. Refer to **High Voltage Connectors** .
5. Test for less than 2 Ω between the component terminals listed below:
   - T24 Battery Charger - DC connector terminal A X3 and T24 Battery Charger - DC connector terminal A X4.
   - T24 Battery Charger - DC connector terminal B X3 and T24 Battery Charger - DC connector terminal B X4.
   - **If 2 Ω or greater**

     Replace the T24 Battery Charger - DC and the K10 Coolant Heater Control Module.
   - **If less than 2 Ω**
6. Replace the K10 Coolant Heater Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **HVAC Component Replacement Reference**
- **Control Module References** for control module replacement, programming and setup.

DTC B3844: ENGINE COOLANT CIRCULATION PUMP CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3844 01

Engine Coolant Circulation Pump Circuit Short to Battery

DTC B3844 06

Engine Coolant Circulation Pump Circuit Low Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Coolant Pump Relay Coil Control	B3844 06, 2	B3844 06, 1	B3844 01, 1	-
Coolant Pump Relay Controlled Output	B3844 06, 1	1	2	-
Coolant Pump Ground	-	1	-	-
1. Coolant Pump inoperative 2. Coolant pump always on				

Circuit/System Description

The coolant heater pump is controlled by a relay. When operating conditions exist that requires the coolant heater to operate, the HVAC control module turns ON the heater coolant pump by applying ground to the relay control circuit which energizes the heater coolant pump relay. The coolant pump then circuilates the coolant within the coolant heater system.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the G17 Heater Coolant Pump operates when commanding the Auxiliary Coolant Pump On and Off with a scan tool.
    - **If the G17 Heater Coolant Pump does not operate**

      Refer to Circuit/System Testing

    - **If the G17 Heater Coolant Pump operates**
3. All OK.

Circuit/System Testing

1. Vehicle OFF, disconnect the X3 harness connector at the X50A Fuse Block- Underhood.
2. Connect a test lamp between the control circuit terminal 49 and B+, Vehicle in Service Mode.
3. Verify the test lamp turns ON and OFF when commanding the Auxiliary Coolant Pump On and Off with a scan tool.
    - **If the test lamp is always OFF**

   1. Vehicle OFF, remove the test lamp, disconnect the X2 harness connector at the K33 HVAC Control Module, Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Vehicle OFF.
   4. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K33 HVAC Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, remove the test lamp, disconnect the X2 harness connector at the K33 HVAC Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K33 HVAC Control Module.
   - **If the test lamp turns ON and OFF**
4. Vehicle OFF and all vehicle systems OFF, connect the X3 harness connector at the X50A Fuse Block- Underhood. Disconnect the harness connector at the G17 Heater Coolant Pump. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
6. Connect a test lamp between the control circuit terminal 2 and ground.
7. Verify the test lamp turns ON and OFF when commanding the Auxiliary Coolant Pump ON and OFF with a scan tool.
   - **If the test lamp is always OFF and the circuit fuse is good**
   1. Vehicle OFF, remove the test lamp, disconnect the X4 harness connector at the X50A Fuse Block- Underhood.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the X50A Fuse Block- Underhood.
   - **If the test lamp is always OFF and the circuit fuse is open**
   1. Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, test or replace the G17 Heater Coolant Pump.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the disconnect the X4 harness connector at the X50A Fuse Block- Underhood, Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the X50A Fuse Block- Underhood.
   - **If the test lamp turns ON and OFF**
8. Test or replace the G17 Heater Coolant Pump.

DTC P0532 OR P0533: AIR CONDITIONING (A/C) REFRIGERANT PRESSURE SENSOR CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of the diagnostic category.

DTC Descriptors

DTC P0532

Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit Low Voltage

DTC P0533

Air Conditioning (A/C) Refrigerant Pressure Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P0532	P0532	P0533	-
Signal	P0532	P0532	P0533	-
Low Reference	-	P0533	-	-

Circuit/System Description

The engine control module monitors the high side refrigerant pressure through the high side A/C refrigerant pressure sensor. The engine control module supplies a 5 V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the engine control module to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low. When pressure is high, the engine control module commands the cooling fans on.

Conditions for Running the DTC

P0532 and P0533

- Any of the conditions for setting the DTC are met for 15 s.
- 12 V battery system voltage is between 11 - 18 V.

Conditions for Setting the DTC

P0532

The engine control module detects that the A/C pressure is less than.25 V.

P0533

The engine control module detects that the A/C pressure is greater than 4.75 V.

Action Taken When the DTC Sets

This is a type B DTC.

Conditions for Clearing the DTC

This is a type B DTC.

Diagnostic Aids

A malfunction within the refrigerant system causing high pressure can cause this DTC to set.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Install the appropriate Air Conditioning Service Center.
3. Verify the high side pressure reading on the Air Conditioning Service Center gauge is within 10% of the scan tool ECM A/C High Side Pressure Sensor parameter.
    - **If the reading is not within 10%**

      Refer to Circuit/System Testing.
    - **If the reading is within 10%**
4. Refer to **Air Conditioning (A/C) System Performance Test** .

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B1 A/C Refrigerant Pressure Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 1 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF, disconnect the harness connectors at the K20 Engine Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 2 and ground.
    - **If less than 4.8 V**

    1. Vehicle OFF, disconnect the harness connectors at the K20 Engine Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 5.2 V**
    1. Vehicle OFF, disconnect the harness connectors at the K20 Engine Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If between 4.8 - 5.2 V**
5. Verify the scan tool Engine Control Module A/C High Side Pressure Sensor parameter is less than.25 V.
    - **If.25 V or greater**
    1. Vehicle OFF, disconnect the harness connectors at the K20 Engine Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K20 Engine Control Module.
    - **If less than.25 V**
6. Connect a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 2.
7. Verify the scan tool A/C High Side Pressure Sensor parameter is greater than 4.75 V.
    - **If 4.75 V or less**
    1. Vehicle OFF, remove the jumper wire and disconnect the harness connectors at the K20 Engine Control Module.
    2. Test for infinite resistance between the signal circuit terminal 3 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K20 Engine Control Module.
    - **If greater than 4.75 V**
8. Test or replace the B1 A/C Refrigerant Pressure Sensor.

DTC P0534: AIR CONDITIONING (A/C) REFRIGERANT CHARGE LOW

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0534

Air Conditioning (A/C) Refrigerant Charge Low

Circuit/System Description

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down and dehumidify the cabin and help maintain the battery temperature. Rather than a more-typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes High Voltage direct current from the vehicle's High Voltage Battery and inverts it to alternating current for the motor. The AC compressor may be activated when any of the following events occur:

- The customer selects Heat and A/C.
- The HVAC system is fan only but the customer selects defrost mode
- The High Voltage Battery Thermal System requests the AC compressor on to help maintain the battery temperature

The Hybrid Powertrain control module 2 (HPCM2) uses values from the A/C refrigerant pressure transducers, ambient air temperature sensor, cabin climate control request, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This message is sent from the HPCM2 to the A/C compressor control module via serial data message.

Conditions for Running the DTC

DTC P0534 Case 1

- The 12V battery system voltage is equal to or greater than 10.2 V.
- The AC compressor has been off for more than 60 min.
- The AC compressor is commanded on and operating above 500 RPM
- The following DTCs must not be set: P0071, P0072, P0073. P0074, P0606, P151C, P2516, P2517, P2518

DTC P0534 Case 2

- The 12V battery system voltage is equal to or greater than 10.2 V.
- The AC compressor is off for more than 60 min.
- Outside air temperature is greater than 15Â° C (59Â°F).
- The following DTCs must not be set: P0071, P0072, P0073. P0074, P0606, P151C, P2516, P2517, P2518

DTC P0534 Case 3

- The 12V battery system voltage is equal to or greater than 10.2 V.
- The AC compressor is off for more than 60 min.
- Outside air temperature is greater than 5Â° C (41Â°F).
- The following DTCs must not be set: P0071, P0072, P0073. P0074, P0606, P151C, P2516, P2517, P2518

Conditions for Setting the DTC

DTC P0534 Case 1

Low side pressure is less than 90 kPa (13.05 PSI) within 60 sec of the compressor turning on

DTC P0534 Case 2

Low side pressure is less than 150 kPa (21.75 PSI) for outside air temperature greater than 20Â° C (68Â°F).

DTC P0534 Case 3

Low side pressure is less than 100 kPa (14.50 PSI) for outside air temperature between 5 - 20Â° C (41 - 68Â° F).

Action Taken When the DTC Sets

Active cooling mode for the battery may be disabled.

Conditions for Clearing the DTC

P0534 is a type B DTC.

Circuit/System Verification

1. Install the appropriate air conditioning service center, vehicle in Service Mode.
2. Verify the low side pressure reading on the Air Conditioning Service Center is within 3% of the scan tool A/C Low Side Pressure Sensor parameter.
   - **If the reading is not within 3%**

     Refer to **DTC P151C or P2516-P2518**.

   - **If the reading is within 3%**
3. Verify the high side pressure reading on the Air Conditioning Service Center is within 3% of the scan tool A/C High Side Pressure Sensor parameter.
   - **If the reading is not within 3%**

     Refer to **DTC P0532 or P0533**.

   - **If the reading is within 3%**
4. Verify the A/C System is operating correctly, refer to **Air Conditioning (A/C) System Performance Test** .
5. Clear all codes in the K114B Hybrid Powertrain Control Module 2 using a scan tool.

6. Verify DTC P0534 does not set while operating the HVAC system under the Conditions for Running the DTC.
    - **If the DTC is set**

      Replace the K114B Hybrid Powertrain Control Module 2.

    - **If the DTC is not set**
7. All OK.

Electric A/C Compressor Control Module Internal Temperature Sensor Circuit Intermittent

Circuit/System Description

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down the cabin, help dehumidify the air in a defrost mode and help maintain the battery temperature. Rather than a more-typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes High Voltage direct current from the vehicle's High Voltage Battery and inverts it to alternating current for the motor. The AC compressor shall be activated when any of the three following events occur:

- The customer pushes the AC button

- The HVAC control, in AUTO mode, requests the electric AC compressor on to help in cooling the cabin or removing moisture in the defrost mode
- The High Voltage Battery Thermal System requests the AC compressor on to help maintain the battery temperature

The Hybrid Powertrain control module 2 uses values from the A/C refrigerant pressure transducers, A/C refrigerant thermistor, duct temperature sensors, ambient air temperature sensor, passenger compartment temperature sensor, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This speed request message is sent from the Hybrid/EV Powertrain Control Module 2 to the A/C compressor control module via serial data message.

Conditions for Running the DTC

DTC P0D69

- 12 V battery system voltage is greater than 10.2 V.
- Main HV battery contactors must be closed.
- DTCs P0AA4, P0ABB, P0ABC, P0ABD, P0AD9, P0C78, P0D5E, P0D6A; P0D6B, P1EC3, P2534, P2535, P3061, U0111, U016B, or U185A must not be set.

DTC P0D6A

- 12 V battery system voltage is above 10.2 V.
- Main HV battery contactors must be closed.
- DTCs P2534, P2535, or U016B must not be set.

DTC P0D6B

- 12 V battery system voltage is above 10.2 V.
- Main HV battery contactors must be closed.
- DTCs P0AA4, P0AD9, P0C78, P0D5E, P1EC3, P2534, P2535, P3061, or U016B must not be set.

DTC P0D71

- 12 V battery system voltage is above 10.2 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor has been off for more than 6 hours
- Outside air temperature is greater than -7Â°C (19Â°F)
- DTCs P0071, P0072, P0073, P0074, P0532, P0533, P0606, P0D72, P0D73, P0D74, P2534, P2535, or U016B must not be set

DTC P0D72, P0D73

- 12 V battery system voltage is above 10.2 V.
- DTCs P2534, P2535, or U016B must not be set

Conditions for Setting the DTC

DTC P0D69

A/C compressor motor voltage is greater than 33 V.

DTC P0D6A

The A/C compressor high voltage input sensor value is greater than 543.08 V for more than 1 second.

DTC P0D6B

The A/C compressor high voltage input sensor value is less than 28.58 V for more than 1 second.

DTC P0D71

The A/C compressor processor temperature sensor value is greater than 45Â°C (113Â°F).

AND

The difference between the A/C compressor processor temperature sensor value and the outside air temperature value is greater than 60Â°C (108Â°F).

DTC P0D72

A/C compressor processor temperature sensor value is less than -40Â°C (-40Â°F) more than 1 second.

DTC P0D73

A/C compressor processor temperature sensor value is greater than 150Â°C (302Â°F) for more than 1 second.

Action Taken When the DTC Sets

The A/C compressor is disabled.

Conditions for Clearing the DTC

These are all type B DTC's

    - **If DTC P0D6B is set**

      Refer to Circuit/System Testing

    - **If DTC P0D6B is not set**
4. Verify that DTC P0D69, P0D6A, P0D71, P0D72, P0D73, or P0D74 are not set.
    - **If any of the DTCs are set**
    1. Program the G1 A/C Compressor and the K114B Hybrid/EV Powertrain Control Module 2 with the latest software calibration.
    2. Verify the DTC's do not set
        - If any of the DTC's set, replace the affected control module.
        - If none of the DTC's are set
    3. All OK.
    - **If none of the DTCs are set**
5. All OK.

Circuit/System Testing

NOTE: **Perform Circuit/System Verification before Circuit/System Testing.**

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

1. Vehicle OFF, disable the high voltage at the G1 A/C Compressor. Refer to **High Voltage Disabling** .
2. Disconnect the X2 harness connector at the G1 A/C Compressor and the X5 harness connector at the T24 Battery Charger - DC. Refer to **High Voltage Connectors** .
3. Test for less than 2 Ω end to end between the 300-Volt Positive and Negative Cable circuit terminals listed below:
    - G1 A/C Compressor harness connector terminal A X2 and T24 Battery Charger - DC harness connector terminal A X5.
    - G1 A/C Compressor harness connector terminal B X2 and T24 Battery Charger - DC harness connector terminal B X5.
    - **If 2 Ω or greater**

      Replace the 300-Volt Positive and Negative Cable.

    - **If less than 2 Ω**
4. Disconnect the X3 harness connector at the T24 Battery Charger - DC. Refer to **High Voltage Connectors** .
5. Test for less than 2 Ω between the component terminals listed below:
    - T24 Battery Charger - DC connector terminal A X3 and T24 Battery Charger - DC connector terminal A X5.

  - T24 Battery Charger - DC connector terminal B X3 and T24 Battery Charger - DC connector terminal B X5.
  - **If 2 Ω or greater**

    Replace the T24 Battery Charger - DC and the G1 A/C Compressor.

  - **If less than 2 Ω**

6. Replace the G1 A/C Compressor.

Circuit/System Description

The Hybrid/EV Powertrain Control Module 2 monitors the low side refrigerant pressure through the A/C pressure sensor. The Hybrid/EV Powertrain Control Module 2 supplies a 5 V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the Hybrid/EV Powertrain Control Module 2 to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low.

Conditions for Running the DTC

P151C

- Vehicle ON
- 12 V battery system voltage above 10.25 V.
- Hybrid/EV Powertrain Control Module 2 is awake and communicating.
- None of these DTCs may be active: P2517, P2518, P0073, P0072, P0071, P0119, P0118, P0117, P0116, P0531, P0532, P0533, P0606.
- Outside Air Temperature raw and corrected values must have had a chance to settle out. Once this occurs these variables are assigned a status of valid. The vehicle may need to have some time driving in EV mode.
- Coolant temperature must be within 15 degrees of outside air temperature.
- Outside Air Temperature between 0Â°C (32Â°F) and 25Â°C (77Â°F).
- AC compressor must have been off for an hour since the last time the AC compressor was on.
- High side refrigerant pressure reading must be between 0 kPa and 675 kPa.

P2516

- Vehicle ON
- 12 V battery system voltage above 10.25 V.
- Hybrid/EV Powertrain Control Module 2 is awake and communicating.
- None of these DTCs may be active: P2517, P2518, P0073, P0072, P0071, P0119, P0118, P0117, P0116, P0606.
- Coolant temperature must be within 15 degrees of outside air temperature.
- AC compressor must have been off for an hour since the last time the AC compressor was on.
- AC compressor must be turned on for one minute. (This may require the service technician to select an HVAC mode that causes the AC compressor to run).

P2517 or P2518

- Vehicle ON
- 12 V battery system voltage above 10.25 V.
- Hybrid/EV Powertrain Control Module 2 is awake and communicating.

Conditions for Setting the DTC

DTC P151C

- The A/C low side Refrigerant Pressure reading and the A/C high side Refrigerant Pressure reading differ by more than 200 kPa (29 psi).
- Loss of HVAC Control Module communication

DTC P2516

The difference between the A/C low side pressure Sensor before compressor on and after compressor on changes less than 50 kPa (7 psi) over a 15 second period.

DTC P2517

The Hybrid/EV Powertrain Control Module 2 detects a short to ground or open at the A/C low side pressure sensor signal circuit.

DTC P2518

The Hybrid/EV Powertrain Control Module 2 detects a short to voltage at the A/C low side pressure sensor signal circuit.

Action Taken When the DTC Sets

These are type B DTCs.

Conditions for Clearing the DTC

These are type B DTCs.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTCs U0140 and U184B are not set.
   - **If any of the DTCs are set**

     Refer to **DTC U0100-U02FF** , or **DTC U184B** .

   - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

1. Vehicle OFF, all vehicle systems OFF, scan tool disconnected, and key removed from vehicle, disconnect the harness connector at the B1C A/C Low Side Pressure Sensor. It may take up to 10 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.

   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 2 and ground.
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the terminals listed below and ground.
      - Terminal 63
      - Terminal 64
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5 V reference circuit terminal 63 end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If greater than 5.2 V**
   1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2, vehicle in Service Mode.
   2. Test for less than 1 V between the terminals listed below and ground.
      - Signal circuit terminal 25
      - Signal circuit terminal 31
      - Signal circuit terminal 50
      - 5 V reference circuit terminal 63
      - 5 V reference circuit terminal 64
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If between 4.8 - 5.2 V**
5. Verify the scan tool Hybrid/EV Powertrain Control Module 2 A/C Low Side Pressure Sensor parameter is less than 0.1 V.
   - **If 0.1 V or greater**
   1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 3 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 0.1 V**
6. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the 5 V reference circuit terminal 2.
7. Verify the scan tool A/C Low Side Pressure Sensor parameter is greater than 4.8 V.
   - **If 4.8 V or less**
   1. Vehicle OFF, remove the jumper wire and disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.

- **If greater than 4.8 V**

8. Test or replace the B1C A/C Low Side Pressure Sensor.

DTC P154F: ELECTRIC A/C COMPRESSOR MOTOR INPUT CURRENT- POSITIVE CONTACTOR STATE NOT PLAUSIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P154F

Electric A/C Compressor motor Input Current- Positive Contactor State Not Plausible

Circuit/System Description

The hybrid powertrain control module 2 receives serial data messages from the A/C compressor. If the electrical current reported by the compressor is not logical based on the currently commanded state, the hybrid powertrain control module 2 sets the DTC.

Conditions for Running the DTC

- Vehicle ON
- 12 V battery system voltage above 10.2 V.
- Hybrid/EV Powertrain Control Module 2 is awake and communicating.
- None of these DTCs are set: P0532, P0533, P0AA4, P0ABB, P0ABC, P0ABD, P0AD9, P0C78, P0D5E, P0D6A, P0D6B, P15CA, P1EC3, P1F0A, P1F0C, P1F0D, P2534, P2535, P3061, U0111, U016B, or U185A.
- The time since the high voltage contactors have been commanded opened or closed is greater than 1 s.
- Hybrid/EV Powertrain Control Module 2 monitors the data from the A/C compressor every 250 ms when the above conditions are met.

Conditions for Setting the DTC

DTC P154F is a Type B DTC.

Condition 1

- The high voltage battery contactors are commanded open.
- Electrical current is reported via serial data from the A/C compressor.

Condition 2

- The high voltage battery contactors are commanded closed.
- The A/C compressor is commanded OFF (0 RPM).
- Electrical current is reported via serial data from the A/C compressor.

  OR

- The RPM reported via serial data from the A/C compressor is greater than 60 RPM.

Condition 3

- The high voltage battery contactors are commanded closed.
- The high voltage battery is between 300 - 410 V.
- The A/C compressor is commanded ON.
- The RPM reported via serial data from the A/C compressor is between 1000 - 8600 RPM.
- The A/C refrigerant high side pressure reported via serial data from the ECM is between 200 - 2300 kPa (29 - 334 PSI).
- Electrical current reported via serial data from the A/C compressor is less than 0.2 A or greater than 27 A.

Action Taken When the DTC Sets

DTC P154F is a Type B DTC.

Conditions for Clearing the DTC

DTC P154F is a Type B DTC.

Diagnostic Aids

These DTCs may be set during a stall.

DTC P156A-P156C: AIR CONDITIONING (A/C) PRESSURE TOO HIGH WHEN A/C OFF, TOO LOW WHEN A/C ON

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of the diagnostic category.

DTC Descriptors

DTC P156A

Air Conditioning (A/C) Pressure Too High when A/C Off

DTC P156B

Air Conditioning (A/C) Pressure Too Low when A/C On

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
5 V Reference	P0452, P0532, P0641	P0532	P0453, P0533, P0641	-
Signal	P0532	P0532	P0533	P0531, P156A, P156B
Low Reference	-	P0533	-	-

Circuit/System Description

The engine control module monitors the high side refrigerant pressure through the high side A/C refrigerant pressure sensor. The engine control module supplies a 5 V reference and a low reference to the sensor. Changes in the A/C refrigerant pressure cause the sensor signal to the engine control module to vary. When the pressure is high, the signal voltage is high. When the pressure is low, the signal voltage is low. When pressure is high, the engine control module commands the cooling fans on.

If the engine control module detects the refrigerant pressure sensor signal is not logical based on the current operating conditions, the engine control module sets the DTC.

Conditions for Running the DTC

P156A

- Vehicle ON
- None of these DTCs are set: P0532, P0533, or U016B
- The compressor has been OFF for more than 20 s.
- The ECM monitors the A/C high side pressure every 100 ms when the above conditions are met.

P156B

- Vehicle ON
- None of these DTCs are set: P0532, P0533, or U016B
- The compressor has been ON for more than 10 s.
- The ECM monitors the A/C high side pressure every 100 ms when the above conditions are met.

Conditions for Running the DTC

P156A

- P156A is a type B DTC
- The ECM detects the A/C high side pressure is too high based on the current operating conditions.

P156B

- P156B is a type B DTC
- The ECM detects the A/C high side pressure is too low based on the current operating conditions.

Action Taken When the DTC Sets

P156A and P156B are type B DTCs

Conditions for Clearing the DTC

P156A and P156B are type B DTCs

Diagnostic Aids

A malfunction within the refrigerant system causing can cause these DTCs to set.

DTC P15C6 OR P15C8-P15CB: ELECTRIC A/C COMPRESSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for a overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P15C6

Electric A/C Compressor Speed Request Signal Message Counter Incorrect

DTC P15C8

Electric A/C Compressor Data Message Counter Incorrect

DTC P15C9

Electric A/C Compressor Status Message Counter Incorrect

DTC P15CA

Electric A/C Compressor Sensors Signal Message Counter Incorrect

DTC P15CB

Electric A/C Compressor Sensors Status Message Counter Incorrect

Circuit/System Description

The hybrid powertrain control module 2 receives serial data messages from the A/C compressor. If the message counter from the A/C compressor is not incrementing based on the currently commanded state, the hybrid powertrain control module 2 sets the DTC.

Conditions for Running the DTC

- Vehicle ON
- 12 V battery system voltage above 10.2 V.
- Hybrid/EV Powertrain Control Module 2 is awake and communicating.
- None of these DTCs are set: P2534, P2535, or U016B
- The A/C compressor is active.
- Hybrid/EV Powertrain Control Module 2 monitors the data from the A/C compressor every 100 ms when the above conditions are met.

Conditions for Setting the DTC

The hybrid powertrain control module 2 detects the message counter from the A/C compressor is not being updated.

Action Taken When the DTC Sets

DTCs P15C6, P15C8, P15C9, P15CA, and P15CB are Type B DTCs.

Conditions for Clearing the DTC

DTCs P15C6, P15C8, P15C9, P15CA, and P15CB are Type B DTCs.

DTC P1F0A-P1F0D: A/C COMPRESSOR MOTOR, ELECTRIC A/C COMPRESSOR CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1F0A

A/C Compressor Motor Speed Performance

DTC P1F0B

A/C Compressor Motor Start-Up Current Performance

DTC P1F0C

Electric A/C Compressor Control Module A/C Compressor Motor Current Feedback Circuit Low Voltage

DTC P1F0D

Electric A/C Compressor Control Module A/C Compressor Motor Current Feedback Circuit High Voltage

Circuit/System Description

The A/C compressor function is to provide refrigerant flow in the A/C refrigerant loop to help cool down the cabin, help dehumidify the air in a defrost mode and help maintain the battery temperature. Rather than a more-typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes High Voltage direct current from the vehicle's High voltage battery and inverts it to alternating current for the motor. The A/C compressor shall be activated when any of the three following events occur:

- The customer pushes the AC button
- The HVAC control, in AUTO mode, requests the electric A/C compressor on to help in cooling the cabin or removing moisture in the defrost mode
- The High Voltage Battery Thermal System requests the A/C compressor on to help maintain the battery temperature

The Hybrid/EV powertrain control module 2 uses values from the A/C refrigerant pressure transducers, A/C refrigerant thermistor, duct temperature sensors, ambient air temperature sensor, passenger compartment temperature sensor, battery cell temperature sensors, battery coolant temperature sensors and battery coolant pumps to determine the speed at which the compressor will operate. This message is sent from the Hybrid/EV powertrain control module 2 to the A/C compressor control module via serial data message.

A/C Compressor has a motor start up procedure that can take a variable length of time to run to bring the motor up to requested speed. Length of time is dependent on external conditions such as underhood temperature and high side pressure. In hotter conditions, the motor start up time will be longer. The A/C compressor control module monitors an internal parameter known as the DC link current which is based off DC input current. It is not possible to measure this parameter externally.

Conditions for Running the DTC

DTC P1F0A

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

DTC P1F0B

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

DTC P1F0C

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

DTC P1F0D

- 12 V battery system voltage is above 10.25 V.
- Vehicle is in Run Mode or Charging Mode
- Compressor is in start up mode

Conditions for Setting the DTC

DTC P1F0A

- A/C compressor control module temperature is greater than 85Â°C (185Â°F) and compressor motor speed does not reach to 1800 RPM within 20 s after the start of spinning
- A/C compressor control module temperature is less than or equal to 85Â°C and A/C compressor motor speed does not reach to 1800 RPM.

DTC P1F0B

Any A/C compressor control module phase current (U/V/W) greater than or equal to -1 A during initial motor startup process

DTC P1F0C

A/C compressor control module DC link Current is less than 2.5 A for 6 s

DTC P1F0D

A/C compressor control module DC link Current is greater than 36.7 A for 6 s

Action Taken When the DTC Sets

The A/C compressor control module is disabled but will retry once the compressor speed request goes to 0 RPM and a new speed request greater than 0 RPM is sent.

Conditions for Clearing the DTC

These are type B DTC's

SYMPTOMS - HVAC SYSTEMS - AUTOMATIC

NOTE: **The following steps must be completed before using the symptom tables:**

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Automatic HVAC Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the HVAC System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.
- Verify the A/C compressor turns freely and is not seized.

- Verify that the customer is using the correct key to enable personalization and is not inadvertently activating auxiliary HVAC controls.
- The A/C compressor will not operate in cold outside air temperatures.
- The following conditions may cause window fogging:
  - Wet carpet or mats
  - High humidity
  - Interior water leak
  - Blocked A/C evaporator drain tube
  - Maximum passenger capacity
  - Blocked body pressure relief valves
- Inspect the air distribution system for causes of reduced air flow:
  - Obstructed or dirty passenger compartment air filter, if equipped
  - Blocked or damaged air inlet or outlet vents

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

HVAC System Malfunction

HVAC SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Aids

Check the following mechanical fault sources:

- Air distribution box
- Air distribution hoses/air distribution ducts

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: **Check for bulletins before proceeding.**

1. Vehicle in Service Mode.
2. Verify every applicable scan tool switch parameter changes when pressing the appropriate switch on the A20 Radio/HVAC Controls.
   - **If any parameter does not change**

     Replace the A20 Radio/HVAC Controls.

   - **If all parameters change**
3. Verify the blower motor operates properly with the blower motor switch in each speed position.
   - **If the blower motor does not operate properly in each speed position**

     Refer to **DTC B0193**.

   - **If the blower motor operates properly in each speed position**
4. Verify every HVAC door moves correctly when pressing the appropriate switch.
   - **If any HVAC door does not move correctly**

     Refer to **DTC B0223, B0233, B023A, or B0408**.

   - **If all HVAC doors move correctly**
5. Install the appropriate ACR Air Conditioning Service Center, Vehicle in Service Mode
6. Verify the high side pressure on the gauge is within 10% of the scan tool A/C High Side Pressure Sensor parameter.
   - **If the A/C High Side Pressure Sensor parameter is not within 10%**

     Refer to **DTC P0532 or P0533**.

   - **If the A/C High Side Pressure Sensor parameter is within 10%**
7. Verify the A/C High Side Pressure Sensor parameter is between 269-2929 kPa (39-425 PSI).
   - **If the reading is not between 269-2929 kPa (39-425 PSI)**

     Refer to **Air Conditioning (A/C) System Performance Test**

   - **If the reading is between 269-2929 kPa (39-425 PSI)**
8. Verify the low side pressure on the gauge is within 10% of the scan tool A/C Low Side Pressure Sensor parameter.
   - **If the A/C Low Side Pressure Sensor parameter is not within 10%**

     Refer to **DTC P151C or P2516-P2518**.

   - **If the A/C Low Side Pressure Sensor parameter is within 10%**
9. Verify the scan tool parameters listed below are within 10% of ambient temperature.
   - Lower Left Duct Air Temperature Sensor
   - Upper Left Duct Air Temperature Sensor
   - **If not within 10% of ambient temperature**

     Refer to **DTC B0173 or B0178**.

   - **If within 10% of ambient temperature**

NOTE: **If the vehicle is equipped with RPO CE1, proceed to step 11.**

10. Verify the scan tool parameters listed below are within 10% of actual conditions.
    - Passenger Compartment Humidity
    - Passenger Compartment Humidity Sensor Temperature
    - Passenger Compartment Windshield Temperature
    - **If not within 10% of actual conditions**

      Refer to DTC B018A, B048C, B048F, or B1395.

    - **If within 10% of actual conditions**
11. Vehicle ON, A/C system ON.
12. Verify cool air flows from the ducts with the temperature control in the coldest position.
    - **If the air is not cool**

      Refer to Air Conditioning (A/C) System Performance Test

    - **If the air is cool**
13. Vehicle in Service Mode.
14. Verify the G36 Auxiliary Heater Coolant Pump turns On and Off when commanded with a scan tool.
    - **If the G36 Auxiliary Heater Coolant Pump does not turn On and Off**

      Refer to DTC B3844.

    - **If the G36 Auxiliary Heater Coolant Pump turns On and Off**
15. Vehicle ON, verify the K10 Coolant Heater Control Module is operating properly.
    - **If the K10 Coolant Heater Control Module is not operating properly**

      Refer to DTC B048E

    - **If the K10 Coolant Heater Control Module is operating properly**
16. Verify warm air flows from the ducts with the temperature control in the warmest position.
    - **If the air is not warm**

      Refer to Heating Performance Diagnostic .

    - **If the air is warm**
17. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- HVAC Component Replacement Reference

AUXILIARY HEATER COOLANT PUMP MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3844 01

Engine Coolant Circulation Pump Circuit Short to Battery

DTC B3844 06

Engine Coolant Circulation Pump Circuit Low Voltage/Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Coolant Pump Relay Coil Control	B3844 06, 2	B3844 06, 1	B3844 01, 1	-
Coolant Pump Relay Controlled Output	B3844 06, 1	1	2	-
Coolant Pump Ground	-	1	-	-
1. Coolant Pump inoperative 2. Coolant pump always on				

Circuit/System Description

The coolant heater pump is controlled by a relay. When operating conditions exist that requires the coolant heater to operate, the HVAC control module turns ON the heater coolant pump by applying ground to the relay control circuit which energizes the heater coolant pump relay. The coolant pump then circulates the coolant within the coolant heater system.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the G17 Heater Coolant Pump operates when commanding the Auxiliary Coolant Pump On and Off with a scan tool.
    - **If the G17 Heater Coolant Pump does not operate**

      Refer to **DTC B3844**.

    - **If the G17 Heater Coolant Pump operates**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

AFTERBLOW ENABLING

Afterblow is a feature that dries the evaporator core by operating the blower motor after the engine is turned off. This aids in reducing microbial growth that can create undesirable odors.

The vehicle does not come equipped with the afterblow feature turned on. If the afterblow feature is required due to an odor concern, it must be enabled by using the scan tool.

Use the following procedure to enable the afterblow feature:

1. Connect the Scan Tool.
2. Ignition ON/ Vehicle in Service Mode
3. Select Module Diagnostics.
4. Select HVAC Control Module.
5. Select Configuration/Reset Functions.
6. Select HVAC Afterblow Configuration.

When afterblow has been enabled, the following conditions must be met for the HVAC control module to operate afterblow:

- The vehicle must be turned OFF.
- The outside air temperature must be at least 11Â°C (52Â°F) when the compressor was last operating before the engine was turned OFF.
- The A/C compressor must have operated for more than 2 minutes before the engine was turned OFF.
- The system voltage must be above 12 V.

Once the above conditions have been met, the blower motor will operate at a low blower speed, following the sequence below up to 5 times:

1. The blower motor will be OFF for 7 - 11 minutes.
2. The blower motor will operate for 20 - 60 seconds.

ACTUATOR RECALIBRATION

Preferred Method (with Scan Tool)

NOTE: **Do not operate any HVAC controls while the HVAC control module is calibrating as this may interrupt the process. If interrupted, improper HVAC performance will result.**

1. Using a scan tool, perform the HVAC Actuators Learn in the HVAC Control Module.
2. Follow the scan tool directions to complete the procedure.
3. Operate the system and verify that no DTCs have set as current DTCs.
4. If DTC B101E 4B is set after attempting the actuator recalibration procedure, perform the following:
    1. Verify which actuator does not have a scan tool learn status parameter status of complete.
    2. Verify the unlearned actuator is physically rotating - A common cause of DTC B101E 4B is an actuator that is electrically OK but fails to physically rotate (e.g. stripped gears).
    3. If the unlearned actuator is not physically rotating, replace the actuator, otherwise replace the HVAC control module.

Alternate Method (without Scan Tool)

NOTE: **Do not operate any HVAC controls while the HVAC control module is calibrating as this may interrupt the process. If interrupted, improper HVAC performance will result.**

1. Ignition OFF/ Vehicle OFF.

2. Remove the HVAC control module fuse for a minimum of 10 s.
3. Install the HVAC control module fuse.
4. Start the vehicle.
5. Wait 40 s for the HVAC control module to self-calibrate.

REPAIR INSTRUCTIONS

HEATER AND AIR CONDITIONING REMOTE CONTROL REPLACEMENT

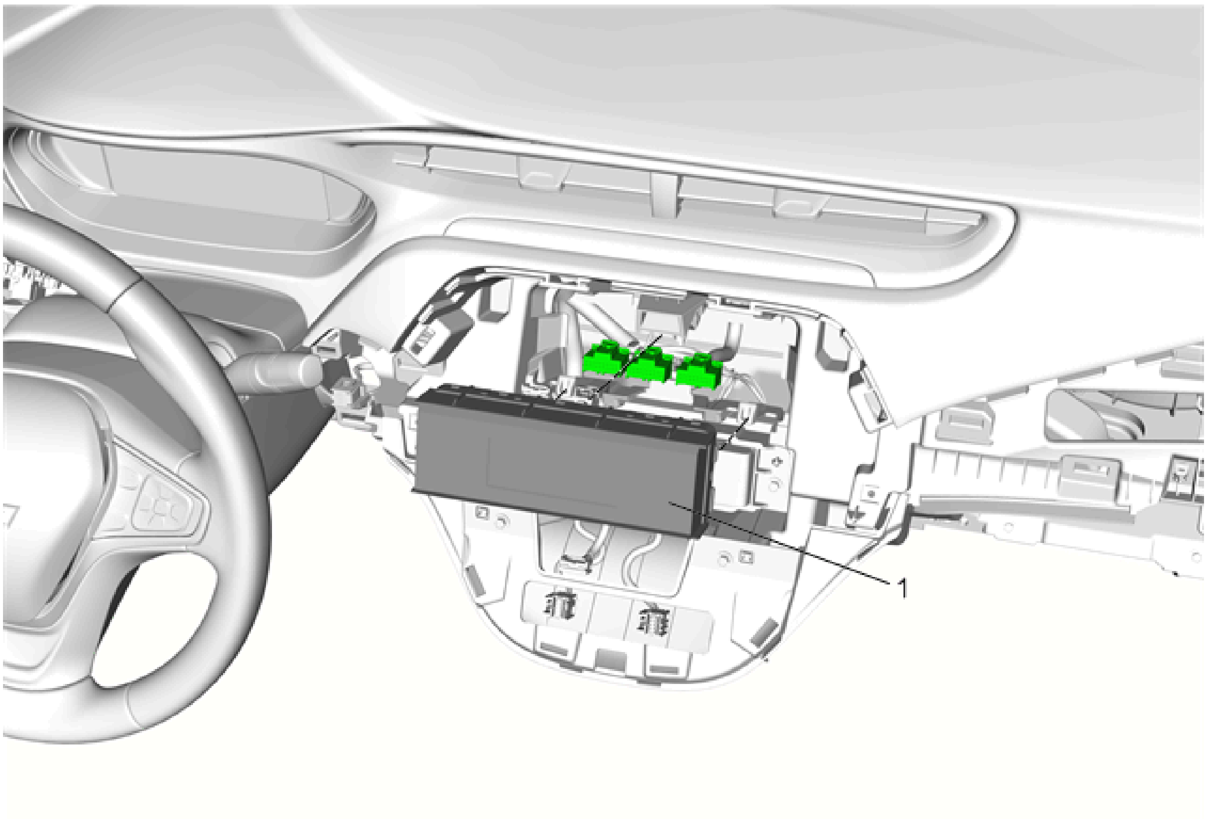

Fig. 6: Heater and Air Conditioning Remote Control
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Instrument Panel Trim Plate Replacement	
1	Heater and Air Conditioning Remote Control **Procedure** 1. Release the retaining tabs. 2. Disconnect the electrical connector. 3. Program the heater and air conditioning remote control. Control Module References

AIR CONDITIONING WIRING HARNESS REPLACEMENT

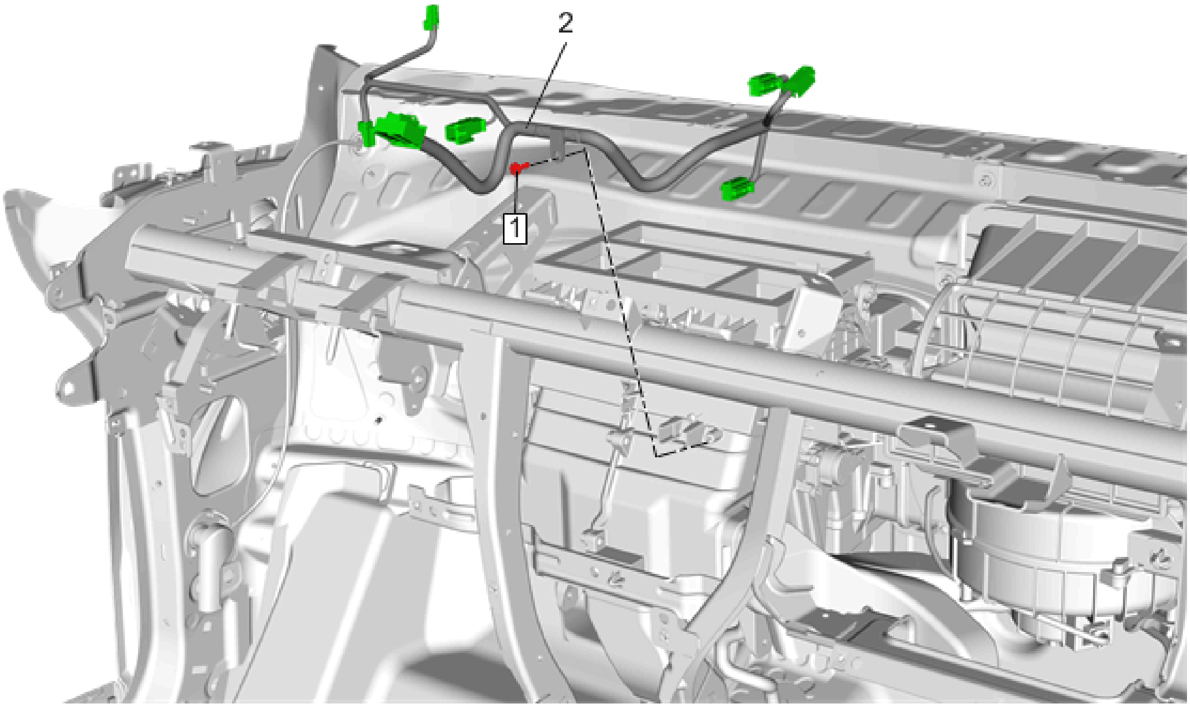

Fig. 7: Air Conditioning Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Instrument Panel Assembly Replacement 2. Loosen the tie bar, if necessary. Instrument Panel Tie Bar Replacement	
1	Air Conditioning Wiring Harness Screw **CAUTION:** Fastener Caution **Tighten** 2.5 N.m (22 lb in)
2	Air Conditioning Wiring Harness **Procedure** Disconnect the electrical connectors.

AIR INLET VALVE ACTUATOR REPLACEMENT

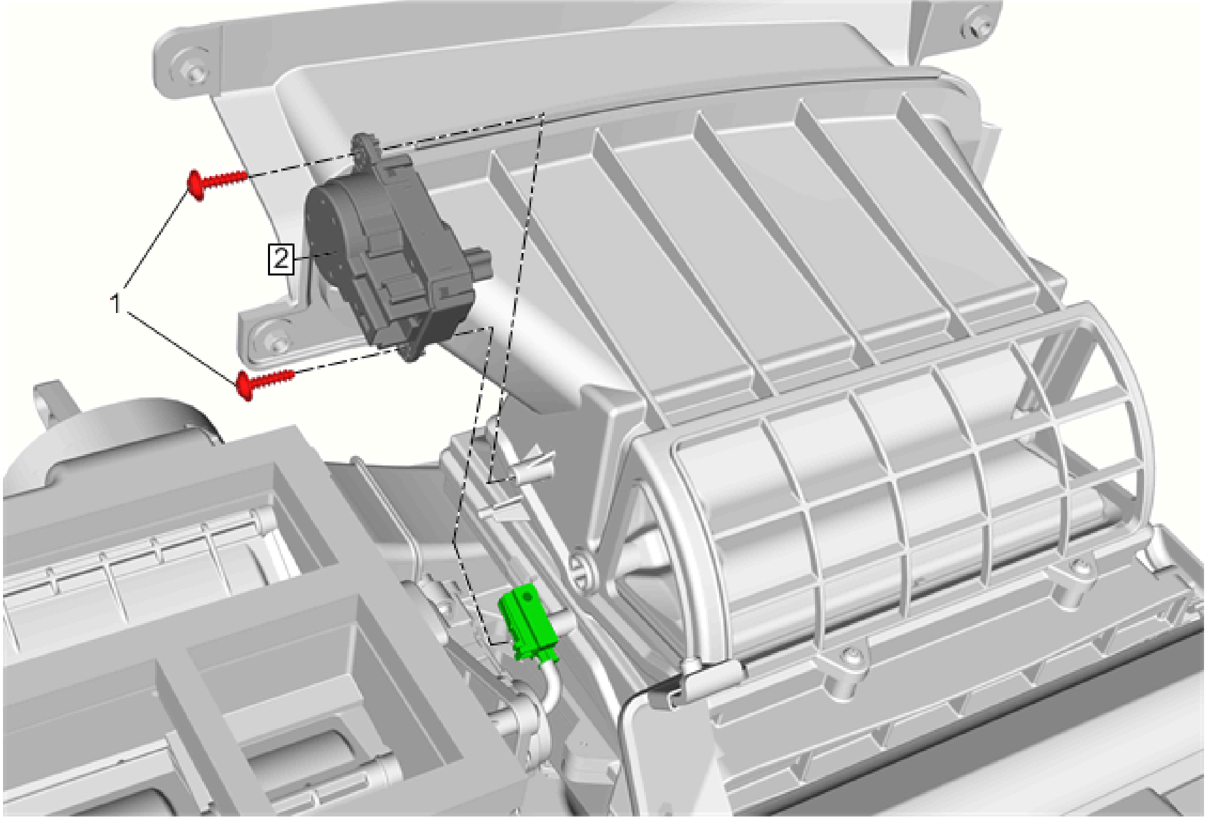

Fig. 8: Air Inlet Valve Actuator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the air inlet housing. Air Inlet Housing Replacement	
1	Air Inlet Valve Actuator Fastener (Qty: 2) **CAUTION:** Fastener Caution **Tighten** 2.5 N.m (22 lb in)
2	Air Inlet Valve Actuator **Procedure** Perform the programming and setup. Actuator Recalibration

MODE VALVE ACTUATOR REPLACEMENT

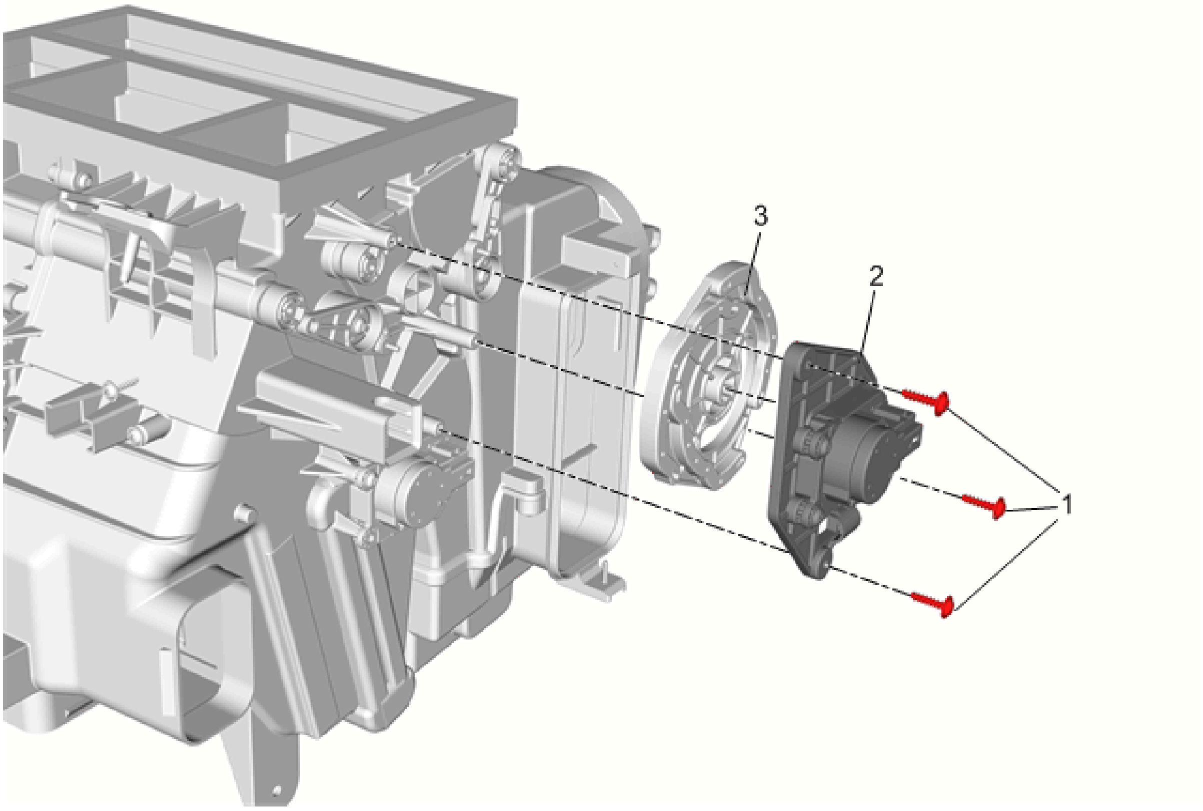

Fig. 9: Mode Valve Actuator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Heater and Air Conditioning Evaporator Case Replacement	
1	Mode Valve Actuator Bolt (Qty: 3) **CAUTION:** Fastener Caution **Tighten** 2.5 N.m (22 lb in)
2	Mode Valve Actuator **Procedure** 1. Mark cam and levers for proper installation. 2. Disconnect the electrical connector. 3. Reposition the air conditioning module wiring harness. 4. Actuator Recalibration
3	Mode Control Cam **Procedure** Remove the mode control cam from the actuator.

MODE CONTROL CAM REPLACEMENT

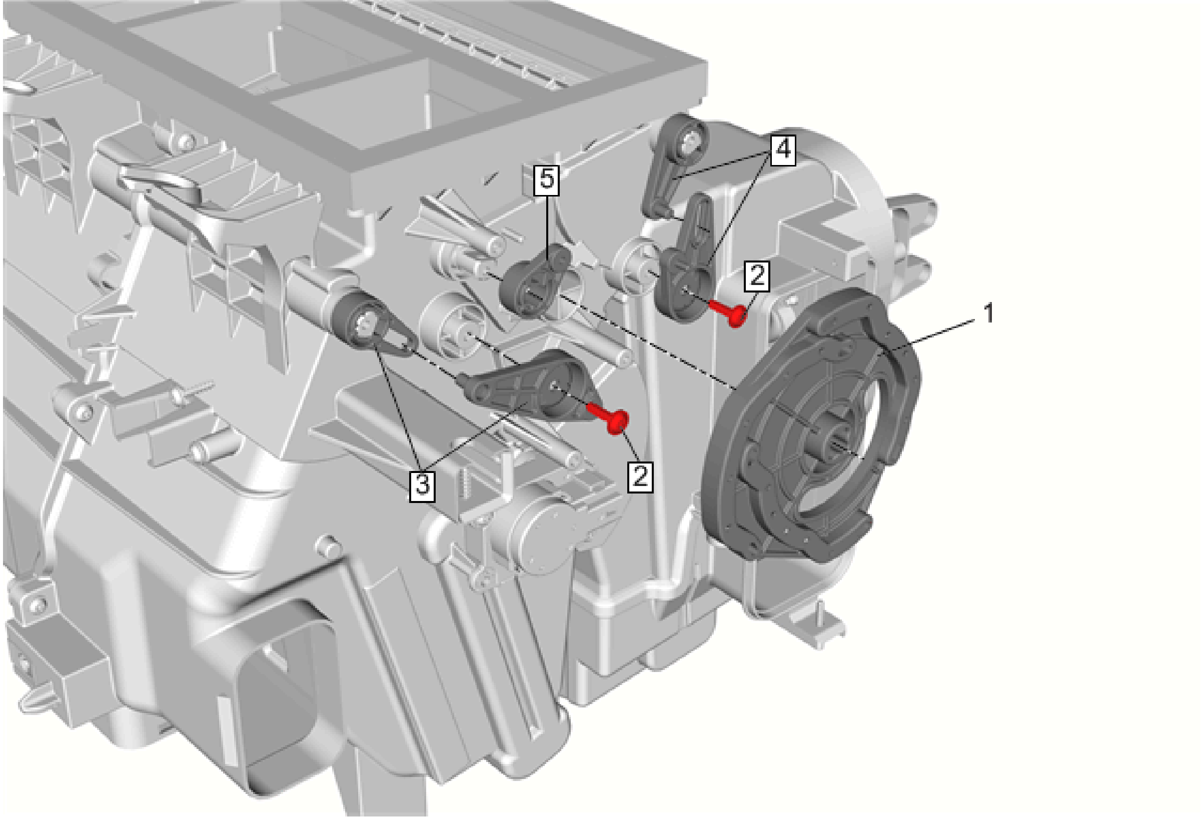

Fig. 10: Mode Control Cam
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Mode Valve Actuator Replacement	
1	Mode Control Cam **Procedure** 1. Mark the cam and levers for proper installation. 2. Lubricate the mode control cam in order to assure proper operation. Use Polylub GLY 801™, or equivalent.
2	Lever Screw (Qty: 2) **CAUTION:** Fastener Caution **Tighten** 2.5 N.m (22 lb in)
3	Floor Air Valve Lever
4	Defroster Valve Lever
5	Vent Valve Gear

TEMPERATURE VALVE ACTUATOR REPLACEMENT

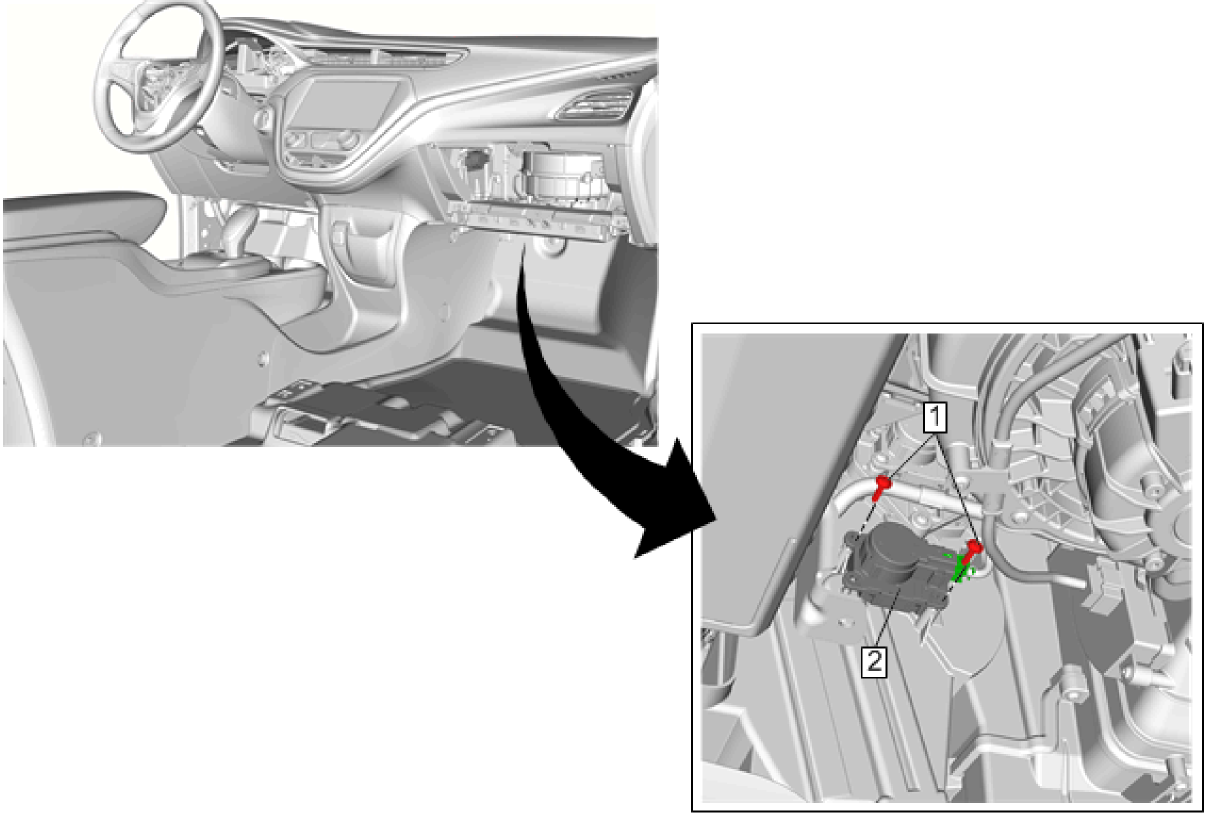

Fig. 11: Temperature Valve Actuator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Instrument Panel Compartment Replacement	
1	Temperature Valve Actuator Fastener (Qty: 2) **CAUTION:** **Fastener Caution** **Tighten** 2.5 N.m (22 lb in)
2	Temperature Valve Actuator **Procedure** 1. Disconnect the electrical connector. 2. Actuator Recalibration

DUCT AIR TEMPERATURE SENSOR REPLACEMENT - UPPER

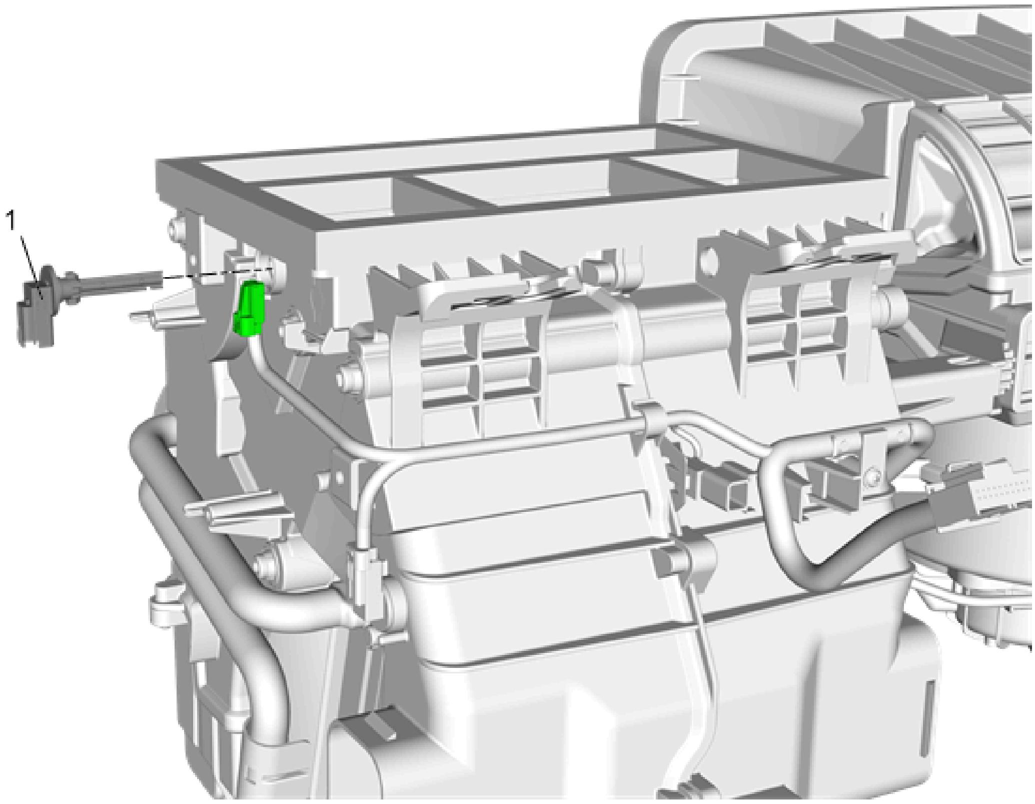

Fig. 12: Duct Air Temperature Sensor - Upper
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Instrument Panel Lower Airbag Bracket Replacement 2. Floor Front Air Outlet Duct Replacement - Left Side	
1	Duct Air Temperature Sensor - Upper **Procedure** 1. Disconnect the electrical connector. 2. Rotate the sensor counter clockwise to remove.

DUCT AIR TEMPERATURE SENSOR REPLACEMENT - LOWER

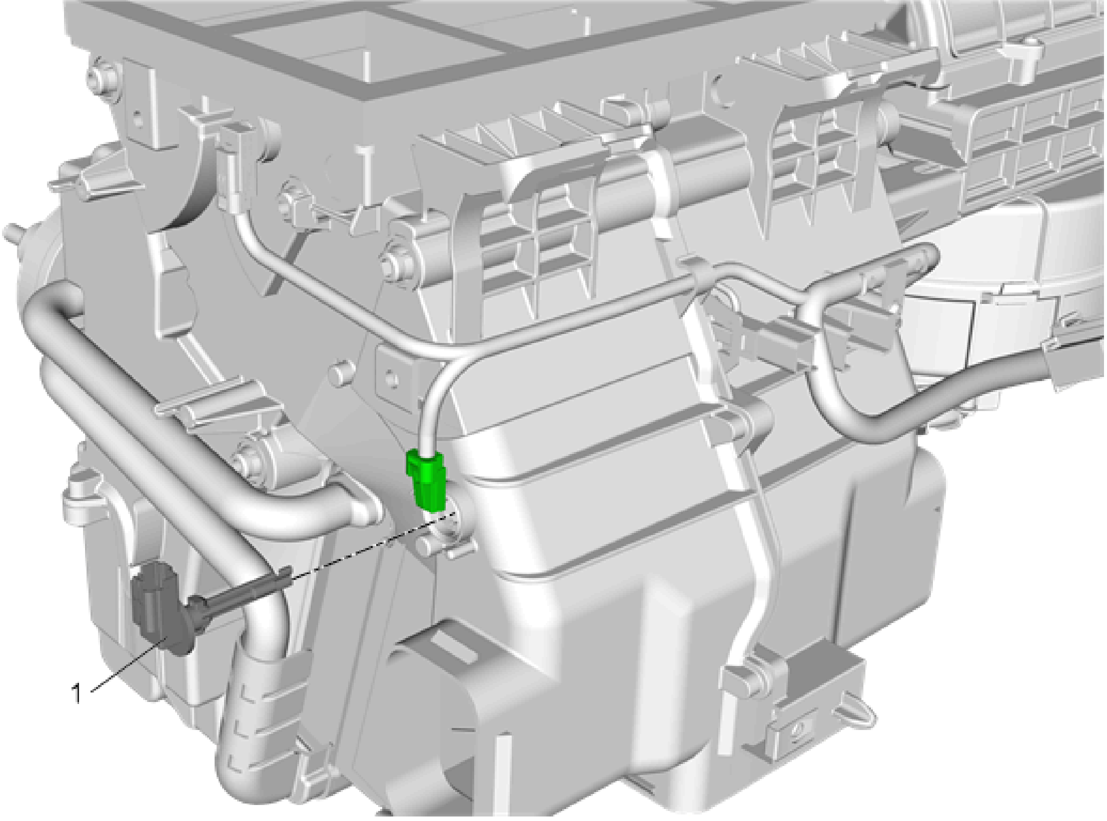

Fig. 13: Duct Air Temperature Sensor - Lower
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Instrument Panel Lower Airbag Bracket Replacement 2. Floor Front Air Outlet Duct Replacement - Left Side	
1	Duct Air Temperature Sensor - Lower **Procedure** 1. Disconnect the electrical connector. 2. Rotate the sensor clockwise to remove.

INSIDE AIR MOISTURE AND WINDSHIELD TEMPERATURE SENSOR REPLACEMENT (WITH FRONT VIEW CAMERA)

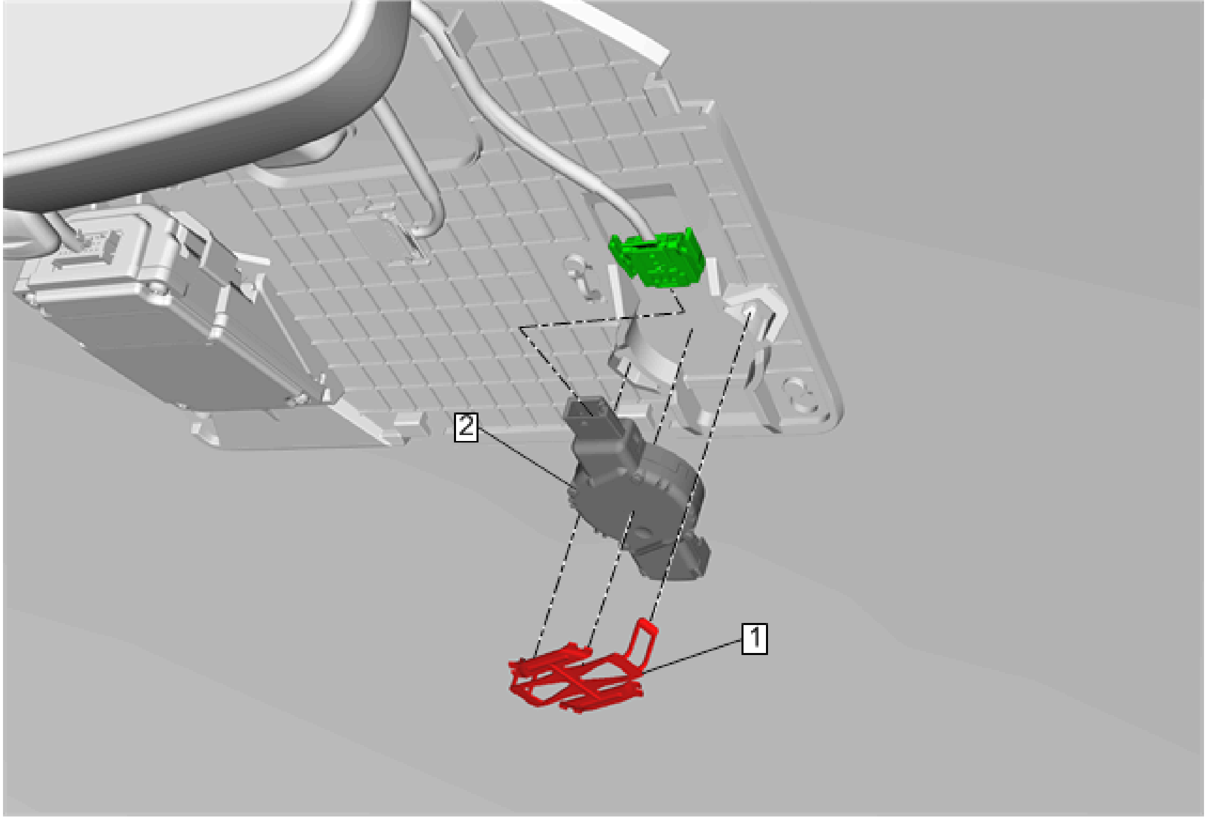

Fig. 14: Windshield Outside Moisture/Ambient Light and Humidity Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Windshield Multifunction Sensor Mount Bracket Cover Replacement (with Front View Camera)	
1	Windshield Outside Moisture/Ambient Light and Humidity Sensor Retainer **Procedure** Unlock the retaining tabs.
2	Windshield Outside Moisture/Ambient Light and Humidity Sensor **Procedure** Disconnect the electrical connector.

INSIDE AIR MOISTURE AND WINDSHIELD TEMPERATURE SENSOR REPLACEMENT (WITHOUT FRONT VIEW CAMERA)

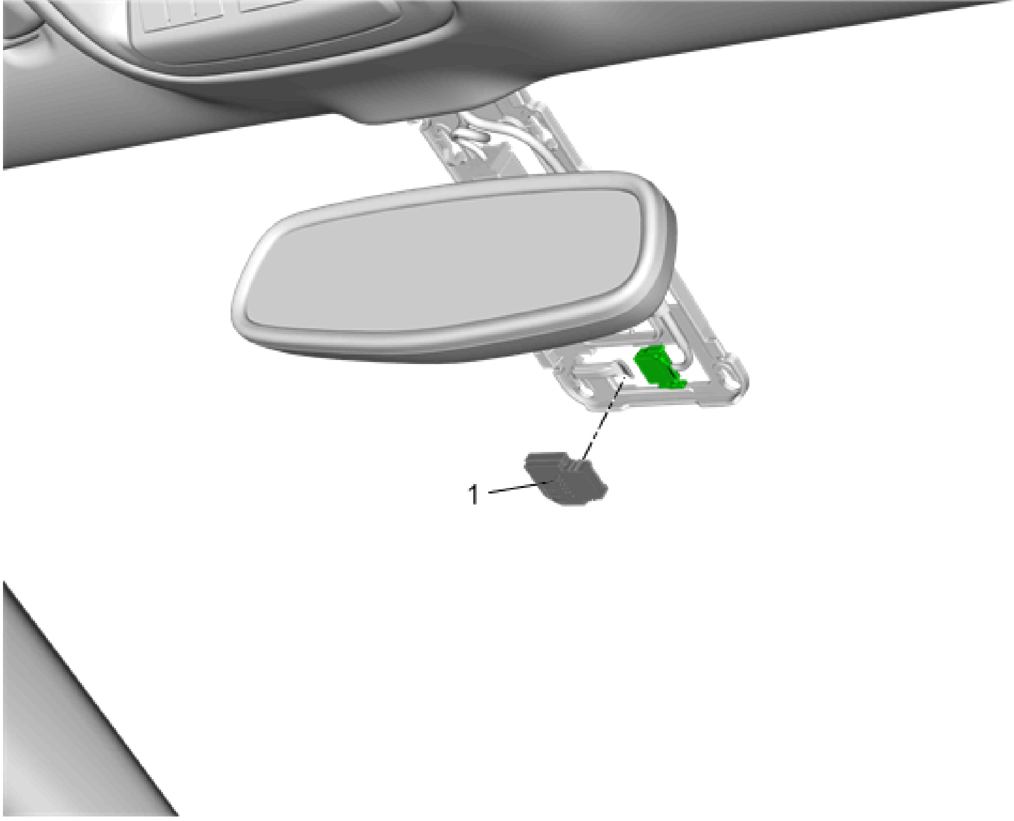

Fig. 15: Inside Air Moisture and Windshield Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

Call out	Component Name
Preliminary Procedure Windshield Multifunction Sensor Mount Bracket Cover Replacement (without Front View Camera)	
1	Inside Air Moisture and Windshield Temperature Sensor **Procedure** 1. Unclip the inside air moisture and windshield temperature sensor from the inside rearview mirror support bracket 2. Disconnect the electrical connector.

SUN LOAD, AMBIENT LIGHT, AND CHARGE INDICATOR SENSOR REPLACEMENT

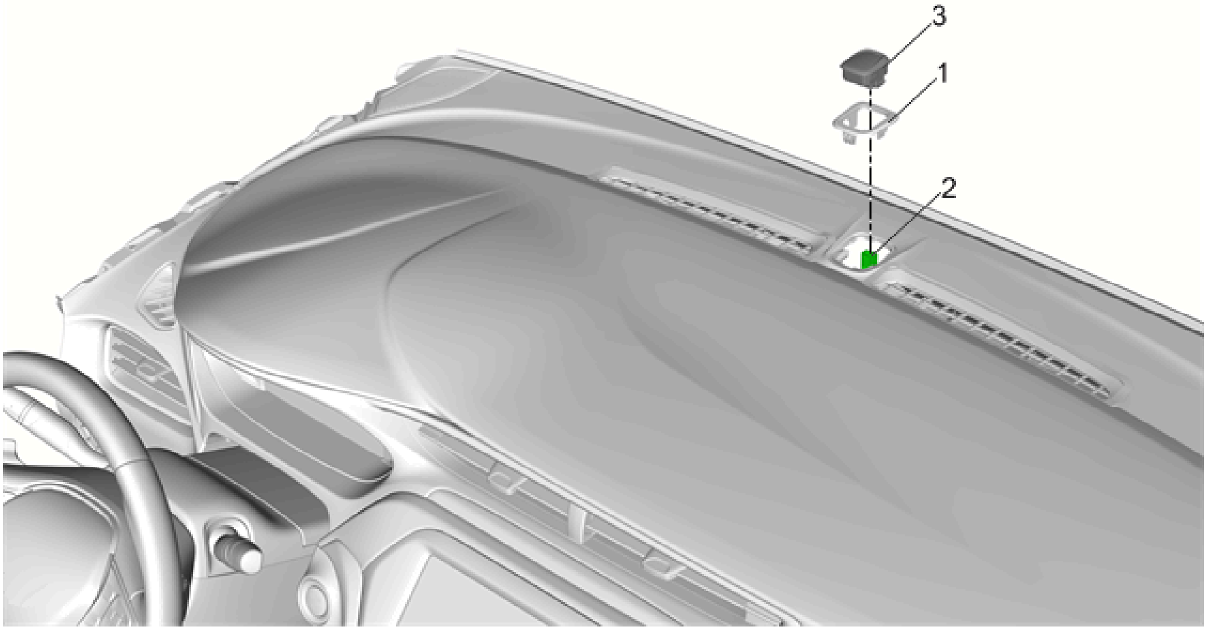

Fig. 16: Sun Load, Ambient Light, and Charge Indicator Sensor
Courtesy of GENERAL MOTORS COMPANY

Call out	Component Name
1	Daytime Running Lamp Ambient Light Bezel **Procedure** Using a plastic trim tool to release the bezel from the instrument panel.
2	Sun Load, Ambient Light, and Charge Indicator Sensor Connector **Procedure** Disconnect the electrical connector.
3	Sun Load, Ambient Light, and Charge Indicator Sensor **Procedure** Separate the sensor from the bezel.

BLOWER MOTOR CONTROL MODULE REPLACEMENT

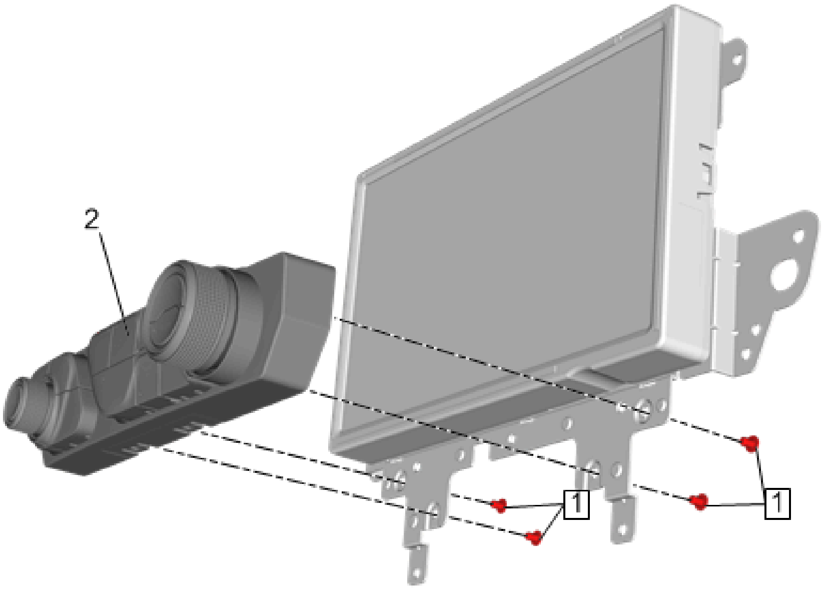

Fig. 17: Blower Motor Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Driver Information Display Replacement	
1	Blower Motor Control Module Bolt (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Blower Motor Control Module

DESCRIPTION AND OPERATION

AUTOMATIC HVAC DESCRIPTION AND OPERATION

The air temperature and the air delivery description and operation are divided into the following areas:

- HVAC Control Components
- Air Speed
- Air Delivery
- Heating and A/C Operation
- Recirculation Operation
- Automatic Operation
- Coolant Heater Control Module
- Coolant and A/C System Refrigerant

HVAC Control Components

HVAC Control

The HVAC control contains all the switches and knobs which are required to control the functions of HVAC and serve as interface between the operator and the HVAC control module. The HVAC controls are part of the radio/HVAC controls assembly. The selected values are passed to the HVAC control module via serial data.

HVAC Control Module

The HVAC control module is a serial data device that interfaces between the operator and the HVAC system to maintain and control desired air temperature and air distribution settings. The battery positive voltage circuit provides power that the HVAC control module uses for keep alive memory. If the battery positive voltage circuit loses power, all HVAC DTCs and settings will be erased from keep alive memory. The body control module (BCM), which is the vehicle power mode master, provides a device ON-Signal. The HVAC control module provides blower, air delivery mode and air temperature settings.

The HVAC control module supports the following features:

Feature	Availability
Afterblow	Available if reprogrammed by the technician
Purge	Yes
Personalization	Yes
Actuator Calibration	Yes

Actuators

Doors in the HVAC case assembly are used to control air flow. The HVAC control module operates the doors through the use of actuators, with one actuator being used for each door. The system has the following air control doors and associated actuators: mode, temperature, and recirculation.

Each actuator used in the system is a 5-wire stepper motor. The HVAC control module supplies a 12 V reference voltage to the stepper motor and energizes the 4 stepper motor coils with a pulsed ground signal. The stepper motor moves the associated air control door into the calculated position in order to reach the selected position. The null point of the stepper motor will be calibrated, if the stepper motor is new. When the stepper motor is calibrated, the HVAC control module can drive the applicable coil to reach exactly the desired position of the air control door.

Blower Motor Control Module

The blower motor control module controls the speed of the blower motor by increasing or decreasing the voltage drop on the ground side of the blower motor. The HVAC control module provides a low side pulse width modulation (PWM) signal to the blower motor control module via the blower motor speed control circuit. As the requested blower speed increases, the HVAC control module increases the amount of time that the speed signal is modulated to ground. As the requested blower speed decreases, the HVAC control module decreases the amount of time that the signal is modulated to ground.

Duct Temperature Sensors

The air temperature sensors are 2-wire negative temperature co-efficient thermistors. The sensors operate within a temperature range of -40 to +85Â°C (-40 to +185Â°F). The sensors are installed in the air distribution ducts and measure the temperature of the air that streams from the ducts. The HVAC control module uses these values to calculate the mixed air flap position.

A/C Refrigerant High Pressure Sensor

The A/C refrigerant pressure sensor is a 3-wire piezoelectric pressure transducer. A 5 V reference voltage, low reference, and signal circuits enable the sensor to operate. The A/C pressure signal can be between 0.2 - 4.8 V. When the A/C refrigerant pressure is low, the signal value is near 0 V. When the A/C refrigerant pressure is high, the signal value is near 5 V. The engine control module (ECM) converts the voltage signal to a pressure value. When pressure is too high or too low, the ECM will not allow the A/C compressor to engage.

A/C Refrigerant Low Pressure Sensor

The A/C refrigerant pressure sensor is a 3-wire piezoelectric pressure transducer. A 5 V reference voltage, low reference, and signal circuits enable the sensor to operate. The A/C pressure signal can be between 0.2 - 4.8 V. When the A/C refrigerant pressure is low, the signal value is near 0 V. When the A/C refrigerant pressure is high, the signal value is near 5 V. The Hybrid/EV Powertrain Control Module 2 monitors the low side refrigerant pressure through the A/C pressure sensor.

A/C Compressor

The AC compressor function is to provide refrigerant flow in the AC refrigerant loop to help cool down the cabin, help dehumidify the air in a defrost mode and help maintain the battery temperature. Rather than a more-typical pulley, the A/C compressor uses a 3-phase alternating current, high voltage electric motor to operate. It has an on-board inverter that takes high voltage direct current from the vehicle's high voltage battery and inverts it to alternating current for the motor. The AC compressor shall be activated when any of the three following events occur:

- The customer pushes the AC button or
- The HVAC control, in ECO climate or Comfort Climate Settings, requests the electric AC compressor on to help in cooling the cabin or removing moisture in conditions where the windows may fog or
- The hybrid/EV powertrain control module 2 requests the AC compressor on to help maintain the battery temperature

The hybrid/EV powertrain control module 2 uses values from the A/C refrigerant pressure sensor, duct temperature sensors, ambient air temperature sensor, passenger compartment temperature sensor, battery cell temperature sensors, battery coolant temperature sensors, and battery coolant pumps to determine the speed at which the compressor will operate. This message is sent from the hybrid/EV powertrain control module 2 to the A/C compressor control module via serial data message.

Ambient Light/Sunload Sensor

The ambient light/sunload sensor includes the sunload sensor and passenger compartment temperature sensor.

This sensor assembly provides information about:

- Sun heat intensity
- Passenger compartment temperature

The solar sensor is connected to ground and to a 5 V stabilized voltage supply through the HVAC control module. As the sunload increases, the sensor signal voltage also increases and vice versa. The signal varies between 1.4 - 4.5 V and is provided to the HVAC control module.

The passenger compartment temperature sensor is a negative temperature co-efficient thermistor. A signal and low reference circuit enables the sensor to operate. As the air temperature increases, the sensor resistance decreases. The sensor signal varies between 0 - 5 V.

Bright or high intensity light causes the vehicles interior temperature to increase. The HVAC system compensates for the increased temperature by diverting additional cool air into the vehicle.

Windshield Temperature and Inside Moisture Sensor

The windshield temperature and inside moisture sensor includes the relative humidity sensor, windshield temperature sensor and humidity sensing element temperature sensor.

This sensor assembly provides information about:

- Relative humidity level at windshield (compartment side)
- Temperature of the windshield inside (compartment side)
- Temperature of the humidity sensor element

The relative humidity sensor measures the relative humidity of the compartment side of the windshield. It also detects the temperature of the windshield surface on the passenger compartment side. Both values are used as control inputs for the HVAC control module application to calculate the fog risk on windshield compartment side and ability to reduce fuel consumption by decreasing A/C compressor power to a minimum without causing any fog. The sensor will also enable partial recirculation mode in order to improve heat-up performance of the passenger compartment under cold ambient temperature conditions without the risk of mist build-up on the windshield. The humidity sensor element temperature sensor supplies the temperature of the humidity sensor element.

When equipped with RPO CE1, the HVAC control module receives this information via serial data from the rain sensor module. When not equipped with CE1, the sensor values are received from signal circuits to the HVAC control module.signal circuits

HVAC Coolant Pump

The coolant heater pump is controlled by a relay. When operating conditions exist that requires coolant flow, the HVAC control module turns ON the heater coolant pump by applying ground to the relay control circuit which energizes the heater coolant pump relay.

Air Speed

The blower control switch is part of the HVAC faceplate control. The selected value of the blower switch position is sent to the HVAC control module via serial data.

The blower motor control circuitry is integrated within the blower motor control module. The HVAC control module provides a ground pulse width modulation (PWM) signal to the blower motor control module to request a specific motor speed. The blower motor control module translates the PWM signal and drives the motor accordingly.

Air Delivery

The HVAC control module controls the distribution of air within the passenger compartment by the use of the mode actuator. The modes that may be selected are:

- Defrost
- Defog
- Panel
- Floor
- BiLevel

In auto mode, the air delivery mode is controlled automatically based on cooling/warming needs of the compartment. The desired air distribution mode can be selected with the air distribution buttons at the HVAC faceplate control. The HVAC control delivers the values to the HVAC control module via serial data. The HVAC control module controls the mode actuator so that it drives the flap to the calculated position. Depending on the position of the flap, air is distributed through various ducts leading to the outlets in the dash. Turning the mode flap to the defrost position, the HVAC control module will move the recirculation actuator to outside air, reducing window fogging. When defrost is selected, the blower motor will be activated. The HVAC control module enables a high volume of air delivered to the front defrost vents. A/C is available in all modes.

The rear window defogger does not affect the HVAC system.

Recirculation Operation

The recirculation switch is integrated into the HVAC control. The selected recirculation switch position is sent to the HVAC control module via LIN-Bus. The HVAC control module controls the air intake using the recirculation actuator. In recirculation mode the recirculation door opens in order to circulate the air within the vehicle. In fresh air mode the recirculation door is closed in order to route outside air into the vehicle.

Inside air recirculation is prevented if the defrost mode is active. When the defrost mode is active, the recirculation actuator opens the recirculation door and outside air is circulated to the windshield to reduce fogging.

In automatic mode the values of the windshield temperature and inside moisture sensor are used as control inputs for the HVAC control module application to calculate the fog risk on passenger compartment side of the windshield compartment side. The A/C compressor and the defrost mode are activated to prevent or remove fog on the passenger compartment side of the windshield.

Heating and A/C Operation

The purpose of the heating and A/C system is to provide heated and cooled air to the interior of the vehicle. The A/C system will also remove humidity from the interior and reduce windshield fogging. Regardless of the temperature setting, the following can affect the rate that the HVAC system can achieve the desired temperature:

- Ambient air temperature
- Difference between inside and desired temperature
- Blower motor speed setting
- Mode setting
- Air conditioning control module operation
- Hybrid/EV powertrain control module 2 operation
- Coolant heater control module

Pressing the climate mode buttons (Comfort Mode or ECO Mode) enables the HVAC control module to determine whether to request A/C compressor and coolant heater activation. Based on the thermal conditions of the vehicle the HVAC control module sends a serial data message to the hybrid/EV powertrain control module 2 for the A/C request. The hybrid/EV powertrain control module 2 will request the A/C compressor control Module to engage A/C. The HVAC control module sends the heating request to the coolant heater control module to produce heat.

Climate Mode button (Fan Only) will disable all heating and cooling of the vehicle unless overridden by dehumidification requirements.

Automatic Operation

The user can select to operate the Blower, Recirculation and Air Delivery operations in auto per auto operation mode.

To put the HVAC system in full automatic mode, the following is required:

1. The auto button must be pressed.
2. The system indicates that all 3 functions are being operated automatically by lighting the auto button LED.

When the auto button is pressed, the system responds by putting the blower, air delivery and recirculation into auto mode. If any of these functions are adjusted then the auto button indication shall go off and the function will leave auto operation and follow the user requested setting: auto, blower, air delivery and recirculation. In this setting the blower request is adjusted to quickly heat the cabin initially. After comfort is reached, the blower speed is minimized to reduce noise and temperature drifts.

Under cold ambient temperatures, the automatic HVAC system provides heat in the most efficient manner. The operator can select an extreme temperature setting but the system will not warm the vehicle any faster. Under warm ambient temperatures, the automatic HVAC system also provides air conditioning in the most efficient manner. Selecting an extreme cool temperature will not cool the vehicle any faster.

In automatic mode the values of the windshield temperature and inside moisture sensor are used as control inputs for the HVAC control module application to calculate the fog risk on the passenger compartment side of the windshield and ability to reduce fuel consumption by decreasing A/C compressor power to a minimum without causing any fog. The A/C compressor and the defrost mode may be activated to prevent or remove fog on the passenger compartment side of the windshield. The sensor will also enable partial recirculation mode in order to improve heat-up performance of the passenger compartment under cold ambient temperature conditions without the risk of mist build-up on the windshield.

Coolant Heater Control Module

The coolant heater control module is a high voltage electric heater. High voltage is supplied from the hybrid/EV battery pack. A fused battery input, ground, and LIN serial data from the HVAC control module are used to control the operation of the coolant heater control module.

The coolant heater control module is an essential element of the hybrid heating system. When cabin heat is required, the HVAC control module commands the coolant heater control module activation via serial data, and commands the coolant pump relay on to operate the coolant pump to circulate the coolant. Heated coolant from the coolant heater will meet HVAC temperature demands. The coolant heater control module will be commanded OFF if the coolant temperature exceeds the desired temperature.

Heater coolant enters the heater core through the inlet heater hose, in a pressurized state. The heater core is located inside the HVAC module. The ambient air drawn through the HVAC module, absorbs the heat of the coolant flowing through the heater core. Heated air is distributed to the passenger compartment, through the HVAC module, for passenger comfort. Opening or closing the air temperature flap controls the amount of heat delivered to the passenger compartment. The coolant exits the heater core through the return heater hose and recirculates back to the system.

Coolant and A/C System Refrigerant

For information on coolant, coolant flow, A/C refrigerant, and the A/C refrigerant cycle, refer to **Heating and Air Conditioning System Description and Operation** .

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 01

1. The CHANGE OIL (or CHANGE ENGINE OIL) message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change.
2. To reset the oil life monitor, turn the ignition switch to RUN position, with engine off. Press the TRIP/OIL RESET button on the instrument panel for 12 seconds. The OIL CHANGE light will start to flash to confirm that system is reset (on some models a chime will also sound). Reset is complete when OIL CHANGE light goes out.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 02

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil. To reset CHANGE OIL light:

1. Remove IP fuse block cover (cover can be seen when driver's door is open).
2. Turn ignition ON, engine OFF.
3. Press OIL RESET button and hold for 5 seconds.
4. If Oil Life light does not reset, repeat procedure with ignition OFF.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 03

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the engine oil is nearly worn out. A CHANGE OIL light on the instrument cluster is illuminated when it is time to change the engine oil.

1. To reset oil life monitor and turn off CHANGE OIL light (or message), turn ignition to ON position with engine off.
2. Depress accelerator pedal to wide open throttle 3 times within 5 seconds.
3. Turn ignition to LOCK/OFF
4. If light (or message) does not turn off, turn ignition OFF and repeat procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 04

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1, 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

Reset Procedure

1. Turn the ignition key to RUN with the engine OFF.
2. Press the INFO and RESET buttons on the Driver Information Center (DIC) at the same time to enter the personalization menu.
3. Press the INFO button to scroll through the available personalization menu modes until the DIC display shows OIL-LIFE RESET.
4. Press the INFO and RESET buttons at the same time for one second and release.
5. Press and hold the reset button until the DIC display shows ACKNOWLEDGED. This will tell you the system has been reset.
6. Turn the key to LOCK/OFF.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 05

Engine oil life monitor calculates engine oil temperature and RPM. It indicates when the oil is nearly worn out. A CHANGE OIL light on left side of instrument cluster is illuminated when it is time to change oil. To reset oil life monitor:

1. Turn ignition on.
2. Depress ENG MET button on trip monitor and release.
3. Within 5 seconds, depress and release ENG MET button again.
4. Within 5 seconds, depress and hold the ENG MET or GAUGES button again. The CHANGE OIL light should flash.
5. Depress and hold the RANGE or GAUGES button until the CHANGE OIL light stops flashing and goes out. When the light goes out, the engine oil life monitor is reset. This should take about 10 seconds.

NOTE: **If the light does not reset, turn ignition off and repeat the procedure.**

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 06

The Driver Information Center (DIC) will display a CHANGE OIL message when an oil change is due. The instrument cluster may also have a CHANGE OIL light. To reset the oil life monitor:

Reset Procedure

1. Turn ignition switch to RUN position, with engine off.
2. Press the TRIP (on some models SELECT or SET/RESET) button, located on the DIC, until the OIL LIFE display appears. Message will display percentage of oil life remaining.

   NOTE: **On models without DIC buttons, use the TRIP/ODOMETER reset stem.**

3. Press and hold SET/RESET button (on some models, the check-symbol button) on DIC for at least 5 seconds. The message will change to indicate that the Oil Life has been reset. On some models, 3 chimes will also sound.
4. Turn ignition off.
5. Turn the key to OFF. If the light or message comes back on when you start your vehicle, the oil life system has not reset. Repeat the procedure.

NOTE: **On some models, if oil life system does not reset, try turning ignition OFF**

after displaying oil life message. Then press and hold reset button.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 07

When the system has calculated that oil life has been diminished, it indicates that an oil change is necessary. A CHANGE ENGINE OIL SOON message in the DIC comes on. Reset the system whenever the engine oil is changed so that the system can calculate the next engine oil change. To reset the system:

1. Press the up or down arrow to scroll the DIC to show OIL LIFE.
2. Once the XXX% ENGINE OIL LIFE menu item is highlighted, press and hold the RESET button until the percentage shows 100%

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 08

The CHANGE ENGINE OIL message is displayed when its time to change engine oil, usually between 3000 and 7500 miles since last oil change. The oil change interval is not based on mileage, but on engine revolutions and engine operating temperature.

1. There are 2 ways to reset the engine oil life monitor. To reset the engine oil life monitor using the accelerator pedal, go to step 4. To reset the engine oil life monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine off. Press and hold the DISP (on some models, TUNE DISP) button (or knob) on the radio for at least 5 seconds until SETTINGS is displayed.
2. Press the SEEK (on some models, SEEK PTYPE or SEEK PSCAN) up or down arrow to scroll through the main menu. Scroll until OIL LIFE appears on the display. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the DISP/TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message indicator has been reset, scroll through the menu until EXIT appears on the display. Press the DISP/TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. To reset the engine oil life monitor using the accelerator pedal, turn ignition on with engine off. Fully depress and release the accelerator pedal slowly 3 times within 5 seconds. If CHANGE ENGINE OIL light flashes, oil life monitor is reset. If the CHANGE ENGINE OIL light comes back on and stays on, oil life monitor has not reset. Repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 09

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. Press and hold the TRIP button on the steering wheel while turning on the ignition. Do not start the engine.
2. The instrument panel cluster will prompt to clear the service code.
3. Release the button.
4. Press and hold ENTER Switch on the left side of the steering wheel for approximately one second.
5. Turn off the ignition.

If the CHANGE ENGINE OIL SOON message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 10

1. Turn ignition ON, with engine off.
2. Press and release reset stem on instrument panel while OIL LIFE message is displayed.
3. Once the alternating OIL LIFE and RESET messages appear, press and hold stem in until several beeps will sound. This confirms that oil life system has been reset. Turn ignition off or full LOCK position. If CHANGE OIL messages comes back after starting engine, repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 11

Reset Procedure

If vehicle is equipped with a Driver Information Center (DIC), reset oil life monitor by pressing the Driver Information Center SELECT button for 5 seconds while ENGINE OIL LIFE is displayed.

Alternate Method

To reset the oil life monitor, turn ignition switch to ON or RUN position with engine off. Depress accelerator pedal slowly to wide open throttle 3 times within 5 seconds. If CHANGE ENG OIL light flashes for 5 seconds, oil life monitor is reset. If the CHANGE ENG OIL light does not flash, oil life monitor has not reset. Repeat this step.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 12

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, turn ignition on. Open glove box to access oil reset button. Press and hold oil reset button in glove box for at least 5 seconds, but not longer than 60 seconds. The CHANGE OIL SOON light will flash 4 times to indicate light has been reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 13

GM Oil Life System calculates when to change your engine oil and filter based on vehicle use. Anytime oil is changed, reset the system so it can calculate when the next oil change is required. If a situation occurs where you change your oil prior to a Change Oil Soon message being turned on, reset the system. After changing the engine oil, reset the system.

1. Display OIL LIFE RESET on the DIC.
2. Press and hold ENTER button for at least one second. An ACKNOWLEDGED display message will appear for 3 seconds or until the next button is pressed. This will tell you the system has been reset.
3. Turn key to OFF.
4. If Change Oil Soon message comes back on when you start your vehicle, engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 14

1. To display this light, press the GAGE INFO or GAGES button on the Driver Information Center (DIC). When oil life index is less than 10 percent, display will show OIL LIFE INDEX CHANGE OIL. After changing oil, reset system.
2. To reset light, display OIL LIFE INDEX. Hold RESET button for more than 5 seconds. After reset, oil life will change to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 15

1. CHANGE OIL SOON light will come on when engine oil has broken down enough to require changing. After changing oil, reset oil life display.
2. To reset light, locate reset button hole under the dash near passenger door. Use a pencil or similar object to push and hold button (inside hole) for 5 seconds. The CHANGE OIL SOON light will

flash 4 times to indicate light has been reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 16

Vehicles WITHOUT Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN, with the engine off. The vehicle must be in P (Park) to access this display. Press the trip odometer reset stem until OIL LIFE REMAINING displays.
2. Press and hold the trip odometer reset stem until OIL LIFE REMAINING shows "100%." Three chimes sound and the CHANGE ENGINE OIL SOON message goes off.
3. Turn the key to LOCK/OFF. If the CHANGE ENGINE OIL SOON message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.

Vehicles WITH Driver Information Center (DIC) Buttons

1. Turn the ignition to ON/RUN position, with the engine off.
2. Press the VEHICLE INFORMATION BUTTON (i) until OIL LIFE REMAINING displays.
3. Press and hold the SET/RESET button (check-mark symbol) until "100%" is displayed. Three chimes sound (on some models) and the CHANGE ENGINE OIL SOON message goes off.
4. Turn ignition to LOCK/OFF position. If the CHANGE ENGINE OIL SOON message comes back on when engine is started, repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 17

Reset Procedure

1. Turn the ignition to ON, with the engine off.
2. Press the MODE button until the Driver Information Center (DIC) reads OIL LIFE LEFT/HOLD SET TO RESET.
3. Press and hold the SET button until 100% is displayed. You will hear three chimes and the CHANGE ENGINE OIL message will go off. Turn the key to OFF.
4. If the CHANGE ENGINE OIL message comes back on when engine is started, the engine oil life system has not reset. Repeat the procedure.

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 18

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL message or light will come on. Change the engine oil as soon as possible within the next 600 miles (1 000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

Vehicles with DIC (& Steering Wheel Controls)

1. Using the DIC controls on the right side of the steering wheel (see Fig. 1), display REMAINING OIL LIFE on the driver information center (DIC).
2. Press SEL or SET/CLR (check mark icon on some systems) on the DIC controls and hold down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

NOTE: **If the CHANGE OIL message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.**

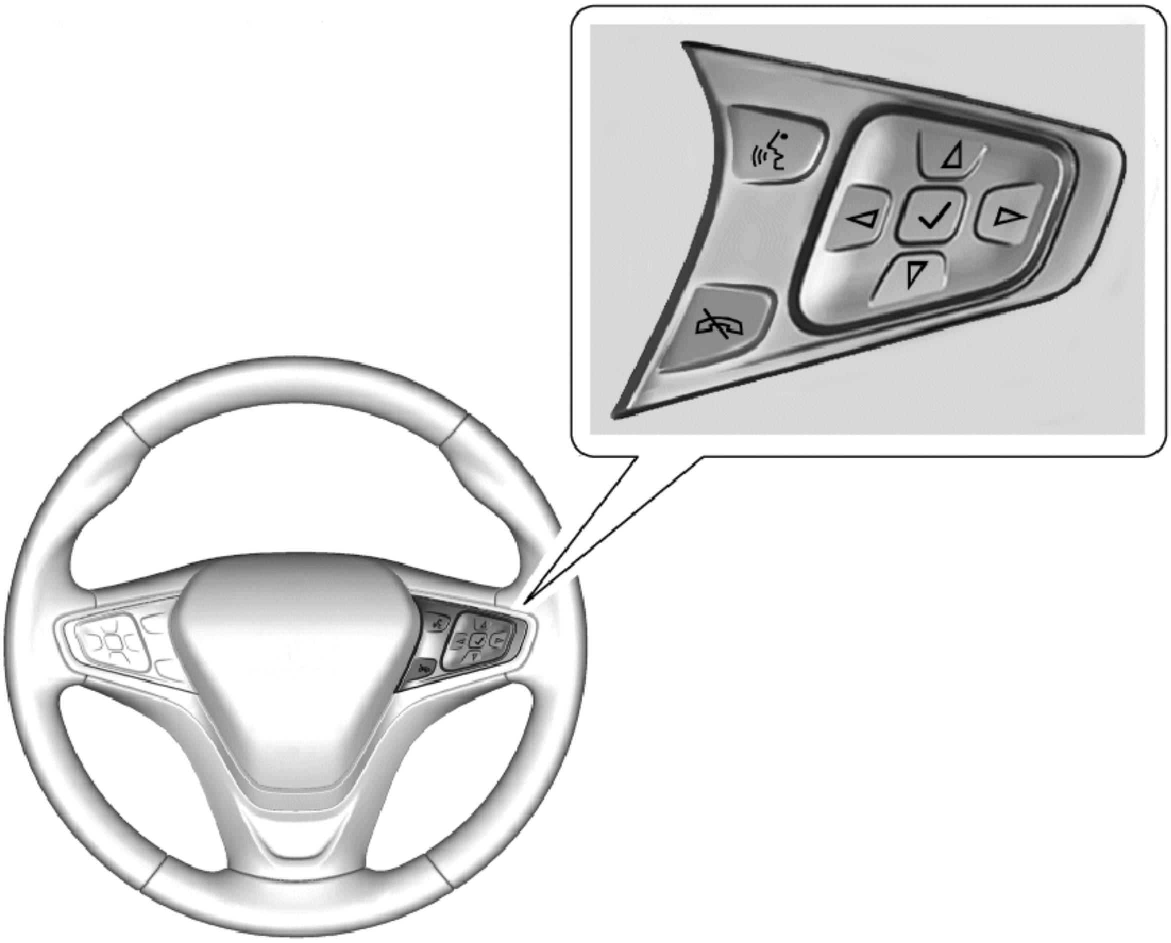

Fig. 1: Identifying DIC Controls (Steering Wheel - Typical)
Courtesy of GENERAL MOTORS COMPANY

Vehicles with DIC (& Turn Signal Lever Controls)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button on the turn signal lever to enter the Vehicle Information Menu. Use the thumbwheel to scroll through the menu items until you reach REMAINING OIL LIFE. See Fig. 2.

NOTE: **On vehicles with an Uplevel DIC, the controls are at the right-hand side of the steering wheel.**

3. Press the SET/CLR button (on some models, the check-symbol button) while the oil life display is active. After a few seconds, there will be a single chime (on some models) and the oil life will be reset to 100%
4. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE OIL message is off and the REMAINING OIL LIFE 100% message is displayed.

NOTE: **If the CHANGE OIL message comes back on or Code 82 DIC message comes on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.**

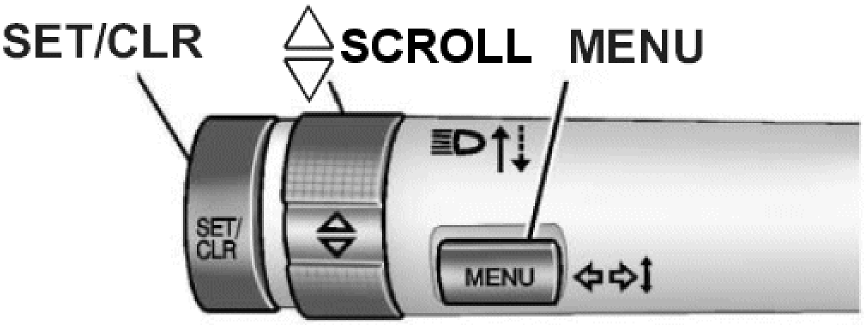

Fig. 2: Identifying DIC Controls (Turn Signal Lever)
Courtesy of GENERAL MOTORS COMPANY

Vehicles without DIC (Some Models)

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, than start the vehicle.

Reset Using Diagnostic Scan Tool (Some Models)

1. Turn on ignition.
2. Connect scan tool.
3. Select Module Diagnosis.
4. Select Engine Control Module.
5. Select Configuration/Reset function.
6. Select Engine Oil System Reset.
7. Push Enter button to run function.
8. Confirm Executed successfully.
9. Turn ignition of and confirm.
10. Turn ignition on and confirm.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 19

1. The Driver Information Center (DIC) will display remaining oil life as a percentage estimate of the useful life of oil.
2. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When oil life expires, display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press INFORMATION (or INFORMATION SKIP) button to display OIL LIFE LEFT. Press and hold RESET (or RESET NO) button until 100 OIL LIFE LEFT (0.0 OIL LIFE LEFT on some early models) is displayed.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 20

With Base Audio System

Press up or down arrow on the INFO button located to right of Driver Information Center (DIC) display to access DIC menu. Once 100 percent ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. Percentage will return to 100 and oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

With Navigation System

Turn the system on by pressing PWR/VOL knob once. PWR/VOL knob is located to lower left of DIC display. Press INFO button located to left of the display to access Vehicle Information menu. Turn TUNE/SEL knob located to lower right of the display until ENGINE OIL LIFE is highlighted. Press TUNE/SEL knob once to select it. When 100 percent Engine Oil Life is displayed, press multifunction button next to reset prompt in upper right corner of the display. Percentage will return to 100 and the oil life indicator will be reset. Repeat procedure if the percentage does not return to 100.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 21

1. Use the SELECT knob to select OIL LIFE on the DIC menu.
2. Press SELECT to start the OIL LIFE reset procedure.
3. The DIC menu will display "Are you sure that you want to reset?" Use SELECT to choose YES to reset oil life or NO to exit and return to the previous menu.
4. If YES is selected, the DIC menu will display RESET OIL LIFE for a short time and then 100% OIL LIFE will be display when OIL LIFE is successfully reset.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 22

With Base Audio System

1. Press the CLR button located to the right of the driver information center (DIC) display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Press the up or down arrow on the INFO button located to the right of the Driver Information Center (DIC) display to access the DIC menu.
3. Once 100% ENGINE OIL LIFE menu item is highlighted, press and hold the CLR button. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
4. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

Without DIC

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, then start the vehicle.

With Navigation System

1. Press the multifunction button, next to the OK prompt in the upper right of the display to acknowledge the Change Engine Oil message. This will clear the message from the display and reset it.
2. Turn the system on by pressing the PWR/VOL knob once. The PWR/VOL knob is located to the lower left of the driver information center (DIC) display.
3. Press the INFO button located to the left of the display to access the Vehicle Information menu.
4. Turn the TUNE/SEL knob located to the lower right of the display until Engine Oil Life is highlighted. Press the knob once to select it.
5. Once the 100% Engine Oil Life is displayed, press the multifunction button next to the Reset prompt in the upper right corner of the display. The percentage will return to 100 and the oil life indicator will be reset. Repeat the steps if the percentage does not return to 100.
6. Turn OFF the key. If the Change Engine Oil message comes back on when you start the vehicle, the engine oil life system has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 23

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset service reminder on 1989 models, press RANGE button until OIL LIFE INDEX appears on display. Depress and hold in AVG ECON and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.

4. On 1990-93 models, press RANGE button until OIL LIFE INDEX appears on DIC display. Depress and hold in AVG SPEED and RANGE buttons for more than 5 seconds or until 100 is displayed. This will reset remaining oil life to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 24

1. An OIL LIFE INDEX is one of 4 displays on Driver Information Center (DIC). It will display remaining oil life as a percentage estimate of the useful life of oil.
2. Display will show 100 percent when the system is reset. When remaining oil life is 10 percent or less, the system will display CHANGE OIL SOON. When the oil life expires, the display will show CHANGE ENGINE OIL. After changing oil, reset oil life display.
3. To reset oil life display, press ENG DATA button until OIL LIFE INDEX appears on DIC display. Depress and hold in ENG DATA and RANGE buttons until 100 is displayed. This will reset remaining oil life to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 25

1. An OIL LIFE INDEX is one of the displays on Driver Information Center (DIC). It will display remaining oil life as a estimated percentage of the useful life of oil.
2. It will show 100 percent when the system is reset. When the oil life is 0 percent, the display will show CHANGE ENGINE OIL. After performing necessary services, reset service reminder.
3. To reset service reminder, turn ignition to on position. Do not start engine. Depress and hold RANGE and FUEL USED buttons until OIL LIFE INDEX appears on DIC display. Depress and hold RANGE and RESET buttons for 5-60 seconds.
4. When CHANGE OIL SOON light flashes 4 times, remaining oil life index is reset to 100 percent. If CHANGE OIL SOON comes on and stays on for 5 seconds, display did not reset. Repeat step 3.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 26

1. Oil change reminder display on the Driver Information Center (DIC) is similar to 1990-91 models, but reset procedures are different. After changing oil, reset oil life display.
2. To reset, press INFORMATION button to display OIL LIFE INDEX. Press and hold STORE/RECALL button until 100 is displayed. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 27

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of engine oil or transaxle fluid. When remaining oil or fluid life is 0 percent, the display will show CHANGE OIL NOW or CHANGE TRNS FLUID NOW. After changing engine oil or transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the OIL LIFE or TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, OIL LIFE 100 or TRNS FLUID 100 will be displayed.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 28

1. An oil change reminder displays estimated percentage of the remaining useful life of the oil. When engine is started, a tone will sound and approximate distance to next oil change will be displayed.
2. When remaining oil life is 10 percent or less, the system will calculate distance to next oil change. When the oil life is 0 percent, the display will show CHANGE OIL NOW. After changing oil, reset oil life display.
3. To reset the display, press and hold in OIL button to select the oil life display. Then, press and hold in RESET and OIL buttons for at least 5 seconds. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 29

1. To reset the display, press and release the TEST button.

2. Press and release the OIL button.
3. Press and hold the RESET button for at least 7 seconds. This will reset oil life display to 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 30

1. To reset the display, press and release RESET button on Driver Information Center (DIC).
2. Press SEL button (with down arrow) to select OIL.
3. Press SEL button (with left and right arrows) to display oil life.
4. Press and hold RESET button for about 5 seconds.
5. A reset message will display, then oil life will display 100 percent.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 31

With Information Center Display

OIL LIFE INDEX is one of 4 engine data displays used on models with Information Center display. It will display remaining oil life as estimated percentage of the useful life of oil. It will show 100 percent when the system is reset. After changing oil, reset oil life display.

1. To reset the display, press ENG DATA button (1989-90) or OPTIONS button (1991-92) until oil life index is displayed.
2. Then, press and hold in ENG DATA and GAGE buttons (1989) or RESET/ENTER button (1990-92) for at least 5 seconds. This will reset remaining oil life to 100 percent.

With Visual Information Center

OIL LIFE is one of the displays used on models with a Visual Information Center (VIC). It will display data regarding previous oil change. A bar graph display shows full when oil is changed. Bar graph will go down as vehicle is driven and oil ages. When bar graph reaches CHANGE OIL mark, oil should be changed. After changing oil, reset oil life display.

1. To reset the display, press INFO hard key and then OIL LIFE soft key to display oil life index.
2. Press RESET soft key.
3. A reset confirmation page will appear and ask if oil has been changed. Press YES soft key to reset bar graph, and update last oil change date and mileage information.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 32

When the system has calculated that oil life has been diminished, it will indicate that an oil change is necessary. A CHANGE ENGINE OIL SOON message will come on. Change the engine oil as soon as possible within the next 600 miles (1000 km). It is possible that, if driving under the best conditions, the oil life system may not indicate that an oil change is necessary for over a year. However, the engine oil and filter must be changed at least once a year and at this time the system must be reset.

To reset the Engine Oil Life System, do the following:

1. With the CHANGE OIL SOON message displayed, press any of the three driver information center (DIC) buttons to clear the CHANGE OIL SOON message.
2. Display OIL LIFE RESET on the DIC.
3. Press and hold the ENTER button for at least one second. An ACKNOWLEDGED display message will appear for three seconds or until the next button is pressed. This will tell you the system has reset.
4. Turn the ignition to OFF.

If the CHANGE ENGINE OIL message comes back on when you start the vehicle the Engine Oil Life System has not reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 33

This vehicle has a computer system that indicates when to change the engine oil and filter. This is based on a combination of factors which include engine revolutions, engine temperature, and miles driven. Based on driving conditions, the mileage at which an oil change is indicated can vary considerably. For the oil life system to work properly, the system must be reset every time the oil is changed. To reset the system:

Reset Procedure

1. Using the DIC controls on the right side of the steering wheel, display REMAINING OIL LIFE on the driver information center (DIC).
2. Press SEL (check mark icon on some systems) on the DIC controls and hold down for a few seconds to clear the CHANGE ENGINE OIL SOON message and reset the oil life at 100%.

NOTE: **Be careful not to reset the oil life display accidentally at any time other than after the oil is changed. It cannot be reset accurately until the next oil change.**

Alternate Method (Some Models)

1. Turn the ignition key to RUN with the engine off.
2. Fully press the release the accelerator pedal 3 times within 5 seconds. Several beeps sound. This confirms the oil life system has been reset.
3. If the CHANGE/OIL message comes back on when you start the engine, the engine oil life system has not been reset. Repeat the procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 34

Vehicles with Driver Information Center (DIC)

1. Turn the ignition to ON/RUN with the engine off.
2. Press the DIC MENU button, on the center console or right-hand steering wheel controls, to enter the Vehicle Information Menu.
3. Press either the up or down arrows to view REMAINING OIL LIFE.
4. Press the SET/CLR button until 100% is displayed.
5. Turn the ignition to LOCK/OFF.

The system is reset when the CHANGE ENGINE OIL SOON message goes off.

NOTE: **If the CHANGE OIL message comes back on when the vehicle is started, the engine oil life system has not been reset. Repeat the procedure.**

Alternate Method

1. With the engine OFF, turn the ignition key to RUN.
2. Fully press and release the accelerator pedal slowly three times within five seconds.
3. Turn the key to OFF, than start the vehicle.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 35

Reset the system whenever the engine oil is changed so that the system can calculate the next engine oil change. Always reset the engine oil life to 100% after every oil change. It will not reset itself. Use the DIC controls at the right side of the instrument cluster to reset the system.

1. Display remaining oil life (oil can w/ %) on the DIC
2. Press and hold SET/CLR on the DIC for more than five seconds. The oil life will change to 100%.

If the OIL CHANGE DIC message comes back on when the vehicle is started, the engine oil life system has not reset. Repeat the procedure.

EMISSIONS MAINTENANCE REMINDER (REMINDER FLAG)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET. Only vehicles listed in this index have an Oxygen Sensor Reminder Flag reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Some Models	
1980	Emissions Maintenance Reminder Reset Procedure

EMISSIONS MAINTENANCE REMINDER RESET PROCEDURE

1. Every 30, 000 miles, a reminder flag appears in speedometer face, indicating service of oxygen sensor is necessary. See Fig. 3. Inspect and service oxygen sensor as necessary and reset flag.
2. To reset flag, remove instrument panel trim plate. Remove instrument cluster lens. Using pointed tool, apply light downward pressure on notches of flag until it is reset. An alignment mark will appear in left center of odometer window when flag is fully reset.

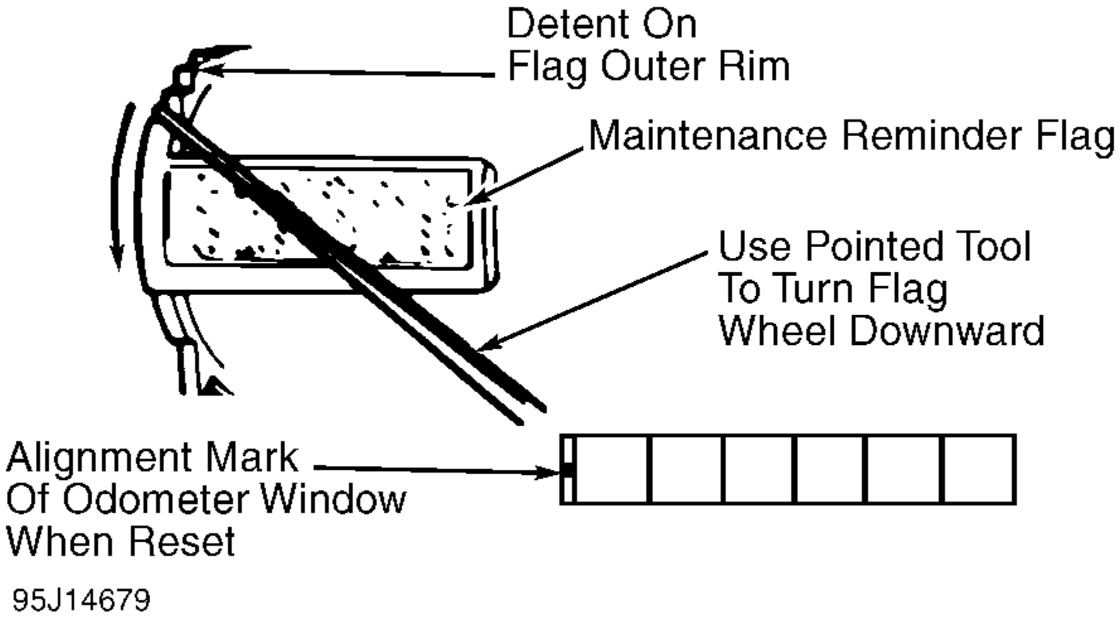

Fig. 3: Resetting Reminder Flag
Courtesy of GENERAL MOTORS CORP.

EMISSIONS MAINTENANCE REMINDER (WARNING LIGHT)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have an oxygen sensor warning light reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Sprint	
1985-86	Emissions Maintenance Reminder Reset Procedure

EMISSIONS MAINTENANCE REMINDER RESET PROCEDURE

At 30, 000 mile intervals, a SENSOR light in dash will start flashing, indicating oxygen sensor needs replacement. To reset mileage counter (after sensor replacement), locate SENSOR light cancel switch on right side of fuse box. Return cancel switch to OFF position. Start engine to ensure light remains off.

EMISSIONS MAINTENANCE REMINDER (CHECK ENGINE LIGHT)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have a check engine light reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Geo Tracker	
1989-94	Emissions Maintenance Reminder Reset Procedure

EMISSIONS MAINTENANCE REMINDER RESET PROCEDURE

Federal Emissions

1. CHECK ENGINE light functions as a service reminder indicator and emission system service. CHECK ENGINE light will come on each 50, 000 miles (PCV and EGR), each 80, 000 miles (oxygen sensor) and each 100, 000 miles (charcoal canister) to indicate needed emission system service.
2. After servicing and/or replacing components, reset CHECK ENGINE light by sliding cancel switch to its opposite position. See CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)for switch location.

CHECK ENGINE LIGHT RESET SWITCH LOCATION (GEO TRACKER)

Application	Location
1989-91	Behind Access Panel, Directly Below Steering Column
1992-94	(1) Behind Instrument Panel, Next To Left Speaker
(1) See Fig. 4.	

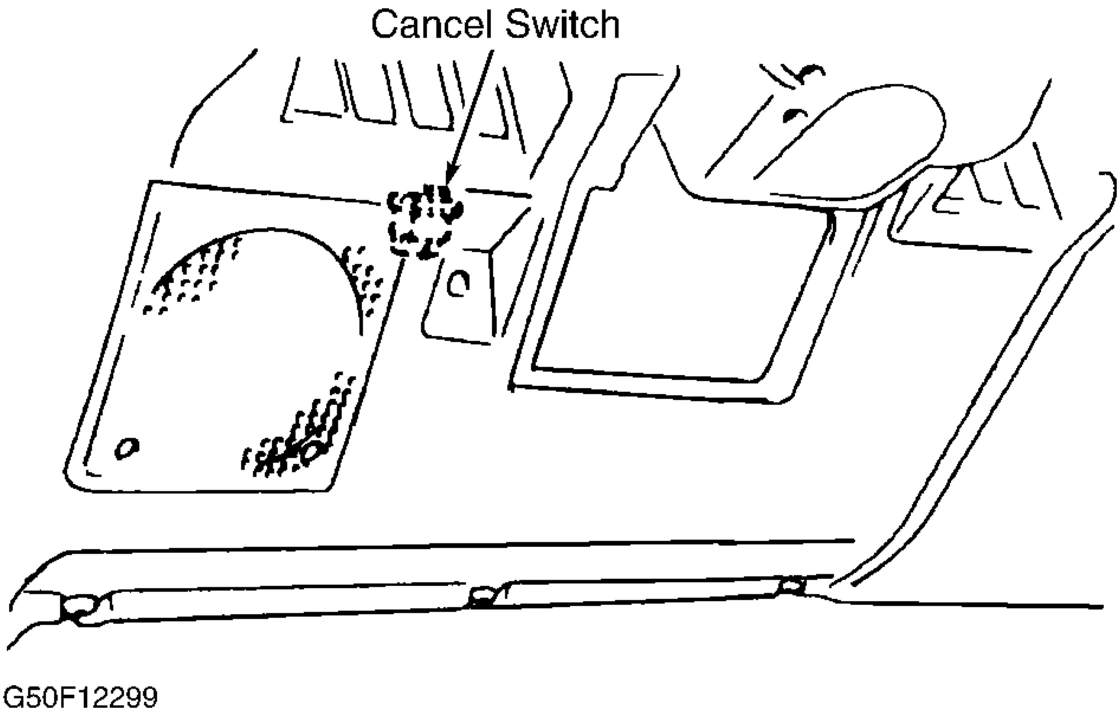

Fig. 4: Check Engine Light Reset Switch Location (1992-94 Geo Tracker - Federal Emissions)
Courtesy of GENERAL MOTORS CORP.

California Emissions

CHECK ENGINE light indicates when it is necessary to have emission system serviced, regardless of mileage. CHECK ENGINE light comes on briefly when starting as a bulb check. If light does not come on or stays on constantly, repair as necessary.

DIESEL FUEL FILTER REPLACEMENT REMINDER

NOTE: **To determine the appropriate reset procedure, refer to Fuel Filter Life Reset Index. Only vehicles listed in this index have a fuel filter life reset.**

FUEL FILTER REPLACEMENT REMINDER RESET INDEX

Application	Reset Procedure
Some Diesel Models	Fuel Filter Replacement Reminder Reset Procedure

FUEL FILTER REPLACEMENT REMINDER RESET PROCEDURE

NOTE: **This procedure applies to some diesel models. Manufacturer does not specify which vehicles are equipped with a Fuel Filter Replacement Reminder.**

NOTE: **ALWAYS reset the FUEL FILTER LIFE system (if equipped) after a fuel filter change.**

"FUEL FILTER LIFE" message will appear when a reset is performed either by using the steering wheel controls or performing manual reset procedure.

1. On vehicles with steering wheel controls, press and hold the select button for 5 seconds while the FUEL FILTER LIFE message is displayed. This message will appear on the Driver Information Center (DIC) for 10 seconds.
2. On vehicles without steering wheel controls, go to next step.
3. Without pressing the pedals, turn the ignition key to the ON position, engine off. Wait 5 seconds.
4. Completely depress the brake and accelerator pedals simultaneously and hold for 10 seconds. The system is now reset. Turn ignition key OFF.
5. On all vehicles, the next time engine is started, the message will no longer be displayed.

MAINTENANCE SERVICE REMINDER

NOTE: **To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX. Only vehicles listed in this index have a Service Reminder reset.**

MAINTENANCE SERVICE REMINDER RESET INDEX

Model & Year	Reset Procedure
6000 STE	
1987-89	Maintenance Service Reminder Reset - Procedure 01
Bonneville	
1988-91	Maintenance Service Reminder Reset - Procedure 01
Caprice	
2011	Maintenance Service Reminder Reset - Procedure 02

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 01

The SERVICE REMINDER message light is used on models with a Driver Information Center (DIC). After performing necessary services, reset service reminder light.

1. To reset service reminder, push DIC button until desired service item is displayed.
2. Press and hold down the DIC button. With button pressed, the distance display will decrease in increments of 500 miles.
3. Release button when desired distance is displayed on the DIC.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 02

The displayed service reminder is reset using a scan tool or by the following procedure:

1. Turn the ignition to the OFF position.
2. Press and hold the TRIP button.
3. Turn the ignition to the ON position.
4. Release the TRIP button.
5. Once in the Service Reset screen, press and hold the ENTER switch for 3-5 seconds. A confirmation beep will sound upon reset.
6. Turn the ignition to the OFF position.

NOTE: **If the service reminder comes back on when you start the vehicle, the Service Reminder Display has not reset. Repeat the procedure.**

TIMING BELT REPLACEMENT REMINDER

NOTE: **To determine the appropriate reset procedure, refer to TIMING BELT REPLACEMENT REMINDER INDEX. Only the vehicles listed in this index have a Timing Belt Replacement Reminder Reset.**

CHANGE TIMING BELT MESSAGE INDEX

Model & Year	Reset Procedure
Chevrolet Cruze - 1.8L LUW and LWE Engines (2011-16)	Timing Belt Replacement Reminder Reset Procedure
Chevrolet Sonic - 1.8L LUW and LWE Engines (2012-16)	Timing Belt Replacement Reminder Reset Procedure

TIMING BELT REPLACEMENT REMINDER RESET PROCEDURE

NOTE: **Applies to 1.8L LUW and LWE engines.**

Description

On LUW and LWE engines, the Instrument Cluster monitors the odometer mileage to determine when a timing belt (if equipped) replacement may be necessary. After the vehicle has accumulated approximately 100, 000 miles (160, 000 kilometers), the Instrument Cluster may display the CHANGE TIMING BELT message.

Message Reset

After the engine timing belt has been replaced, reset the CHANGE TIMING BELT message by locating and removing the fuses that supply power to the Instrument Cluster, for two minutes.

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 01

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due. Change fluid in both the oil pan and side cover.

1. To reset display, turn ignition ON with engine OFF.
2. On the climate control panel, press and hold OFF and REAR DEFOG buttons until TRANS FLUID RESET message appears in DIC (about 5-20 seconds).

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 02

The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due. Percentage of transaxle fluid life remaining may be checked at any time by pressing INFO button several times until TRANS FLUID LIFE message appears.

1. To reset display, turn ignition key ON with engine OFF.
2. Press the INFO button until TRANS FLUID LIFE message appears.
3. Press and hold INFO RESET button until display shows 100 percent TRANS FLUID LIFE. Transaxle fluid life index is now reset.

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 03

NOTE: **The CHANGE TRANS FLUID message will appear on the Driver Information Center (DIC) when trans fluid change is due.**

Resetting With Base Audio System

Press CLR button located to the right of the DIC display to acknowledge the CHANGE TRANS FLUID message. This will clear the message from the display and reset it. To reset transmission fluid life indicator, press up or down arrow on INFO button located to the right of the DIC display to access the DIC menu. Once percentage TRANS FLUID LIFE menu item is highlighted, press and hold CLR button. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

Resetting With Navigation System

Press multifunction button located to the right of the DIC display, next to the OK prompt to acknowledge the CHANGE TRANS FLUID message. This will clear the message form the display and reset it. To reset transmission fluid life indicator, turn system on by pressing PWR/VOL knob once. PWR/VOL knob is located to the lower left of the DIC display. Press INFO button located to the left of the DIC display to access the VEHICLE INFO menu. Turn TUNE/SEL knob located to the lower right of the DIC display until TRANS FLUID LIFE is highlighted. Press knob once to select it. Once percentage TRANS FLUID LIFE is displayed, press multifunction button next to the RESET prompt in the upper right corner of the display. Percentage will return to 100, and transmission fluid life indicator will be reset. Repeat if percentage does not return to 100.

TRANSMISSION FLUID REPLACEMENT REMINDER RESET - PROCEDURE 04

1. The Driver Information Center (DIC) displays estimated percentage of the remaining useful life of transaxle fluid. When remaining fluid life is 0 percent, the display will show CHANGE TRNS FLUID NOW. After changing transaxle fluid, reset oil life display.
2. To reset the display, turn ignition on with engine off. Press ENG button to select the TRNS FLUID LIFE percentage display. Then, press and hold in RESET for at least 5 seconds.
3. The word RESET will appear. Then, TRNS FLUID 100 will be displayed.

TIRE PRESSURE MONITOR SYSTEM REMINDER

NOTE: **To determine the appropriate reset procedure, refer to TPMS REMINDER RESET INDEX. Only vehicles listed in this index have a TPMS Reminder Reset.**

(1) This is an Indirect TPM System. A tire sensor activation tool is not required for this procedure.

(2) A tire sensor activation tool cannot be used for this procedure.

TPMS REMINDER RESET - PROCEDURE 01

NOTE: **When the wheels have been rotated, or a tire pressure sensor or EGM/LGM has been replaced, retrain tire pressure sensors.**

NOTE: **The DIC will display the "SERVICE TIRE MONITOR" message if one or more of the tire pressure sensors has malfunctioned or if all of the sensors have not been programmed successfully. If, after the relearn procedure, the warning indicators are still on, there is a problem in the TPM system.**

NOTE: **If this procedure is performed following replacement and reprogramming of the Liftgate Module (LGM), DIC may display a low tire pressure fault and all tire pressures read 0 psi. If this problem occurs, see appropriate manufacturer service information.**

NOTE: **The TPM system will cancel the learn mode if more than 2 minutes have passed and no sensors have been learned, or if the system has been in learn mode for more than 5 minutes. If the learn mode is canceled before any sensor has been learned, the EGM/LGM will remember all current sensor IDs and their locations. As soon as the first sensor ID code is learned, all other IDs are erased from the EGM/LGM's memory. On models that display the individual tire pressure on DIC, updated tire pressures will not be displayed until EGM/LGM receives 2 more valid transmissions from each sensor.**

NOTE: **Before proceeding with the steps below, ensure that no other sensor learn procedure is being performed simultaneously, or that tire pressures are not being adjusted on a TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF. Apply parking brake.

   NOTE: **If Learn Mode cannot be enabled, TPM system is not enabled in EGM/LGM. See appropriate manufacturer service information.**

3. To enable Learn Mode, turn headlight switch from OFF to parking lamps 4 times within 4 seconds. A double horn chirp will sound and the low tire pressure indicator will begin to flash to indicate the learn mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.
7. Test drive the vehicle above 25 mph for at least 2 minutes before viewing tire pressures on DIC.

TPMS REMINDER RESET - PROCEDURE 02

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **Under the following conditions, the TPM system may not function properly:**

- **If one or more of the tire pressure sensors are missing or inoperable.**
- **A compact spare tire is used.**

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be retrained.**

NOTE: **The relearn procedure must be completed within 15 minutes from when the vehicle is stationary after being driven at 20 mph (32 km/h), or greater, for 10 seconds.**

NOTE: **The learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor that has not been learned. If the learn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the learn mode is canceled after the first sensor is learned, the following will occur:**

- **All stored sensor IDs will be invalidated in the RCDLR memory.**
- **If equipped, the DIC will display dashes instead of tire pressures.**
- **DTC C0775 will be set.**

These conditions will now require the learn procedure to be repeated for the system to function properly.

IMPORTANT: Ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.

1. Turn ignition switch to ACC position. Apply parking brake.
2. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
3. To enable Learn Mode:
    - On vehicles equipped with keyless entry, simultaneously press the keyless entry transmitters lock and unlock buttons until a double horn chirp sounds indicating the Learn Mode has been enabled. On vehicles with DIC, a TIRE LEARN message may be displayed. The left front turn signal will also be illuminated.
    - On vehicles not equipped with keyless entry, press and release the driver information center (DIC) INFO button until the TIRE LEARN message appears on the DIC display. Press and hold the SET/RESET button until a double horn chirp sounds indicating the Learn Mode has been enabled. The left front turn signal will also be illuminated.
4. Ignition ON.
5. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
6. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After left rear sensor has been learned, turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 03

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **In vehicles without the "UH3" option, each turn signal will illuminate one at a time indicating which location is to be learn.**

NOTE: **The TPM system will cancel the learn mode if more then 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ACC position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.

    NOTE: **The left front turn signal will also illuminate to indicate the learn mode has been enabled.**

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 04

NOTE: **If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.

   NOTE: **If the TPM Learn Mode cannot be enabled, ensure the TPM option is enabled in the RCDLR. See appropriate manufacturer service information.**

3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.

   NOTE: **If a horn chirp does not sound after 15 seconds, remove, then re-apply TPM sensor relearn magnet.**

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 05

NOTE: **If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
6. After the left rear sensor ID is learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn the ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 06

NOTE: **If the wheels have been rotated, or tire pressure sensor or Remote Control Door Lock Receiver (RCDLR) is replaced, the TPM system needs to relearn tire pressure sensor IDs.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel Learn Mode if ignition is turned off, if more than 1 or 2 minutes has passed and no sensors have been learned, vehicle battery voltage is less than 8 volts, all 4 sensors have been learned, or if the RCDLR has been in Learn Mode for more than 5 minutes. If Learn Mode is cancelled before any IDs are learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition ON with engine OFF.
3. Press RESET button on DIC in order to clear any warning messages.
4. Press and release OPTIONS button until display is blank.
5. Press and hold RESET button for 3 seconds.

NOTE: **If the DIC does not display "TIRE TRAINING" message, ensure TPM option is enabled in the RCDLR. See appropriate manufacturer service information.**

6. Press and release OPTIONS button until "TIRE TRAINING" is displayed.
7. Press and release RESET button. The DIC should display "LEARN L FRONT TIRE", verifying Learn Mode has been enabled.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After the horn chirp sounds, proceed to the next 3 sensors in the following order: right front, right rear, then left rear.
10. Turn the ignition switch to OFF position to exit the learn mode.

TPMS REMINDER RESET - PROCEDURE 07

NOTE: **An OEM scan tool or Pressure Increase/Decrease Method is used to perform this procedure.**

NOTE: **Before proceeding with this process, ensure that no other learn procedure is being performed simultaneously or that tire pressures are not being adjusted on another TPM equipped vehicle within close proximity. Stray signals from other TPM equipped vehicles just driving by can be inadvertently learned. If any random horn chirps are heard from the vehicle while performing the learn procedure, most likely a stray sensor has been learned and the procedure will need to be cancelled and repeated. Under these circumstances, performing the TPM Learn Procedure away from other vehicles would be highly recommended. In the event a particular sensor activation does not cause the horn to chirp, it may be necessary to rotate the wheel valve stem to a different position due to the sensor signal is being blocked by another component.**

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a scan tool, initiate the TPM Learn Mode.
3. Perform the procedure by following the menu selections. A double horn chirp will sound and the IPC tire pressure monitor indicator warning lamp icon will flash indicating Learn Mode is enabled.
4. Starting with the left front tire, active the sensors by one of the following methods:
    - Hold the antenna of the scan tool, aimed upward, against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button and wait for a horn chirp. Once the horn chirp has sounded, the sensor information is learned.
    - Increase/decrease the tire pressure for 8-10 seconds then wait for a horn chirp. The horn chirp may occur before or up to 30 seconds after the 8-10 second pressure increase/decrease time period has been reached. Once the horn chirp has sounded, the sensor information has been learned.
5. After the horn chirp has sounded, repeat step 4 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
6. After the left rear sensor is learned, a double horn chirp will sound indicating all sensor IDs have been learned and the tire pressure module will exit the Learn mode turning OFF the IPC tire pressure monitor warning indicator lamp icon.
7. Ignition OFF, adjust all tires to the recommended pressures. Refer to the tire placard label.

TPMS REMINDER RESET - PROCEDURE 08

Automatic Sensor Learn Process

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. When a tire is installed, the vehicle must be stationary for about 20 minutes before the system recalculates. The following relearn process takes up to 10 minutes, driving at a minimum speed of 12 mph (19 km/h). A dash (-) or pressure value will display in the DIC. A warning message displays in the DIC if a problem occurs during the relearn process.

TPMS REMINDER RESET - PROCEDURE 09

NOTE: **For Cadillac CTS with RPO UH3, use this procedure. For CTS without RPO UH3, see Procedure 10.**

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel the learn mode if more then 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to RUN position. Apply parking brake.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled. On some models, a TIRE LEARNING ACTIVE message may also be displayed on the DIC screen.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 10

NOTE: **For Cadillac CTS without RPO UH3, use this procedure. For CTS with RPO UH3, see Procedure 9.**

NOTE: **If a tire pressure sensor or the Remote Control Door Lock Receiver (RCDLR) is replaced, or if wheels have been rotated, tire pressure sensor must be relearned.**

NOTE: **When the tire pressure warning light illuminates and warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning indicators are still on or display shows dashes instead of a value, there is a problem in the TPM system. See appropriate manufacturer service information.**

NOTE: **The TPM system will cancel the learn mode if more then 2 minutes have passed and no sensors have been learned, or if the ignition switch is turn to the OFF position. If the learn mode is canceled before the first ID is learned, the RCDLR will remember all previously stored IDs and their locations. As soon as the first sensor ID is learned, all other IDs are erased from the RCDLR's memory. If the learn mode is canceled after the first ID is learned, the RCDLR will store the IDs as invalid and the DIC will display dashes instead of tire pressures.**

NOTE: **Before proceeding with the registration procedure, ensure that no other sensor learn procedure is being performed simultaneously, or that no tire pressures are being adjusted on another TPM equipped vehicle within close proximity.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Depending on ignition type:
   - With standard ignition switch, place the switch in the RUN position.
   - With electronic keyless ignition, place the switch in the ACC position.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a double horn chirp sounds, indicating the Learn Mode has been enabled.
4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 11

NOTE: **This procedure is for vehicles with an Uplevel DIC.**

When a low tire pressure condition is detected, the TPMS illuminates the low tire pressure warning light on the instrument cluster. A message to check the pressure in a specific tire displays in the Driver Information Center (DIC). The low tire pressure warning light and the DIC warning message come on at each ignition cycle until the tires are inflated to the correct inflation pressure. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Place the vehicle power mode in ON/RUN/START.
4. Make sure the Tire Pressure info display option is turned on. The info displays on the DIC can be turned on and off through the Settings menu.
5. Use the five-way DIC control on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SEL button located in the center of the five-way DIC control. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching

process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.

10. Press STOP to turn the ignition off.

TPMS REMINDER RESET - PROCEDURE 12

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Use the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC). Use the arrow keys to scroll to the Tire Pressure screen
5. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
6. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Start with the driver side front tire. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position.
8. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Turn the ignition to LOCK/OFF.

TPMS REMINDER RESET - PROCEDURE 13

LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or when vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. There are 2 ways to reset the tire inflation monitor. To reset the tire inflation monitor using the exterior or interior lamp controls, go to step 4. To reset tire inflation monitor using the radio, turn the radio off. Turn ignition to ACC or ON, with the engine OFF. Press and hold the TUNE DISP button on the radio for at least 5 seconds until settings is displayed.
2. To scroll through the main menu:
   - On Impala, press the SEEK PTYPE up or down arrow.
   - On Monte Carlo, press the SEEK PSCAN up or down arrow.

   On all models, scroll until TIRE MON appears on the display. Press the 1 PREV or 2 NEXT button to enter the sub-menu. RESET will be displayed.
3. Press the TUNE DISP button to reset. A chime will sound to verify the new setting and DONE will be displayed for one second. Once the message has been reset, scroll through the menu until EXIT appears on the display. Press the TUNE DISP button to exit the program. A chime will sound to verify the exit.
4. Reset the tire inflation monitor:

- On Impala, using the interior lighting controls, turn the switch from OFF to ON position 3 times with ignition switch in ON position.
- On Monte Carlo, using the exterior lighting controls, turn the switch from OFF to parking lamps 3 times with ignition switch in ON position.

TPMS REMINDER RESET - PROCEDURE 14

NOTE: **There are 3 different ways to reset the Tire Pressure Monitor (TPM) system. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the 3 speed ranges to complete the calibration process.**

Using Exterior Lamp Switch

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Cycle the exterior lamp switch from OFF to parking lamps 3 times within 5 seconds.
4. Use the scan tool in order to clear the TPM DTC.

Using RDS Radio, If Equipped

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn the ignition to ACC or ON, with the engine OFF.
3. Turn the radio OFF.
4. Press and hold the DISP button until SETTINGS is displayed.
5. Press the SEEK up or down arrows until TIRE MON is displayed.
6. Press the PREV or NEXT button to enter the sub-menu. RESET will be displayed.
7. Press the DISP button, A chime will sound and DONE will be displayed.
8. Scroll until EXIT is displayed.
9. Press the DISP button to exit the TPM reset mode. A chime will sound to verify exit.
10. Use the scan tool in order to clear the TPM DTC.

Using Scan Tool

1. Adjust all tire pressures to the recommended kPa/psi.
2. Install the scan tool.
3. Turn ignition ON with engine OFF.
4. With the scan tool select Special Functions.
5. Select TIM Reset.
6. Press the Reset soft key.
7. Use the scan tool in order to clear the TPM DTC.

TPMS REMINDER RESET - PROCEDURE 15

CHECK TIRE PRESSURE or TIRE PRESS message will come on if air pressure in one tire is lower than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Message will stay on until system is recalibrated. Check and adjust air pressure in all 4 tires before recalibrating system.

NOTE: **If vehicle is equipped with Systems Monitor, go to step 2.**

1. To recalibrate vehicle equipped with Driver Information Center (DIC), turn ignition ON with engine OFF. Using the MODE and SELECT button on DIC, change display until TIRE PRESSURE appears. Press and hold RESET button for 5 seconds. TIRE PRESSURE RESET should now appear on display. If TIRE PRESSURE RESET does not appear on display after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.

2. To recalibrate vehicle equipped with Systems Monitor, turn ignition ON with engine OFF. Press and hold TIRE PRESS RESET button for 5 seconds. TIRE PRESS light on the Systems Monitor should begin to flash. Release the TIRE PRESS RESET button. TIRE PRESS light should go out and system is now reset. If TIRE PRESS light does not begin to flash after 5 seconds, repair system as necessary. Using a scan tool, clear TPM DTC.

TPMS REMINDER RESET - PROCEDURE 16

CHECK TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi (kPa) less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, or if air pressure is adjusted. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.

1. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
2. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the CHECK TIRE PRESSURE indicator light will begin to flash. While the CHECK TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If CHECK TIRE PRESSURE light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS REMINDER RESET - PROCEDURE 17

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

NOTE: **When the low tire pressure warning messages appear, immediately check air pressure of all tires and adjust to the specified pressure. If warning messages are still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

NOTE: **Under the following conditions, the system may not function properly:**

- **More than one tire is low.**
- **Only one tire is replaced with a new tire during service.**
- **Vehicle is moving faster than 65 mph (105 km/h).**
- **The system is not yet calibrated.**
- **Tire treadwear is uneven.**
- **Compact spare tire is installed.**
- **Tire chains are being used.**
- **Vehicle is being driven on a rough or frozen road.**
- **If ABS warning light is on.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.**

NOTE: **There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:**

- ***Using DIC Reset Button*** **(if no scan tool is available)**
- ***Using Scan Tool*** **(if an OBD-II compatible scan tool is available).**

Using DIC Reset Button

1. Turn ignition switch to OFF position.

2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press SELECT right arrow button until "GAGE" is displayed.
5. Press SELECT down arrow button until "TIRE PRESSURE" is displayed.
6. Press and hold RESET button until "TIRE PRESSURE RESET" is displayed.
7. Release RESET button. DIC should display "TIRE PRESSURE NORMAL".
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
    - 15-40 mph (24-64 km/h).
    - 40-70 mph (64-113 km/h).
    - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

NOTE: **Learning process does not need to be completed during a single trip.**

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select "SPECIAL FUNCTIONS".
5. Select "TIRE PRESSURE RESET".
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
    - 15-40 mph (24-64 km/h).
    - 40-70 mph (64-113 km/h).
    - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

NOTE: **Learning process does not need to be completed during a single trip.**

TPMS REMINDER RESET - PROCEDURE 18

The Tire Pressure Monitor (TPM) system alerts the driver when a large change in the pressure of one tire exists, while the vehicle is being driven. The TPM system uses the Electronic Brake Control Module (EBCM), ABS wheel speed sensor inputs, class 2 serial data circuit, and the Driver Information Center (DIC) to perform the system functions. The EBCM contains software to calculate relative tire pressure differences. The software requires approximately 30 minutes of straight line driving in 3 different speed ranges to complete the calibration process to have full capability for detecting a tire pressure condition. The speed ranges are 15-40 mph, 40-70 mph and 70-90 mph.

1. LOW TIRE PRESSURE light comes on if air pressure in one tire drops to 12 psi less than the other 3 tires, if tires are rotated, if tire(s) are repaired or replaced, if air pressure is adjusted or if vehicle battery is disconnected. Light will stay on until ignition is turned off or RESET button is pressed. Check and adjust air pressure in all 4 tires before resetting system.
2. To reset tire inflation monitor, turn ignition ON with engine OFF. Press and release the RESET button. RESET button is located inside of driver's side instrument panel fuse block (left end of instrument panel). The CHANGE OIL indicator light will begin to flash.
3. Press and release the RESET button again. The CHANGE OIL indicator light will turn off, and the LOW TIRE PRESSURE indicator light will begin to flash. While the LOW TIRE PRESSURE indicator light is flashing, press and hold the RESET button until the chime sounds indicating system is reset. If the LOW TIRE PRESSURE indicator light does not go out, repeat reset procedure. If system still will not reset, repair system as necessary.

TPMS REMINDER RESET - PROCEDURE 19

NOTE: **After resetting, the tire pressure monitoring (TPM) system requires 60 minutes or more of driving at a speed of 30 km/h (19 mph) or above to complete the calibration process to have full capability for detecting a tire pressure condition.**

1. Adjust all tire pressures to the recommended kPa/psi.
2. Turn ignition ON with engine OFF.
3. Press and hold the tire pressure warning reset switch until the tire pressure warning indicator blinks 3 times at one second intervals.
4. If the tire pressure warning indicator does not blink, repeat the procedure starting at step 2.
5. Drive the vehicle for 60 minutes or more at a speed of 30 km/h (19 mph).
6. Verify the system has initialized. Turn ignition ON with engine OFF and observe the tire pressure warning indicator.
    - System Initialized: light on for 3 seconds.
    - System not initialized: light on for 4 seconds.

TPMS REMINDER RESET - PROCEDURE 20

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.**

NOTE: **When the tire pressure warning message appears on DIC, immediately check air pressure of all tires and adjust to the specified pressure. If warning message is still displayed, there is a malfunction in the TPM system. See appropriate manufacturer service information.**

NOTE: **Under the following conditions, the system may not function properly:**

- **More than one tire is low.**
- **Vehicle is moving faster than 65 mph (105 km/h).**
- **The system is not yet calibrated.**
- **Tire treadwear is uneven.**
- **Compact spare tire is installed.**
- **Tire chains are being used.**
- **Vehicle is being driven on a rough or frozen road.**
- **If ABS warning light is on.**

NOTE: **There are 2 ways to recalibrate the Tire Pressure Monitor (TPM) system:**

- ***Using DIC Reset Button*** **(if no scan tool is available)**
- ***Using Scan Tool*** **(if an OBD-II compatible scan tool is available).**

Using DIC Reset Button

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold appropriate button (located on left side of steering column) until "TIRE PRESSURE" message appears on display:
    - 1997-99 models: Press and hold GAGES button
    - 2000-05 models: Press and hold GAGES INFO button
5. Press and hold RESET button for 5 seconds. After 5 seconds, "TIRE PRESSURE RESET" message should appear on display.
6. Release RESET button. A "TIRE PRESSURE NORMAL" message should appear on display.
7. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
    - 15-40 mph (24-64 km/h).
    - 40-70 mph (64-113 km/h).
    - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

NOTE: **Learning process does not need to be completed during a single trip.**

Using Scan Tool

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Connect scan tool. Turn ignition ON with engine OFF.
4. Using scan tool, select SPECIAL FUNCTIONS.
5. Select TIM RESET.
6. Press RESET soft key. A "TIRE PRESSURE NORMAL" message should appear on display.
7. If necessary, use scan tool to clear any TPM Diagnostic Trouble Codes (DTCs).
8. After resetting, the TPM system requires up to 30 minutes of straight line driving in each of the following speed ranges to complete calibration process:
    - 15-40 mph (24-64 km/h).
    - 40-70 mph (64-113 km/h).
    - 70-90 mph (113-145 km/h).

NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Monitor Mode 1, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Monitor Mode 2, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

NOTE: **Learning process does not need to be completed during a single trip.**

TPMS REMINDER RESET - PROCEDURE 21

Using Reset Button (1999-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Press and hold the red RESET button located in the passenger side instrument panel fuse block.
3. The LOW TIRE indicator will flash 3 times, then turn off.
4. Use scan tool to clear the TPM DTC.

Using Scan Tool (2003-05 Models)

1. Adjust all tire pressures to the recommended Psi (kPa). See vehicle's Loading Information Label for recommended tire pressure. Turn ignition ON with engine OFF.
2. Install scan tool. Turn ignition ON with engine OFF.
3. With scan tool, select Special Functions.
4. Select TIM Reset.
5. Press Reset soft key.
6. LOW TIRE indicator will flash 3 times, then turn OFF.
7. Clear the TPM DTC.

TPMS REMINDER RESET - PROCEDURE 22

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.**

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button chime sounds and "TIRE PRESSURE RESET" is displayed and a chime sounds 3 times.
6. Release SET button and DIC will display "TIRE PRESSURE NORMAL".

   NOTE: **If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure. If it does not work after two tries, refer to appropriate service information.**

7. After resetting, the TPM system requires up to 5 miles of driving in each of the following speed ranges to complete the calibration process:
   - 25-40 mph (40-64 km/h).
   - 40-60 mph (65-96 km/h).
   - 60-85 mph (96-136 km/h).

   NOTE: **Learning process does not need to be completed during a single trip.**

TPMS REMINDER RESET - PROCEDURE 23

1. Check and adjust air pressure in all 4 tires before resetting system. Refer to tire placard located on the inside edge of the driver's door. Turn ignition ON, with engine OFF.
2. Press the MODE button on the Driver Information System until LOW TIRE PRESSURE HOLD SET TO RESET is displayed.
3. Press and hold the SET button until a chime sounds and TIRE PRESSURE RESET is displayed and a chime sounds 3 times.
4. Release the SET button and TIRE PRESSURE NORMAL will be displayed.

TPMS REMINDER RESET - PROCEDURE 24

NOTE: **When a spare tire is mounted, a wheel is replaced or rotated, or tire pressure has been adjusted, TPM system will need to be recalibrated.**

CAUTION: **DO NOT recalibrate TPM system until all problems are fixed and tire pressure in all 4 tires has been adjusted. If recalibration is done when tire pressures are incorrect, TPM system will not work properly and may not set an alert when a tire pressure is low or high.**

1. Turn ignition switch to OFF position.
2. Ensure all tire pressures are adjusted to the pressure recommended on tire pressure label.
3. Turn ignition ON with engine OFF.
4. Press and hold the MODE button until DIC display reads "LOW TIRE PRESSURE HOLD SET TO RESET".
5. Press and hold SET button until a chime sounds and "TIRE PRESSURE RESET" is displayed.
6. System will now sound a chime 3 times, and DIC will display "TIRE PRESSURE NORMAL".

   NOTE: **If low tire pressure warning message is still set, TPM system has not reset. Repeat procedure.**

7. After resetting, the TPM system requires up to 5 miles (8 km) of flat, smooth road, straight line driving in each of the 4 speed ranges (about 10-20 minutes in each range) to complete the calibration process:
   - 19-40 mph (31-65 km/h).
   - 40-59 mph (65-95 km/h).
   - 59-74.5 mph (95-120 km/h).
   - 74.5-90 mph (120-145 km/h).

   NOTE: **The EBCM learns tire pressure calibration for each speed range independently. In Calibration Mode, EBCM has only partially learned tire pressure calibration for speed range and has limited detection capability for a tire pressure condition. In Detection Mode, EBCM has fully learned tire pressure calibration for speed range and has full detection capability for a tire pressure condition.**

   NOTE: **Learning process does not need to be completed during a single trip.**

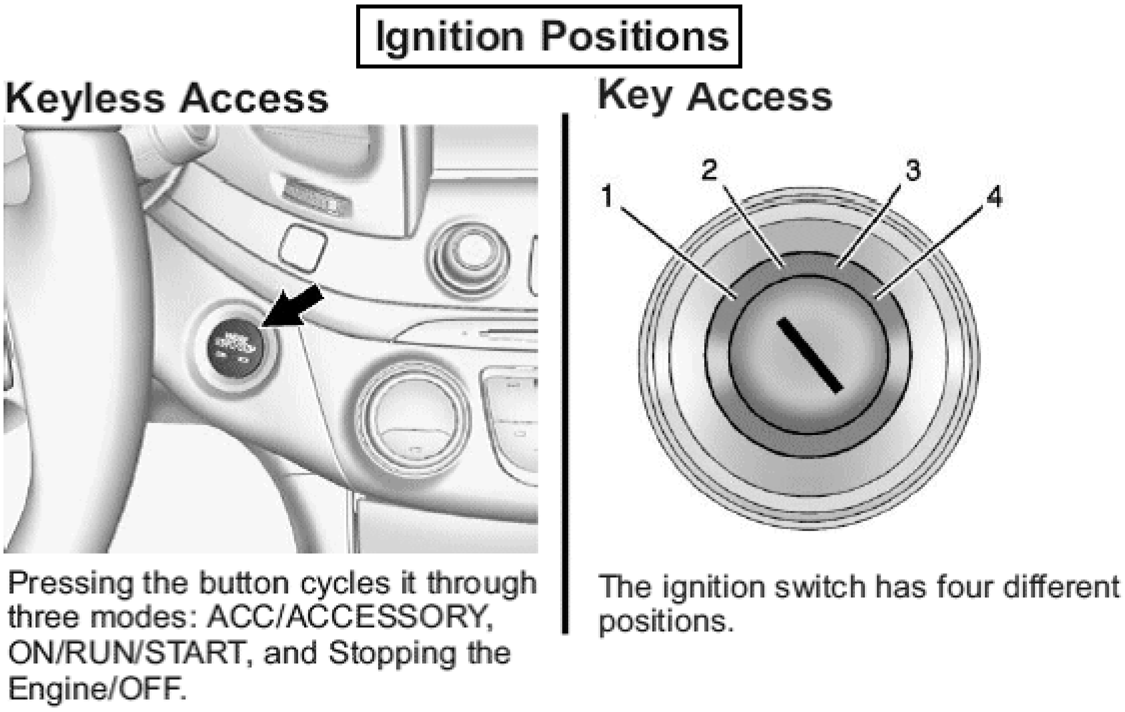
TPMS REMINDER RESET - PROCEDURE 25

NOTE: **This procedure is for vehicles with a Base DIC.**

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions using a TPMS relearn tool. There are two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 7**.
4. Use the MENU button to select the VEHICLE INFORMATION MENU in the Driver Information Center (DIC). See **Fig. 8**.
5. Use the thumbwheel (or up and down arrows) to scroll to the TIRE PRESSURE MENU item screen.
6. Press the SET/CLR button to begin the sensor matching process. A message requesting acceptance of the process should display.
7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.



Pressing the button cycles it through three modes: ACC/ACCESSORY, ON/RUN/START, and Stopping the Engine/OFF.

The ignition switch has four different positions.

TPMS REMINDER RESET - PROCEDURE 26

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
5.
    - **Up-Level DIC** : Use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page.
    - **Base-Level DIC** : Use the TRIP ODOMETER RESET stem to scroll to the TIRE PRESSURE screen.
6.
    - **Up-Level DIC** : Press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls.
    - **Base-Level DIC** : Press and hold the TRIP ODOMETER RESET stem for about five seconds. A message asking if the process should begin should appear. Select YES and press the TRIP ODOMETER RESET stem to confirm the selection.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 27

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn ignition switch to ON/RUN position, with engine OFF.
3. Simultaneously press the keyless entry transmitter's lock and unlock buttons until a horn chirp sounds, indicating Learn Mode has been enabled. The TIRE LEARNING ACTIVE message displays on the DIC screen.

NOTE: **If the vehicle does not have RKE, press the Driver Information Center (DIC) vehicle information button until the PRESS (check mark**

symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen. If the vehicle does not have RKE or DIC buttons, press the trip odometer reset stem on the instrument cluster until the PRESS (check mark symbol) TO RELEARN TIRE POSITIONS message displays. The horn sounds twice to signal the receiver is in relearn mode and TIRE LEARNING ACTIVE message displays on the DIC screen.

4. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
5. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
6. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 28

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/ RUN with the engine OFF or place the vehicle power mode in ON/ RUN/ START. See **Fig. 7**.
4. Make sure the Tire Pressure info page option is turned on. The info pages on the Driver Information Center (DIC) can be turned on and off through the Settings menu.
5. Use the DIC controls on the right side of the steering wheel to scroll to the Tire Pressure screen under the DIC info page.
6. Press and hold the SET/RESET button (check mark symbol) located in the center of the DIC controls.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 29

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button (right-hand side of instrument cluster) once on the Driver Information Center (DIC).
5. Press the up or down arrow button until the Tire Learn screen is displayed.
6. Press and hold the SET/CLR button to begin the sensor matching process.
7. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 30

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

TPMS sensors are mounted onto each tire and wheel assembly, excluding the spare tire and wheel assembly. Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the vehicle's tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Put the vehicle in ON/ RUN and place the vehicle in P (Park).
4. If the Driver Information Center (DIC) display is minimized, press the SELECT knob to maximize it. See **Fig. 9**.
5. Use the SELECT knob to scroll to the Tire Pressure display screen.
6. Press and hold the SELECT knob for five seconds to begin the sensor matching process. A message displays confirming to begin the process.
7. Use the SELECT knob to select YES with the highlighted selection, and press the SELECT knob again to confirm the selection.
8. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
9. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
10. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
11. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

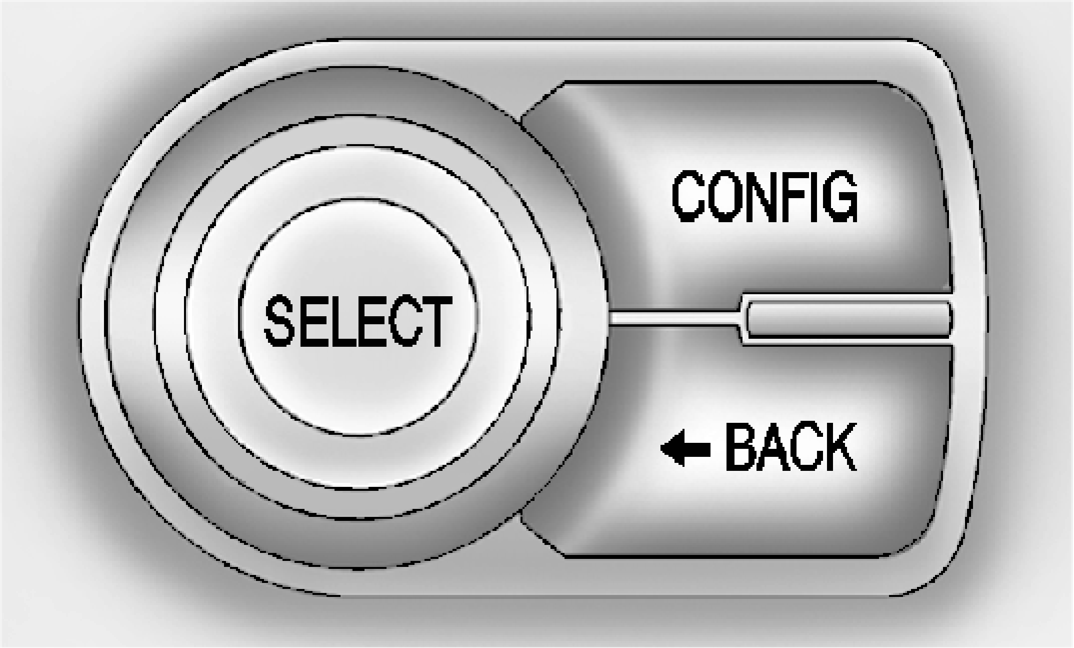

Fig. 9: Identifying DIC Controls (Spark EV)
Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 31

NOTE: **You have two minutes to match the first tire/wheel position, and five minutes overall to match all four tire/wheel positions. If it takes longer, the matching process stops and must be restarted.**

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine off.
4. Enter the learn sequence from the TPM Learn screen, located under the Customization Menu in the instrument panel cluster. Press SRCE button until you see Customize Options and then press ENTER (left pointing arrow). Move the thumbwheel up or down to scroll through the available options. Press ENTER to select an item. To exit the current menu, or go back, use the thumbwheel to select BACK (left arrow) at the top of the screen and then press ENTER.
5. Start with the driver side front tire. The driver side front indicator lamp also comes on to indicate that corner's sensor is ready to be learned. Place a tire sensor activation tool against the tire sidewall, near the valve stem. Then press the button to activate the TPMS sensor. A horn chirp confirms that the sensor identification code has been matched to this tire and wheel position
6. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
7. After the driver side rear TPMS sensor has been learned the horn chirps two times. The driver side rear indicator lamp turns off and the TPMS sensor matching process is done. Turn the ignition switch to LOCK/OFF.

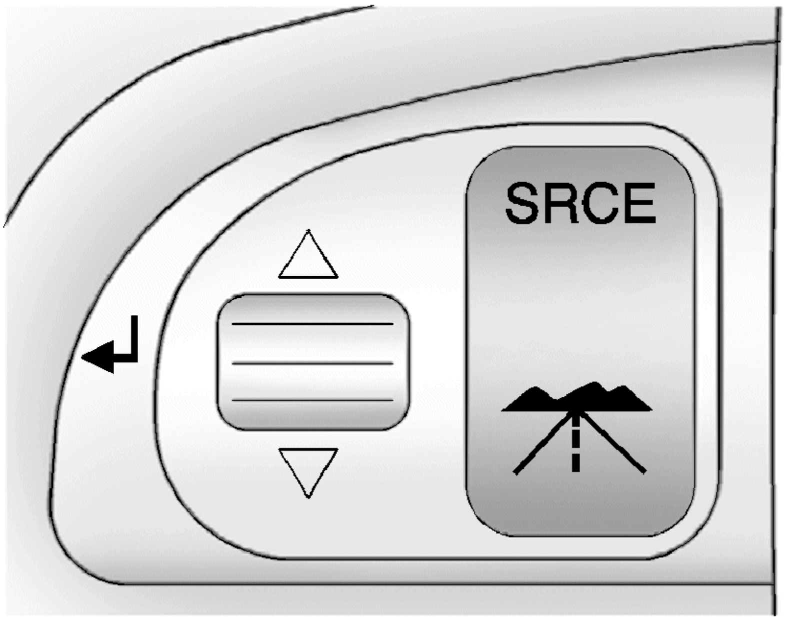

Fig. 10: Identifying DIC Controls
Courtesy of GENERAL MOTORS CORP.

TPMS REMINDER RESET - PROCEDURE 32

NOTE: **An OEM or generic TPMS sensor activation tool is used to perform this procedure.**

NOTE: **The sensor learn procedure must be performed after every tire rotation, tire pressure indicator module replacement, or sensor replacement. Make sure the TPM sensor activation tool battery is sufficient to complete TPM learn process. Do not place the TPM tool directly on the valve stem. The TPM tool should be placed against the tire sidewall near the valve stem. The TPM sensor learn activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. The low tire pressure warning light will start to flash to indicate the learn mode has been enabled. The front and back turn signals will flash twice when a sensor has been learned.**

1. Ignition ON with engine OFF, apply the parking brake.
2. Using a sensor activation tool, initiate the TPM Learn Mode.
3. Starting with the left front tire, active the sensor by holding the antenna of the tire pressure sensor activation tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for the front and back turn signals to flash twice. If the front and back turn signals do not flash, repeat the sensor activation sequence with the tool. Once the front and back turn signals have flashed twice, the sensor information is learned.

   NOTE: **Follow the sensor order listed here since there is no visual indicator on the vehicle for the sensor learn order.**

4. After the front and back turn signals have flashed twice, repeat step 2 for the remaining 3 sensors in the following order: Right front, Right rear, Left rear.
5. When the left rear sensor has been learned, the front and back turn signals will flash twice, the learn process is complete and the tire pressure indicator module exits the Learn mode.

TPMS REMINDER RESET - PROCEDURE 33

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Set the parking brake.
3. Turn the ignition to ON/RUN with the engine OFF.
4. Press the MENU button (center console) to select the Vehicle Information Menu in the Driver Information Center (DIC).
5. Use the arrow keys to scroll to the Tire Pressure screen.
6. Press the SET/CLR button to begin the sensor matching process. A message should display requesting acceptance of the process.
7. Press the SET/CLR button again to confirm the selection. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
8. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
9. After horn chirp has sounded, proceed to the next 3 sensors in the following order: right front, right rear and left rear.
10. After left rear sensor has been learned, a double horn chirp will sound, indicating all 4 sensor IDs have been learned. Turn ignition switch to OFF position to exit Learn Mode.

TPMS REMINDER RESET - PROCEDURE 34

If refilling a low tire, no specific reset procedure is required. All warnings are extinguished once the TPMS receives a signal that all tires are properly inflated.

Each TPMS sensor has a unique identification code. The identification code needs to be matched to a new tire/wheel position after rotating the tires or replacing one or more of the TPMS sensors. The TPMS sensor matching process should also be performed after replacing a spare tire with a road tire containing the TPMS sensor. The malfunction light and the DIC message should go off at the next ignition cycle. The sensors are matched to the tire/ wheel positions, using a TPMS relearn tool.

1. Set the tire pressure of all wheels to pressure specified on the tire and loading information label.
2. Turn the ignition to ON/RUN with the engine OFF. Set the parking brake.
3. Up-level Driver Information Center (DIC) Only: Make sure the TIRE PRESSURE INFO page option is turned on. The info pages on the DIC can be turned on and off through the SETTINGS menu.
4.
    - **Up-Level DIC** : Use the DIC controls (arrow buttons) on the right side of the steering wheel to scroll to the TIRE PRESSURE screen under the DIC info page.
    - **Base-Level DIC** : Use the MENU button to select the Vehicle Information menu in the DIC. Use the thumbwheel to scroll to the Tire Pressure Menu item screen. See Fig. 8.
5.
    - **Up-Level DIC** : Press and hold the SET/RESET button (check-mark symbol) located in the center of the DIC controls.
    - **Base-Level DIC** : Press the SET/CLR button to begin the sensor matching process. A message asking if the process should begin should appear. Press the SET/CLR button again to confirm the selection.
6. The horn sounds twice to signal the receiver is in relearn mode and the TIRE LEARNING ACTIVE message displays on the DIC screen.
7. Starting with left front tire, hold a tire sensor activation tool against the side wall of the tire, within 3 inches of the valve stem. Activate tool until a horn chirp sounds.
8. After horn chirp has sounded and the right turn signal has illuminated, proceed to the next 3 sensors in the following order: right front, right rear and left rear.

9. After left rear sensor has been learned, the horn sounds two times to indicate the sensor identification code has been matched to the driver side rear tire, and the TPMS sensor matching process is no longer active. The TIRE LEARNING ACTIVE message on the DIC display screen goes off.
10. Turn the ignition switch to LOCK/OFF.
11. Set all four tires to the recommended air pressure level as indicated on the Tire and Loading Information label.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B0072 OR B0073: DRIVER/PASSENGER SEAT BELT SWITCH CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

DTC Descriptors

DTC B0072

Driver Seat Belt Switch Circuit

DTC B0073

Passenger Seat Belt Switch Circuit

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	High Resistance	Open	Short to Voltage	Signal Performance
Driver Seat Belt Buckle Signal	B0072 02, B0072 0B	B0072 04, B0072 06, B0072 0C	B0072 04, B0072 06	B0072 01, B0072 05	B0072 08

Passenger Seat Belt Buckle Low Reference	-	B0073 04, B0073 06, B0073 0C	B0073 04, B0073 06	-	-

Circuit/System Description

The inflatable restraint seat belt buckle switch is within the seat belt buckle and provides an input to the inflatable restraint sensing and diagnostic module (SDM). The inflatable restraint sensing and diagnostic module supplies a low reference circuit and a seat belt switch signal circuit to determine a buckled or unbuckled condition. The inflatable restraint sensing and diagnostic module monitors the seat belt switch circuits and if a fault is detected a DTC will be set.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0072 01 or B0073 01

The seat belt switch circuit is shorted to voltage.

B0072 02 or B0073 02

The seat belt switch circuit is shorted to ground.

B0072 04 or B0073 03

The seat belt switch circuit is open.

B0072 05 or B0073 05

The seat belt switch circuit is shorted to voltage or open.

B0072 06 or B0073 06

The seat belt switch circuit is shorted to ground or open.

B0072 08 or B0073 08

The seat belt switch signal is invalid.

B0072 0B or B0073 0B

The seat belt switch signal is above threshold.

B0072 0C or B0073 0C

The seat belt switch signal is below threshold.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module will store a DTC and illuminate the air bag indicator in the instrument cluster.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the appropriate scan tool Seat Belt Status parameter changes between Buckled and Unbuckled when the seat belt is buckled and unbuckled.
    - **If the parameter does not change**

      Refer to Circuit/System Testing.

    - **If the parameter changes**
3. All OK.

Circuit/System Testing

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**

- **B153D Seat Belt Buckle-Driver**
- **B153P Seat Belt Buckle-Passenger**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Ignition OFF. Scan tool disconnected. Disconnect the harness connector at the appropriate B153 Seat Belt Buckle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
   - **If 5 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 5 Ω**
3. Ignition ON.
4. Verify the appropriate scan tool Seat Belt Status parameter is Buckled.
   - **If not Buckled**
   1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the signal circuit terminal 1 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If Buckled**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
6. Verify the appropriate scan tool Seat Belt Status parameter is Unbuckled.
   - **If not Unbuckled**
   1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If Unbuckled**
7. Test or replace the B153 Seat Belt Buckle.

Component Testing

1. Ignition OFF. Scan tool disconnected. Disconnect the harness connector at the appropriate B153 Seat Belt Buckle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the signal terminal 1 and the low reference terminal 2.
   - **If 5 Ω or greater**

     Replace the B153 Seat Belt Buckle.

        - **If less than 5 Ω**

3. Insert the seat belt into the buckle.
4. Test for infinite resistance between the signal terminal 1 and the low reference terminal 2.
    - **If less than infinite resistance**

      Replace the B153 Seat Belt Buckle.

    - **If infinite resistance**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Belt Buckle Replacement**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming, and setup.

DTC B059A: PASSENGER SEAT BELT INDICATOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

DTC Descriptors

DTC B059A 01

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Seat Belt Switch Signal	1	2	2	-
Passenger Seat Belt Switch Low Reference	-	2	-	-
Passenger Seat Belt Indicator Control	B059A 02, 3	B059A 04, 3	B059A 01, 4	-
Ground	-	B059A 04, 3	-	-
1. Indicator will remain ON with Seat Belt Buckled. 2. Indicator will illuminate only for the bulb check. 3. Indicator will not illuminate. 4. Indicator always ON.				

Circuit/System Description

The Inflatable Restraint Sensing and Diagnostic Module (SDM) monitors the passenger seat status and the passenger Seat Belt Buckle switch and provides an output to the passenger seat belt indicator. When the Inflatable Restraint Sensing and Diagnostic Module detects the passenger seat is occupied and the seat belt is not fastened, the Inflatable Restraint Sensing and Diagnostic Module supplies a pulse width modulated signal to control the passenger seat belt indicator circuit. The Inflatable Restraint Sensing and Diagnostic Module monitors the passenger seat belt indicator circuits and if a fault is detected a DTC will be set.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B059A 01

The passenger seat belt indicator circuit is shorted to voltage.

B059A 02

The passenger seat belt indicator circuit is shorted to ground.

B059A 04

The passenger seat belt indicator circuit is open.

Action Taken When the DTC Sets

The Inflatable Restraint Sensing and Diagnostic Module will store the DTC.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Circuit/System Testing

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**

- **P14 Passenger Air Bag Disable Indicator**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**

1. Ignition OFF, disconnect the harness connector at the P14 Passenger Air Bag Disable Indicator.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 4 and ground. Ignition On/Vehicle in Service Mode.
4. Verify with a scan tool, command the Passenger Seat Belt Reminder Indicator ON and OFF, the test lamp should turn ON and OFF while changing between the commanded states.
    - **If the test lamp is always on**
    1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition On/Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If the test lamp is always off**
    1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If test lamp turns on and off while changing between the commanded states**
5. Test or replace the P14 Passenger Air Bag Disable Indicator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Panel Airbag Arming Status Display Replacement** for P14 Passenger Air Bag Disable Indicator replacement.
- **Control Module References** for device replacement, programming, and setup.

SYMPTOMS - SEAT BELTS

NOTE: **Review the seat belt system description and operation in order to familiarize yourself with the system and how it functions. Refer to Seat Belt System Description and Operation.**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the seat belt system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to the following symptom diagnostic procedure in order to diagnose the symptom:

- **Seat Belt Indicator Malfunction - Driver**
- **Seat Belt Indicator Malfunction - Passenger**

SEAT BELT DOES NOT RETRACT

1. Grasp the seat belt and pull it out slowly and evenly from the retractor, do that in 15 - 25 mm (5/8 - 1 in) increments, continuing until the seat belts entire length has been pulled out.
2. Release the seat belt and allow the retractor to slowly retract the full length of the seat belt. The seat belt must retract without any additional help.
3. Additionally, make sure that the seat belt can be stopped at any time while retracting and then resumed while being released again. This muss also be possible in all retracting positions.
4. Should problems be observed in step 3, perform the first two steps 2 more times.
5. Should the retractor, after performing these steps, not function freely and properly, it is to be replaced with a new part.

SEAT BELT INDICATOR MALFUNCTION - DRIVER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Seat Belt Switch Signal	1	2	2	-
Driver Seat Belt Switch Low Reference	-	2	-	-
1. Indicator will remain ON with seat belt buckled. 2. Indicator will illuminate only for the bulb check.				

Circuit/System Description

The driver seat belt switch is a 2-wire switch wired to the Inflatable Restraint Sensing and Diagnostic Module (SDM) using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The Inflatable Restraint Sensing and Diagnostic Module sends the status of the driver seat belt via serial data to the instrument cluster. After receiving the message, the instrument cluster controls the illumination of the driver seat belt indicator.

Circuit/System Verification

1. Verify the driver seat belt indicator turns ON and OFF when commanding the instrument cluster all indicators ON and OFF with a scan tool.
   - **If the driver seat belt indicator does not turn ON and OFF as commanded .**

     Replace the P16 Instrument Cluster.

   - **If the driver seat belt indicator does turn ON and OFF as commanded**
2. Verify the scan tool Diver Seat Belt Switch parameter changes between Buckled and Unbuckled when buckling and unbuckling the driver seat belt.
   - **If the parameter does not change**

     Refer to Circuit/System Testing.

   - **If the parameter changes**
3. All OK.

Circuit/System Testing

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**

- **B153D Seat Belt Buckle-Driver**
- **Seat belt switch harness connector**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B153D Seat Belt Buckle-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
   - **If 5 Ω or greater**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 2 Ω in each low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 5 Ω**
3. Ignition ON.
4. Verify the scan tool Driver Seat Belt Status parameter is Buckled.
   - **If not Buckled**
   1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the seat belt switch signal circuit terminal 1 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If Buckled**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
6. Verify the scan tool Driver Seat Belt Status parameter is Unbuckled.
    - **If Unbuckled**
    1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in each circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If Unbuckled**
7. Test or replace the B153D Seat Belt Buckle-Driver.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B153D Seat Belt Buckle-Driver, buckle the driver seat belt.
2. Test for infinite resistance between the signal circuit terminal 1 and the low reference terminal 2.
    - **If not infinite resistance**

      Replace the B153D Seat Belt Buckle-Driver.

    - **If infinite resistance**
3. Unbuckle the driver seat belt.
4. Test for less than 1 Ω between the signal circuit terminal 1 and the low reference terminal 2.
    - **If 1 Ω or greater**

      Replace the B153D Seat Belt Buckle-Driver.

    - **If less than 1 Ω**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Front Seat Belt Buckle Replacement
- Control Module References for Inflatable Restraint Sensing and Diagnostic Module or instrument cluster replacement, programming and setup

SEAT BELT INDICATOR MALFUNCTION - PASSENGER

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Seat Belt Switch Signal	1	2	2	-
Low Reference	-	2	-	-
1. Indicator will remain ON with seat belt buckled. 2. Indicator will illuminate only for the bulb check.				

Circuit/System Description

When an individual is sitting in the passenger seat the passenger presence sensor detects the individual. A signal to the inflatable restraint sensing and diagnostic module indicates a person is in the passenger seat. The inflatable restraint sensing and diagnostic module will turn the passenger seat belt indicator. The passenger seat belt switch is a 2-wire switch wired to the inflatable restraint sensing and diagnostic module using a signal circuit and a low reference circuit. When the seat belt is unbuckled the switch is closed, and when the seat belt is buckled the switch is open. The inflatable restraint sensing and diagnostic module sends the status of the passenger seat belt via a hard wire to the passenger air bag disable indicator. After receiving the message, the passenger air bag disable indicator controls the illumination of the passenger seat belt indicator.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. With a scan tool, Command the Passenger Seat Belt Reminder Indicator ON and OFF.
    - **If the passenger seat belt reminder indicator turns ON and OFF as commanded**

      Refer to Passenger Seat Belt Switch Malfunction

    - **If the passenger seat belt reminder indicator does not turn ON and OFF as commanded**

      Refer to Passenger Seat Belt Indicator Malfunction

Circuit/System Testing

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected**

component/connector.

- **B153P Seat Belt Buckle - Passenger**
- **B153P Seat Belt Buckle - Passenger harness connector**
- **K36 Inflatable Restraint Sensing and Diagnostic Module**
- **K36 Inflatable Restraint Sensing and Diagnostic Module harness connector**

Passenger Seat Belt Switch Malfunction

1. Ignition OFF. Disconnect the harness connector at the B153P Seat Belt Buckle - Passenger.
2. Test for less than 5 Ω between the low reference circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
        - **If less than 5 Ω**
3. Ignition ON.
4. Verify the scan tool Passenger Seat Belt Status parameter listed below is Buckled.
    - **If the scan tool Passenger Seat Belt Status parameter does not display Buckled**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the seat belt switch signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If the scan tool Passenger Seat Belt Status parameter does display Buckled**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the low reference circuit terminal 2.
6. Verify the scan tool Passenger Seat Belt Status parameter is Unbuckled.
    - **If the scan tool Passenger Seat Belt Status parameter does not display Unbuckled**
    1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
    3. Test for less than 2 Ω in each circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If the scan tool Passenger Seat Belt Status parameter does display Unbuckled**
7. Ignition OFF, reconnect all harness connectors. Ignition ON.
8. With a scan tool, monitor the Passenger Seat Belt Status parameter while buckling and unbuckling the seat belt. The parameter should display Buckled and Unbuckled when buckling and unbuckling the seat belt.
    - **If the Passenger Seat Belt Status parameter does not display Buckled and Unbuckled**

      Test or replace the B153P Seat Belt Buckle - Passenger.

    - **If the Passenger Seat Belt Status parameter does display Buckled and Unbuckled**
9. All OK.

Passenger Seat Belt Indicator Malfunction

1. Ignition OFF. Disconnect the harness connector at the P14 Passenger Air Bag Disabled Indicator.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 10 Ω**
3. Ignition ON. With a scan tool, command the Passenger Seat Belt Reminder Indicator OFF.
4. Test for less than 11 V between the control circuit terminal 4 and ground.
    - **If 11 V or greater**
    1. Ignition OFF. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
    2. Test for less than 1 V between the control circuit terminal 4 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 11 V**
5. With a scan tool, command the Passenger Seat Belt Reminder Indicator ON.
6. Test for greater than 4 V between the control circuit terminal 4 and ground.
    - **If 4 V or less**
    1. Ignition OFF. Disconnect the X 1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the control circuit terminal 4 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
    3. Test for less than 2 Ω between the control circuit terminal 4 and ground.
        - If 2 Ω or greater repair the open/high resistance in the circuit.
        - If less than 2 Ω replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 4 V**
7. Ignition OFF, reconnect all harness connectors. Ignition ON.
8. With a scan tool, Command the Passenger Seat Belt Reminder Indicator ON and OFF.
    - **If the passenger seat belt reminder indicator does not turn ON and OFF as commanded**

      Replace the P14 Passenger Air Bag Disabled Indicator.

    - **If the passenger seat belt reminder indicator turns ON and OFF as commanded**
9. All OK.

Component Testing

1. Ignition OFF. Disconnect the harness connector at the B153P Seat Belt Buckle - Passenger. Buckle the B153P Seat Belt Buckle - Passenger.
2. Test for infinite resistance between the signal circuit terminal 1 and the low reference terminal 2 at the B153P Seat Belt Buckle - Passenger.
    - **If there is not infinite resistance**

      Replace the B153P Seat Belt Buckle - Passenger.

    - **If there is infinite resistance**
3. Unbuckle the B153P Seat Belt Buckle - Passenger.
4. Test for less than 1 Ω between the signal circuit terminal 1 and the low reference terminal 2 at the B153P Seat Belt Buckle - Passenger.
    - **If 1 Ω or greater**

      Replace the B153P Seat Belt Buckle - Passenger.

- **If less than 1 Ω**

5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Front Seat Belt Buckle Replacement** for B153P Seat Belt Buckle - Passenger replacement.
- **Instrument Panel Airbag Arming Status Display Replacement** for P14 Passenger Air Bag Disable Indicator replacement.
- **Control Module References** for device replacement, programming and setup.

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

WARNING: **Restraint systems can be damaged in a collision. To help avoid injury and ensure that all parts in need of replacement are replaced:**

- **Replace any seat belt system that was in use during the collision serious enough to deploy any automatic restraint device such as air bags and seat belt pretensioners. This not only includes seat belt systems in use by people of adult size, but seat belt systems used to secure child restraints, infant carriers and booster seats, including LATCH system and top tether anchorages.**
- **Replace any seat belt system that has torn, worn, or damaged components. This not only includes adult seat belt systems, but built-in child restraints and LATCH system components, if any.**
- **Replace any seat belt system if you observe the words "REPLACE" or "CAUTION", or if a yellow tag is visible. Do not replace a seat belt if only the child seat caution label is visible.**
- **Replace any seat belt system if you are doubtful about its condition. This not only includes adult seat belt systems, but built-in child restraints, LATCH system components, and any restraint system used to secure infant carriers, child restraints, and booster seats.**

  Do NOT replace single seat belt system components in vehicles that have been in a collision as described above. Always replace the entire seat belt system with the buckle, guide and retractor assembly, which includes the latch and webbing material.

After a minor collision where no automatic restraint device was deployed, seat belt system replacement may not be necessary, unless some of the parts are torn, worn, or damaged.

FRONT SEAT BELT BUCKLE REPLACEMENT

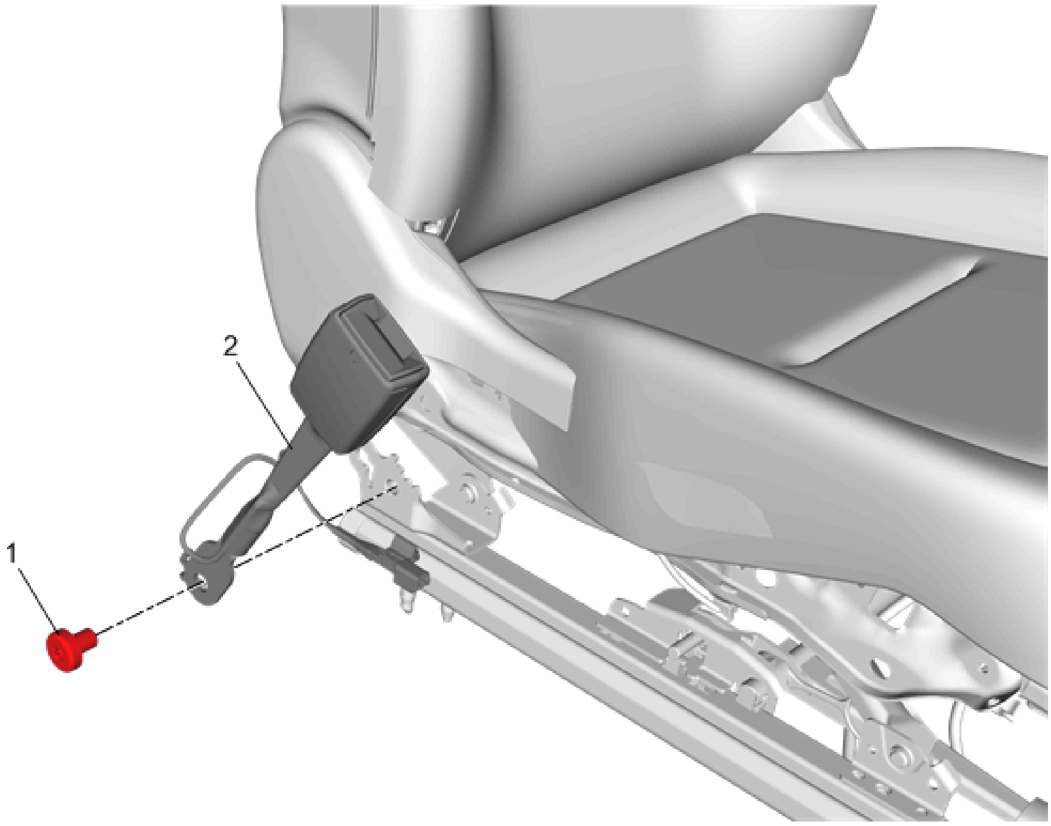

Fig. 3: Front Seat Belt Buckle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Driver or Passenger Seat Removal and Installation	

Callout	Component Name
1	Front Seat Belt Buckle Fastener **CAUTION:** Fastener Caution **Tighten** 45 N.m (33 lb ft) **NOTE:** **Selfcutting bolts, prevailing nuts must be replaced if loosened.**
2	Front Seat Belt Buckle **Procedure** Disconnect the electrical connector.

REAR SEAT BELT BUCKLE REPLACEMENT

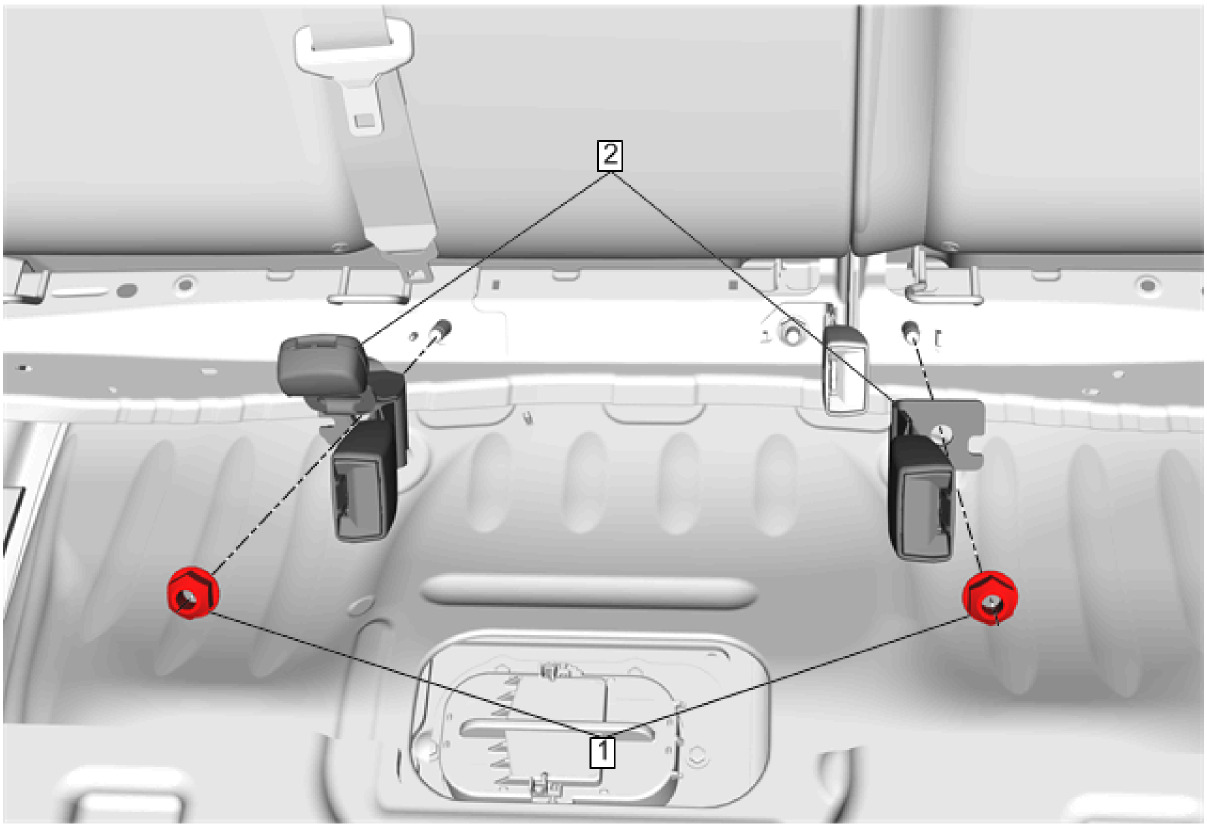

Fig. 4: Rear Seat Belt Buckle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Seat Cushion Removal and Installation	

Callout	Component Name
1	Rear Seat Belt Buckle Nut (Qty: 2) **CAUTION:** **Fastener Caution** **Tighten** 45 N.m (33 lb ft) **NOTE:** **Selfcutting bolts, prevailing nuts must be replaced if loosened.**
2	Rear Seat Belt Buckle **Procedure** If replacing the right buckle, release the center retractor belt from the mini buckle. Rear Center Seat Belt Retractor Replacement

REAR CENTER SEAT BELT BUCKLE REPLACEMENT

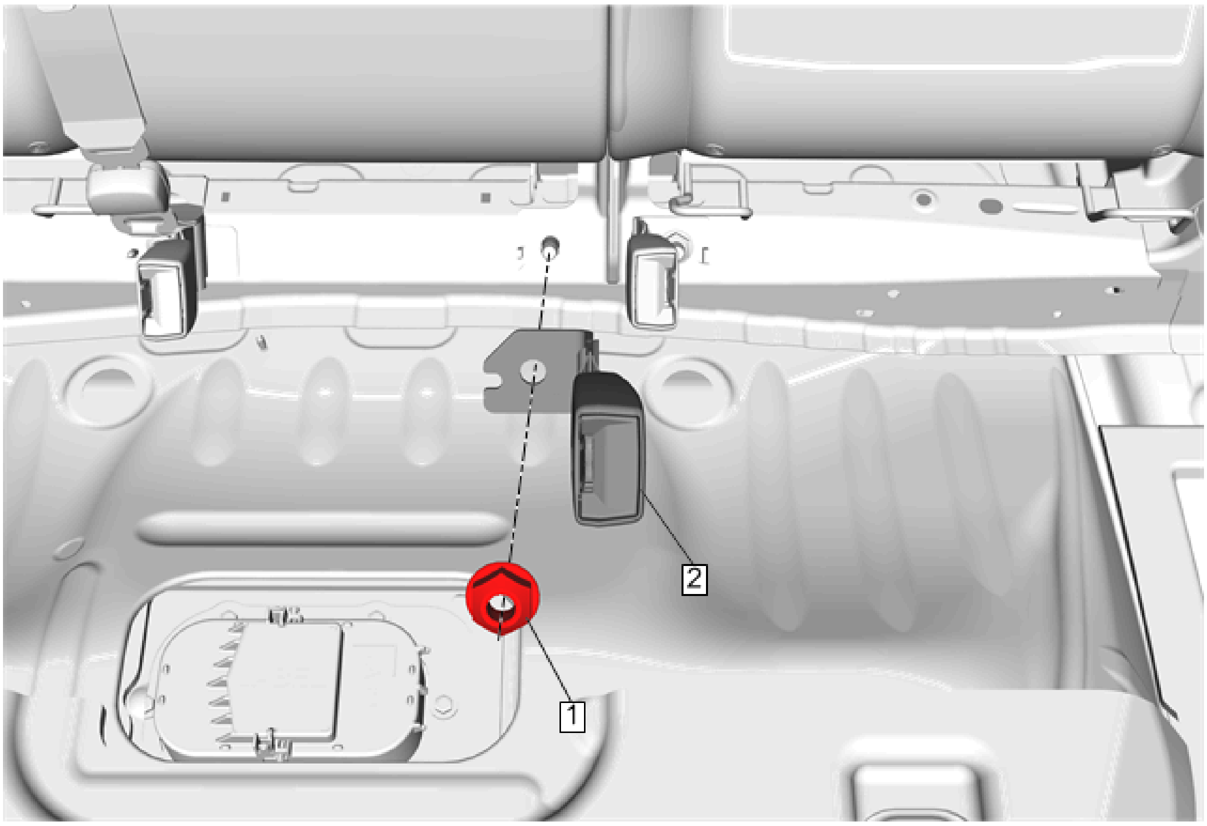

Fig. 5: Rear Center Seat Belt Buckle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Seat Cushion Removal and Installation	

Callout	Component Name
1	Rear Center Seat Belt Buckle Nut **CAUTION:** Fastener Caution **Tighten** 45 N.m (33 lb ft) **NOTE:** **Selfcutting bolts, prevailing nuts must be replaced if loosened.**
2	Rear Center Seat Belt Buckle

REAR CENTER SEAT BELT RETRACTOR REPLACEMENT

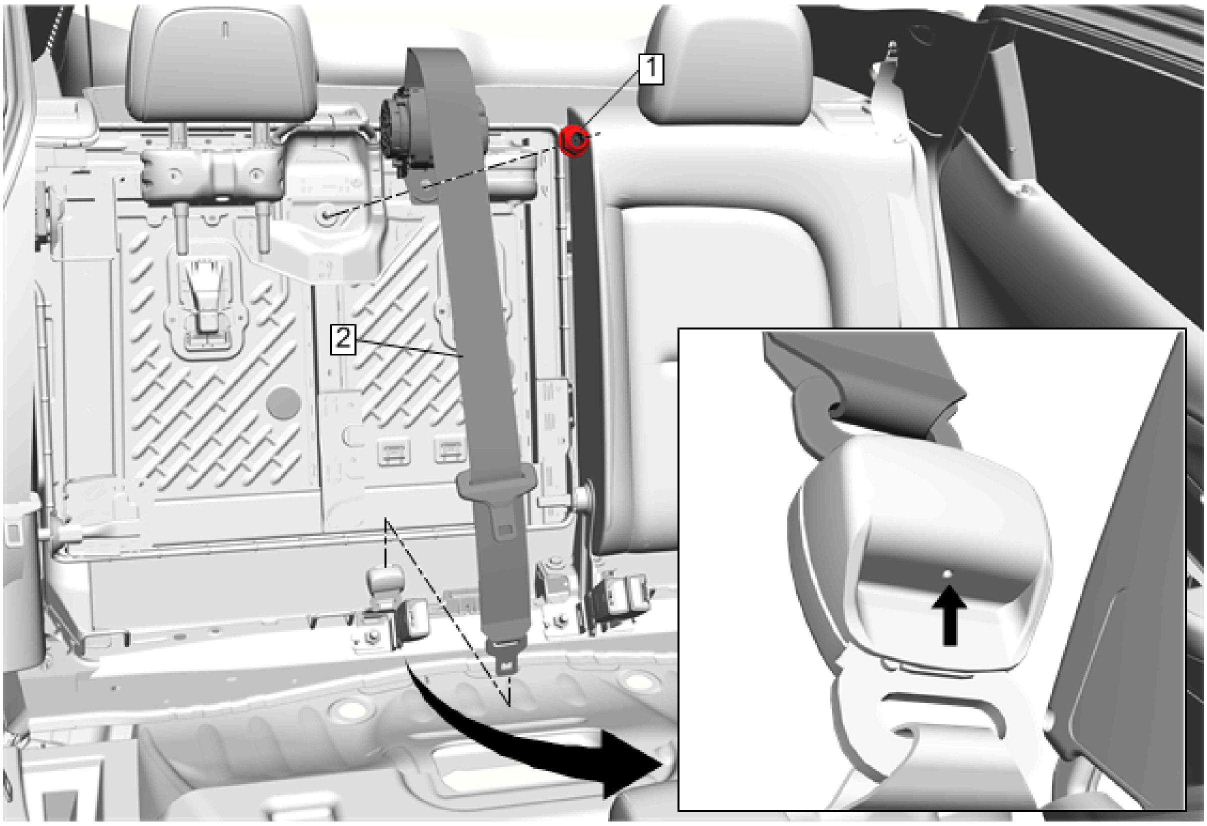

Fig. 6: Rear Center Seat Belt Retractor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Push pin in the slot on mini-buckle to disengage the rear center seat belt retractor from rear center seat belt buckle. 2. Rear Seat Back Cushion Cover and Pad Replacement (60%) Rear Seat Back Cushion Cover and Pad Replacement (with Armrest, 60%) Rear Seat Back Cushion Cover and Pad Replacement (40%) **NOTE:** **Do not separate the cover from the pad.**	

Callout	Component Name
1	Rear Center Seat Belt Retractor Nut **CAUTION:** Fastener Caution **Tighten** 45 N.m (33 lb ft) **NOTE:** **Selfcutting bolts, prevailing nuts must be replaced if loosened.**
2	Rear Seat Center Belt Retractor

REAR SEAT BELT RETRACTOR REPLACEMENT

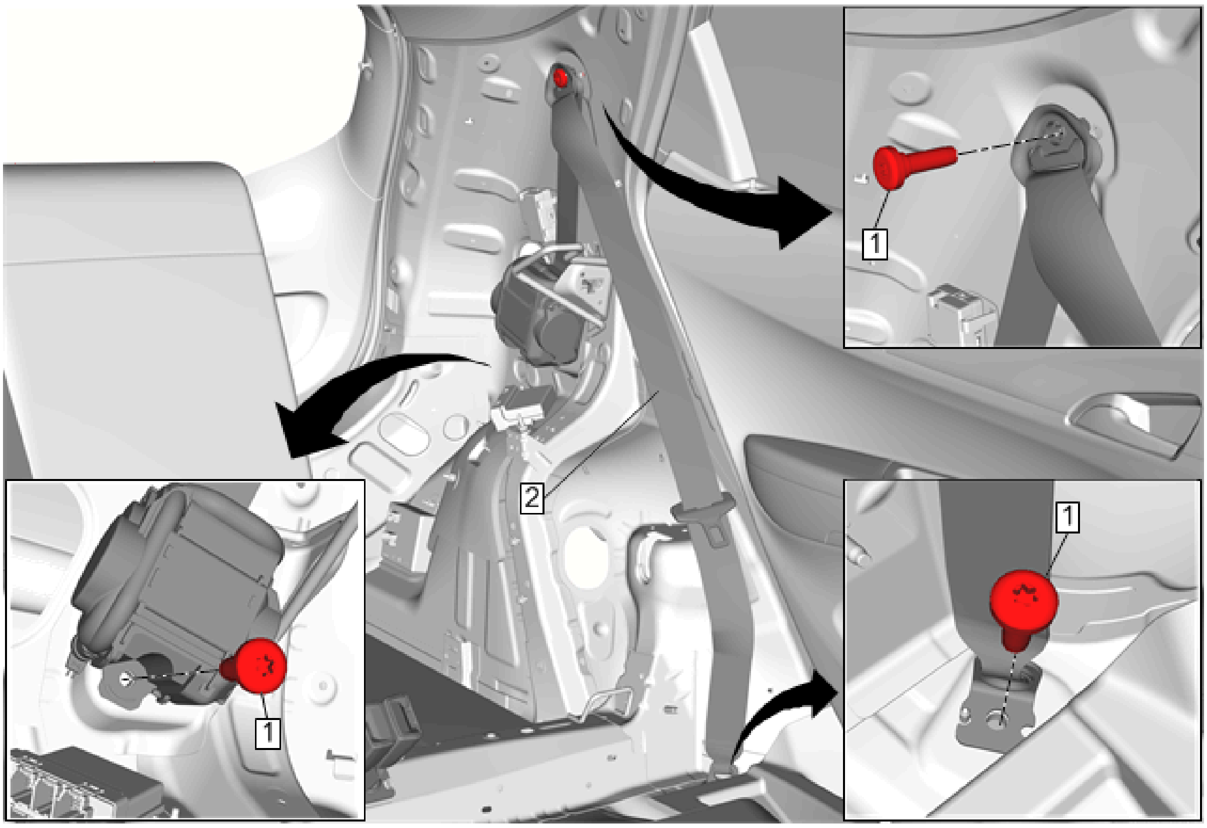

Fig. 7: Rear Seat Belt Retractor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: SIR Warning **Preliminary Procedures** 1. Disable the supplement inflatable restraint (SIR) system. SIR Disabling and Enabling 2. Rear Seat Cushion Removal and Installation 3. Body Lock Pillar Upper Trim Panel Replacement 4. Quarter Lower Rear Trim Panel Replacement	

Callout	Component Name
1	Rear Seat Belt Retractor Bolt (Qty: 3) **CAUTION:** **Fastener Caution** **Tighten** 45 N.m (33 lb ft) **NOTE:** **When the seat belt retractor is replaced with a new one, there is no thread in the nut welded in the body. This is normal as the bolt will make the thread in the welded nut when the bolt is tightened.** **NOTE:** **Selfcutting bolts, prevailing nuts must be replaced if loosened.**
2	Rear Seat Belt Retractor **Procedure** Enable the supplement inflatable restraint (SIR) system. **SIR Disabling and Enabling**

Restraint System

NOTE: **If the vehicle has been in a collision, refer to Repairs and Inspections Required After a Collision**

The vehicle has front and rear seat belts that are the primary means of occupant restraint. Seat belts help to keep the occupants inside the passenger compartment and to gradually reduce the impact forces during the following events:

- Frontal impact type crashes
- Rear impact type crashes
- Side impact type crashes
- Roll-over type crashes

All seat belt retractors have emergency locks. The retractors remain unlocked during normal operation and under normal driving conditions. The retractors remain unlocked during normal conditions in order to allow free movement of the upper body of each occupant. A pendulum locks the seat belt webbing into position. The pendulum causes a locking bar to engage a cog on the spool of the retractor mechanism when the following conditions occur:

- A rapid extraction of the seat belt webbing from the retractor
- An abrupt change in vehicle speed
- An abrupt change in vehicle direction
- Operation of the vehicle on a steep upgrade
- Operation of the vehicle on a downgrade

The seat belts have an automatic locking (cinch) feature. The cinch feature is activated when the seat belt webbing is completely extended from the retractor. The cinch feature prevents the webbing from extending beyond the position from which it is allowed to retract. Use of the cinch feature is recommended for securing a child seat. The cinch feature may be cancelled by allowing the webbing to wind back completely into the retractor. After the cinch feature is cancelled, the webbing is unlocked. After the cinch feature is cancelled, the webbing will extend from the retractor. This vehicle is also equipped with a supplemental inflatable restraint (SIR) system. Refer to **Supplemental Inflatable Restraint System Description and Operation**

Front Seat Belt System

The front seat belt system includes a driver and passenger seat belt pretensioner retractor. Both front seat belt pretensioners includes a seat belt switch in the seat buckle which controls a reminder lamp and a tone alarm.

NOTE: **The front passenger seat is equipped with a passenger presence detection sensor, which detects an occupant. If the passenger presence detection sensor detects an empty front passenger seat, then the passenger fasten safety belt indicator will be disabled.**

- When the driver seat belt is buckled and the ignition switch is turned ON, the following events will occur:
  - The tone alarm will not operate.
  - The reminder lamp will not operate.
- When the passenger seat belt is buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the following events will occur:
  - The tone alarm will not operate.
  - The reminder lamp, which is located within the Passenger Air Bag Disable Indicator, will not be turned ON.
- When the driver seat belt is not buckled and the ignition switch is in the ON position, the following events will occur:
  - The tone alarm will operate for 4 - 8 seconds and then go OFF.
  - The fasten safety belt indicator will turn ON for 20 seconds, until the driver seat belt is buckled.
- When the passenger seat belt is not buckled with an occupant sitting in the passenger front seat, then the ignition switch is turned ON, the following events will occur:
  - The tone alarm will operate for 4 - 8 seconds and then go OFF.
  - The reminder lamp, which is located within the Passenger Air Bag Disable Indicator, will be turned ON.

Rear Seat Belt System

The Rear Seat Belt System includes the following components:

- The rear seat belt retractor is located at the wheelhouse panel and attached to the floor panel by the rear seat shoulder belt retractor bracket.
- The rear seat belt buckles and the center seat belt buckle are attached to each seat.

Child Seat Restraint System

WARNING: **A child in a rear-facing child restraint can be seriously injured if the right-front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.**

A child in a rear-facing child restraint can be seriously injured if the right-front passengers air bag inflates. This is because the back of a rear-facing child restraint would be very close to the inflating air bag. NEVER use a rear-facing child restraint in this vehicle. If a forward-facing child restraint is suitable for your child, ALWAYS move the front passenger seat as far back as it will go and then install the child restraint. Be sure the child restraint position does not conflict with any additional requirements provided by the manufacturer. For more information, refer to the vehicle owners manual and the instruction that came with the child restraint.

The child seat may only be used in a forward facing seating location. The child seat should be installed and secured according to the manufacturer's directions. If the child seat has a top strap, the seat will need to be anchored. Passengers should not be allowed to sit at locations where the seat belts are being used to secure the child seat.

All vehicles are equipped with a dual-mode type retractor with emergency and automatic locking features. The automatic locking feature is for restraint of a child seat. The child seat can be secured by pulling the seat belt all the way out to lock it. Then tighten the seat belt around the child seat.

If a child seat is to be used in the second seat position, a special dealer-installed anchor must be used in order to anchor the child seat top strap. This only applies to the seats designed with the top strap provision and for the vehicles sold in Canada. In order to ensure the correct top strap angle, the child seat is only to be used at the seating position for which the top strap anchor is installed.

Fasten Safety Belt Indicators

There are two fasten safety belt indicators for this vehicle. The driver fasten safety belt reminder is displayed in the instrument cluster, and the passenger fasten safety belt reminder is displayed in the passenger air bag disable indicator. The fasten safety belt indicator may only be ON during RUN. The fasten safety belt indicator illuminates under the following conditions:

- During the bulb check
- The inflatable restraint sensing and diagnostic module (SDM) sends the status of the driver seat belt to the instrument cluster via serial data. The passenger seat belt status is sent to the passenger air bag disable indicator via a hardwire. If any of the seat belts are unfastened, the instrument cluster will send a message requesting a chime sound to be turned ON after a bulb check.

Driver Steering Wheel Air Bag Stage 2 High Control	B0013 02, B0013 0E	B0013 0D	B0013 04, B0013 0D	B0013 01	-
Driver Steering Wheel Air Bag Stage 2 Low Control	B0013 02, B0013 0E	B0013 0D	B0013 04, B0013 0D	B0013 01	-

Circuit/System Description

During a frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy the steering wheel air bag. The SDM performs continuous diagnostic tests on the deployment loops to check for proper circuit continuity and for shorts to ground or voltage. There are two shorting bars used within the steering wheel air bag coil connector which will short together both steering wheel air bag stage 1 high control circuit and steering wheel air bag stage 1 low control circuit and both steering wheel air bag stage 2 high control circuit and steering wheel air bag stage 2 low control circuit when the connector is disconnected. This will help to prevent unwanted deployment of the steering wheel air bag during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0012 01 stage 1 or B0013 01 stage 2

The steering wheel air bag deployment loop is shorted to voltage for 2 s

B0012 02 stage 1 or B0013 02 stage 2

The steering wheel air bag deployment loop is shorted to ground for 2 s

B0012 04 stage 1 or B0013 04 stage 2

The steering wheel air bag deployment loop is open for 2 s

B0012 0D stage 1 or B0013 0D stage 2

The steering wheel air bag deployment loop resistance is greater than 4.4 Ω for 2 s

B0012 0E stage 1 or B0013 0E stage 2

The steering wheel air bag deployment loop resistance is less than 1.7 Ω for 2 s

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployment.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

A worn steering wheel air bag coil can cause a repeated history DTC to set. To verify this condition, turn the steering wheel 360 degrees in one direction then back 360 degrees in the other direction, multiple times, while viewing the scan tool Deployment Loop Resistance parameters.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Steering wheel air bag assembly
- Steering wheel air bag coil assembly
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Driver steering wheel air bag**
  - **Driver steering wheel air bag coil**
  - **Inflatable restraint sensing and diagnostic module**
  - **Air bag wiring harness connector**
  - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any spikes or dropouts while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.
   - **If less than 2.1 Ω or greater than 4.0 Ω**

     Refer to Circuit/System Testing.

   - **If there are spikes or dropouts**

     Replace the X85 Steering Wheel Air Bag Coil.

   - **If between 2.1 - 4.0 Ω without any spikes or dropouts**
2. Verify DTC B0012 or B0013 is only set as a history DTC.
   - **If the DTC is set as current**

     Refer to Circuit/System Testing.

   - **If the DTC is set as history**
3. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any drop outs or spikes while moving the harness near each connector listed below.
   - X85 Steering Wheel Air Bag Coil
   - F107 Steering Wheel Air Bag
   - Any inline harness connector
   - K36 Inflatable Restraint Sensing and Diagnostic Module
   - **If the reading is erratic while moving the harness, perform the following**

- Inspect each connector terminal for damage or corrosion and repair as necessary
- Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
- Ensure each connector and CPA is correctly seated
- **If between 2.1 - 4.0 Ω without any spikes or dropouts**

4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the scan tool and disconnect the appropriate harness connector listed below at the F107 Driver Steering Wheel Air Bag.
   - DTC B0012 connector X1
   - DTC B0013 connector X2
2. Test for greater than 25 Ω between the control circuit terminal 1 and the control circuit terminal 2.
   - **If 25 Ω or less**
   1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

      NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

   2. Test for infinite resistance between the two control circuits.
      - If less than infinite resistance, repair the short between the two circuits.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between each control circuit terminal listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 11 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between each control circuit terminal listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 25 Ω or less**
   1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

      NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a**

connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.

    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 25 Ω**
7. Install a 3 A fused jumper wire between the control circuit terminal 1 and the control circuit terminal 2, ignition ON.
8. Verify the appropriate scan tool Deployment Loop Resistance parameter is consistently less than 2 Ω while turning the steering wheel 360 degrees in one direction then back 360 degrees in the other direction.
    - **If the reading is erratic while turning the steering wheel**

      Replace the X85 Steering Wheel Air Bag Coil.

    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in the K85 Steering Wheel Airbag Coil and each control circuit end to end.
        - If 2 Ω or greater, replace the X85 Steering Wheel Air Bag Coil or repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 2 Ω**
9. Ignition OFF, connect the harness connector at the F107 Steering Wheel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0012 or B0013 is not set.
    - **If DTC B0012 or B0013 is set**

      Test or replace the F107 Steering Wheel Air Bag.

    - **If DTC B0012 or B0013 is not set**
12. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Steering Wheel Airbag Coil Replacement
- Steering Wheel Airbag Replacement
- SIR/SRS Wiring Repairs

Circuit/System Description

During a side or frontal crash of sufficient force, the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short the control circuits together when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0014 01, B0021 01, B0031 01, B0038 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0014 02, B0021 02, B0031 02, B0038 02

The air bag control circuit is shorted to ground for 2 seconds.

B0014 04, B0021 04, B0031 04, B0038 04

The air bag control circuit is open for 2 seconds.

B0014 0D, B0021 0D, B0031 0D, B0038 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0014 0E, B0021 0E, B0031 0E, B0038 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Front and rear seat side air bags
- Left and right roof rail air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Seat side air bag**
  - **Inflatable restraint sensing and diagnostic module**
  - **All wiring harness connectors**
  - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any spikes or dropouts while moving the harness near each connector.
   - F106 Seat Side Air Bag
   - Any inline harness connector
   - K36 Inflatable Restraint Sensing and Diagnostic Module
   - **If less than 2.1 Ω or greater than 4.0 Ω**

     Refer to Circuit/System Testing.
   - **If there are spikes or dropouts, perform the following:**
   - Inspect each connector terminal and harness for damage or corrosion and repair as necessary.
   - Apply dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal.
   - Ensure each connector and CPA is correctly seated.
   - **If between 2.1 - 4.0 Ω without any spikes or dropouts**
2. All OK

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, disconnect the harness connector at the appropriate F106 Seat Side Air Bag.
2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.
   - **If 25 Ω or less**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

   2. Test for infinite resistance between the 2 control circuits.
      - If less than infinite resistance, repair the short between the 2 circuits.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between each control circuit terminal listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 11 V or greater**
   1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between each control circuit terminal listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 25 Ω or less**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
7. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2, ignition ON.
8. Verify the appropriate scan tool Deployment Loop Resistance parameter is less than 2 Ω.
   - **If 2 Ω or greater**
   1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 2 Ω in each control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 2 Ω**
9. Ignition OFF, connect the harness connector at the F106 Seat Side Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0014, B0021, B0031, or B0038 is not set.
    - **If DTC B0014, B0021, B0031, or B0038 is set**

Test or replace the F106 Seat Side Air Bag.

- **If DTC B0014, B0021, B0031, or B0038 is not set**

12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0015 01, B001A 01, B001B 01, B0022 01

The pretensioner control circuit is shorted to voltage for 2 s.

B0015 02, B001A 02, B001B 02, B0022 02

The pretensioner control circuit is shorted to ground for 2 s.

B0015 04, B001A 04, B001B 04, B0022 04

The pretensioner control circuit is open for 2 s.

B0015 0D, B001A 0D, B001B 0D, B0022 0D

The pretensioner deployment loop resistance is greater than 4.2 Ω for 2 s.

B0015 0E, B001A 0E, B001B 0E, B0022 0E

The pretensioner deployment loop resistance is less than 1.4 Ω for 2 s.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: The following diagnostic aids apply for both current and history DTCs.

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger anchor or retractor pretensioners
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE: **Refer to SIR Service Precautions.**

- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Seat belt retractor pretensioner**
  - **Seat belt anchor pretensioner**
  - **Inflatable restraint sensing and diagnostic module**
  - **Seat belt retractor pretensioner wiring harness connector**
  - **Seat belt anchor pretensioner wiring harness connector**
  - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or**

equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify the appropriate scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
    - F112 Seat Belt Retractor Pretensioner
    - F113 Seat Belt Anchor Pretensioner
    - Any inline harness connector
    - K36 Inflatable Restraint Sensing and Diagnostic Module
    - **If less than 2.1 or greater than 4.0 Ω**

      Refer to Circuit/System Testing.

    - **If there are spikes or dropouts, perform the following**
    - Inspect each connector terminal and harness for damage or corrosion and repair as necessary
    - Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
    - Insure each connector and CPA is correctly seated.
    - **If within 2.1 and 4.0 Ω without any spikes or dropouts**
2. All OK

Circuit/System Testing

1. Ignition OFF. Scan tool disconnected. Disconnect the appropriate harness connector listed below:
    - F112 Seat Belt Retractor Pretensioner
    - F113 Seat Belt Anchor Pretensioner
2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.
    - **If 25 Ω or less**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

       NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

    2. Test for infinite resistance between the two control circuits.
        - If less than infinite resistance, repair the short between the two circuits.
        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
    - Control circuit terminal 1
    - Control circuit terminal 2
    - **If 11 V or greater**
    1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON

   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 25 Ω or less**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
7. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2. Ignition ON.
8. Verify the appropriate scan tool Deployment Loop Resistance parameter is less than 2 Ω.
   - **If 2 Ω or greater**
   1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 2 Ω in each control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 2 Ω**
9. Ignition OFF, connect the harness connector at the F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0015, B001A, B001B, or B0022 is not set.
    - **If DTC B0015, B001A, B001B, or B0022 is set**

      Replace the appropriate F112 Seat Belt Retractor Pretensioner or F113 Seat Belt Anchor Pretensioner.

    - **If DTC B0015, B001A, B001B, or B0022 is not set**
12. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Right Roof Rail Air Bag High Control	B0023 02, B0023 0E	B0023 0D	B0023 04, B0023 0D	B0023 01	-
Right Roof Rail Air Bag Low Control	B0023 02, B0023 0E	B0023 0D	B0023 04, B0023 0D	B0023 01	-

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag or pretensioner. There are 2 shorting bars which will short together control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0016 01, B0023 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0016 02, B0023 02

The air bag control circuit is shorted to ground for 2 seconds.

B0016 04, B0023 04

The air bag control circuit is open for 2 seconds.

B0016 0D, B0023 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0016 0E, B0023 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Left and right roof rail air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. DTCs of deployment loops which are in the seat DTC can occur because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment type loop parameters.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Roof rail air bag**
  - **Roof rail air bag wiring harness connector**
  - **Inflatable restraint sensing and diagnostic module**
  - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the appropriate scan tool Deployment Loop Resistance parameter stays consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
   - F105L Roof Rail Air Bag - Left
   - F105R Roof Rail Air Bag - Right
   - Any inline harness connector
   - K36 inflatable restraint sensing and diagnostic module
   - **If less than 2.1 or greater than 4.0 Ω**

     Refer to Circuit/System Testing.

   - **If there are spikes or dropouts, perform the following**
   - Inspect each connector terminal and harness for damage or corrosion and repair as necessary
   - Ensure each connector and CPA is correctly seated.
   - **If within 2.1 and 4.0 Ω without any spikes or dropouts**

2. All OK

Circuit/System Testing

1. Ignition OFF. Scan tool disconnected. Disconnect the harness connector at the appropriate F105 Roof Rail Air Bag. It may take up to 2 min for all vehicle systems to power down.
2. Test for greater than 25 Ω between the control circuit terminals 1 and 2.
   - **If 25 Ω or less**
   1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.

      NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

   2. Test for infinite resistance between the two control circuits.
      - If less than infinite resistance, repair the short between the two circuits.
      - If infinite resistance, replace the K36 inflatable restraint sensing and diagnostic module.
   - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 11 V or greater**
   1. Ignition OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module. Ignition ON.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 inflatable restraint sensing and diagnostic module.
   - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
   - Control circuit terminal 1
   - Control circuit terminal 2
   - **If 25 Ω or less**
   1. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K36 inflatable restraint sensing and diagnostic module.
   - **If greater than 25 Ω**
7. Ignition OFF. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2. Ignition ON.
8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω.
   - **If 2 Ω or greater**
   1. Ignition OFF. Disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.

    2. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 inflatable restraint sensing and diagnostic module.
  - **If less than 2 Ω**

9. Ignition OFF, connect the harness connector at the F105 Roof Rail Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0016 or B0023 is not set.
    - **If DTC B0016 or B0023 is set**

      Test or replace the F105 Roof Rail Air Bag.

    - **If DTC B0016 or B0023 is not set**
12. All OK.

Repair Instructions

Circuit/System Description

During a side or frontal crash of sufficient force the inflatable restraint sensing and diagnostic module (SDM) will allow current to flow through the deployment loop in order to deploy an air bag. There are 2 shorting bars used within the connector that will short together the control circuits, when the connector is disconnected. This will help to prevent unwanted deployment of the air bag or retractor pretensioner during servicing.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0017 01, B0024 01

The air bag control circuit is shorted to voltage for 2 seconds.

B0017 02, B0024 02

The air bag control circuit is shorted to ground for 2 seconds.

B0017 04, B0024 04

The air bag control circuit is open for 2 seconds.

B0017 0D, B0024 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 seconds.

B0017 0E, B0024 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 seconds.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.

- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Driver and passenger knee air bags
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connector can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set. Deployment loop DTCs of air bags in the seats can set because of stress or damage to the harness due to seat movement. Move the seat to the full extent of travel while using the scan tool to observe deployment loop resistance parameters.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or**

replacement of the affected component/connector.
    - **Knee air bag**
    - **Inflatable restraint sensing and diagnostic module**
    - **All wiring harness connectors**
    - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 and 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
    - F114D Knee Air Bag - Driver
    - F114P Knee Air Bag - Passenger
    - Any inline harness connector
    - K36 Inflatable Restraint Sensing and Diagnostic Module
    - **If less than 2.1 or greater than 4.0 Ω**

      Refer to Circuit/System Testing.

    - **If there are spikes or dropouts, perform the following:**
    - Inspect each connector terminal and harness for damage or corrosion and repair as necessary.
    - Apply dielectric grease/lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
    - Ensure each connector and CPA is correctly seated
    - **If within 2.1 and 4.0 Ω without any spikes or dropouts**
2. All OK

Circuit/System Testing

1. Ignition OFF, disconnect the scan tool and disconnect the harness connector at the appropriate F114 Knee Air Bag.
2. At the harness connector, test for greater than 25 Ω between the control circuit terminals 1 and 2.
    - **If 25 Ω or less**
    1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

       NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental inflator deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

    2. Test for infinite resistance between the 2 control circuits.
        - If less than infinite resistance, repair the short between the 2 circuits.

        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 25 Ω**

3. Ignition ON.
4. Test for less than 11 V between the control circuit terminals listed below and ground:
    - Control circuit terminal 1
    - Control circuit terminal 2
    - **If 11 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between the control circuit terminals listed below and ground:
    - Control circuit terminal 1
    - Control circuit terminal 2
    - **If 25 Ω or less**
    1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 25 Ω**
7. Install a 3 A fused jumper wire between the control circuit terminals 1 and 2, ignition ON.
8. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 2 Ω**
9. Ignition OFF, disconnect the 3 A fused jumper wire. Connect the harness connector at the F114 Knee Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
10. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0017 or B0024 is not set.
    - **If DTC B0017 or B0024 is set**

      Test or replace the appropriate F114 Knee Air Bag.

    - **If DTC B0017 or B0024 is not set**
12. All OK.

The air bag control circuit is shorted to voltage for 2 s.

B0019 02, B0020 02

The air bag control circuit is shorted to ground for 2 s.

B0019 04, B0020 04

The air bag control circuit is open for 2 s.

B0019 0D, B0020 0D

The air bag deployment loop resistance is greater than 4.2 Ω for 2 s.

B0019 0E, B0020 0E

The air bag deployment loop resistance is less than 1.4 Ω for 2 s.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module will store a DTC, however if an event occurs the system will still attempt deployments.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

An incorrectly installed connector position assurance (CPA) or incorrectly seated connector can cause a shorting bar to short both control circuits together. Check the connectors and CPAs if a DTC with symptom byte 02 or 0E is set, to ensure the shorting bars are not causing the circuits to be shorted together. Shorting bars are used in the locations listed below:

- Passenger instrument panel air bag
- Inline harness connectors
- Harness side of the inflatable restraint sensing and diagnostic module connector

Terminal fretting or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 04 or 0D is set.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Passenger instrument panel air bag**
  - **inflatable restraint sensing and diagnostic module**
  - **Passenger instrument panel air bag wiring harness connector**
  - **inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify the scan tool Deployment Loop Resistance parameters stay consistently between 2.1 - 4.0 Ω without any spikes or dropouts while moving the harness near each connector listed below:
   - F101 Passenger Instrument Panel Air Bag
   - Any inline harness connector
   - K36 Inflatable Restraint Sensing and Diagnostic Module
   - **If less than 2.1 Ω or greater than 4.0 Ω**

     Refer to Circuit/System Testing.

   - **If there are spikes or dropouts, perform the following**
   - Inspect each connector terminal and harness for damage or corrosion and repair as necessary
   - Apply dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087) to each connector terminal
   - Insure each connector and CPA is correctly seated.
   - **If between 2.1 - 4.0 Ω without any spikes or dropouts**
2. All OK.

Circuit/System Testing

1. Ignition OFF, scan tool disconnected, disconnect the X215 inline harness connector for the F101 Passenger Instrument Panel Air Bag. It may take up to 2 min for all vehicle systems to power down.
2. Test for greater than 25 Ω between the appropriate control circuit terminals listed below on the K36 Inflatable Restraint Sensing and Diagnostic Module side of the connector:
   - F101 Passenger Instrument Panel Air Bag stage 1 X215 terminal 1 and 2
   - F101 Passenger Instrument Panel Air Bag stage 2 X215 terminal 3 and 4
   - **If 25 Ω or less**

   1. Disconnect the X1 harness connector at the K36 inflatable restraint sensing and diagnostic module.

      NOTE: **Some connectors may be equipped with shorting bars as a safety component to prevent accidental deployment. When testing on a connector with shorting bars, the shorting bars must be disabled to ensure accurate test results. Insert an appropriate pick from EL-38125-580 and depress the shorting bars above the appropriate terminals. This will lift the shorting bar from the terminal and allow accurate test results. Take care not to damage the connector, shorting bar, or terminal when depressing the shorting bar.**

   2. Test for infinite resistance between the two control circuits.
      - If less than infinite resistance, repair the short between the two circuits.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
3. Ignition ON.
4. Test for less than 11 V between each control circuit terminal listed below on the instrument panel harness side of the connector and ground:
   - X215 control circuit terminal 1
   - X215 control circuit terminal 2
   - X215 control circuit terminal 3
   - X215 control circuit terminal 4
   - **If 11 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
   2. Test for less than 1 V between each control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 11 V**
5. Ignition OFF.
6. Test for greater than 25 Ω between each control circuit terminal listed below on the instrument panel harness side of the connector and ground:
   - X215 control circuit terminal 1
   - X215 control circuit terminal 2
   - X215 control circuit terminal 3
   - X215 control circuit terminal 4
   - **If 25 Ω or less**
   1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 25 Ω**
7. Install a 3 A fused jumper wire between the control circuit terminals listed below on the instrument panel harness side of the connector:
   - F101 Passenger Instrument Panel Air Bag stage 1 X215 terminal 1 and 2
   - F101 Passenger Instrument Panel Air Bag stage 2 X215 terminal 3 and 4
8. Ignition ON.
9. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω.

   - **If 2 Ω or greater**
     1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
     2. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 2 Ω**

10. Ignition OFF, connect the X215 inline harness connector and disconnect the appropriate X1 (DTC B0019) or X2 (DTC B0020) harness connector at the F101 Passenger instrument panel air bag. Ignition ON.
11. Test for less than 11 V between each control circuit terminals listed below and ground:
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X2
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
    - **If 11 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 11 V**
12. Ignition OFF.
13. Test for greater than 25 Ω between each control circuit terminals listed below and ground:
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X1
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X1
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 1 X2
    - F101 Passenger Instrument Panel Air Bag control circuit terminal 2 X2
    - **If 25 Ω or less**

      Repair the short to ground on the circuit.

    - **If greater than 25 Ω**
14. Install a 3 A fused jumper wire between the control circuit terminals listed below:
    - F101 Passenger Instrument Panel Air Bag stage 1 control circuit terminal 1 X1 and 2 X1
    - F101 Passenger Instrument Panel Air Bag stage 2 control circuit terminal 1 X2 and 2 X2
15. Ignition ON.
16. Verify the scan tool Deployment Loop Resistance parameter is less than 2 Ω.
    - **If 2 Ω or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in each control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit between the F101 Passenger Instrument Panel Air Bag connector and the X215 inline harness connector.
    - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 2 Ω**
17. Ignition OFF, connect the harness connector at the F101 Passenger Instrument Panel Air Bag, press in the CPA (if equipped) until an audible and/or tactile click is heard.
18. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
19. Verify DTC B0019 or B0020 is not set.
    - **If DTC B0019 or B0020 is set**

      Test or replace the F101 Passenger Instrument Panel Air Bag.

    - **If DTC B0019 or B0020 is not set**

20. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Instrument Panel Airbag Replacement**

DTC B0052: DEPLOYMENT COMMANDED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using the diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0052 00

Deployment Commanded

DTC B0052 56

Deployment Commanded Too Many Transitions

Circuit/System Description

The inflatable restraint sensing and diagnostic module (SDM) senses vehicle impacts and provides deployment signals to the air bags and anchor and/or retractor pretensioners when warranted. The inflatable restraint sensing and diagnostic module sets DTC B0052 after each command for deployment. DTC B0052 will latch and not clear after 3 commanded deployments by the inflatable restraint sensing and diagnostic module. Therefore the inflatable restraint sensing and diagnostic module has to be replaced.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

- The inflatable restraint sensing and diagnostic module detects a frontal impact of sufficient force to warrant deployment of the frontal air bags.
- The inflatable restraint sensing and diagnostic module detects a side impact or rollover (if equipped) of sufficient force to warrant deployment of a seat air bag and/or roof rail air bag.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- DTC B0052 00 is a DTC that may be cleared with a scan tool without replacing the inflatable restraint sensing and diagnostic module. This DTC will not clear if deployment has been commanded more then two times, and the inflatable restraint sensing and diagnostic module would have to be replaced.
- DTC B0052 56 is a latched DTC. The DTC cannot be cleared with the scan tool. Replacement of the inflatable restraint sensing and diagnostic module is required.

DTC B0071: PASSENGER SEAT BELT TENSION SENSOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0071 03

Passenger Seat Belt Tension Sensor Circuit Voltage Below Threshold

DTC B0071 04

Passenger Seat Belt Tension Sensor Circuit Open

DTC B0071 07

Passenger Seat Belt Tension Sensor Circuit Voltage Above Threshold

DTC B0071 08

Passenger Seat Belt Tension Sensor Circuit Voltage Performance - Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Seat Belt Tension Sensor Signal	B0071 03	B0071 04	B0071 07	B0071 08
Passenger Seat Belt Tension Sensor Low Reference	-	B0071 07	-	-

Circuit/System Description

The seat belt tension sensor is a 2-wire sensor mounted on the passenger seat belt retractor and provides an input to the passenger presence module. When an infant car seat is properly restrained on the front passenger seat, the seat belt is tightly secured through the car seat. The seat belt pulls on the tension sensor and changes the voltage signal to the passenger presence module. The passenger presence module monitors the belt tension sensor signal circuit and if a fault is detected, DTC will be set. When the passenger presence module detects this DTC it will send out a serial data message and the inflatable restraint sensing and diagnostic module will notify the customer of the enable/disable status by illuminating the OFF indicator on the PASSENGER AIR BAG ON/OFF indicators. The inflatable restraint sensing and diagnostic module will then suppress the deployment of the passenger instrument panel air bag and illuminate the AIR BAG indicator.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 volts.

Conditions for Setting the DTC

- The passenger presence module detects the voltage at the passenger seat belt tension sensor signal circuit is less than 0.5 V or greater than 4.5 V for 1 s.
- The passenger presence module detects the voltage at the passenger seat belt tension sensor voltage reference circuit is less than 4.5 V or greater than 9.1 V for 1 s.
- The passenger presence module detects the amperage at the passenger seat belt tension sensor low reference circuit is 25 mA or greater for 1 s.

Action Taken When the DTC Sets

- The passenger presence module will set a DTC, and then communicate with the inflatable restraint sensing and diagnostic module.
- The inflatable restraint sensing and diagnostic module will set DTC B0081
- The inflatable restraint sensing and diagnostic module disables the passenger instrument panel air bag.
- The passenger presence module will illuminate the passenger air bag status OFF indicator.
- The inflatable restraint sensing and diagnostic module requests the instrument panel to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

Inspect the passenger seat belt tension sensor signal and low reference circuits carefully for cutting and/or chafing.

Circuit/System Testing

NOTE: **The seat belt buckle replacement with the seat belt tension sensor must be serviced as a complete unit.**

When removing connectors, inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected component/connector:

- **Passenger seat belt tension sensor**
- **Passenger presence module**
- **Passenger seat belt tension sensor wiring harness connector**
- **Passenger presence module wiring harness connector**

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B61P Seat Belt Tension Sensor - Passenger. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - **If greater than 10 Ω**
    1. Ignition OFF, disconnect the harness connector at the K85 Passenger Presence Module. It may take up to 2 min for all vehicle systems to power down.
    2. Test for less than 10 Ω between the low reference circuit and ground.
        - If less than 10 Ω, replace the K85 Passenger Presence Module.
        - If greater than 10 Ω, repair the open/high resistance.
    - **If less than 10 Ω**
3. Ignition On/Vehicle in Service Mode.
4. Test for less than 6 V between the signal circuit terminal 1 and ground.
    - **If 6 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K85 Passenger Presence Module. Ignition On/Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.

        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K85 Passenger Presence Module.
    - **If less than 6 V**

5. Ignition OFF.
6. Test for greater than 5K Ω between the signal circuit terminal 1 and ground. It may take up to 2 minutes for all vehicle systems to power down.
    - **If less than 5K Ω**
    1. Disconnect the harness connector at the K85 Passenger Presence Module.
    2. Test for Infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K85 Passenger Presence Module.
    - **If greater than 5K Ω**
7. Disconnect the harness connector at the K85 Passenger Presence Module.
8. Test for less than 2 Ω between the B61P Seat Belt Tension Sensor - Passenger signal circuit terminal 1 and the K85 Passenger Presence Module signal circuit terminal 6.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
9. If all circuits test normal, replace the B61P Seat Belt Tension Sensor - Passenger.
10. Ignition On/Vehicle in Service Mode, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
11. Verify DTC B0071 does not set.
    - **If DTC B0071 is set**

      Replace the K85 Passenger Presence Module.

    - **If DTC B0071 is not set**
12. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Front Seat Belt Retractor Replacement for B61P Seat Belt Tension Sensor - Passenger.
- Control Module References for device replacement, programming, and setup.

DTC B0081 (PASSENGER PRESENCE SYSTEM): PASSENGER PRESENCE MODULE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B0081 11

Passenger Presence Module High Input

DTC B0081 4B

Passenger Presence Module Calibration Not Learned

DTC B0081 5A

Passenger Presence Module Not Plausible

Circuit/System Description

When the ignition is turned ON, the inflatable restraint sensing and diagnostic module and the passenger presence module perform tests to diagnose critical malfunctions. Upon a successful power-up mode the inflatable restraint sensing and diagnostic module will illuminate both PASSENGER AIRBAG ON/OFF indicators. If the inflatable restraint sensing and diagnostic module detects a fault in the passenger presence module, it may disable the passenger instrument panel air bag deployment loop, set DTC B0081 and illuminate the air bag indicator.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

Any of the following conditions must exist for 5 s.

B0081 11

The passenger presence module has failed the rezero procedure.

B0081 4B

The passenger presence module is not calibrated.

B0081 5A

The passenger presence module sets this code when the passenger presence module has lost communication with the inflatable restraint sensing and diagnostic module.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment loop will be disabled.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the inflatable restraint sensing and diagnostic module or passenger presence module were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (Computers, MP3 Players, Cell Phones, Diagnostic Scan Tool, Power Inverter, etc.) was placed on the passenger seat the passenger presence module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

Circuit/System Verification

NOTE:

- **This system is serviced as a kit (seat foam, module and sensing mat). Perform a passenger presence system rezero procedure whenever a component is replaced. Refer to Passenger Presence System Programming and Setup .**
- **Both K36 Inflatable Restraint Sensing and Diagnostic Module and K85 Passenger Presence Module set DTC B0081 but with different symptoms bytes. Therefore it is important to identify which module has set the DTC B0081. Use the symptom bytes as a way of identify the correct module to diagnose.**
- **The K36 Inflatable Restraint Sensing and Diagnostic Module sets a B0081 3A when an incorrect K85 Passenger Presence Module is installed.**

1. Verify that the seat is free of any objects or an aftermarket seat heater.
    - **If objects and/or an aftermarket seat heater is present**
    1. Remove objects and/or aftermarket seat heater.
    2. Ignition ON, clear the DTC.
    3. Verify that DTC B0081 is not set
        - If the DTC B0081 is set, replace the K85 Passenger Presence Module
        - If the DTC B0081 is not set
    4. All OK.
    - **If the seat is empty and does not have an aftermarket seat heater**
2. Verify that DTC B0081 3A is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If DTC B0081 3A is set in the K36 Inflatable Restraint Sensing and Diagnostic Module**

      Replace the K85 Passenger Presence Module.

    - **If DTC B0081 3A is not set in the K36 Inflatable Restraint Sensing and Diagnostic Module**
3. Verify that DTC B0081 11 or DTC B0081 4B is not set in the K85 Passenger Presence Module.

    NOTE: **The K36 Inflatable Restraint Sensing and Diagnostic Modulesets a redundant B0081 00 DTC when the K85 Passenger Presence Module sets a DTC B0081 11 or B0081 4B.**

    - **If DTC B0081 11 or DTC B0081 4B is set in the K85 Passenger Presence Module**

      Perform the passenger presence system rezero procedure. Refer to Passenger Presence System Programming and Setup .

    - **If neither of these DTCs are set in the K85 Passenger Presence Module**
4. Verify DTC B0081 5A is not set in the K85 Passenger Presence Module.
    - **If DTC B0081 5A is set in the K85 Passenger Presence Module**
    1. Verify the connections at the K36 Inflatable Restraint Sensing and Diagnostic Module and K85 Passenger Presence Module, for terminal corrosion, properly seated connectors, and the connector position assurance is installed.
    2. Clear the DTC.
    3. Verify DTC B0081 5A does not set in the K85 Passenger Presence Module.

        - If DTC B0081 5A sets, replace the K85 Passenger Presence Module.
        - If DTC B0081 5A does not set
    4. All OK.
    - **If DTC B0081 5A is not set in the K85 Passenger Presence Module**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for passenger presence module or inflatable restraint sensing and diagnostic module replacement, programming and setup

DTC B0081 (INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE): PASSENGER PRESENCE MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B0081 00

Passenger Presence Module Malfunction

DTC B0081 3A

Passenger Presence Module Incorrect Component Installed

Circuit/System Description

When the ignition is turned ON, the Inflatable Restraint Sensing and Diagnostic Module and the Passenger Presence Module perform tests to diagnose critical malfunctions. Upon a successful power-up mode the Inflatable Restraint Sensing and Diagnostic Module will illuminate both PASSENGER AIRBAG ON/OFF indicators. If the Inflatable Restraint Sensing and Diagnostic Module detects a fault in the Passenger Presence Module, it may disable the passenger instrument panel air bag deployment loop, set DTC B0081 00 or DTC B0081 3A and illuminate the AIRBAG indicator.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0081 00

The Inflatable Restraint Sensing and Diagnostic Module has received a fault present message from the Passenger Presence Module.

B0081 3A

The Inflatable Restraint Sensing and Diagnostic Module has received a message from the Passenger Presence Module indicating a vehicle and Passenger Presence Module mismatch.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument cluster to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment loop will be disabled.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

- If either the Inflatable Restraint Sensing and Diagnostic Module or Passenger Presence Module were replaced verify that the correct part numbers were used for the vehicle application.
- If this DTC is set as either current or history it may have been caused by an electronic device. If an electronic device (Computers, MP3 Players, Cell Phones, Diagnostic Scan Tool, Power Inverter, etc.) was placed on the passenger seat the Passenger Presence Module may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Make sure there are no objects on the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.
- If this DTC is set as either current or history it may have been caused by an aftermarket seat heater. The aftermarket seat heater may command the passenger air bag indicator to turn on and/or command the passenger seat belt indicator to turn on. Remove the aftermarket seat heater from the passenger seat and clear the DTCs. If this DTC resets then perform this diagnostic. If the DTC does not reset there is no further work needed on the passenger presence system.

Circuit/System Verification

NOTE:

- **This system is serviced as a kit (seat foam, module and/or sensing mat). Perform a Passenger Presence System Preload procedure whenever a component is replaced. Refer to Passenger Presence System Programming and Setup .**
- **Both Inflatable Restraint Sensing and Diagnostic Module and Passenger Presence Module set DTC B0081 but with different symptom bytes. Therefore it is important to identify which module has set the DTC B0081. Use the symptom bytes as a way of identify the correct module to diagnose.**

1. Verify that DTC B1001 is not set in the Inflatable Restraint Sensing and Diagnostic Module.

- **If DTC B1001 is set in the Inflatable Restraint Sensing and Diagnostic Module**

  Refer to DTC B1001 (Inflatable Restraint Sensing and Diagnostic Module)DTC B1001 (Passenger Presence System).

- **If DTC B1001 is not set in the Inflatable Restraint Sensing and Diagnostic Module**

2. Verify that DTC B0074, B101D, or B101E is not set in the Passenger Presence Module.
   - **If any of these DTCs are set in the Passenger Presence Module**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If none of these DTCs are set in the Passenger Presence Module**

NOTE: **The Inflatable Restraint Sensing and Diagnostic Module sets a redundant B0081 00 DTC when the Passenger Presence Module sets a DTC B0081 11 or B0081 4B.**

3. Verify that DTC B0081 00 is not set in the Inflatable Restraint Sensing and Diagnostic Module
   - **If DTC B0081 00 is set in the Inflatable Restraint Sensing and Diagnostic Module**

     The Passenger Presence Module has set B0081 11 or a B0081 4B. Refer to B0081 (Passenger Presence Module) for diagnosis.

   - **If DTC B0081 00 is not set in the Inflatable Restraint Sensing and Diagnostic Module**

NOTE: **The Inflatable Restraint Sensing and Diagnostic Module sets a B0081 3A when an incorrect Passenger Presence Module is installed.**

4. Verify that DTC B0081 3A is not set in the Inflatable Restraint Sensing and Diagnostic Module.
   - **If DTC B0081 3A is set in the Inflatable Restraint Sensing and Diagnostic Module**

     Replace the K85 Passenger Presence Module.

   - **If DTC B0081 3A is not set in the Inflatable Restraint Sensing and Diagnostic Module**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for device replacement, programming and setup

DTC B0082: PASSENGER PRESENCE DETECTION SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC B0082 01

Passenger Presence Detection Sensor Short to Battery

DTC B0082 02

Passenger Presence Detection Sensor Short to Ground

DTC B0082 04

Passenger Presence Detection Sensor Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Presence Detection Sensor Signal	B0082 02	B0082 04	B0082 01	-
Passenger Presence Detection Sensor Ground	-	B0082 04	B0082 04	-

Circuit/System Description

The passenger presence detection sensor is within the passenger seat cushion and provides an input to the Inflatable Restraint Sensing and Diagnostic Module (SDM). The SDM supplies a low reference circuit and a passenger presence detection sensor signal circuit to determine seated or unseated condition of passenger seat.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0082 01

The K36 Inflatable Restraint Sensing and Diagnostic Module detects a short to voltage in the passenger presence detection sensor signal circuit.

B0082 02

The K36 Inflatable Restraint Sensing and Diagnostic Module detects a short to ground in the passenger presence detection sensor signal circuit

B0082 04

The K36 Inflatable Restraint Sensing and Diagnostic Module detects an open/high resistance in the passenger presence detection sensor signal circuit or the seat belt reminder sensor ground circuit

Action Taken When the DTC Sets

The SIR System is disabled and no deployments are allowed.

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present
- When the fault is no longer present, the DTC will be a history DTC
- A history DTC will clear after 50 ignition cycles

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.
2. With passenger seat empty, verify the scan tool Passenger Seat Occupancy Status parameter is Empty Seat.
   - **If scan tool Passenger Seat Occupancy Status parameter is not Empty Seat**

     Refer to Circuit/System Testing.

   - **If scan tool Passenger Seat Occupancy Status parameter is Empty Seat**
3. With the passenger seat occupied, verify the scan tool Passenger Seat Occupancy Status parameter is Occupied.
   - **If scan tool Passenger Seat Occupancy Status parameter is not Occupied**

     Refer to Circuit/System Testing.

   - **If scan tool Passenger Seat Occupancy Status parameter is Occupied**
4. All OK.

Circuit/System Testing

1. Ignition OFF.
2. Disconnect the harness connector at the B60 Passenger Presence Sensor.
3. Test for less than 30 Ω between the low reference circuit terminal 2 and ground.
   - **If 30 Ω or greater**
   1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 2 Ω in the B60 Passenger Presence Sensor low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 30 Ω**
4. Ignition On/Vehicle in Service Mode, test for 4.75 - 5.25 V between the signal circuit terminal 1 and ground.
   - **If less than 4.75 V**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 5.25 V**
   1. Ignition OFF.
   2. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.

3. Ignition On/Vehicle in Service Mode.
4. Test for less than 1 V between the signal circuit and ground.
    - If 1 V or greater, repair the short to voltage on the circuit.
    - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
- **If between 4.75 - 5.25 V**

5. Replace the B60 Passenger Presence Sensor.

Circuit/System Description

The impact sensors are equipped on vehicles to supplement the Supplemental Inflatable Restraint (SIR) System performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the inflatable restraint sensing and diagnostic module. The impact sensors can assist in determining the severity of some frontal and side collisions. The inflatable restraint sensing and diagnostic module uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the inflatable restraint sensing and diagnostic module determines a deployment is warranted, the inflatable restraint sensing and diagnostic module will cause current to flow through the deployment loops deploying the air bags.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

Any of the following conditions exist for 10 seconds:

B0083 01, B0084 01

- The sensor has been shorted to voltage.
- The sensor has High Voltage/Open.

B0083 02, B0084 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 milliseconds.

B0083 04, B0083 05, B0084 04, B0084 05

- The sensor circuit is open.
- The inflatable restraint sensing and diagnostic module has not received a message from the sensor for greater than 375 milliseconds.

B0083 39, B0084 39

- The inflatable restraint sensing and diagnostic module has received a Not OK message from the sensor.
- The inflatable restraint sensing and diagnostic module has not received a message.

B0083 3A, B0084 3A

- The inflatable restraint sensing and diagnostic module has received identification message from the sensor, which does not match the identification stored in the inflatable restraint sensing and diagnostic module memory.
- The inflatable restraint sensing and diagnostic module has reset the impact sensor twice without detecting the correct identification message.

B0083 71, B0084 71

The inflatable restraint sensing and diagnostic module has received invalid serial data from the sensor.

Action Taken When the DTC Sets

The inflatable restraint sensing and diagnostic module requests the instrument panel cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

Terminal fretting, damaged terminals, damaged connectors, or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 05 is set.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Impact sensor**
  - **Impact sensor wiring harness connector**
  - **Inflatable restraint sensing and diagnostic module**
  - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify that DTC B0083 or B0084 symptom byte 39 or 71 is not set as current.
   - **If DTC B0083 or B0084 symptom byte 39 or 71 is set as current**

     Replace the appropriate B59 Impact Sensor.

   - **If DTC B0083 or B0084 symptom byte 39 or 71 is not set as current**
2. Verify that the inflatable restraint sensing and diagnostic module calibrations match the VIN, software part number, and calibration part number.
   - **If the inflatable restraint sensing and diagnostic module calibrations do not match the VIN data**

     Program the inflatable restraint sensing and diagnostic module.

   - **If the inflatable restraint sensing and diagnostic module calibrations match the VIN data**
3. Verify the B59 Front Impact Sensors have the correct part numbers, matching the label part numbers with the parts catalog.
   - **If the inflatable restraint sensing and diagnostic module part numbers do not match**

     Replace the incorrect B59 Front Impact Sensor

   - **If the inflatable restraint sensing and diagnostic module part numbers do match**
4. Verify that DTC B0083 or B0084 symptom byte 01, 02, 04, or 05 is not set as current.
   - **If DTC B0083 or B0084 symptom byte 01, 02, 04, or 05 is set as current**

     Refer to Circuit/System Testing.

   - **If DTC B0083 or B0084 symptom byte 01, 02, 04, 05 is not set as current**
5. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate B59 front impact sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**

   1. Ignition OFF, disconnect the X2 harness connector at the K36 inflatable restraint sensing and diagnostic module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 inflatable restraint sensing and diagnostic module.
   - **If less than 10 Ω**

3. Test for greater than 50k Ω between the signal circuit terminal 1 and ground.
   - **If 50k Ω or less**
   1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 50k Ω**
4. Ignition ON, wait 1 min, test for less than 1 V between the signal circuit terminal 1 and ground.
   - **If 1 V or greater**
   1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
   2. Test for less than 1 V between the signal circuit and ground.
      - If greater than 1 V, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange and manually set the DMM range to 000.0 V.**

5. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V. Ignition ON.
6. Verify the MAX voltage captured by the DMM is between 4 - 9V.
   - **If less than 4 V**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 9V**
   1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
   2. Test for less than 1 V between the signal circuit terminal 1 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If between 4 - 9V**
7. Ignition OFF, reconnect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
8. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
9. Operate the vehicle under the conditions for setting the DTC. The DTC should not set.

- **If the DTC sets**

  Replace the B59 Impact Sensor.

- **If the DTC does not set**

10. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Airbag Front End Discriminating Sensor Replacement - Right Side (with AYF)**
- **Airbag Front End Discriminating Sensor Replacement - Left Side (with AYF)**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming and setup

DTC B0085 OR B0088: LEFT FRONT/RIGHT REAR SIDE IMPACT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the Inflatable Restraint Sensing and Diagnostic Module (SDM). The impact sensors can assist in determining the severity of some frontal and side collisions. The Inflatable Restraint Sensing and Diagnostic Module uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the Inflatable Restraint Sensing and Diagnostic Module determines a deployment is warranted, the Inflatable Restraint Sensing and Diagnostic Module will cause current to flow through the deployment loops deploying the air bags.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

Any of the following conditions exist for 10 seconds:

B0085 01, B0088 01

- The impact sensor has an open/high resistance.
- The impact sensor has been shorted to voltage.

B0085 02, B0088 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 ms.

B0085 04, B0088 04

- The impact sensor has an open or high resistance.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message from the sensor for greater than 375 ms.

B0085 39, B0088 39

- The Inflatable Restraint Sensing and Diagnostic Module has received a Not OK message from the sensor.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message.

B0085 3A, B0088 3A

- The Inflatable Restraint Sensing and Diagnostic Module has received identification message from the sensor, which does not match the identification stored in the Inflatable Restraint Sensing and Diagnostic Module memory.
- The Inflatable Restraint Sensing and Diagnostic Module has reset the impact sensor twice without detecting the correct identification message.

Action Taken When the DTC Sets

The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Side Impact Sensor**
  - **Inflatable Restraint Sensing and Diagnostic Module**
  - **Front impact sensor wiring harness connector**
  - **Side Impact Sensor wiring harness connector**
  - **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify that DTC B0085 or B0088 symptom byte 39 is not set as current.
    - **If DTC B0085 or B0088 symptom byte 39 is set as current**

      Replace the sensor listed below:

    - B0085 - B63LF Side Impact Sensor-Left Front
    - B0088 - B63RR Side Impact Sensor-Right Rear
    - **If DTC B0085 or B0088 symptom byte 39 is not set as current**
2. Verify that DTC B0085 or B0088 symptom byte 3A is not set as current.
    - **If DTC B0085 or B0088 symptom byte 3A is set as current**

      Replace the incorrect B63 Side Impact Sensor

    - **If DTC B0085 or B0088 symptom byte 3A is not set as current**
3. Verify that DTC B0085 or B0088 symptom byte 02 or 05 is set as current.
    - **If only DTC B0085 symptom byte 01, 02 or 04 is set as current**

      Refer to Circuit/System Testing - Only DTC B0085 or B0088 is set.

    - **If only DTC B0088 symptom byte 01, 02 or 04 is set as current**

      Refer to Circuit/System Testing - Only DTC B0085 or B0088 is set.

    - **If both DTC B0085 or B0088 symptom byte 01 or 02 is set as current**

      Refer to Circuit/System Testing - Both DTC B0085 and B0088 are set.

    - **If DTC B0085 or B0088 symptom byte 01 or 02 is not set as current**
4. All OK.

Circuit/System Testing

NOTE: **The signal circuit is shared at the K36 Inflatable Restraint Sensing and Diagnostic Module between the B63LF Side Impact Sensor - Left Front and the B63RR Side Impact Sensor - Right Rear (DTC B0085 and DTC B0088). Therefore a short to ground or short to voltage in either of these signal circuits can set a DTC for both circuits, and an open in either circuit will only set its corresponding DTC.**

Only DTC B0085 or B0088 is set

1. Ignition OFF, disconnect the harness connector at the appropriate B63 Side Impact Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4-9 V between the signal circuit terminal 1 and ground.
    - **If less than 4 V**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the signal circuit and ground.

      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 9V**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If between 4-9 V**
5. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
6. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
7. Verify the DTC does not set.
   - **If the DTC sets**
   1. Replace the B63 Side Impact Sensor.
   2. Verify the DTC does not set.
      - If the DTC sets, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
      - If the DTC does not set.
   3. All OK.
   - **If the DTC does not set**
8. All OK

Both DTC B0085 and B0088 are set

1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for greater than 50k Ω between each signal circuit listed below and ground:
   - Left front signal circuit - terminal 19 X2
   - Right rear signal circuit - terminal 30 X2
   - **If 50k Ω or less**
   1. Ignition OFF. Disconnect the harness connector at the B63 Side Impact Sensor that failed the test. Ignition ON.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the B63 Side Impact Sensor.
   - **If greater than 50k Ω**
3. Ignition ON.
4. Test for less than 1 V between the signal circuit terminals listed below and ground:
   - Left front signal circuit - terminal 19 X2
   - Right rear signal circuit - terminal 30 X2
   - **If 1 V or greater**
   1. Disconnect the harness connector at the B63 Side Impact Sensor that failed the test.
   2. Test for less than 1 V between signal circuit and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.
      - If less than 1 V, replace the B63 Side Impact Sensor.
   - **If less than 1 V**
5. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.

6. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
7. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

    - **If the DTC does not set**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Airbag Side Impact Sensor Replacement - Front Side Door (with AYF)**
- **Airbag Side Impact Rear Sensor Replacement (with AYF)**
- **Control Module References** for Inflatable Restraint Sensing and Diagnostic Module replacement, programming and setup

DTC B0086 OR B0087: RIGHT FRONT/LEFT REAR SIDE IMPACT SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the Inflatable Restraint Sensing and Diagnostic Module (SDM). The impact sensors can assist in determining the severity of some frontal and side collisions. The Inflatable Restraint Sensing and Diagnostic Module uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the Inflatable Restraint Sensing and Diagnostic Module determines a deployment is warranted, the Inflatable Restraint Sensing and Diagnostic Module will cause current to flow through the deployment loops deploying the air bags.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

Any of the following conditions exist for 10 seconds:

B0086 01, B0087 01

- The impact sensor has been shorted to voltage.
- The impact sensor has an open/high resistance.

B0086 02, B0087 02

- The sensor has been shorted to ground.
- The sensor current is greater than 23 mA for greater than 5 ms.

B0086 04, B0087 04

- The sensor circuit is open.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message from the sensor for greater than 375 ms.

B0086 39, B0087 39

- The Inflatable Restraint Sensing and Diagnostic Module has received a Not OK message from the sensor.
- The Inflatable Restraint Sensing and Diagnostic Module has not received a message.

B0086 3A, B0087 3A

- The Inflatable Restraint Sensing and Diagnostic Module has received identification message from the sensor, which does not match the identification stored in the Inflatable Restraint Sensing and Diagnostic Module memory.

- The Inflatable Restraint Sensing and Diagnostic Module has reset the impact sensor twice without detecting the correct identification message.

Action Taken When the DTC Sets

The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster to illuminate the AIR BAG indicator.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.
- An ignition cycle is required for the DTC to go from current to history.

Circuit/System Verification

NOTE: **Refer to SIR Service Precautions.**

Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.

- **Side Impact Sensor**
- **Inflatable Restraint Sensing and Diagnostic Module**
- **Front impact sensor wiring harness connector**
- **Side Impact Sensor wiring harness connector**
- **Inflatable Restraint Sensing and Diagnostic Module wiring harness connector**

NOTE: **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**

If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.

1. Verify that DTC B0086 or B0087 symptom byte 39 is not set as current.
    - **If DTC B0086 or B0087 symptom byte 39 is set as current**

      Replace the sensor listed below:

    - B0086 - B63LF Side Impact Sensor-Right Front
    - B0087 - B63RR Side Impact Sensor-Left Rear
    - **If DTC B0086 or B0087 symptom byte 39 is not set as current**
2. Verify that DTC B0086 or B0087 symptom byte 3A is not set as current.
    - **If DTC B0086 or B0087 symptom byte 3A is set as current**

      Replace the incorrect B63 Side Impact Sensor

    - **If DTC B0086 or B0087 symptom byte 3A is not set as current**
3. Verify that DTC B0086 or B0087 symptom byte 02 or 05 is set as current.
    - **If only DTC B0086 symptom byte 01, 02 or 04 is set as current**

      Refer to Circuit/System Testing - Only DTC B0086 or B0087 is set.

    - **If only DTC B0087 symptom byte 01, 02 or 04 is set as current**

      Refer to Circuit/System Testing - Only DTC B0086 or B0087 is set.

    - **If both DTC B0086 or B0087 symptom byte 01, 02 or 04 is set as current**

      Refer to Circuit/System Testing - Both DTC B0086 and B0087 are set.

    - **If DTC B0086 or B0087 symptom byte 01, 02 or 04 is not set as current**
4. All OK.

Circuit/System Testing

NOTE: **The signal circuit is shared at the K36 Inflatable Restraint Sensing and Diagnostic Module between the B63RF Side Impact Sensor right front and the B63LR Side Impact Sensor left rear (DTC B0086 and DTC B0087). Therefore a short to ground or short to voltage in either of these signal circuits can set a DTC for both circuits, and an open in either circuit should only set its corresponding DTC.**

Only DTC B0086 or B0087 is set

1. Ignition OFF, disconnect the harness connector at the appropriate B63 Side Impact Sensor. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for 4-9 V between the signal circuit terminal 1 and ground.

   - **If less than 4 V**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If greater than 9V**
   1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If between 4-9 V**
5. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
6. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
7. Verify the DTC does not set.
   - **If the DTC sets**
   1. Replace the B63 Side Impact Sensor.
   2. Verify the DTC does not set.
      - If the DTC sets, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
      - If the DTC does not set.
   3. All OK.
   - **If the DTC does not set**
8. All OK.

Both DTC B0086 and B0087 are set

1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for greater than 50k Ω between each signal circuit listed below and ground:
   - Right front signal circuit - terminal 22 X2
   - Left rear signal circuit - terminal 27 X2
   - **If 50k Ω or less**
   1. Disconnect the harness connector at the B63 Side Impact Sensor that failed the test.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the B63 Side Impact Sensor.
   - **If greater than 50k Ω**
3. Ignition ON.
4. Test for less than 1 V between the signal circuit terminals listed below and ground:
   - Right front signal circuit - terminal 22 X2
   - Left rear signal circuit - terminal 27 X2
   - **If 1 V or greater**
   1. Ignition OFF. Disconnect the harness connector at the B63 Side Impact Sensor that failed the test. Ignition ON.
   2. Test for less than 1 V between signal circuit and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.

        - If less than 1 V, replace the B63 Side Impact Sensor.
    - **If less than 1 V**
5. Ignition OFF, connect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
6. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
7. Verify the DTC does not set.
    - **If the DTC sets**
    1. Replace the B63 Side Impact Sensor.
    2. Verify the DTC does not set.
        - If the DTC sets, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
        - If the DTC does not set.
    3. All OK.
    - **If the DTC does not set**
8. All OK.

Circuit/System Description

The impact sensors are equipped on vehicles to supplement the supplemental inflatable restraint (SIR) system performance. The impact sensors are electronic and are not part of the deployment loops, but instead provide inputs to the inflatable restraint sensing and diagnostic module. The impact sensors can assist in determining the severity of some frontal and side collisions. The inflatable restraint sensing and diagnostic module uses the input from the impact sensors to assist in determining the severity of a collision further supporting air bag deployment. If the inflatable restraint sensing and diagnostic module determines a deployment is warranted, the inflatable restraint sensing and diagnostic module will cause current to flow through the deployment loops deploying the appropriate air bags. The center front impact sensor and side impact sensors utilize a bidirectional 2-wire circuit. The sensors modulate current on the interface to send identification, state of health, and deployment commands to the inflatable restraint sensing and diagnostic module. The inflatable restraint sensing and diagnostic module serves as a power source and a ground for the sensors. When the ignition is turned ON and input power from the inflatable restraint sensing and diagnostic module is first detected, the sensors respond by performing internal diagnostics and sending an identification to the inflatable restraint sensing and diagnostic module. The inflatable restraint sensing and diagnostic module considers the identification to be valid if the response time is less than 5 s. The sensors continually communicate status messages to the inflatable restraint sensing and diagnostic module, which determines if a fault is present in the sensor circuit. When a fault is detected, the inflatable restraint sensing and diagnostic module may reset the sensors up to 2 times by removing and reapplying power to it. If the fault is still present, the inflatable restraint sensing and diagnostic module will set a DTC.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

B0091 02

- The inflatable restraint sensing and diagnostic module has detected the center front impact sensor has been shorted to ground.
- The center front impact sensor current is greater than 23 mA for greater than 5 ms.

B0091 04

The impact sensor has an open or high resistance.

B0091 05

- The impact sensor has an open or high resistance.
- The impact sensor has been shorted to voltage.

B0091 08

The impact sensor has an invalid signal.

B0091 0F

The impact sensor has an erratic signal.

B0091 39

- The inflatable restraint sensing and diagnostic module has received a Not OK message from the center front impact sensor.
- The inflatable restraint sensing and diagnostic module has not received a message.

B0091 3A

- The inflatable restraint sensing and diagnostic module has received identification message from the center front impact sensor which does not match the identification stored in the inflatable restraint sensing and diagnostic module memory.
- The inflatable restraint sensing and diagnostic module has reset the center front impact sensor twice without detecting the correct identification message.

B0091 71

The inflatable restraint sensing and diagnostic module has received invalid serial data from the center front impact sensor.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument panel cluster to illuminate the AIR BAG indicator.
- The SIR system is disabled and no deployments are allowed.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aid

NOTE: **The following diagnostic aids apply for both current and history DTCs.**

Terminal fretting, damaged terminals, damaged connectors, or incorrectly seated connectors can cause an open/high resistance condition. Check the circuit terminals for fretting or incorrectly seated connector if a DTC with symptom byte 05 or 71 is set.

Circuit/System Verification

NOTE:

- **Refer to SIR Service Precautions.**
- **Inspect all terminals for damage or corrosion when disconnecting connectors. Damage or corrosion in the following requires repair or replacement of the affected component/connector.**
  - **Front impact sensor**
  - **Side impact sensor**
  - **Inflatable restraint sensing and diagnostic module**
  - **Front impact sensor wiring harness connector**
  - **Side impact sensor wiring harness connector**
  - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars**

within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.

- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify that DTC B0091 symptom byte 08, 0F, 3A, 39 or 71 is not set as current.
    - **If DTC B0091 symptom byte 08, 0F, 3A, 39 or 71 is set as current**

      Replace the B59 Front Impact Sensor.

    - **If DTC B0091 symptom byte 08, 0F, 3A, 39 or 71 is not set as current**
2. Verify that DTC B0091 symptom byte 01, 02, 04, or 05 is not set as current.
    - **If DTC B0091 symptom byte 01, 02, 04, or 05 is set as current**

      Refer to Circuit/System Testing.

    - **If DTC B0091 symptom byte 01, 02, 04, 05 is not set as current**
3. All OK.

Circuit/System Testing

1. Ignition OFF, and all vehicle systems OFF, disconnect the harness connector at the B59 Front Impact Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF, disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 10 Ω**
3. Test for greater than 50k Ω between the signal circuit terminal 1 and ground.
    - **If 50k Ω or less**
    1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 50k Ω**
4. Ignition ON, wait 1 min, test for less than 1 V between the signal circuit terminal 1 and ground.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 1 V**

NOTE: **When using the MIN MAX function, autorange on the DMM may not function properly. To ensure accurate test results, turn off autorange**

and manually set the DMM range to 000.0 V.

5. Ignition OFF, install a DMM between the signal circuit terminal 1 and ground. Set the DMM to capture DC voltage using the MIN MAX function. Turn off autorange and manually set the DMM range to 000.0 V. Ignition ON.
6. Verify the MAX voltage captured by the DMM is between 4 - 9V.
    - **If less than 4 V**
    1. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 9V**
    1. Ignition OFF. Disconnect the X2 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
    2. Test for less than 1 V between the signal circuit terminal 1 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If between 4 - 9V**
7. Ignition OFF, reconnect all harness connectors, press in the CPA (if equipped) until an audible and/or tactile click is heard.
8. Ignition ON, clear DTCs. Operate the vehicle within the Conditions for Running the DTC.
9. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the B59 Front Impact Sensor.

    - **If the DTC does not set**
10. All OK.

  - **Impact sensor wiring harness connector**
  - **Inflatable restraint sensing and diagnostic module wiring harness connector**
- **The connector and connector position assurance (CPA) may seat independent of each other. Both the connector and CPA should seat with an audible and/or tactile click. The CPA isolates the shorting-bars within the connector allowing the deployment circuit to operate properly. Replace any CPA that is damaged or missing.**
- **If the condition is intermittent or cannot be duplicated, disconnect the connectors and add dielectric grease / lubricant (Nyogel 760G or equivalent, meeting GM specification 9986087). This procedure will correct the high resistance condition due to terminal fretting corrosion.**

1. Verify that DTC B0092 or B0093 symptom byte 3A, 39, or 71 is not set as current.
   - **If DTC B0092 or B0093 symptom byte 3A, 39 or 71 is set as current**

     Replace the appropriate B63 Side Impact Sensor.

   - **If DTC B0092 or B0093 symptom byte 3A, 39 or 71 is not set as current**
2. Verify that DTC B0092 or B0093 symptom byte 01, 02, or 04 is not set as current.
   - **If DTC B0092 or B0093 symptom byte 01, 02, or 04 is set as current**

     Refer to Circuit/System Testing.

   - **If DTC B0092 or B0093 symptom byte 01, 02, or 04 is not set as current**
3. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the harness connector at the appropriate B63 Side Impact Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 10 Ω**
3. Test for greater than 50k Ω between the signal circuit terminal 1 and ground.
    - **If 50k Ω or less**
    1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If greater than 50k Ω**
4. Ignition ON.
5. Test for less than 1 V between the signal circuit terminal 1 and ground.
    - **If 1 V or greater**
    1. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If greater than 1 V, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 1 V**
6. Ignition OFF, disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
7. Test for less than 2 Ω between the signal circuit end to end from the impact sensor terminal 1 and the K36 Inflatable Restraint Sensing and Diagnostic Module terminal listed below:
    - Left Center Side Impact Sensor terminal 27 X2
    - Right Center Side Impact Sensor terminal 30 X2
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
8. Connect all harness connectors. Ignition ON, clear the DTC.
9. Verify the DTC does not set.
    - **If the DTC sets**

      Replace the B63 Side Impact Sensor.

    - **If the DTC does not set**
10. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Airbag Side Impact Center Pillar Sensor Replacement (with AY0)**
- **Control Module References** for device replacement, programming and setup

DTC B067F OR B0680: PASSENGER AIR BAG ON/OFF INDICATOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag OFF Indicator Control	B0680 02	B0680 04	B0680 01	-
Passenger Air Bag ON Indicator Control	B067F 02	B067F 04	B067F 01	-
Passenger Air Bag Disable Indicator Ground	-	B067F 04, B0680 04	-	-

Circuit/System Description (C99)

When the ignition switch is turned to ON, the inflatable restraint sensing and diagnostic module (SDM) continuously checks the air bag enable/disable switch position switch and circuit defect by letting regular voltage flow through the switch circuit and verifying the current. The passenger air bag switch controls when the air bag is enabled or disabled and notifies the driver when the passenger instrument panel air bag is enabled or disabled using the passenger air bag ON/OFF indicators. When the inflatable restraint sensing and diagnostic module receives the signal from the passenger air bag disable switch (on/off), the inflatable restraint sensing and diagnostic module will then provide voltage to the appropriate indicator.

Circuit/System Description (ALO)

The passenger air bag ON/OFF indicators are used to notify the driver when the passenger presence system has enabled or disabled the passenger instrument panel air bag. When the ignition is turned ON, the ignition voltage is supplied to the passenger presence module. When the inflatable restraint sensing and diagnostic module receives the appropriate serial data message from the passenger presence system the inflatable restraint sensing and diagnostic module will then provide voltage to the appropriate indicator.

Conditions for Running the DTC

Ignition Voltage is between 9 - 16 V

Conditions for Setting the DTC

The inflatable restraint sensing and diagnostic module detects improper voltage on the control circuit of the passenger air bag ON or OFF indicator

Actions Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- Passenger air bag ON and OFF indicators are disabled.

Conditions for Clearing the DTC

The condition for setting the DTC no longer exists.

Control Module References for scan tool information

Circuit/System Verification

NOTE: **The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTCs before proceeding with this diagnostic.**

With C99 Passenger Air Bag Disable Switch

1. Observe the scan tool Passenger Air Bag Disabled Switch parameter while commanding the passenger air bag ON and OFF by using the S40 passenger air bag disable switch. The value should change between On and Off. If the value does not change refer to Passenger Air Bag Disable Switch Circuit/System Testing.
   - **If the Passenger Air Bag Disabled Switch parameter does not change between On and Off**

     Refer to Passenger Air Bag Disable Switch Circuit/System Testing.

   - **If the Passenger Air Bag Disabled Switch parameter does change between On and Off**
2. All OK.

With ALO Passenger Presence System

1. Ignition On/Vehicle in Service Mode.
2. Passenger seat unoccupied.
3. Verify the scan tool Passenger Seat Occupancy Status parameter is Empty.
   - **If the Passenger Seat Occupancy Status parameter does not display Empty**

    The Passenger Presence System Module has set a DTC. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the Passenger Seat Occupancy Status parameter does display Empty**

4. Passenger seat unoccupied.
5. Verify the passenger air bag OFF indicator is illuminated.
    - **If the passenger air bag OFF indicator is not illuminated**

      Refer to Passenger Air Bag Indicator Circuit/System Testing.

    - **If the passenger air bag OFF indicator is illuminated**
6. Passenger seat occupied.
7. Verify the scan tool Passenger Seat Occupancy Status parameter is Occupied.
    - **If the Passenger Seat Occupancy Status parameter does not display Occupied**

      The Passenger Presence System Module has set a DTC. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the Passenger Seat Occupancy Status parameter displays Occupied**
8. Passenger seat occupied.
9. Verify the passenger air bag ON indicator is illuminated.
    - **If the passenger air bag ON indicator is not illuminated**

      Refer to Passenger Air Bag Indicator Circuit/System Testing.

    - **If the passenger air bag ON indicator is illuminated**
10. All OK.

Passenger Air Bag Disable Switch Circuit/System Testing (C99)

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.**

- **Passenger air bag disable switch.**
- **Passenger air bag disable switch wiring harness.**

1. Ignition OFF, disconnect the harness connector at the S40 Passenger Air Bag Disable Switch.
2. Test for less than 30 Ω between the ground circuit terminal 1 and ground.
    - **If 30 Ω or greater**
    1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the signal circuit terminal 3 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
    3. Test for less than 2 Ω in the signal circuit terminal 3 end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 30 Ω**
3. Ignition On/Vehicle in Service Mode.
4. Test for 4.75-5.25 V between the signal circuit terminal 3 and ground.
    - **If less than 4.75 V**
    1. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

3. Test for less than 2 Ω in the signal circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If greater than 5.25 V**

1. Ignition OFF.
2. Disconnect the harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
3. Ignition On/Vehicle in Service Mode.
4. Test for less than 1 V between the signal circuit terminal 3 and ground:
   - If 1 V or greater, repair the short to voltage on the circuit.
   - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

- **If between 4.75 - 5.25 V**

  Replace the S40 Passenger Air Bag Disable Switch.

Passenger Air Bag Indicator Circuit/System Testing (ALO)

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.**

- **Passenger air bag disable on/off indicator.**
- **Passenger air bag disable on/off indicator wiring harness.**

1. Ignition OFF, disconnect the scan tool, disconnect the harness connector at the P14 Passenger Air Bag Disable Indicator, wait 2 min.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition On/Vehicle in Service Mode, command the Passenger Airbag Off Indictor OFF with a scan tool.
4. Test for less than 11 V between the control circuit terminal 3 and ground.
   - **If 11 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition On/Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 inflatable restraint sensing and diagnostic module.
   - **If less than 11 V**
5. Command the Passenger Airbag Off Indictor On with a scan tool.
6. Test for greater than 4 V between the control circuit terminal 3 and ground.
   - **If 4 V or less**
   1. Ignition OFF. Disconnect the X1 harness connector at the K36 inflatable restraint sensing and diagnostic module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   3. Test for less than 2 Ω in each control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K36 inflatable restraint sensing and diagnostic module.
   - **If greater than 4 V**

7. Command the Passenger Airbag On Indictor Off, with a scan tool.
8. Test for less than 11 V between the control circuit terminal 2 and ground.
    - **If 11 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 inflatable restraint sensing and diagnostic module. Ignition On/Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 inflatable restraint sensing and diagnostic module.
    - **If less than 11 V**
9. Command the Passenger Airbag On Indictor On, with a scan tool.
10. Test for greater than 4 V between the control circuit terminal 2 and ground.
    - **If 4 V or less**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 inflatable restraint sensing and diagnostic module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in each control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 inflatable restraint sensing and diagnostic module.
    - **If greater than 4 V**
11. Test or replace the P14 Passenger Air Bag Disable Indicator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Control Module References** for device replacement, programming and setup.

DTC B1001 (INFLATABLE RESTRAINT SENSING AND DIAGNOSTIC MODULE): OPTION CONFIGURATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category

DTC Descriptor

DTC B1001 00

Option Configuration

Circuit/System Description

The inflatable restraint sensing and diagnostic module stores a primary data key, which is a 4-digit number. When the ignition is turned ON, the inflatable restraint sensing and diagnostic module compares this information to the information stored in the body control module (BCM) via serial data. If there is a mismatch between the information stored in the inflatable restraint sensing and diagnostic module and body control module, DTC B1001 will set.

Conditions for Running the DTC

System voltage is between 9 - 16 V.

Conditions for Setting the DTC

The 4-digit Primary Data Key stored in the inflatable restraint sensing and diagnostic module does not match the 4 digits stored in the body control module.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG indicator.
- The inflatable restraint sensing and diagnostic module disables all deployments.

Conditions for Clearing the DTC

The last 4-digit Primary Data Key in the inflatable restraint sensing and diagnostic module matches the last 4 digits stored in the Body Control Module.

Diagnostic Aids

- This DTC is an indication that an incorrect inflatable restraint sensing and diagnostic module is installed in the vehicle, or that the inflatable restraint sensing and diagnostic module and/or the body control module was replaced without reprogramming the body control module with the new information.
- If the inflatable restraint sensing and diagnostic module was previously programmed and DTC B1001 is now set, the setup portion of program was not completed. Proceed to the inflatable restraint sensing and diagnostic module setup portion of the **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**

DTC B1001 (PASSENGER PRESENCE SYSTEM): OPTION CONFIGURATION ERROR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1001 00

Option Configuration Error

Circuit/System Description

The Inflatable Restraint Sensing and Diagnostic Module (SDM) stores a 4-digit primary key for the Passenger Presence Module. The Inflatable Restraint Sensing and Diagnostic Module sends the Passenger Presence Module the primary key. If the Passenger Presence Module determines that it is the wrong primary key, the Passenger Presence Module will set DTC B1001 and send the Inflatable Restraint Sensing and Diagnostic Module a vehicle mismatch message. The Inflatable Restraint Sensing and Diagnostic Module then will set DTC B0081 and illuminate the SIR warning indicator. The Passenger Presence Module does not use a secondary key.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 volts.

Conditions for Setting the DTC

The 4-digit primary key stored in the Inflatable Restraint Sensing and Diagnostic Module does not match the 4-digit key stored in the Passenger Presence Module.

Action Taken When the DTC Sets

- The Inflatable Restraint Sensing and Diagnostic Module requests the instrument panel cluster to illuminate the AIR BAG indicator.
- The passenger instrument panel air bag deployment is disabled.

Conditions for Clearing the DTC

The 4-digit Primary Key in the Inflatable Restraint Sensing and Diagnostic Module and in the Passenger Presence Module match.

Diagnostic Aids

This DTC is an indication that the passenger presence system module was not set-up correctly, is not the correct part number or that the Passenger Presence Module is defective.

Circuit/System Verification

NOTE: **When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.**

- **Passenger Presence Module**
- **Passenger Presence Module wiring harness**

1. Verify the correct K85 Passenger Presence Module part number has been installed
    - **If the K85 Passenger Presence Module installed has an incorrect part number**

      Replace the K85 Passenger Presence Module.

    - **If the K85 Passenger Presence Module installed has a correct part number**
2. Verify that DTC B1001 is not set as current in the K85 Passenger Presence Module.
    - **If DTC is set as current. If Inflatable Restraint Sensing and Diagnostic Module part number is correct**
    1. Verify the Inflatable Restraint Sensing and Diagnostic Module part number is correct.
        - If the K36 Inflatable Restraint Sensing and Diagnostic Module part number is incorrect, replace the K36 Inflatable Restraint Sensing and Diagnostic Module
        - If the K36 Inflatable Restraint Sensing and Diagnostic Module part number is correct
    2. Replace the K85 Passenger Presence Module
    - **If the DTC is no set as current**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

Control Module References for K85 Passenger Presence Module and K36 Inflatable Restraint Sensing and Diagnostic Module replacement, setup, and programming

DTC B1019: SYSTEM CONFIGURATION ERROR

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1019 00

System Configuration Error

Circuit/System Description

The inflatable restraint sensing and diagnostic module monitors the number of safety components installed on the vehicle. When the ignition is turned ON, the inflatable restraint sensing and diagnostic module evaluates the number of safety components installed and compares it to the number of components the inflatable restraint sensing and diagnostic module expects to see on the vehicle with its current calibration. If there is a mismatch between detected components and the components programmed with the inflatable restraint sensing and diagnostic module calibration, DTC B1019 will set. The components (if equipped) that the inflatable restraint sensing and diagnostic module will detect include inflatable restraint deployment loops, impact sensors, passenger presence system components, seat position sensors, disable switches, and seat belt switches.

Conditions for Running the DTC

Ignition voltage is between 9 - 16 V.

Conditions for Setting the DTC

The setup for the inflatable restraint sensing and diagnostic module has not been completed and the inflatable restraint sensing and diagnostic module does not detect the passenger presence system (if equipped), the correct number of sensors, or deployment loops, that is expected with this calibration.

Action Taken When the DTC Sets

- The inflatable restraint sensing and diagnostic module requests the instrument cluster to illuminate the AIR BAG warning indicator.
- The DTC must be cleared before running the setup inflatable restraint sensing and diagnostic module.
- Air bag indicator will continue to flash until inflatable restraint sensing and diagnostic module setup procedure is complete.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 100 malfunction-free ignition cycles have occurred.

Diagnostic Aids

The inflatable restraint sensing and diagnostic module scan tool deployment loop, impact sensor, and passenger presence (if equipped) data will match what the inflatable restraint sensing and diagnostic module has been programmed to expect to see on the vehicle. B1019 DTC will set if a deployment loop or impact sensor is added or removed from the system, or if the passenger presence is not detected.

DTC B1019 will set when an open/high resistance DTC sets for a deployment loop or impact sensor. This causes mismatch between the learned and actual components connected to the inflatable restraint sensing and diagnostic module.

DTC B1019 can set with no other DTCs if an unused deployment loop or impact sensor circuit is shorted to ground. This causes a mismatch between the learned and actual components connected to the inflatable restraint sensing and diagnostic module.

Control Module References for scan tool information

Circuit/System Verification

NOTE: **DTC B1019 can set after the inflatable restraint sensing and diagnostic module has been replaced and/or reprogrammed before the setup procedure is completed. The setup procedure cannot be completed if DTC B1019 is set as current or history. If a short or open is detected in a deployment circuit prior to the setup procedure being performed, the inflatable restraint sensing and diagnostic module will set DTC B1019.**

1. Ignition ON.
2. Verify no other K36 Inflatable Restraint Sensing and Diagnostic Module DTCs are set.
   - **If other K36 Inflatable Restraint Sensing and Diagnostic Module DTCs are set**

     Diagnose those DTCs first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

   - **If no other K36 Inflatable Restraint Sensing and Diagnostic Module DTCs are set**
3. Verify the enabled impact sensors identified in the scan tool data list match the number of actual impact sensors installed on the vehicle.
   - **If the number of enabled impact sensors do not match**
   1. Verify the correct K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is loaded in the K36 Inflatable Restraint Sensing and Diagnostic Module.
      - If the K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is correct and the vehicle contains an incorrect number of sensors, identify which sensors are missing to make the vehicle match the K36 Inflatable Restraint Sensing and Diagnostic Module impact sensor calibration scan tool data list.
      - If the calibration file is incorrect
   2. Reprogram the K36 Inflatable Restraint Sensing and Diagnostic Module. Refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**
   - **If the number of enabled impact sensors match**
4. Verify the enabled deployment loops identified in the scan tool data list match the deployment loops installed on the vehicle.
   - **If the number of enabled deployment loops do not match**
   1. Verify the correct K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is loaded in the K36 Inflatable Restraint Sensing and Diagnostic Module.
      - If the K36 Inflatable Restraint Sensing and Diagnostic Module calibration file is correct and the vehicle contains an incorrect number of loops, identify which deployment loops are missing to make the vehicle match the K36 Inflatable Restraint Sensing and Diagnostic Module impact sensor calibration scan tool data list.
      - If the calibration file is incorrect

   2. Program the K36 Inflatable Restraint Sensing and Diagnostic Module. Refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**
   - **If the number of enabled deployment loops match**
5. Verify a passenger presence system is equipped on the vehicle.
   - **If a passenger presence system is not equipped on the vehicle**

     Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

   - **If a passenger presence system is equipped on the vehicle**
6. Verify the scan tool Passenger Presence System Enable Status parameter is Enabled.
   - **If the Passenger Presence System Enable Status parameter is not Enabled**

     Refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**

   - **If the Passenger Presence System parameter is Enabled**
7. Verify the scan tool Passenger Presence System Learn Status parameter is Learned.
   - **If the Passenger Presence System Learn Status parameter is not Learned**
   1. Ignition OFF, disconnect the scan tool. It may take up to 2 min for all vehicle systems to power down. Ignition ON.
   2. Verify DTC B1019 is not set as current.
      - If the DTC is set as current, refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup**
      - If the DTC is not set as current
   3. All OK.
   - **If the Passenger Presence System Learn status is Learned**
8. Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **SIR/SRS Wiring Repairs**
- **Control Module References** for inflatable restraint sensing and diagnostic module replacement, programming and setup

PASSENGER PRESENCE SYSTEM REZEROING

Introduction

The inflatable restraints passenger presence system is a calibrated system that requires re-zeroing or a zero check anytime the seat cushion trim attachments have been removed or the passenger presence system has been replaced. The procedures below are designed to assist in the re-zeroing of the passenger presence system. Before you start, read these procedures carefully and completely. For further information regarding the passenger presence system refer to **Supplemental Inflatable Restraint System Description and Operation**.

NOTE: **The following procedures must be followed:**

1. Read this procedure carefully and completely.
2. The passenger presence system will not function properly if the passenger presence system re-zeroing procedure is not performed.
3. Perform the **Diagnostic Repair Verification** after successfully completing the re-zeroing procedure to ensure the system is functioning properly.

Passenger Presence System Re-zeroing Procedure

NOTE:

- **Before the passenger presence system can be re-zeroed the front passenger seat must be completely empty of all items. The presence**

of any liquid or items on the front passenger seat will affect the calibration and operation of the passenger presence system.

- **DTC B0081 will set if the re-zero system test is performed with:**
    - **An aftermarket seat heater located too close to the sensor mat**
    - **A scan tool, laptop, or other electronic device is in the seat**
    - **The seat is damp or wet**
    - **An object or person is in the seat**

1. Verify that the temperature is between 32Ã‚Â°F (0Ã‚Â°C) to 100Ã‚Â°F (38 Ã‚Â°C) before running a re-zero procedure.
2. Verify the seat is completely dry.
3. Empty the front outboard passenger seat.
4. Verify that all SIR and passenger presence system components, connectors, and connector position assurances are properly connected and mounted.
5. Install a scan tool.
6. Ignition - On / Vehicle - In Service Mode

NOTE: **The presence of current DTCs, except DTC B0081 11 or B0081 4B, will prevent the passenger presence system from re-zeroing and may set additional DTCs.**

7. With a scan tool, perform the Passenger Presence Sensor Learn procedure.
8. If the test fails, confirm that the seat is empty and completely dry. Perform the Passenger Presence Sensor Learn test again. If the test fails again, verify DTC B0081 is not set as current, if the DTC is set refer to **Diagnostic Trouble Code (DTC) List - Vehicle** . If the test successfully completed, cycle the ignition OFF.
9. After the passenger presence system has been successfully re-zeroed, perform the **Diagnostic Repair Verification** .

SYMPTOMS - SIR

NOTE: **Complete the following steps before using the symptom tables:**

1. **Perform Diagnostic System Check - Vehicle before using the symptom tables in order to verify that all of the following are true:**
    - **There are no DTCs set.**
    - **The inflatable restraint sensing and diagnostic module (SDM) can communicate via the serial data link.**
2. **Review the SIR system description and operation in order to familiarize yourself with the system functions. Refer to Supplemental Inflatable Restraint System Description and Operation.**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the SIR system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Airbag Indicator Malfunction (Driver)Airbag Indicator Malfunction (Passenger)** in order to diagnose the symptom.

AIRBAG INDICATOR MALFUNCTION (DRIVER)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When the ignition is turned ON the driver air bag indicator will illuminate, and then turn OFF after the bulb check is complete. The inflatable restraint sensing and diagnostic module (SDM) performs diagnostic tests on the SIR system during the bulb check. If any malfunction exists the inflatable restraint sensing and diagnostic module will request the instrument cluster to illuminate the air bag indicator steady, via serial data. If a preexisting malfunction exists, the air bag indicator will illuminate steady immediately after the ignition is turned ON. If the ignition 1 voltage is outside of the normal operating voltage range of 9 - 16 V, the inflatable restraint sensing and diagnostic module will command the instrument cluster to illuminate the air bag indicator ON, even with no DTCs present, and then disable all deployment loops.

Diagnostic Aids

- A DTC B1370 may set if the ignition 1 circuit is outside the 9 - 16 V range.
- A flashing driver air bag indicator is displayed if the inflatable restraint sensing and diagnostic module was programmed but did not fully complete the programming. For a flashing driver airbag indicator, refer to **Inflatable Restraint Sensing and Diagnostic Module Programming and Setup** .

Circuit/System Verification

1. Verify the air bag indicator turns ON and OFF when commanding the All Indicators ON and OFF with a scan tool.
   - **If the air bag indicator does not turn ON or OFF**

     Replace the P16 Instrument Cluster.

   - **If the air bag indicator does turn ON or OFF**

2. Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **SIR/SRS Wiring Repairs**
- **Control Module References** for instrument cluster or inflatable restraint sensing and diagnostic module replacement, programming and setup

AIRBAG INDICATOR MALFUNCTION (PASSENGER)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Passenger Air Bag OFF Indicator Control	2	2*	4	-
Passenger Air Bag ON Indicator Control	3	3*	5	-
Passenger Air Bag Disable Indicator Ground	-	1	1	-
1. Both indicators always OFF 2. The OFF indicator will not illuminate 3. The ON indicator will not illuminate 4. The OFF indictor always ON 5. The ON indicator always ON * High resistance may cause the appropriate indicator to illuminate less bright than normal				

Circuit/System Description

The passenger air bag ON/OFF indicators are used to notify the driver when the passenger presence system has enabled or disabled the passenger instrument panel air bag. When the ignition is turned ON, the ignition voltage is supplied to the passenger presence module. When the Inflatable Restraint Sensing and Diagnostic Module (SDM) receives the appropriate serial data message from the passenger presence module the SDM will then provide voltage to the appropriate indicator.

Circuit/System Verification

NOTE: The passenger air bag ON and OFF indicators may not operate as expected if there are supplemental inflatable restraint (SIR) DTCs. Repair all SIR DTCs before proceeding with this diagnostic.

1. Ignition On/Vehicle in Service Mode.
2. Verify the passenger air bag ON indicator turns ON and OFF when commanding the Passenger Air Bag ON Indicator ON and OFF with a scan tool.
   - **If the air bag ON indicator does not turn ON or OFF**

     Refer to Circuit/System Testing.
   - **If the air bag ON indicator turns ON or OFF**
3. Verify the passenger air bag OFF indicator turns ON and OFF when commanding the Passenger Air Bag OFF Indicator ON and OFF with a scan tool.
   - **If the air bag OFF indicator does not turn ON or OFF**

     Refer to Circuit/System Testing.
   - **If the air bag OFF indicator turns ON or OFF**
4. All OK.

Circuit/System Testing

NOTE: When removing connectors inspect for damage or corrosion. Damage or corrosion in the following requires repair or replacement of the affected.

- **P14 Passenger Airbag Disabled Indicator**
- **P14 Passenger Airbag Disabled Indicator wiring harness.**

1. Ignition OFF, disconnect the harness connector at the P14 Passenger Airbag Disabled Indicator. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition On/Vehicle in Service Mode, command the passenger air bag OFF indicator OFF with a scan tool.
4. Test for less than 11 V between the control circuit terminal 3 and ground.
   - **If 11 V or greater**
   1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module, Ignition On/Vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If less than 11 V**

5. Command the passenger air bag OFF indicator ON with a scan tool.
6. Test for 1 V or greater between the control circuit terminal 3 and ground.
    - **If less than 1 V**
    1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If 1 V or greater**
7. Command the passenger air bag ON indicator OFF with a scan tool.
8. Test for less than 11 V between the control circuit terminal 2 and ground.
    - **If 11 V or greater**
    1. Ignition OFF, disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module. Ignition On/Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If less than 11 V**
9. Command the passenger air bag ON indicator ON with a scan tool.
10. Test for 1 V or greater between the control circuit terminal 2 and ground.
    - **If less than 1 V**
    1. Disconnect the X1 harness connector at the K36 Inflatable Restraint Sensing and Diagnostic Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
    - **If 1 V or greater**
11. Test or replace the P14 Passenger Airbag Disabled Indicator.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Instrument Panel Airbag Arming Status Display Replacement for P14 Passenger Air Bag Disable Indicator replacement
- Control Module References for device replacement, programming and setup

SIR DISABLING AND ENABLING

SIR component location affects how a vehicle should be serviced. There are parts of the SIR system installed in various locations around a vehicle. To find the location of the SIR components refer to Supplemental Inflatable Restraint System Description and Operation.

There are several reasons for disabling the SIR system, such as repairs to the SIR system or servicing a component near or attached to an SIR component. There are several ways to disable the SIR system depending on what type of service is being performed. The following information covers the proper procedures for disabling/enabling the SIR system.

Condition	Action
If the vehicle was involved in an accident with an air bag deployment.	Disconnect the negative battery cable(s) *. Refer to **Repairs and Inspections Required After a Collision**.
When performing SIR diagnostics.	Follow the appropriate SIR service manual diagnostic procedure(s) *
When moving, removing or replacing an SIR component or a component attached to an SIR component. (Anytime you remove fasteners.)	Disconnect the negative battery cable(s) *
If the vehicle is suspected of having shorted electrical wires.	Disconnect the negative battery cable(s) *
When performing electrical diagnosis on components other than the SIR system.	Remove the SIR/Airbag fuse(s) when indicated by the diagnostic procedure to disable the SIR system
* DTC's may be lost when the negative battery cable is disconnected.	

SIR Service Precautions

WARNING: **When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Failure to observe the correct procedure could cause deployment of the SIR components. Serious injury can occur. Failure to observe the correct procedure could also result in unnecessary SIR system repairs.**

The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the air bags if the Inflatable Restraint Sensing and Diagnostic Module loses battery power during a collision. Deployment power is available for as much as 2 minutes after disconnecting the vehicle power. Waiting 2 minutes before working on the system after disabling the SIR system prevents deployment of the air bags from the reserved energy supply.

General Service Instructions

The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:

- Do not expose air bags to temperatures above 85Ã,Â°C (185Ã,Â°F).
- Verify the correct replacement part number. Do not substitute a component from a different vehicle.
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system.

Discard any of the following components if it has been dropped from a height of 80 cm (31.5 Inches) or greater:

- Inflatable Restraint Sensing and Diagnostic Module (SDM)
- Any air bag
- Driver steering wheel air bag coil
- Any impact sensor
- Seat belt anchor and/or retractor pretensioners
- Passenger presence module and/or occupant sensor

Disabling Procedure - Air Bag Fuse

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Place the ignition in the OFF position.

> **WARNING:** **The SDM may have more than one fused power input. To ensure there is no unwanted SIR deployment, personal injury, or unnecessary SIR system repairs, remove all fuses supplying power to the SDM. With all SDM fuses removed and the ignition switch in the ON position, the AIR**

BAG warning indicator illuminates. This is normal operation, and does not indicate a SIR system malfunction.

3. Locate and remove the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to **SIR Schematics**, or **Electrical Center Identification Views** .
4. Wait 2 minutes before working on the system.

Enabling Procedure - Air Bag Fuse

1. Place the ignition in the OFF position.
2. Install the fuse(s) supplying power to the Inflatable Restraint Sensing and Diagnostic Module. Refer to **SIR Schematics**, or **Electrical Center Identification Views** .
3. Turn the ignition switch to the ON position. The AIR BAG indicator will illuminate or flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to **Diagnostic System Check - Vehicle** .

Disabling Procedure - Negative Battery Cable

1. Turn the steering wheel so that the vehicles wheels are pointing straight ahead.
2. Place the ignition in the OFF position.
3. Disconnect the negative battery cable from the battery. Refer to **Battery Negative Cable Disconnection and Connection** .
4. Wait 2 minutes before working on system.

Enabling Procedure - Negative Battery Cable

1. Place the ignition in the OFF position.
2. Connect the negative battery cable to the battery. Refer to **Battery Negative Cable Disconnection and Connection** .
3. Turn the ignition switch to the ON position. The AIR BAG indicator will illuminate or flash then turn OFF.
4. Perform the Diagnostic System Check - Vehicle if the AIR BAG warning indicator does not operate as described. Refer to **Diagnostic System Check - Vehicle** .

REPAIR INSTRUCTIONS

SIR SERVICE PRECAUTIONS

General Service Instructions

WARNING: **If a service procedure indicates that a module is to be replaced, a new production unit MUST be ordered from the GM Parts Catalog or certified supplier. Using a module that has been reset by a 3rd party company is strictly prohibited. Not using a new production unit may result in improper performance of the safety system in the event of an accident, which may result in bodily injury.**

WARNING: **When performing service on or near the SIR components or the SIR wiring, the SIR system must be disabled. Refer to SIR Disabling and Enabling. Failure to observe the correct procedure could cause deployment of the SIR components, personal injury, or unnecessary SIR system repairs.**

WARNING: **Do not strike or jolt the inflatable restraint sensing and diagnostic module (SDM). Before applying power to the SDM, make sure that it is securely fastened with the arrow facing toward the front of the vehicle. Failure to observe the correct installation procedure could cause SIR deployment, personal injury, or unnecessary SIR system repairs.**

NOTE: **The Inflatable Restraint Sensing and Diagnostic Module (SDM) maintains a reserved energy supply. The reserved energy supply provides deployment power for the SIR air bags. Deployment power may be available for up to 2 minutes after disconnecting the vehicle power. Disabling the SIR system prevents deployment of the SIR air bags from the reserved energy supply.**

NOTE: **The following are general service instructions which must be followed in order to properly repair the vehicle and return it to its original integrity:**

- Do not expose air bags to temperatures above 85 Ã,Â°C (185 Ã,Â°F)
- Verify the correct replacement part number. Do not substitute a component from a different vehicle
- Use only original GM replacement parts available from your authorized GM dealer. Do not use salvaged parts for repairs to the SIR system

NOTE: **Discard any of the following components if it has been dropped from a height of 80 cm (31.49 in) or greater:**

- Inflatable Restraint Sensing and Diagnostic Module
- Passenger instrument panel air bag
- Driver steering wheel air bag
- Driver steering wheel air bag coil
- Roof rail air bags
- Front and /or side impact sensors
- Seat belt achor and/or retractor pretensioners
- Front seat side air bag
- Knee air bag

11. Insert a small flathead screwdriver on the back of the steering wheel.
12. Push the screwdriver down like an arrow as shown in the picture while pulling the airbag module.

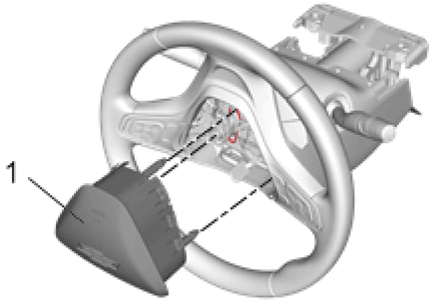

Fig. 16: Airbag Steering Wheel Module
Courtesy of GENERAL MOTORS COMPANY

13. Disconnect the electrical connectors.
14. Remove the airbag steering wheel module (1).

Installation Procedure

1. Ensure that the retaining spring is properly installed.
2. Connect the electrical connectors.

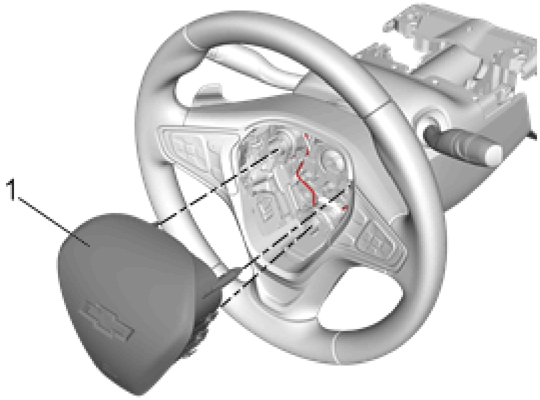

Fig. 17: Airbag Steering Wheel Module
Courtesy of GENERAL MOTORS COMPANY

3. Align the steering wheel airbag fasteners to the steering column fastener holes.

WARNING: **After installation of the steering wheel airbag module to the steering wheel, slightly pull the module outward. If there is no give on the airbag module then it is secured correctly. If the airbag module is not fully attached personal injury could result.**

4. Push the airbag steering wheel module (1) firmly into the steering column in order to engage the fasteners.

5. Enable the SIR system. SIR Disabling and Enabling
6. Inflatable Restraint Module Handling and Scrapping

STEERING WHEEL AIRBAG COIL REPLACEMENT

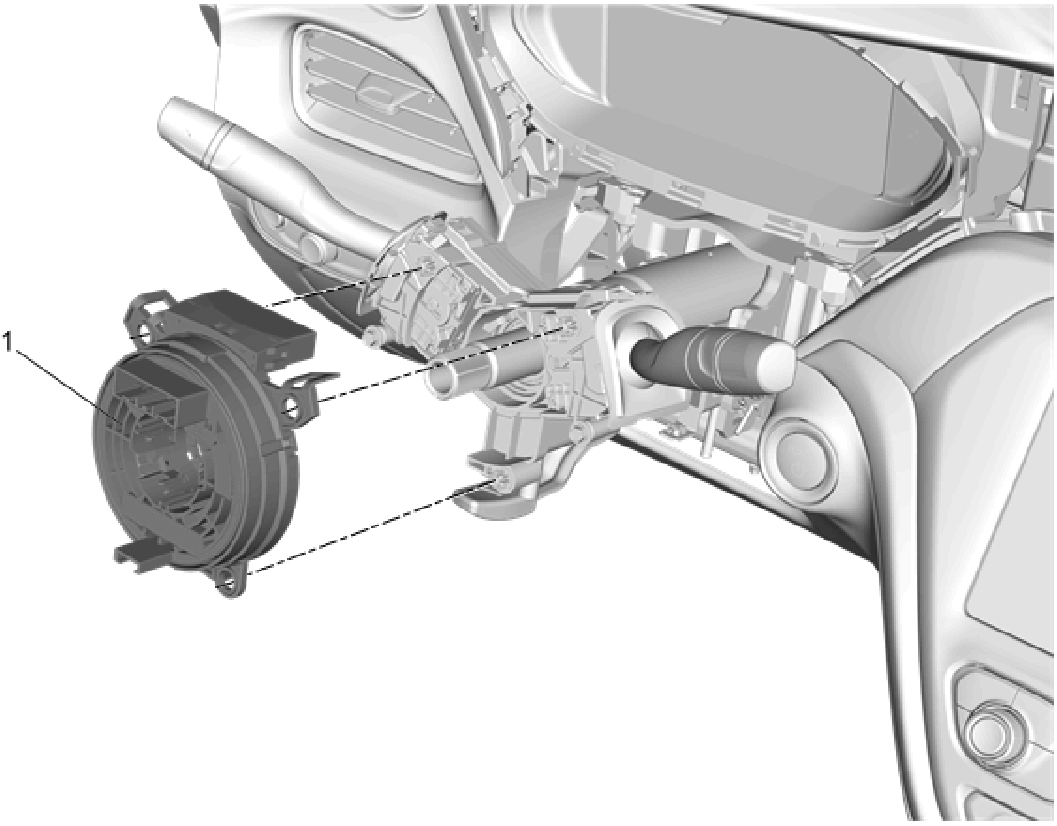

Fig. 18: Steering Wheel Airbag Coil
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Steering Wheel Replacement 2. Steering Column Lower Trim Cover Replacement 3. Reposition the steering column upper trim cover as necessary.	
1	Steering Wheel Airbag Coil **Procedure** 1. Disconnect the electrical connectors. 2. Release the retaining tabs and remove the steering wheel airbag coil from the steering column. 3. Ensure the steering wheel airbag coil is CENTERED during installation. Airbag Steering Wheel Module Coil Centering

AIRBAG STEERING WHEEL MODULE COIL CENTERING

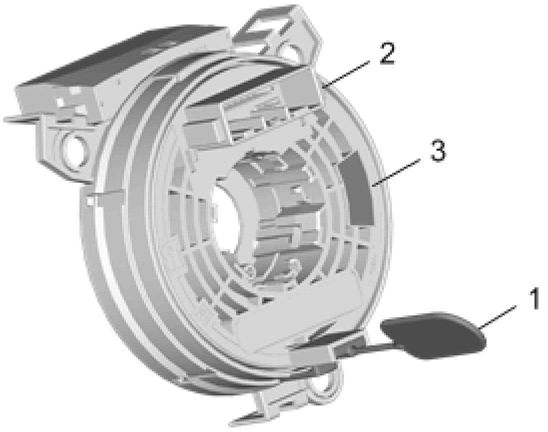

Fig. 19: Steering Wheel Airbag Coil
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **The new SIR coil assembly will be centered. Improper alignment of the SIR coil assembly may damage the unit, causing an inflatable restraint malfunction.**

1. Inspect the steering wheel airbag coil. If the yellow lock pin (1) is present, the uplead post (2) is at the 12 o'clock position and the loop (u-turn) appears in the centering window (3) then the coil is already in the centered position and no further action is required.

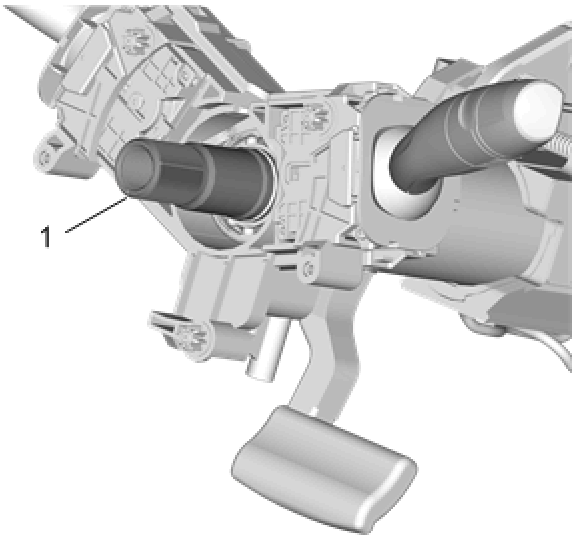

Fig. 20: Block Tooth
Courtesy of GENERAL MOTORS COMPANY

2. If the steering wheel airbag coil needs to be centered, perform the following preliminary steps:
    1. Ensure the wheels on the vehicle are straight ahead.
    2. Ensure the block tooth (1) on the steering shaft is in the 6 o'clock position.

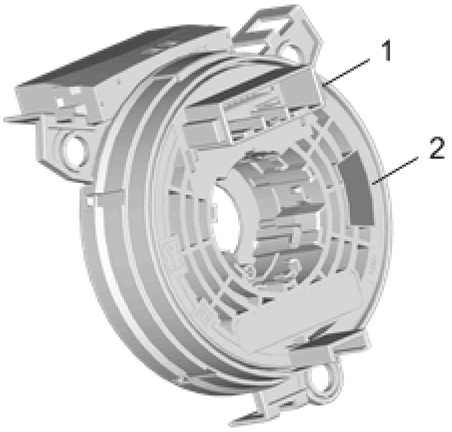

Fig. 21: Centering Steering Wheel Airbag Coil
Courtesy of GENERAL MOTORS COMPANY

3. To center the steering wheel airbag coil, perform the following steps:
    1. Hold the coil with the face up.
    2. Slowly rotate the coil hub clockwise until the coil ribbon stops.
    3. Slowly rotate the coil hub counterclockwise 3 turns until the uplead post (1) is at the 12 o'clock position.
    4. View the centering window (2) and ensure the orange loop (u-turn) is visible. If the loop is visible then the coil is in the center position.
    5. While holding the coil hub in the center position, align the coil with the steering column components and slide the coil onto the steering shaft.

FRONT AND REAR ROW SEAT ROOF RAIL AIRBAG REPLACEMENT

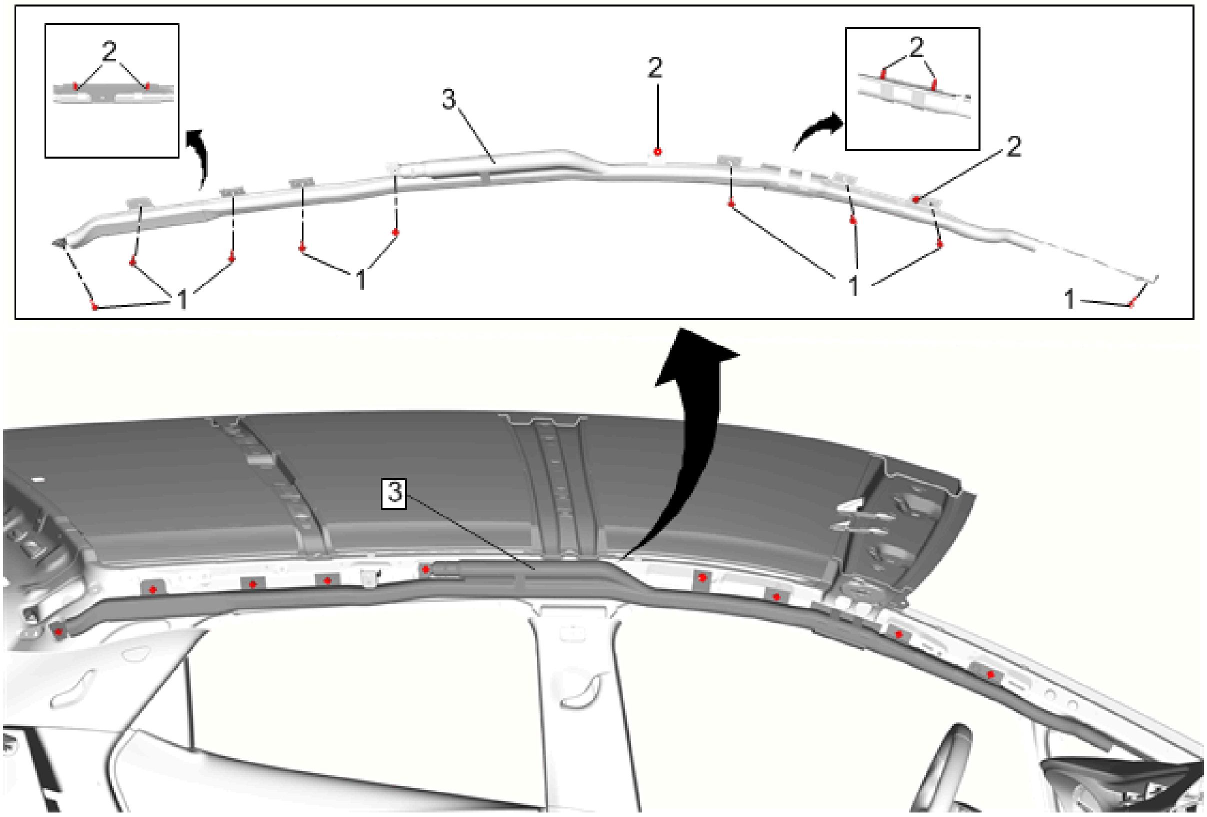

Fig. 26: Front and Rear Row Seat Roof Rail Airbag
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
WARNING: **Refer to SIR Warning .** **WARNING:** **Refer to SIR Inflator Module Handling and Storage Warning .** **Preliminary Procedures** 1. Disable the SIR system. **SIR Disabling and Enabling** 2. It is only necessary to lower the headliner. Only do those steps in headliner replacement that will lower the headliner enough to gain access to the part. **Headlining Trim Panel Replacement**	
1	Front and Rear Row Seat Roof Rail Airbag Fastener (Qty: 9) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in) **Procedure** Disconnect the electrical connector.
2	Front and Rear Row Seat Roof Rail Airbag Retainer (Qty: 6)
3	Front and Rear Row Seat Roof Rail Airbag **Procedure** 1. Remove the roof side rail inflatable restraint module from the vehicle. 2. If the airbag is being replaced, prepare the old airbag for disposal. **Inflatable Restraint Module Handling and Scrapping** 3. Enable the SIR System. **SIR Disabling and Enabling**

FRONT SEAT OUTBOARD SEAT BACK AIRBAG REPLACEMENT

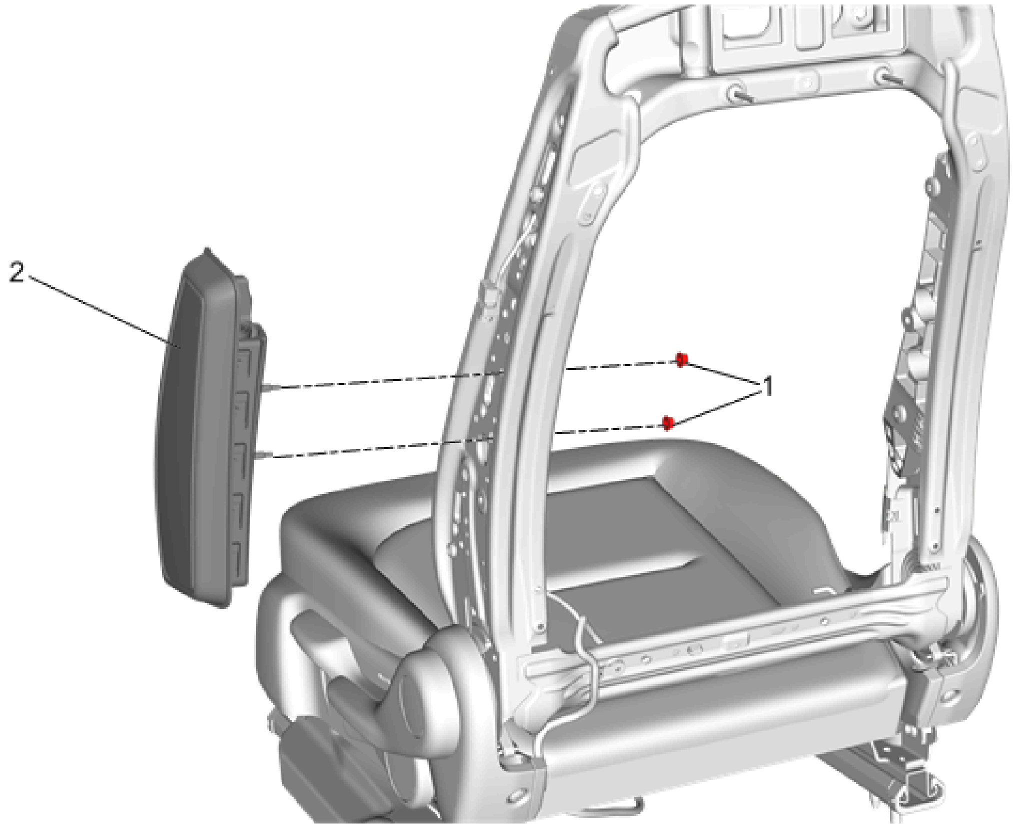

Fig. 27: Front Seat Outboard Seat Back Airbag
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
	WARNING: **Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary:** - **The seat cushion frame** - **The seat recliner, if equipped** - **The seat adjuster** - **The seat back frame** **Failure to do so may cause future personal injury.** **Preliminary Procedure** Front Seat Back Cushion Latch Finish Cover Replacement (Back Panel) Front Seat Back Cushion Latch Finish Cover Replacement (Front Panel)
1	Front Seat Outboard Seat Back Airbag Nut (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 3.5 N.m (31 lb in)
2	Front Seat Outboard Seat Back Airbag **Procedure** 1. Remove the connector position assurance (CPA) from the module electrical connector. 2. Disconnect the electrical connector. 3. Inflatable Restraint Module Handling and Scrapping

REAR SEAT BOLSTER AIRBAG REPLACEMENT

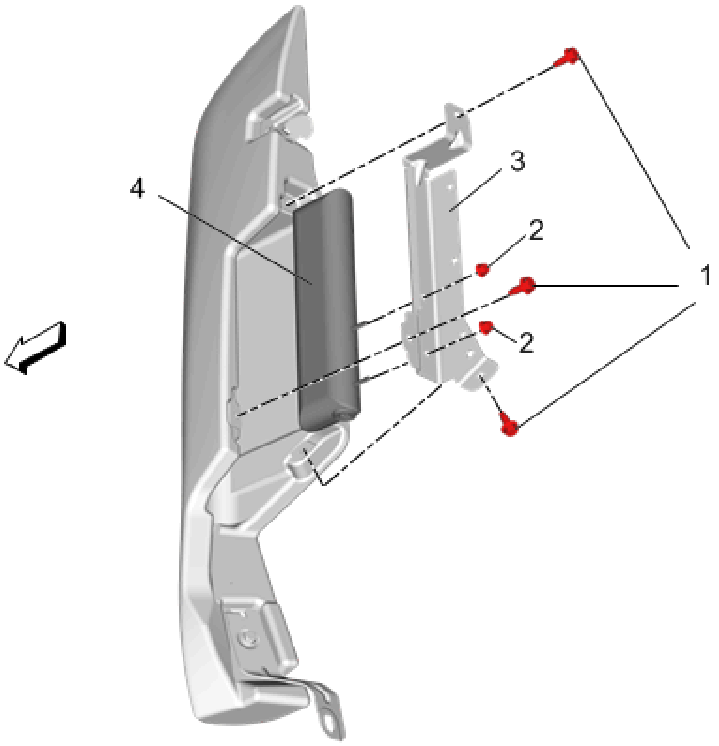

Fig. 28: Rear Seat Bolster Airbag
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **WARNING:** **Following the deployment of a rear seat side air bag, inspect the following parts for damage. Replace these parts if necessary:** • **The rear seat side bolster, attachments, brackets and wiring** • **The rear seat back frame, cushion and cover** • **The rear seat cushion frame, cushion and cover** **Failure to do so may cause future personal injury.** **Preliminary Procedure** Rear Seat Back Bolster Replacement	
1	Rear Seat Bolster Airbag Bracket Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 3.25 N.m (29 lb in)
2	Rear Seat Bolster Airbag Nut (Qty: 2) **Tighten** 3.25 N.m (29 lb in)
3	Rear Seat Bolster Airbag Bracket **Procedure** Reposition the bracket only and leave log rings attached.
4	Rear Seat Bolster Airbag **Procedure** Inflatable Restraint Module Handling and Scrapping

AIRBAG SIDE IMPACT CENTER PILLAR SENSOR REPLACEMENT (WITH AY0)

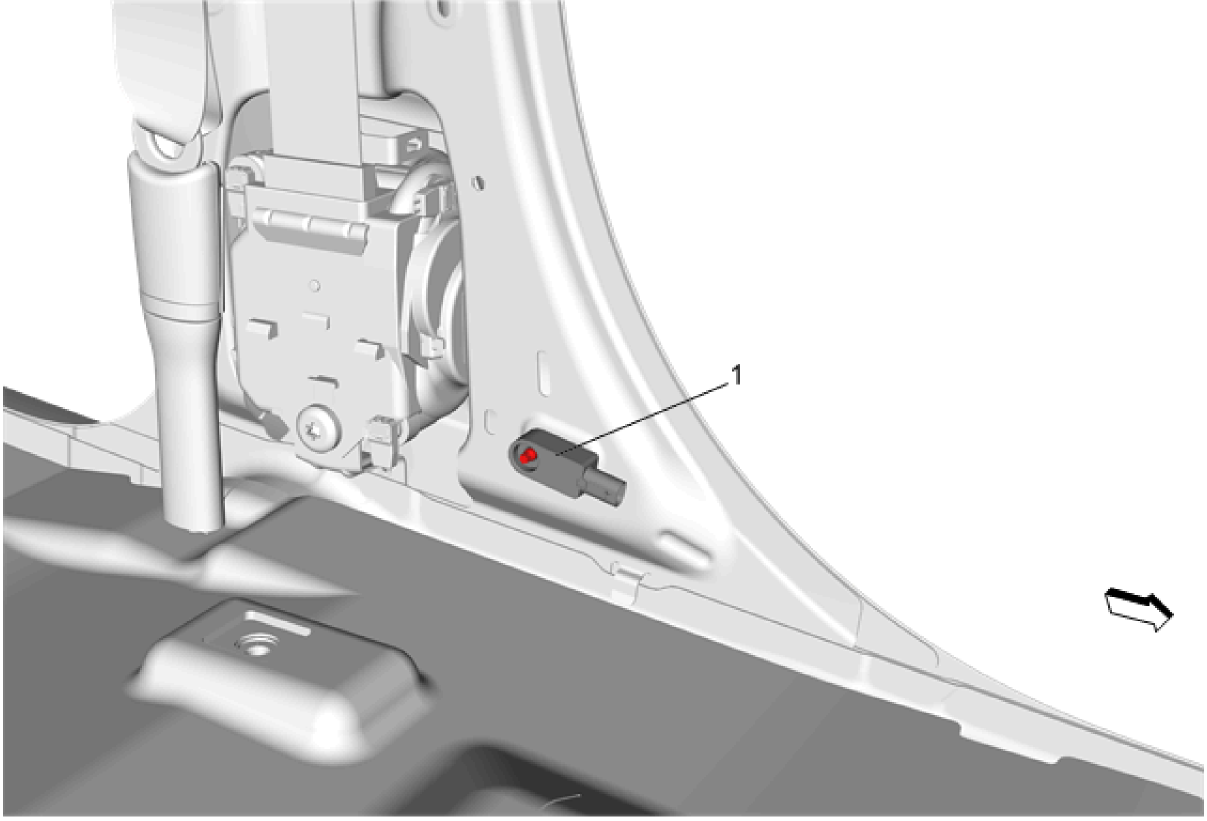

Fig. 29: Airbag Side Impact Center Pillar Sensor (with AY0)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **WARNING:** **Refer to SIR Inflator Module Handling and Storage Warning .** **WARNING:** **Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary:** • **The seat cushion frame** • **The seat recliner, if equipped** • **The seat adjuster** • **The seat back frame** **Failure to do so may cause future personal injury.** **Preliminary Procedures** 1. Disable the SIR system. SIR Disabling and Enabling 2. Remove the center pillar lower trim panel from side being worked on. Center Pillar Lower Trim Panel Replacement	

Callout	Component Name
1	Airbag Side Impact Center Pillar Sensor **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Disconnect the electrical connector. **NOTE:** **Integral sensor bolt uses left hand threads. Use counterclockwise rotation to loosen fastener at TORXÃ‚Â® tip end. If accessing at pan head end of the fastener, use clockwise rotation to loosen bolt.** 2. Loosen the fastener and slide the sensor out of the keyhole slot. 3. The bolts are integral to the sensor and DO NOT remove separately. 4. Enable the SIR System. SIR Disabling and Enabling **Tighten** 7.5 N.m (66 lb in)

AIRBAG SIDE IMPACT SENSOR REPLACEMENT - FRONT SIDE DOOR (WITH AYF)

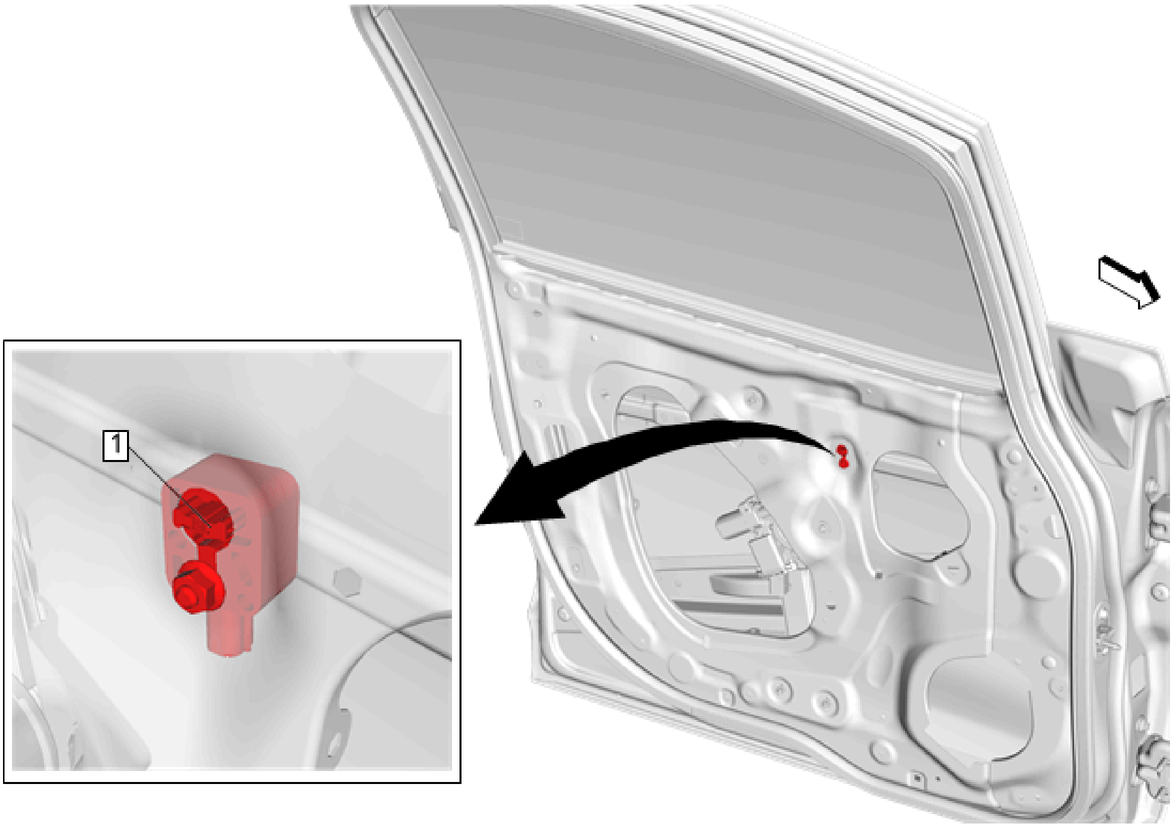

Fig. 30: Airbag Side Impact Sensor - Front Side Door (with AYF)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
	WARNING: **Refer to SIR Warning .** **WARNING:** **Following the deployment of a side impact air bag, inspect the following parts for damage. Replace these parts if necessary:** - **The seat cushion frame** - **The seat recliner, if equipped** - **The seat adjuster** - **The seat back frame** **Failure to do so may cause future personal injury.** **Preliminary Procedures** 1. Disable the SIR system. **SIR Disabling and Enabling** 2. **Front Side Door Trim Replacement** 3. For access to sensor detach the water deflector partly from front of door.
1	Airbag Side Impact Sensor **CAUTION:** **Refer to Fastener Caution .** **NOTE:** **The sensor is located on the inside of the front door inner panel.** **Procedure** 1. Loosen the fastener and slide the sensor out of the keyhole slot. 2. Disconnect the electrical connector. 3. The fastener is integral to the sensor, DO NOT remove separately. 4. Enable the SIR System. **SIR Disabling and Enabling** **Tighten** 7.5 N.m (66 lb in)

AIRBAG SIDE IMPACT REAR SENSOR REPLACEMENT (WITH AYF)

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **WARNING:** **Refer to SIR Inflator Module Handling and Storage Warning .** **Preliminary Procedures** 1. Disable the SIR system. SIR Disabling and Enabling 2. Center Pillar Lower Trim Panel Replacement	
1	Front Seat Belt Anchor Plate Tensioner Cover
2	Front Seat Belt Anchor Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 5 N.m (44 lb in)
3	Front Seat Belt Anchor Plate Tensioner Bolt **Procedure** Fold the edge of the floor panel carpet down and out of the way to access the bolt. **Tighten** 45 N.m (33 lb ft)
4	Front Seat Belt Anchor Plate Tensioner **Procedure** 1. Disengage the seat belt from the tensioner. 2. Disconnect the electrical connector. 3. Enable the SIR System. SIR Disabling and Enabling

REPAIRS AND INSPECTIONS REQUIRED AFTER A COLLISION

Accident With or Without Air Bag Deployment - Component Inspections

WARNING: **Proper operation of the Supplemental Inflatable Restraint (SIR) sensing system requires that any repairs to the vehicle structure return the vehicle structure to the original production configuration. Not properly repairing the vehicle structure could cause non-deployment of the air bag(s) in a frontal collision or deployment of the air bag(s) for conditions less severe than intended.**

After any collision, inspect the following components as indicated. If you detect any damage, replace the component. If you detect any damage to the mounting points or mounting hardware, repair the component or replace the hardware as needed.

NOTE: **Hybrid Vehicles Only - Perform an inspection of the high voltage system for damage. Refer to High Voltage System Inspection under the Hybrid/EV Controls repair section.**

- The steering column - Inspect the steering column for bending, twisting, buckling or any type of damage.

- The instrument panel knee bolsters and mounting points - Inspect the knee bolsters for bending, twisting, buckling, or any other type of damage.
- The instrument panel brackets, braces, etc. - Inspect for bending, twisting, buckling, or any other type of damage.
- The seat belts - Perform the seat belt operational and functional checks. Refer to **Repairs and Inspections Required After a Collision** .
- The instrument panel cross car beam - Inspect for bending, twisting, buckling, or any other type of damage.
- The instrument panel mounting points and brackets - Inspect for bending, twisting, buckling, or any other type of damage.
- The seats and seat mounting points - Inspect for bending, twisting, buckling, or any other type of damage.
- The roof and headliner mounting points.
- The brake pedal --Inspect the brake pedal for bending, twisting, buckling or any type of damage.

Accident With Frontal Air Bag Deployment - Component Replacement and Inspections

After a collision involving air bag deployment, replace the following components.

- Driver steering wheel air bag
- Passenger instrument panel air bag, if deployed
- Inflatable restraint sensing and diagnostic module (SDM), if SDM has DTC B0052 56
- Front and/or side impact sensors
- Driver/Passenger seat side air bag, if deployed
- Seat back cover if side seat air bag is deployed
- Driver/Passenger seat belt anchor and/or retractor pretensioners

Perform additional inspections on the following components.

- Steering wheel air bag coil and the coil wiring pigtail - Inspect for melting, scorching, or other damage due to excessive heat.
- Mounting points or mounting hardware for the passenger instrument panel air bag, steering wheel air bag, SDM, seat side air bag (if deployed) and seat belt anchor and/or retractor pretensioners - Inspect for any damage and repair or replace each component as needed.

Accident With Side Seat Air Bag Deployment - Component Replacement and Inspections

After a collision involving driver/passenger side seat air bag deployment, replace the following components.

- Left/right side impact sensors on the side of the impact.
- Left/right roof rail air bag on the side of the impact.
- Inflatable restraint sensing and diagnostic module (SDM), if SDM has DTC B0052 56.
- Inflatable restraint seat belt anchor and/or retractor pretensioner.
- Driver or passenger seat back cushion cover replacement.

WARNING: **Do not repair or replace the seat stitching or seams in the seat back trim cover with an internal mounted seat side airbag module. Replace the complete seat back trim cover from the OEM. Non-OEM seat stitching may cause improper airbag deployment which could result in personal injury.**

Perform additional inspections on the following components.

- Mounting points or mounting hardware for the side impact sensors, and driver/passenger side seat air bags on the side of impact - Inspect for any damage and repair or replace each component as needed.
- Mounting points, mounting hardware, headliner and trim pieces for the left/right roof rail air bag on the side of impact - Inspect for any damage and repair or replace each component as needed.

- Mounting points or mounting hardware for the SDM and seat belt anchor and/or retractor pretensioners - Inspect for any damage and repair or replace each component as needed.
- The seat cushion frame
- The seat recliner and cover, if equipped
- The seat adjuster
- The seat back frame
- Door trim assembly
- Impacted seat cushion side covers and switches

Accident With Seat Belt Pretensioner Deployment Only - Component Replacement and Inspections

After a collision involving driver/passenger Seat Belt Retractor or Anchor Pretensioner deployment, replace the following components.

- Driver and Passenger Inflatable restraint seat belt anchor pretensioner and/or retractor pretensioner
- Inflatable Restraint Sensing and Diagnostic Module (SDM), if the Inflatable Restraint Sensing and Diagnostic Module has set DTC B0052 and will not clear

Perform additional inspections for any damage and repair or replace each component as needed on the following components.

- Mounting points or mounting hardware for the Inflatable Restraint Sensing and Diagnostic Module
- Mounting points or mounting hardware for the Seat Belt Anchor Pretensioners
- Mounting points or mounting hardware for the Seat Belt Retractor Pretensioners

Impact Sensor Replacement Guidelines

The impact sensor replacement policy requires replacing sensors in the area of the accident damage. The area of accident damage is defined as the portion of the vehicle which is crushed, bent, or damaged due to a collision. An example of this would be a moderate collision where the front of the vehicle impacts a object. If the vehicle has an impact sensor mounted forward of the radiator, it must be replaced.

- Replace the impact sensor whether or not the air bags have deployed.
- Replace the impact sensor even if it appears to be undamaged.

Impact sensor damage which is not visible, such as slight bending of the mounting bracket or cuts in the wire insulation, can cause improper operation of the SIR system. Do not try to determine whether the impact sensor is undamaged, replace the impact sensor. Also, if you follow a diagnostic trouble code (DTC) procedure and a malfunctioning impact sensor is indicated, replace the impact sensor.

INFLATABLE RESTRAINT MODULE HANDLING AND SCRAPPING

Special Tools

- **EL-38826** SIR Deployment Harness
- **EL-39401-B** SIR Deployment Fixture

For equivalent regional tools, refer to Special Tools.

Live and Undeployed Air Bag

WARNING: **Refer to SIR Inflator Module Handling and Storage Warning .**

Take special care when handling or storing an undeployed air bag. An air bag deployment produces a rapid generation of gas. This may cause the air bag, or an object in front of the air bag, to project through the air in the event of an unlikely deployment.

Dual Stage Air Bags

Dual stage air bags have two deployment stages. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. Therefore, a deployed dual stage air bag must be treated as an active air bag. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.

Scrapping Procedure

During the course of a vehicle's useful life, certain situations may arise which will require the disposal of a live and undeployed air bag. Do NOT dispose a live and undeployed air bag through normal disposal channels until the air bag has been deployed.

Do not deploy the air bag in the following situations:

- After replacement of an air bag under warranty - the air bag may need to be returned undeployed to the manufacturer.
- If the vehicle is the subject of a product liability claim, related to the SIR system and is subject to a preliminary investigation - do NOT alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the air bags - follow the instructions in the campaign service bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: **Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.**

You can deploy the air bag either inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation:

Deployment Outside Vehicle - Steering Wheel Air Bag, Instrument Panel Air Bag, and Roof Rail Air Bag

Deploy the air bag outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the air bag is malfunctioning.
- The air bag is cosmetically damaged, scratched, or ripped.
- The air bag pigtail is damaged.
- The air bag connector is damaged.
- The air bag connector terminals are damaged.

Deployment and disposal of a malfunctioning air bag is subject to any required retention period.

WARNING: **Refer to SIR Inflator Module Disposal Warning .**

1. Turn OFF the ignition.

   WARNING: **Refer to SIR Inflator Module Handling and Storage Warning .**

2. Remove the air bag.

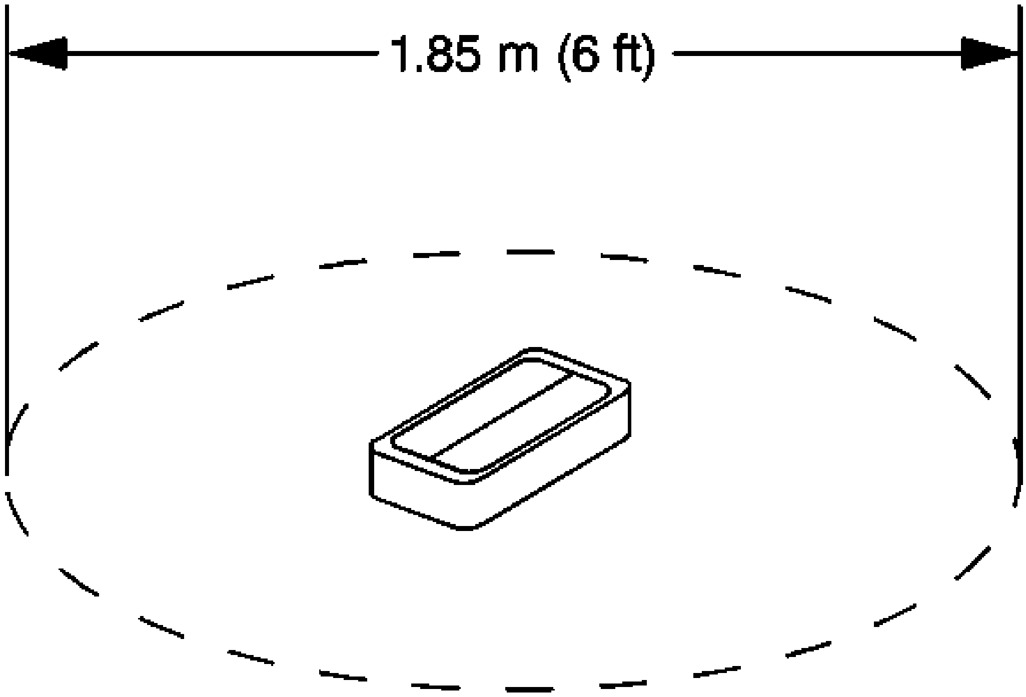

Fig. 35: Clearance For Deployment Of Inflator Module
Courtesy of GENERAL MOTORS COMPANY

3. Clear a space on the ground about 1.85 m (6 ft) in diameter for deployment of the air bag or deployment fixture. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Ensure you have sufficient ventilation.
4. Clear the area of loose or flammable objects.

NOTE: **Dual stage deployments are only used in steering wheel and instrument panel air bags. If stage 1 was used to deploy a dual stage air bag, stage 2 may still be active. If disposal of a dual stage air bag is required, both deployment loops must be energized to deploy the air bag.**

5. If you are deploying a steering wheel air bag, place the air bag in the center of the space with the vinyl trim cover facing up and away from the surface.

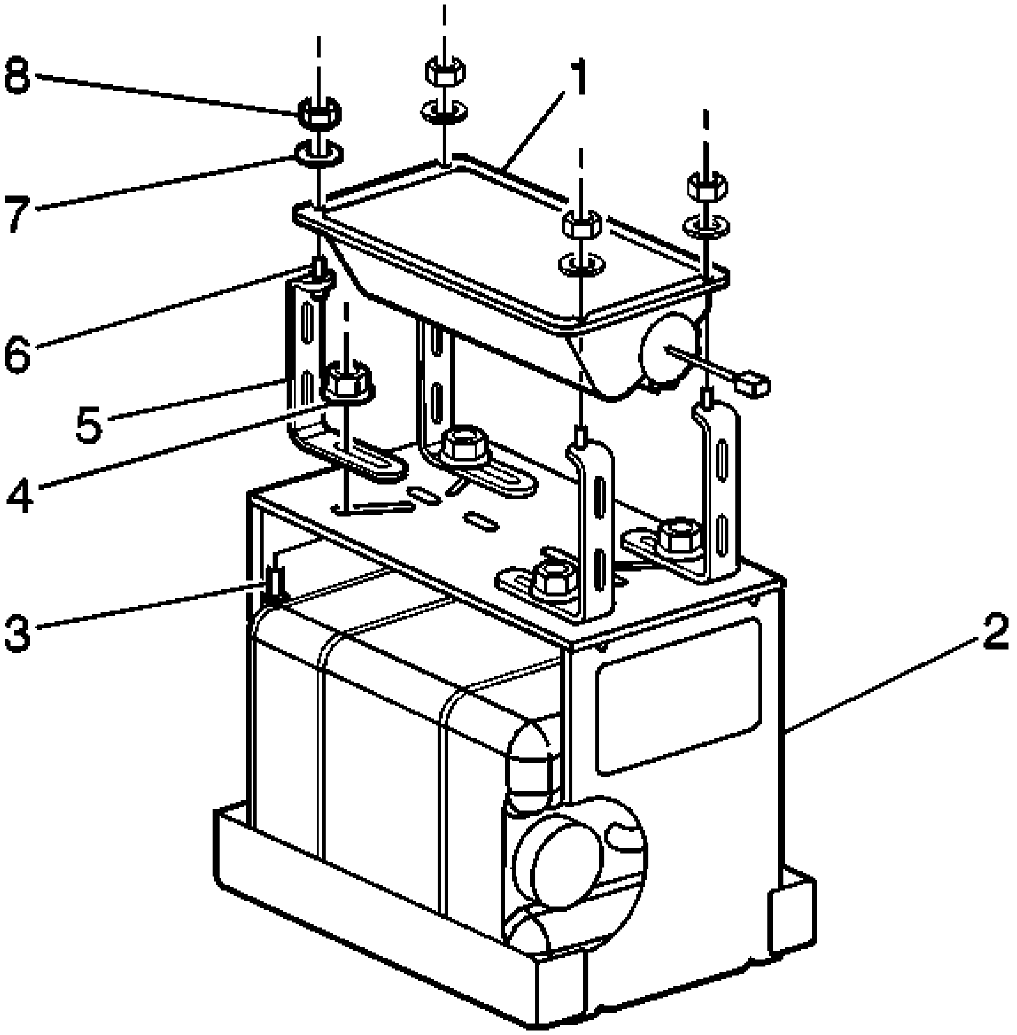

Fig. 36: I/P Module Components
Courtesy of GENERAL MOTORS COMPANY

6. When deploying an instrument panel air bag, perform the following instructions:
    1. Place the **EL-39401-B** fixture in the center of the cleared area.
    2. Fill the deployment fixture with water or sand.
    3. Using the proper nuts and bolts, mount the instrument panel air bag (1) to the deployment fixture (2), with the vinyl trim facing up.
    4. Securely tighten all fasteners that hold the instrument panel air bag (1) to the deployment fixture (2).

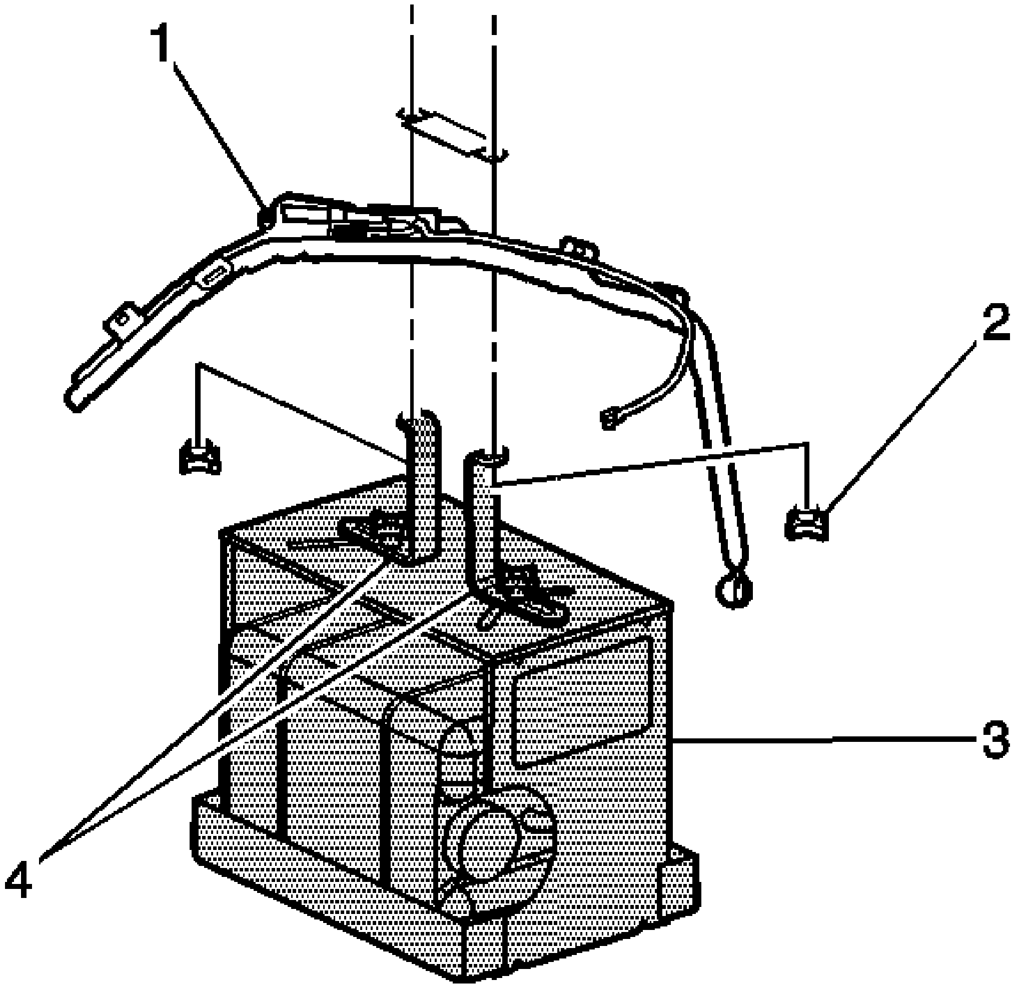

Fig. 37: Fasteners Holding Side Impact Module To Deployment Fixture
Courtesy of GENERAL MOTORS COMPANY

7. When deploying a roof rail air bag, perform the following instructions:
    1. Place the **EL-39401-B** fixture (3) in the center of the cleared area.
    2. Fill the deployment fixture with water or sand to provide sufficient stabilization of fixture during deployment.
    3. Adjust and secure the fixture arms (4) to the deployment fixture (3), using the proper nuts and bolts.
    4. Attach the roof rail air bag in the deployment fixture and securely tighten all fasteners.

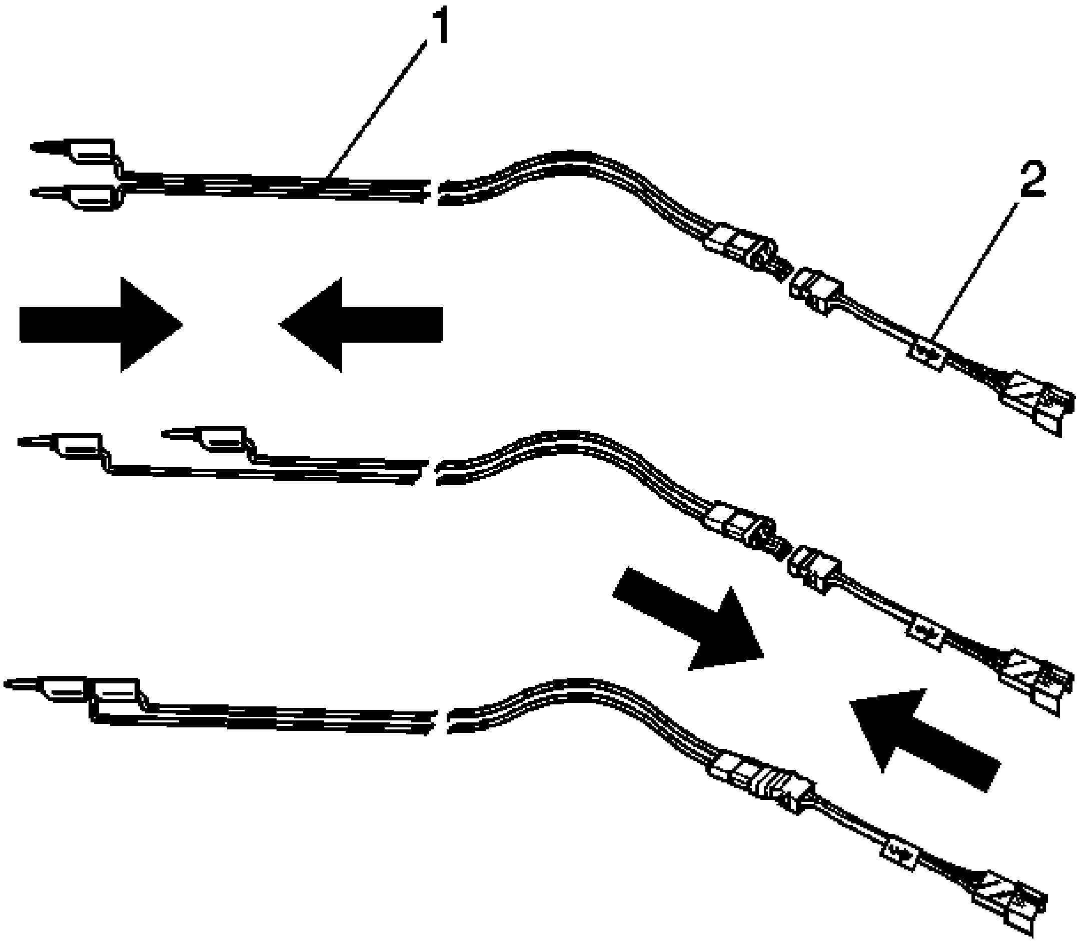

Fig. 38: SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

8. Inspect the **EL-38826** harness and the appropriate pigtail adapter (2) for damage. Replace as needed.
9. Short the 2 SIR deployment harness leads (1) together using one banana plug seated into the other.
10. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).

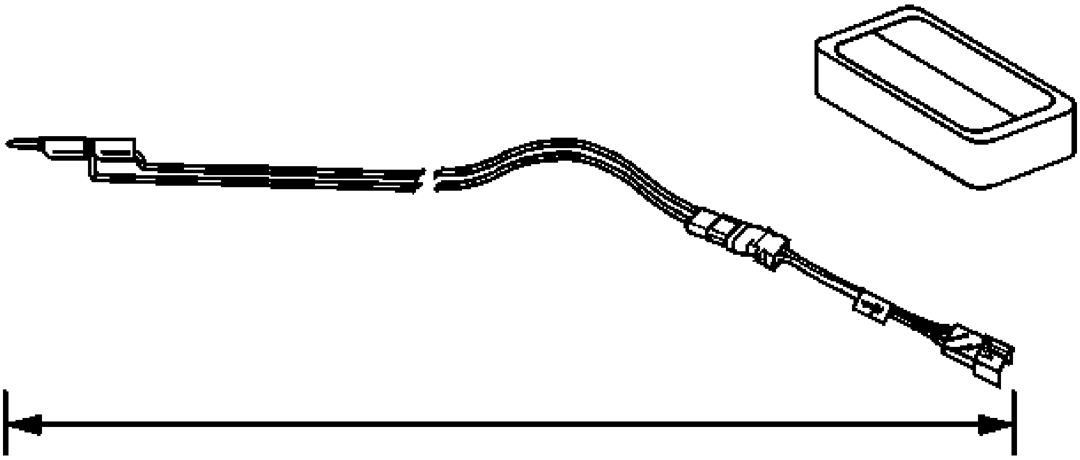

Fig. 39: Extending SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

11. Extend the SIR deployment harness and adapter to the full length from the deployment fixture or area.

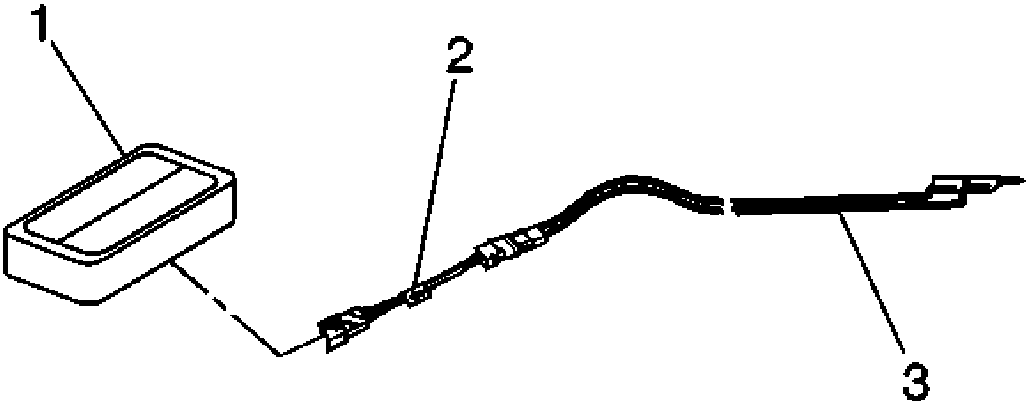

Fig. 40: Inflator Module, SIR Deployment Harness & Adapter
Courtesy of GENERAL MOTORS COMPANY

NOTE: **On a dual stage air bag, both connectors must be attached to the deployment harness adapter. This will ensure that both stage 1 and stage 2 of the deployment loops are energized, regardless of the deployment state.**

12. Connect the air bag (1) to the adapter (2) on the SIR deployment harness (3).

NOTE:

- **The rapid expansion of gas involved with deploying an air bag is very loud. Notify all the people in the immediate area that you intend to deploy the air bag.**
- **When the air bag deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the air bag due to the force of the rapid expansion of gas inside the air bag.**
- **If you are deploying a dual stage air bag with stage 1 already deployed, the fixture may not move and the noise may have been reduced.**

13. Clear the area of people.

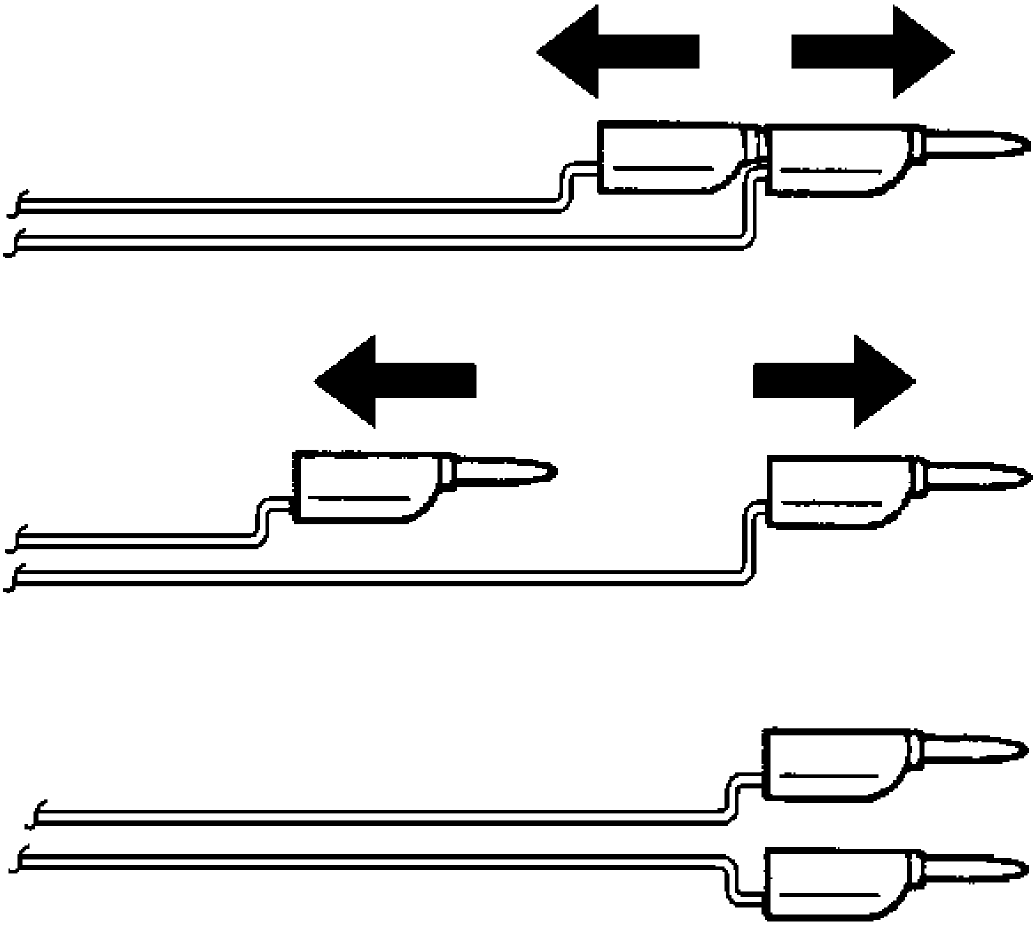

Fig. 41: Separating Banana Plugs
Courtesy of GENERAL MOTORS COMPANY

14. Separate the 2 banana plugs on the SIR deployment harness that were shorted together earlier in the procedure.

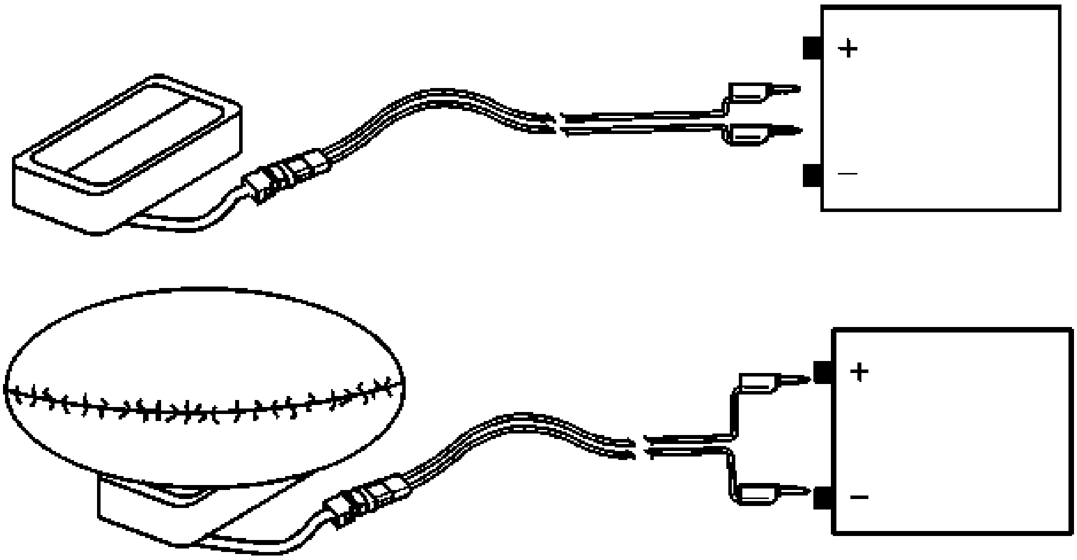

Fig. 42: SIR Deployment Harness Wires To Power Source
Courtesy of GENERAL MOTORS COMPANY

15. Place a 12 V minimum/2A minimum power source, such as a vehicle battery, near the shorted end of the harness.
16. Connect the SIR deployment harness wires to the power source. Deployment of the air bag will occur when contact is made.

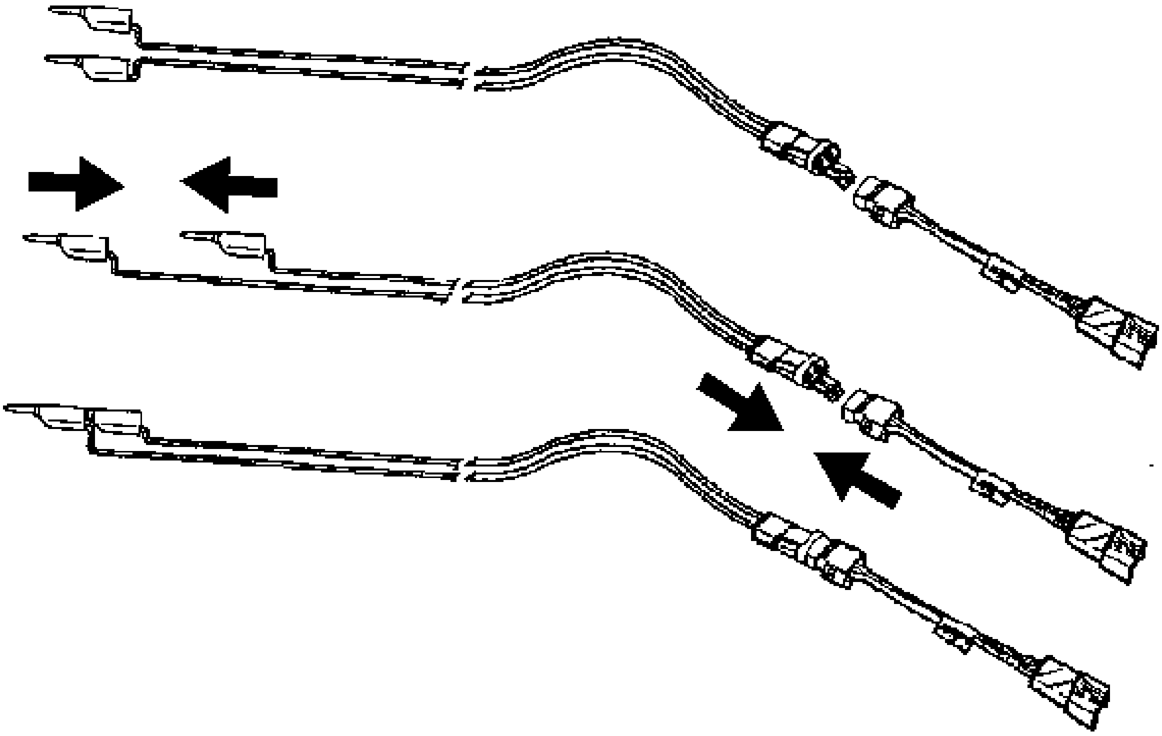

Fig. 43: Deployment Harness Leads
Courtesy of GENERAL MOTORS COMPANY

17. Disconnect the SIR deployment harness from the power source after the air bag deploys.
18. If the air bag did not deploy, disconnect the adapter and discontinue the procedure and contact the Technical Assistance Group.

    If deployment was successful, proceed to the following steps.

WARNING: **Refer to SIR Deployed Inflator Modules Are Hot Warning .**

19. Seat one banana plug into the other in order to short the deployment harness leads.
20. Put on a pair of shop gloves.
21. Disconnect the pigtail adapter from the air bag as soon as possible.
22. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
23. Dispose of the deployed air bag through normal refuse channels.
24. Wash your hands with a mild soap.

Deployment Inside Vehicle - Vehicle Scrapping Procedure

Deploy the air bags inside of the vehicle when destroying the vehicle or when salvaging the vehicle for parts. This includes, but is not limited to, the following situations:

- The vehicle has completed all useful life.
- Irrepairable damage occurred to the vehicle in a non-deployment type accident.
- Irrepairable damage occurred to the vehicle during a theft.

- The vehicle is being salvaged for parts to be used on a vehicle with a different VIN, as opposed to rebuilding as the same VIN.

WARNING: **Refer to SIR Inflatable Module Deployment Outside Vehicle Warning .**

1. Lower the driver and passenger windows.
2. Turn the ignition switch to the OFF position and remove the ignition key.
3. Check that all air bags which will be deployed are mounted securely.
4. Remove all loose objects from the front seats.

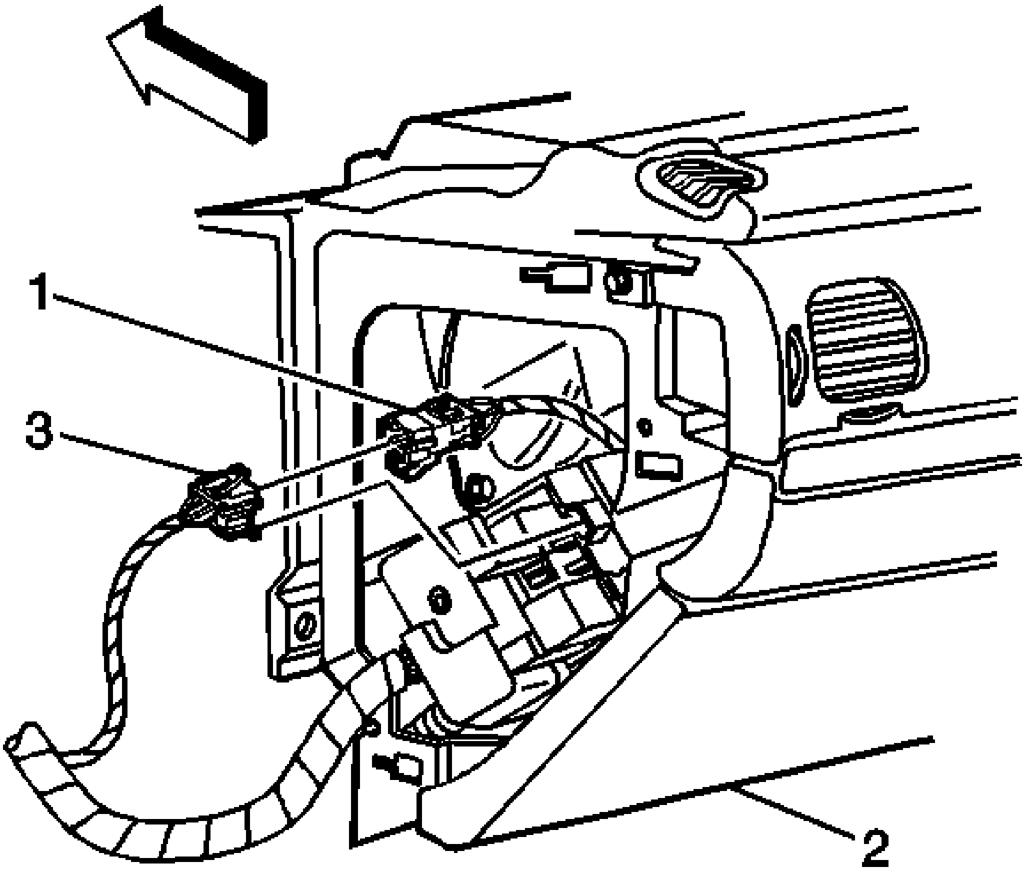

Fig. 44: I/P Module Connector To Vehicle Harness Connector (LH Side I/P)
Courtesy of GENERAL MOTORS COMPANY

WARNING: **A deployed dual stage inflator module will look the same whether one or both stages were used. Always assume a deployed dual stage inflator module has an active stage 2. Improper handling or servicing can activate the inflator module and cause personal injury.**

5. Disconnect the steering wheel air bag yellow connector (1) from vehicle harness yellow connector (3).

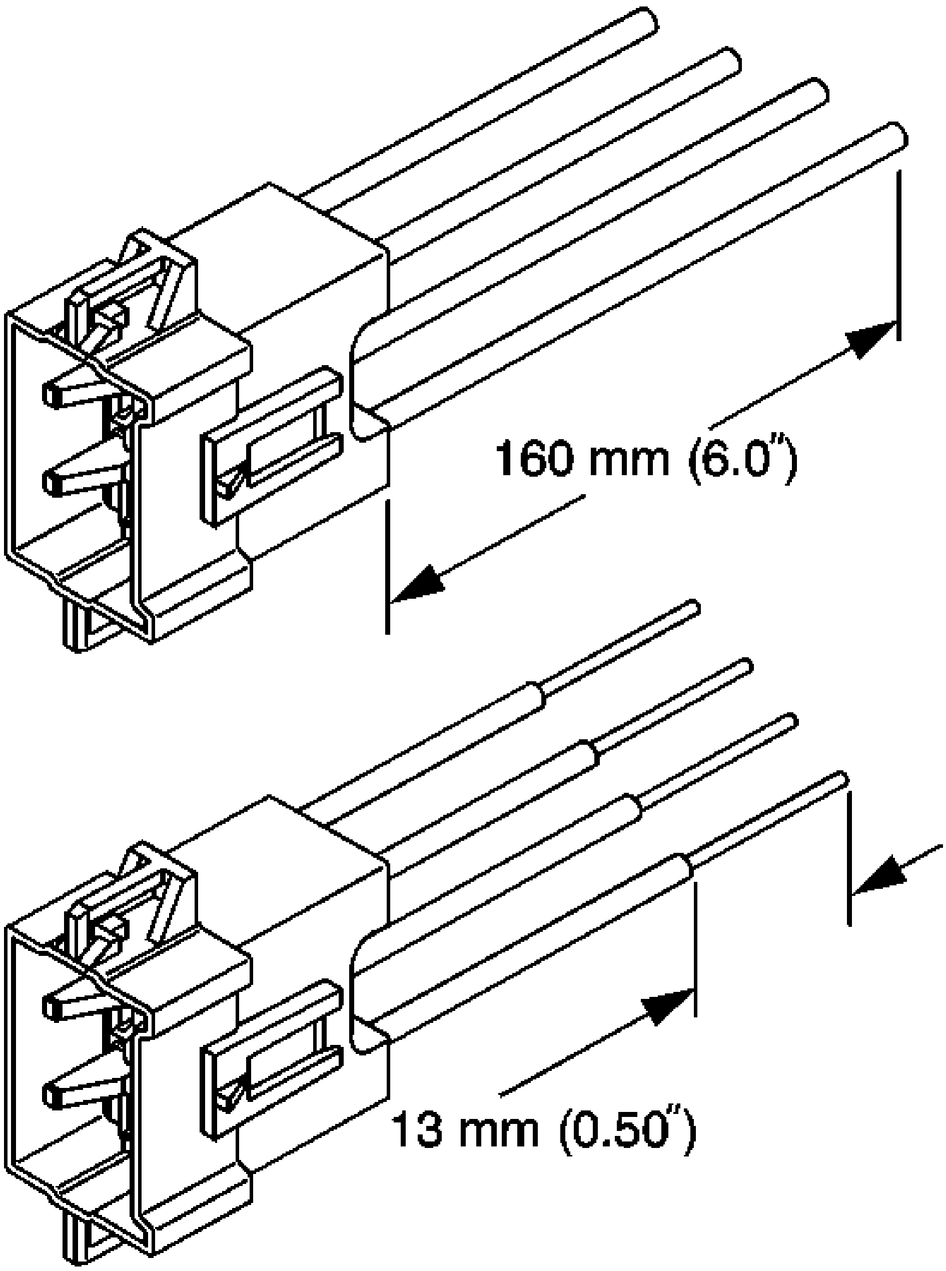

Fig. 45: Stripping SIR Wires
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to COMPONENT CONNECTOR END VIEWS - INDEX for determining high and low circuits.**

6. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
7. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.

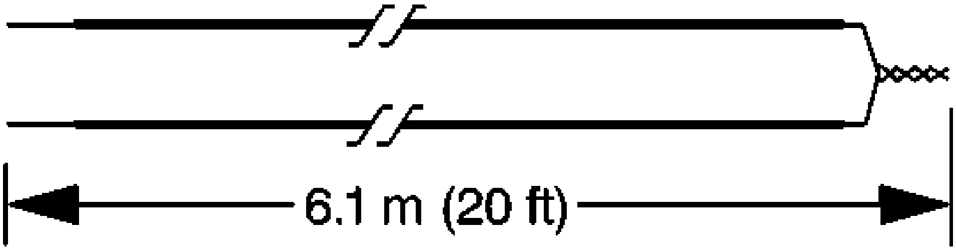

Fig. 46: Fabricating 20 Ft. Deployment Harness
Courtesy of GENERAL MOTORS COMPANY

8. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. Use these wires to fabricate the driver deployment harness.
9. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
10. Twist together one end from each of the wires in order to short the wires. Deployment wires shall remain shorted, and not connected to a power source until you are ready to deploy the air bag.

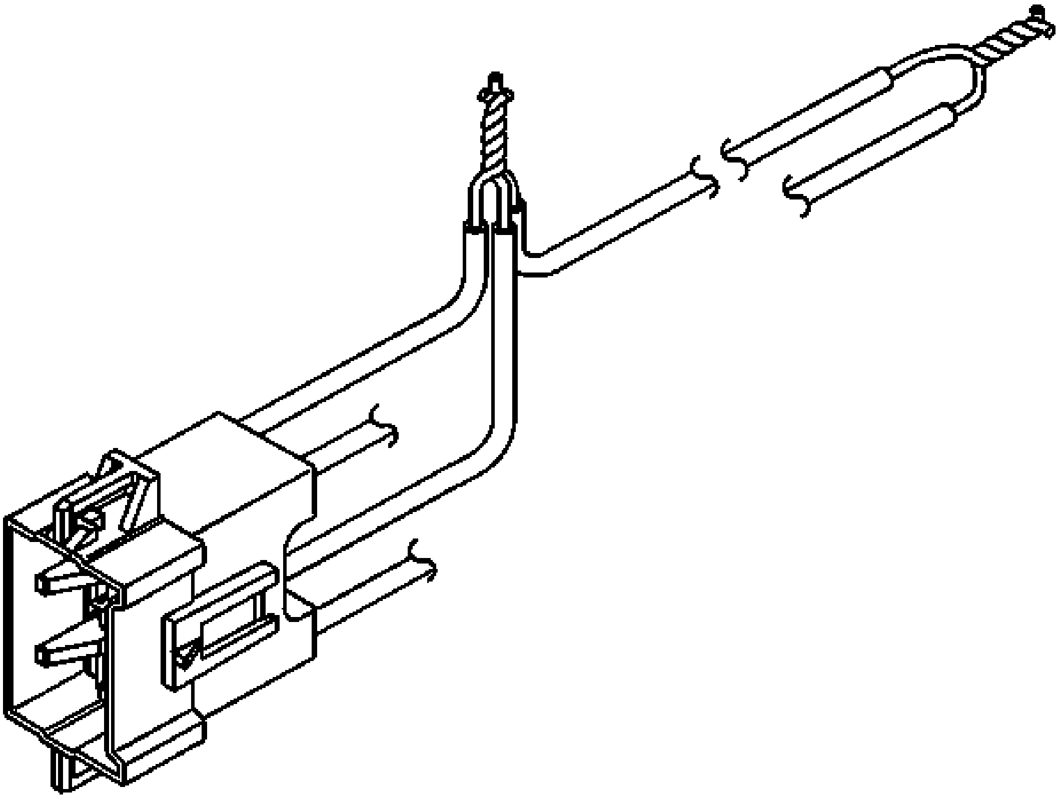

Fig. 47: Twisting Connector Wire Leads (High Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

11. Twist together the 2 connector wire leads from the high circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
12. Inspect that the 3-wire connection is secure.
13. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.

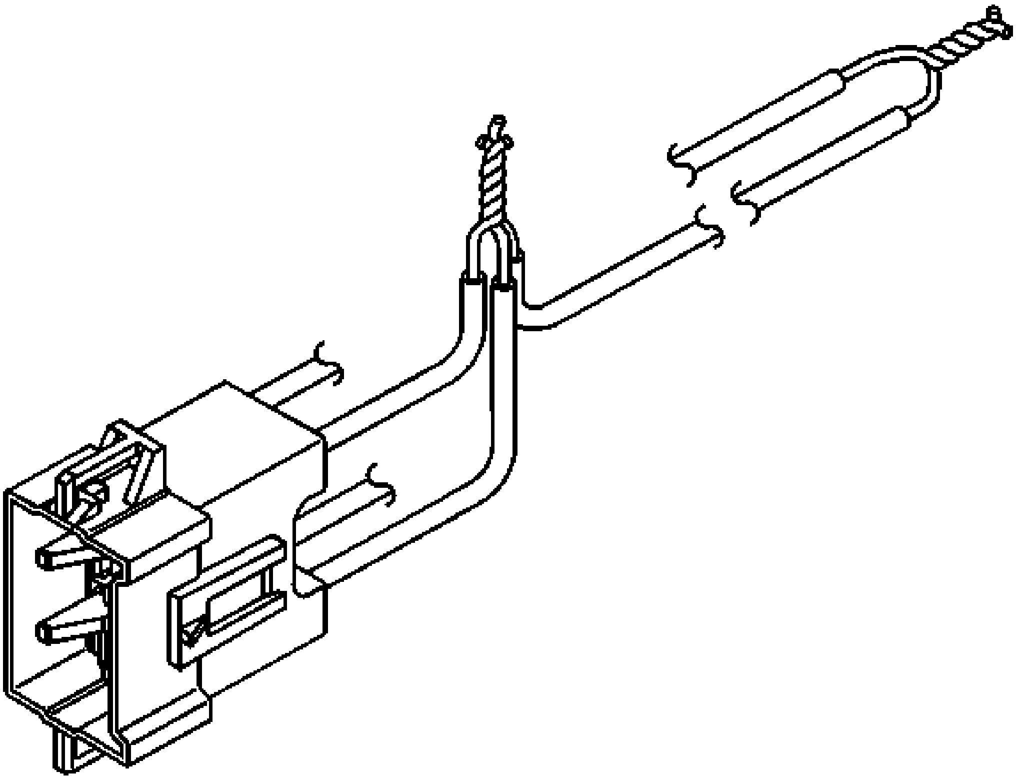

Fig. 48: Twisting Connector Wire Leads (Low Circuits) To Deployment Harness Wire
Courtesy of GENERAL MOTORS COMPANY

14. Twist together the 2 connector wire leads from the low circuits from both stages of the steering wheel air bag, to one set of deployment wires. Refer to **COMPONENT CONNECTOR END VIEWS - INDEX** in order to determine the correct circuits.
15. Inspect that the 3-wire connection is secure.
16. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
17. Connect the deployment harness to the connector on the steering wheel air bag.
18. Route the deployment harness out of the driver side of the vehicle.
19. Disconnect the yellow left roof rail harness connector from the vehicle harness connector.
20. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
21. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
22. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
23. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
24. Twist together one end from each of the wires in order to short the wires.
25. Twist together one connector wire lead to one deployment wire.
26. Secure and insulate the connection using electrical tape.
27. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
28. Connect the deployment harness to the yellow connector of the roof rail air bag.
29. Route the deployment harness out of the driver side of the vehicle.

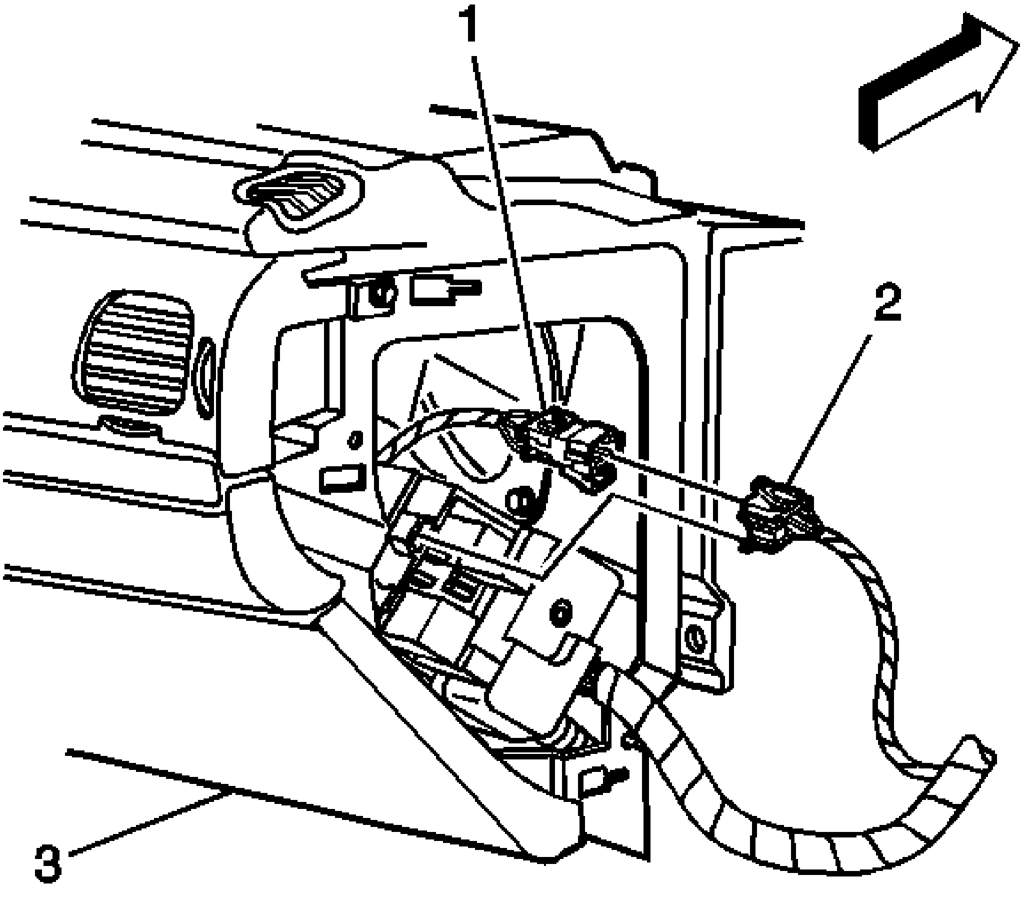

Fig. 49: I/P Module Connector To Vehicle Harness Connector
Courtesy of GENERAL MOTORS COMPANY

30. Disconnect the instrument panel air bag yellow harness connector (1) from the vehicle harness connector (2).

NOTE: **If the vehicle is equipped with dual stage air bags the steering wheel air bag and instrument panel air bag will each have 4 wires. Refer to COMPONENT CONNECTOR END VIEWS - INDEX for determining high and low circuits.**

31. Cut the yellow harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
32. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
33. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the passenger deployment harness.
34. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
35. Twist together one end from each of the wires in order to short the wires.
36. Twist together the 2 connector wire leads from the high circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to COMPONENT CONNECTOR END VIEWS - INDEX in order to determine the correct circuits.
37. Inspect that the 3-wire connection is secure.
38. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.
39. Twist together the 2 connector wire leads from the low circuits from both stages of the instrument panel air bag to one set of deployment wires. Refer to COMPONENT CONNECTOR END VIEWS - INDEX in order to determine the correct circuits.
40. Inspect that the 3-wire connection is secure.
41. Secure and insulate the 3-wire connection to the deployment harness using electrical tape.

42. Connect the deployment harness to the instrument panel air bag in-line connector.
43. Route the deployment harness out of the passenger side of the vehicle.
44. Disconnect the yellow harness connector to the right roof rail air bag from the vehicle harness connector.
45. Cut the harness connector out of the vehicle, leaving at least 16 cm (6 in) of wire at the connector.
46. Strip 13 mm (0.5 in) of insulation from each of the connector wire leads.
47. Cut two 6.1 m (20 ft) deployment wires from a 0.8 mm (18 gauge) or thicker multi-strand wire. These wires will be used to fabricate the roof rail air bag deployment harness.
48. Strip 13 mm (0.5 in) of insulation from both ends of the wires.
49. Twist together one end from each of the wires in order to short the wires.
50. Twist together one connector wire lead to one deployment wire.
51. Secure and insulate the connection using electrical tape.
52. Twist together and tape the remaining connector wire lead to the remaining deployment wire.
53. Connect the deployment harness to the roof rail air bag yellow connector.
54. Route the deployment harness out of the passenger side of the vehicle.
55. Completely cover the windshield and the front door window openings with a drop cloth.
56. Stretch to the full length all of the deployment harness wires on the right side of the vehicle.
57. Deploy each deployment loop one at a time.
58. Place a power source, 12 V minimum/2A minimum, such as a vehicle battery, near the shorted end of the harnesses.
59. Separate one set of wires and touch the wire ends to the power source in order to deploy the selected air bag.
60. Disconnect the deployment harness from the power source and twist the wire ends together.
61. Continue the same process with the remaining deployment harnesses.
62. Disconnect all harnesses from the vehicle.
63. Discard the harnesses.
64. Scrap the vehicle in the same manner as a non-SIR equipped vehicle.
65. If one or all of the air bags did not deploy, remove the undeployed air bags from the vehicle.

PRETENSIONER HANDLING AND SCRAPPING

Scrapping Procedure

During the course of a vehicles useful life, certain situations may arise which will necessitate the disposal of a live (undeployed) pretensioner. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner. Deploy the pretensioner before disposal. Do not dispose of a live (undeployed) pretensioner through normal disposal channels until the pretensioner has been deployed. The following information covers the proper procedures for the disposing of a live (undeployed) pretensioner.

- After replacement of a pretensioner under warranty. The pretensioner may need to be returned undeployed to the original manufacturer of pretensioner.
- If the vehicle is the subject of a Product Liability report related to the SIR system and is subject to a Preliminary Investigation (GM-1241). Do not alter the SIR system in any manner.
- If the vehicle is involved in a campaign affecting the pretensioners. Follow the instructions in the Campaign Service Bulletin for proper SIR handling procedures.

Deployment Procedures

NOTE: **Some countries, states or localities may not allow service deployment of air bags without special permission or training. Local laws regarding deploying and scrapping of air bags/devices with pyrotechnics must be followed.**

The pretensioner can be deployed inside or outside of the vehicle. The method used depends upon the final disposition of the vehicle. Review the following procedures in order to determine which will work best in a given situation.

Deployment Inside the Vehicle

Refer to **Inflatable Restraint Module Handling and Scrapping** for deploying the pretensioner inside vehicle under Vehicle Scrapping Procedure.

Deployment Outside Vehicle for Seat Belt Pretensioners

Deploy the seat belt pretensioners outside of the vehicle when the vehicle will be returned to service. Situations that require deployment outside of the vehicle include the following:

- Using the SIR diagnostics, you determine that the seat belt pretensioner is malfunctioning.
- The pretensioner pigtail (if equipped) is damaged.
- The pretensioner connector is damaged.
- The pretensioner connector terminal is damaged.

Deployment and disposal of a malfunctioning seat belt pretensioner is subject to any required retention period.

WARNING: **In order to prevent accidental deployment of the pretensioner which could cause personal injury, do not dispose of an undeployed pretensioner as normal shop waste. The undeployed pretensioner contains substances that could cause severe illness or personal injury if the sealed container is damaged during disposal. Use the following deployment procedures to safely dispose of an undeployed pretensioner. Failure to dispose of a pretensioner as instructed may be a violation of federal, state, or local laws.**

WARNING: **When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.**

Special Tools

- **EL-39401-B** SIR Deployment Fixture
- **EL-38826** SIR Deployment Harness

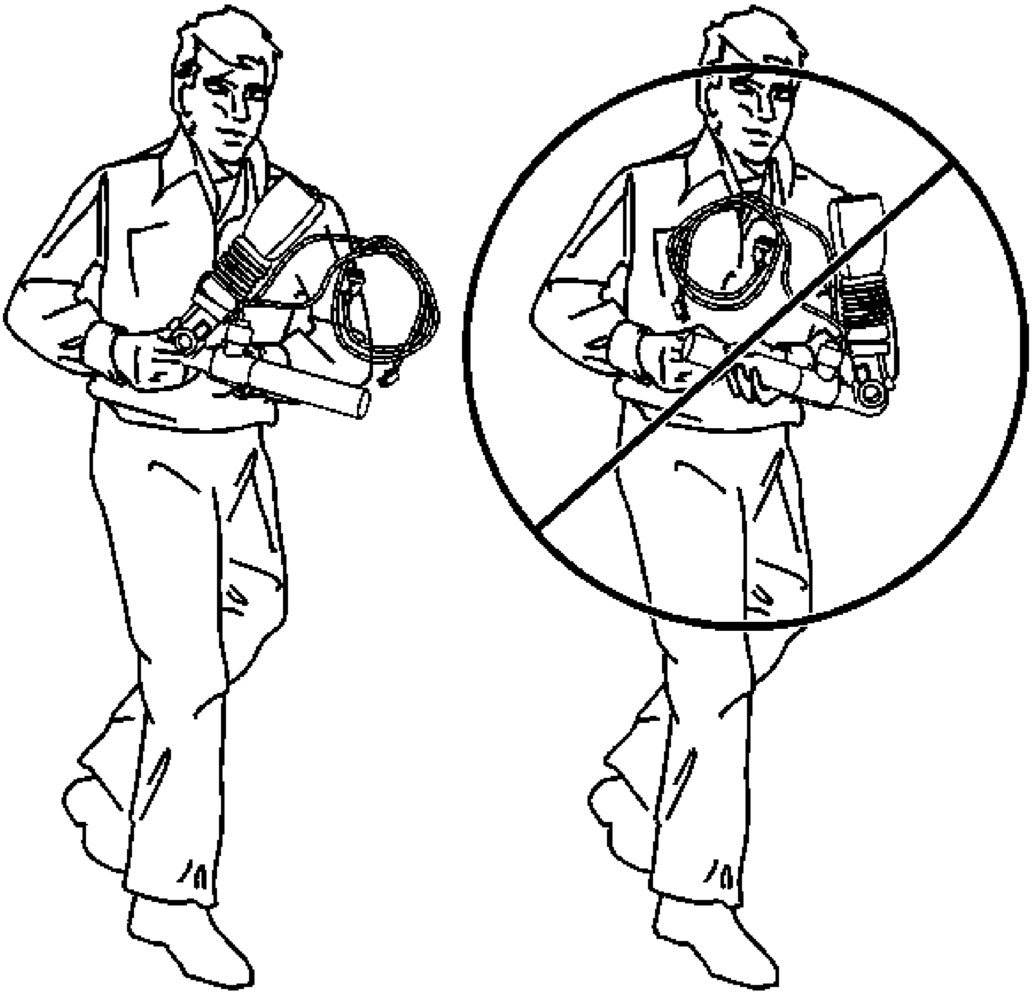

Fig. 50: Proper Pretensioner Carrying
Courtesy of GENERAL MOTORS COMPANY

1. Turn the ignition switch to the OFF position.
2. Remove the ignition key.
3. Put on safety glasses.
4. Remove the seat belt pretensioner from the vehicle.
5. When carrying a pretensioner to the deployment area keep the open end of pretensioner pointed away from the body.

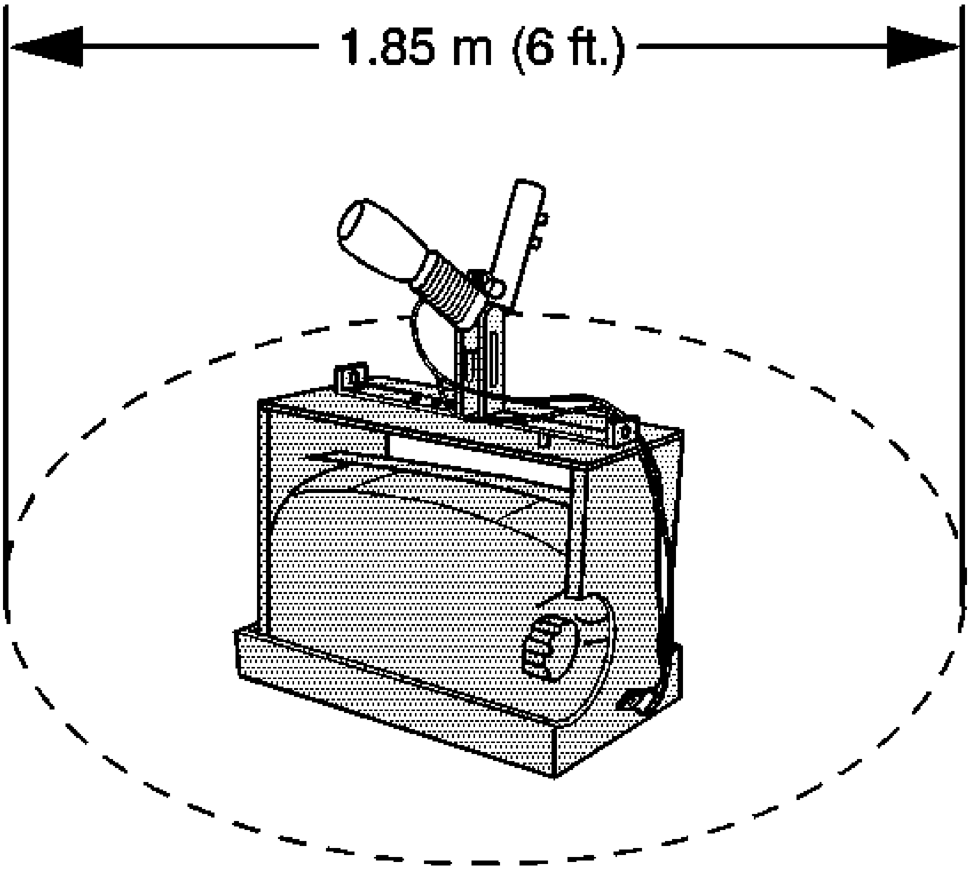

Fig. 51: Pretensioner Deployment Area
Courtesy of GENERAL MOTORS COMPANY

6. Clear a space on the ground about 1.85 M (6 ft) in diameter for deployment of the pretensioner. If possible, use a paved, outdoor location free of activity. Otherwise, use a space free of activity on the shop floor. Make sure you have sufficient ventilation.
7. Make sure no loose or flammable objects are in the area.
8. Place the **EL-39401-B** SIR deployment fixture in the center of the cleared area.
9. Fill the fixture plastic reservoir with water or sand.

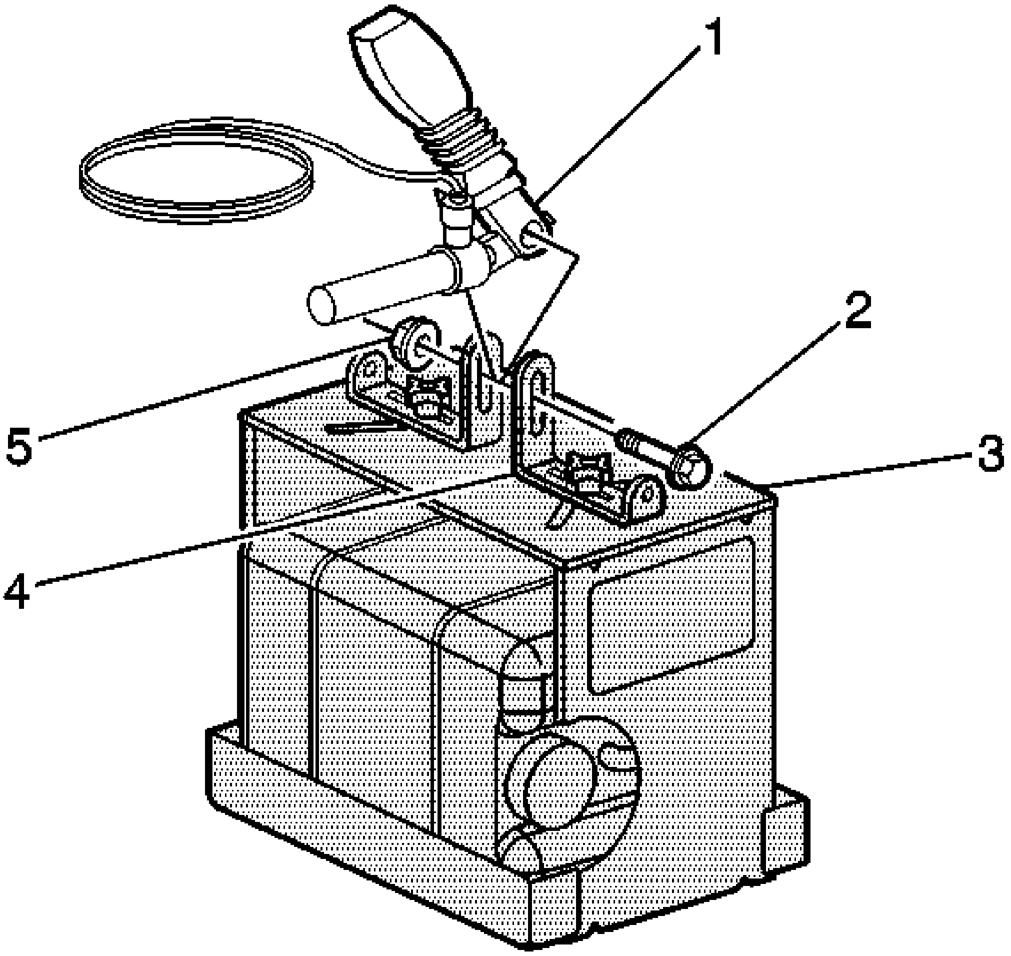

Fig. 52: Mounting Pretensioner In SIR Deployment Fixture
Courtesy of GENERAL MOTORS COMPANY

10. Mount the pretensioner (1) in the SIR deployment fixture (3) with the open end facing up using the following mounting method.
    1. Adjust and secure the EL-39401-B arms (4) to the deployment fixture (3).
    2. To mount, use the proper size bolt (2) and nut (5) with washers in order to secure the pretensioner (1) to the deployment fixture brackets (4).
    3. Securely tighten all fasteners prior to deployment.

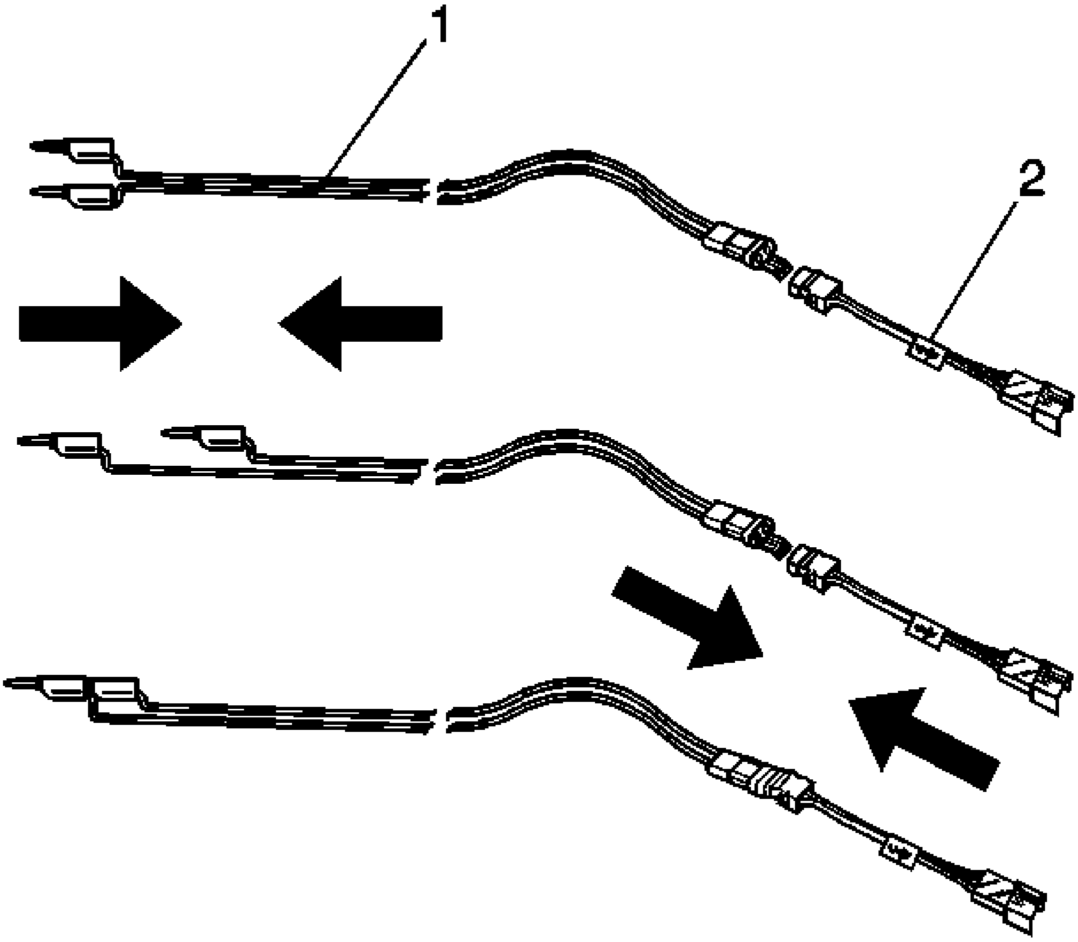

Fig. 53: SIR Deployment Harness & Adapter
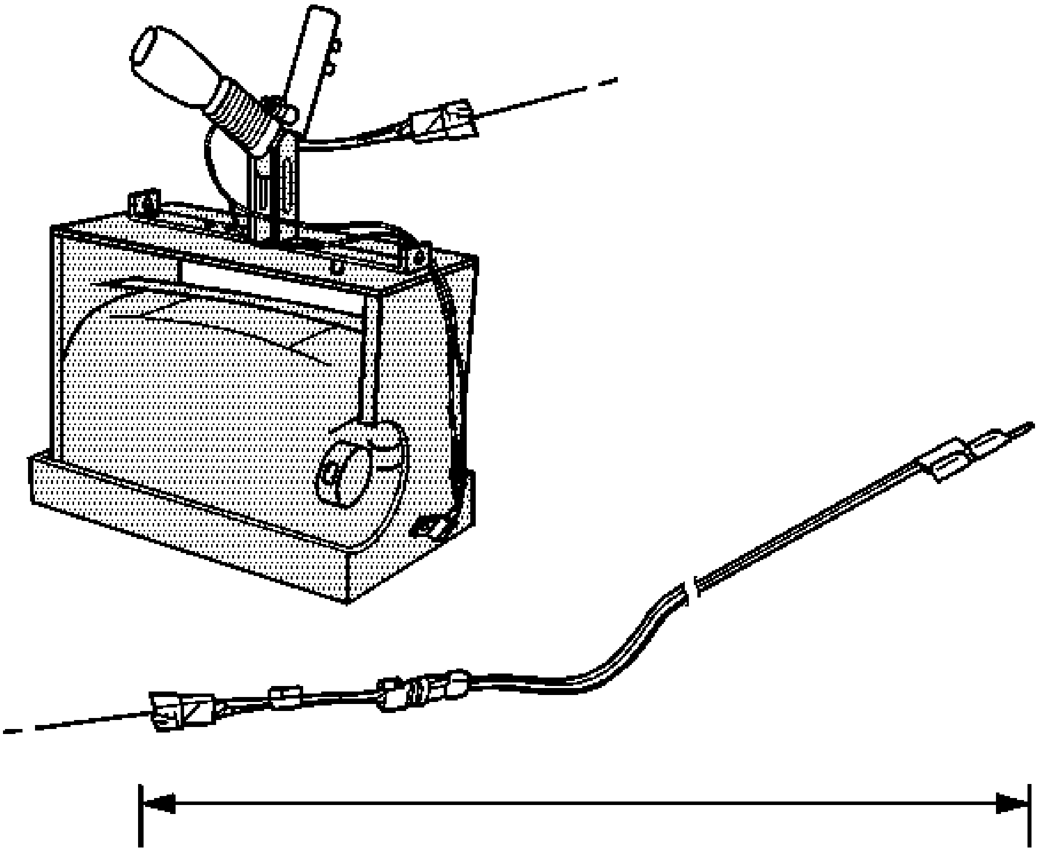
Courtesy of GENERAL MOTORS COMPANY

11. Inspect the **EL-38826** SIR deployment harness and the appropriate pigtail adapter for damage. Replace as needed.
12. Short the 2 SIR deployment harness (1) leads together using one banana plug seated into the other.
13. Connect the appropriate pigtail adapter (2) to the SIR deployment harness (1).



[Fig. 54: Extending SIR Deployment Harness & Adapter](#)
Courtesy of GENERAL MOTORS COMPANY

14. Extend the SIR deployment harness and adapter to full length from the deployment fixture.

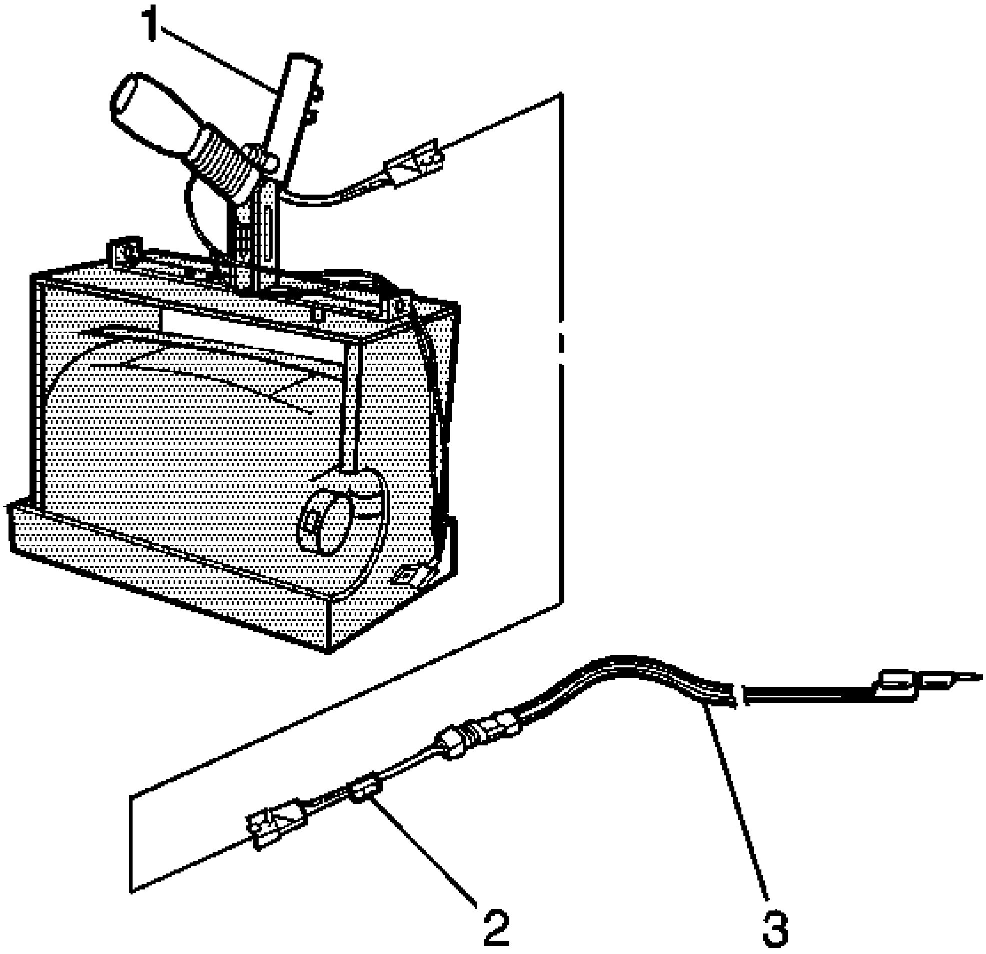


Fig. 55: Connecting Pretensioner To Adapter
Courtesy of GENERAL MOTORS COMPANY

15. Connect the pretensioner (1) to the adapter (2) on the deployment harness (3).

NOTE: **The rapid gas expansion involved with deploying a pretensioner is very loud. Notify all the people in the immediate area that you intend to deploy the seat belt pretensioner.**

16. Clear the area of people.

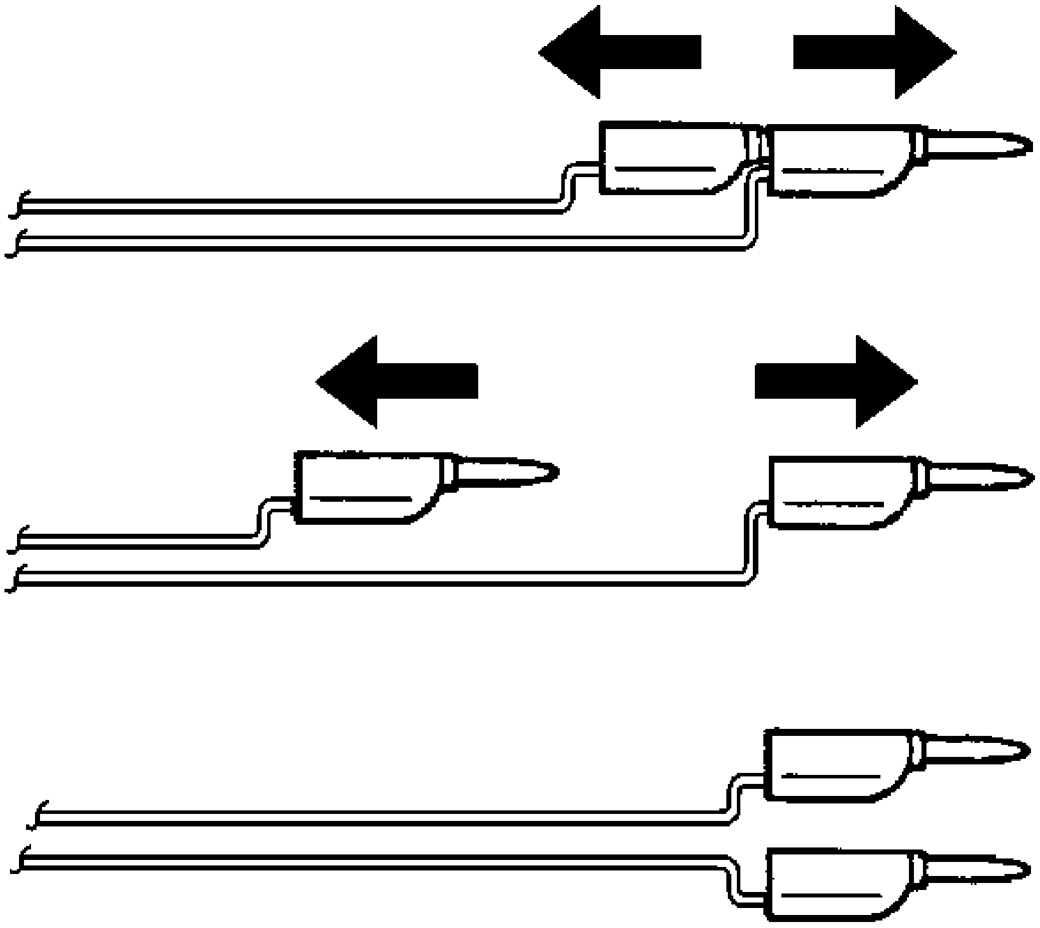

Fig. 56: Separating Banana Plugs
Courtesy of GENERAL MOTORS COMPANY

WARNING: **When you are deploying a pretensioner for disposal, perform the deployment procedures in the order listed. Failure to follow the procedures in the order listed may result in personal injury.**

17. Separate the 2 banana plugs on the SIR deployment harness.

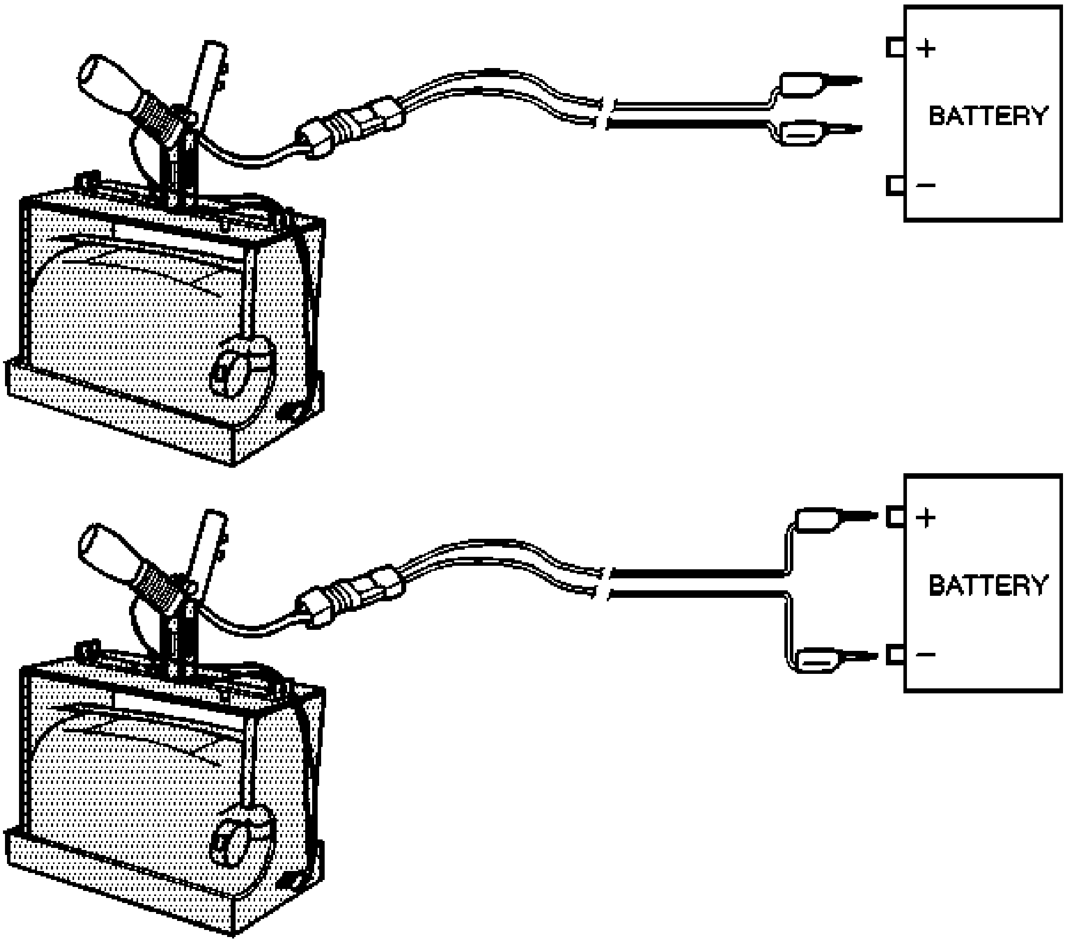

Fig. 57: Deploying Pretensioner
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When the seat belt pretensioner deploys, the deployment fixture may jump about 30 cm (1 ft) vertically. This is a normal reaction of the seat belt pretensioner due to the force of the rapid expansion of gas inside the pretensioner.**

18. Place a 12 V minimum/2 A minimum power source (i.e., vehicle battery) near the shorted end of the harness.
19. Connect the SIR deployment harness wires to the power source. Pretensioner deployment will occur when contact is made.
20. Disconnect the SIR deployment harness from the power source after the pretensioner deploys.

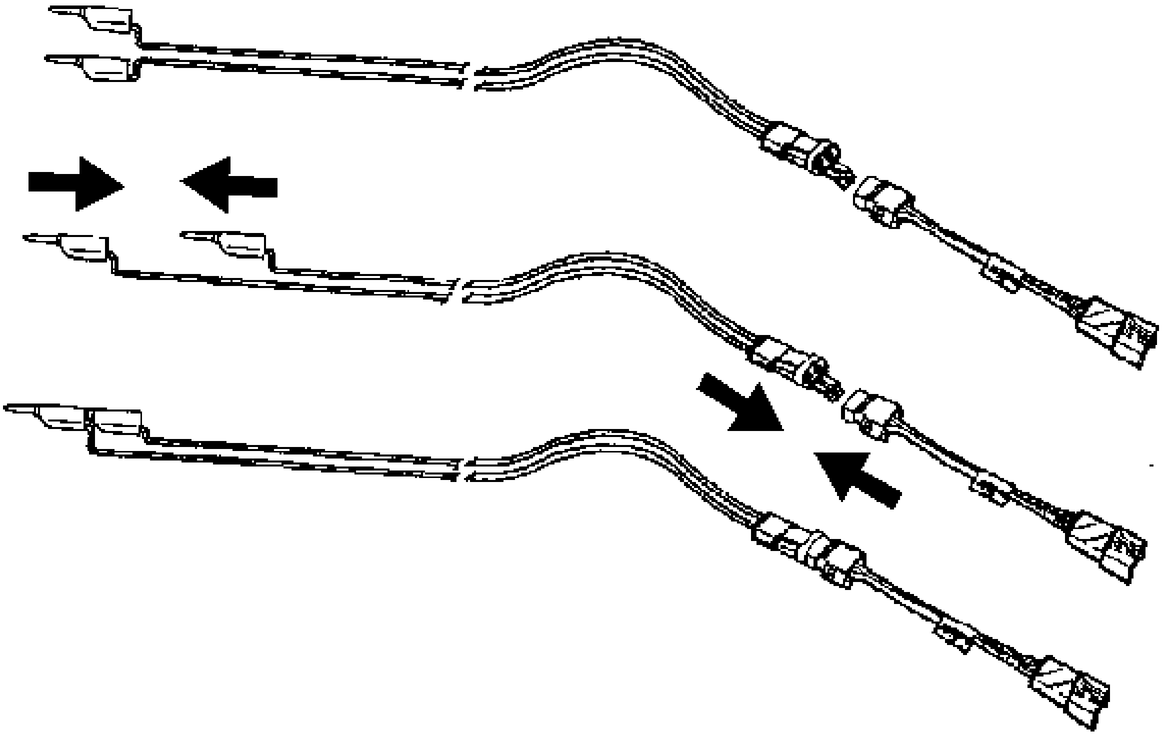

Fig. 58: Deployment Harness Leads
Courtesy of GENERAL MOTORS COMPANY

21. Seat one banana plug into the other in order to short the deployment harness leads.
22. If the pretensioner did not deploy, disconnect the adapter and discontinue the procedure. Contact the Technical Assistance Group. Otherwise, proceed to the following steps.
23. Put on a pair of shop gloves.
24. Disconnect the pigtail adapter from the pretensioner as soon as possible.
25. Inspect the pigtail adapter and the SIR deployment harness. Replace as needed.
26. Dispose of the deployed pretensioner through normal refuse channels.
27. Wash hands with a mild soap.

DESCRIPTION AND OPERATION

SUPPLEMENTAL INFLATABLE RESTRAINT SYSTEM DESCRIPTION AND OPERATION

SIR System Overview

The supplemental inflatable restraint (SIR) system supplements the protection offered by the seat belts. The SIR system contains an inflatable restraint sensing and diagnostic module (SDM), air bags, seat belt pretensioners (anchor and retractor), and impact sensors. The SDM determines the severity of a collision with the assistance of impact sensors located at strategic points on the vehicle. When the SDM detects a collision, the SDM will process the information provided by the sensors to further support air bag or pretensioner deployment. The SDM will deploy the air bags and pretensioners if it detects a collision of sufficient force. If the force of the impact is not sufficient to warrant air bag deployment, the SDM may still deploy the seat belt pretensioners. The SDM contains a sensing device that converts vehicle velocity changes to an electrical signal. The SDM compares these signals to values stored in memory. If the signals exceed a stored value, the SDM will determine the severity of the impact and either cause current to flow through the frontal deployment loops deploying the frontal air bags and pretensioners, or it will deploy the pretensioners only. The SDM continuously monitors the deployment loops for malfunctions and illuminates the SIR system AIR BAG indicator if a fault is detected.The SDM performs continuous diagnostic monitoring of the SIR system electrical components. Upon detection of a circuit malfunction, the SDM will set a DTC and inform the driver by illuminating the SIR system AIR BAG indicator. The steering column and knee bolsters are designed to absorb energy and compress during frontal collisions in order to limit leg movement and decrease the chance of injury to the driver and passenger.

SIR System AIR BAG Indicator

The SIR system AIR BAG indicator, located in the instrument cluster, is used to notify the driver of SIR system malfunctions and to verify that the inflatable restraint sensing and diagnostic module (SDM) is communicating with the instrument cluster. When the ignition is turned ON, the SDM is supplied with ignition positive voltage. The instrument cluster will momentarily turn on the SIR system AIR BAG indicator. While the indicator is on, the SDM conducts tests on all SIR system components and circuits. If no malfunctions are detected the SDM will communicate with the instrument cluster through the serial data circuit and command the SIR system AIR BAG indicator OFF. The SDM provides continuous monitoring of the air bag circuits by conducting a sequence of checks. If a malfunction is detected the SDM will store a diagnostic trouble code (DTC) and command the instrument cluster to illuminate the SIR system AIR BAG indicator via serial data. The presence of a SIR system malfunction could result in non-deployment of the air bags or deployment in conditions less severe than intended. The SIR system AIR BAG indicator will remain ON until the malfunction has been repaired.

Inflatable Restraint Sensing and Diagnostic Module (SDM)

The inflatable restraint sensing and diagnostic module (SDM) is a microprocessor and the control center for the supplemental inflatable restraint (SIR) system. The SDM contains internal sensors along with external impact sensors, mounted at strategic locations on the vehicle. In the event of a collision, the SDM compares the signals from the internal and external impact sensors to a value stored in memory. When the generated signals exceed the stored value, the SDM will cause current to flow through the appropriate deployment loops to deploy the air bags. The SDM records the SIR system status when a deployment occurs and illuminates the SIR system AIR BAG indicator located in the instrument cluster. The SDM performs continuous diagnostic monitoring of the SIR system electrical components and circuitry when the ignition is turned ON. If the SDM detects a malfunction, a DTC will be stored and the SDM will request the instrument cluster to illuminate the SIR system AIR BAG indicator, notifying the driver that a malfunction exists. In the event that ignition positive voltage is lost during a collision, the SDM maintains a 23-volt loop reserve for deployment of the air bags. It is important when disabling the SIR system for servicing or rescue operations to allow the 23-volt loop reserve to dissipate, which could take up to 1 minute.

Air Bags

This vehicle contains 10 air bags. The 10 air bags are located in the steering wheel (dual inflators), instrument panel (passenger side) (dual inflators), driver side (B-pillar), passenger side (B-pillar), driver side (C-pillar), passenger side (C-pillar), driver side knee, passenger side knee, left roof rail, and right roof rail. To view the locations of the air bags refer to **Master Electrical Component List** . Air bags contain a housing, inflatable air bag, two initiating devices (if dual air bags), canister of gas generating material and, in some cases, stored compressed gas. The deployment loops supply current to deploy the air bags. The driver steering wheel and passenger instrument panel air bags have two stages of deployment, which varies the amount of restraint to the occupant according to the collision severity. For moderate frontal collisions the air bags deploy at less than full deployment which consists of stage 1 of the air bag. For more severe frontal collisions a full deployment is initiated which consists of stage 1 and stage 2 of the air bag. The current passing through the air bags ignite the material in the canister producing a rapid generation of gas and is some cases, the release of compressed gas. The gas produced from this reaction rapidly inflates the air bag. Once the air bag is inflated it quickly deflates through the air bag vent holes and/or the bag fabric. A shorting bar (if equipped) is located in the connector.

Seat Belt Pretensioners (Anchor and Retractor)

The seat belt pretensioners (driver and passenger) consist of a housing, seat belt retractor (located in the B-pillar), seat belt anchor (located on the floor), seat belt webbing, an initiator, and a canister of gas generating materials. To view the locations of the seat belt pretentioners refer to Master Electrical Component List . The initiator is part of the seat belt pretensioner deployment loop. When the vehicle is involved in a collision of sufficient force, the SDM causes current to flow through the seat belt deployment loops to the initiator. Current passing through the initiator ignites the material in the canister producing a rapid generation of gas. The gas produced from this reaction deploys the seat belt pretensioners which removes all of the slack in the seat belts. Depending on the severity of the collision, the seat belt pretensioners may deploy without the frontal air bags deploying, or they will deploy immediately before the frontal air bags deploy. A shorting bar (if equipped) is located in the connector.

Impact Sensors

There are multiple impact sensors which may be located in the front of the vehicle, in the front doors or on the B-pillar, and on the C-pillar depending on the vehicle configuration. To view the locations of the impact sensors refer to Master Electrical Component List . The front of vehicle, B-pillar, and C-pillar impact sensors contain a sensing device which monitors vehicle acceleration to detect collisions that are severe enough to warrant air bag deployment. The front door impact sensors contain a sensing device which monitors the door cavity air pressure change to detect side collisions that are severe enough to warrant air bag deployment. It is important when working on components in the door to make sure any items which have a sealing impact on the door (water deflector, exterior door handle, speaker, door harness grommet, or sealing strip) are securely fastened when reinstalled. The impact sensors are not part of the deployment loop, but instead provide input to the Inflatable Restraint Sensing and Diagnostic Module (SDM). The Inflatable Restraint Sensing and Diagnostic Module contains a microprocessor that performs calculations using the measured inputs from acceleration and pressure sensors. When the generated calculations exceed the stored value, the Inflatable Restraint Sensing and Diagnostic Module will cause current to flow through the deployment loops deploying the appropriate air bags.

Passenger Presence Detection System and Passenger Air Bag Indicator

NOTE: **The passenger presence system (PPS) is a calibrated unit. When replacing the assembly all parts in the service kit must remain together. Do not mix any of the old parts with the new parts. After repairing or replacing the PPS, the Preload test must be performed in order to function properly.**

The passenger presence system (PPS) is used to monitor the type of occupant that is sitting in the front passenger seat and communicate the status to the inflatable restraint sensing and diagnostic module (SDM). The SDM then uses this information to determine whether to enable or suppress the deployment of the passenger instrument panel air bag. PPS consists of an electronic control module, a sensor mat in the seat, a harness, and PASSENGER AIR BAG ON/OFF indicators. PPS transmits and receives a low-level electric field. The measured capacitance value of this field is used to determine the type of occupant sitting in the front passenger seat. If the measured capacitance is less than a calibrated value, then the passenger presence module will send a serial data signal to the SDM to disable the passenger instrument panel air bag. If the measured capacitance is greater than a calibrated value, then the passenger presence module will send a serial data signal to the SDM to enable the passenger instrument panel air bag. The SDM will notify the customer of the enable/disable status by illuminating one of the PASSENGER AIR BAG ON/OFF indicator. The PPS monitors itself for faults and will displays diagnostic trouble codes (DTCs) onthe scan tool. When a fault is detected, the passenger presence module sends out a message to the SDM. The SDM responds by sending a command message to the IPC to illuminate the SIR system AIR BAG indicator.

Seat Belt Indicators

The seat belt indicators are controlled through the inflatable restraint sensing and diagnostic module (SDM). For further information on seat belt indicators refer to Seat Belt System Description and Operation .

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0176: CONTROL MODULE TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC C0176

Control Module Temperature Sensor

Symptom Byte Information: Symptom Byte List

Circuit/System Description

For an overview of the component/system, refer to: **Power Steering System Description and Operation**

Conditions for Running the DTC

- Ignition = On/Vehicle = Service Mode
- Engine = Running
- System Voltage = 9 to 16 V

Conditions for Setting the DTC

Power Steering Control Module Temperature = 115 to 125Â°C (240 to 257Â°F)

Actions Taken When the DTC Sets

Power Steering Output Torque = Reduced

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Diagnostic Aids

This DTC does not indicate any system malfunction.To avoid thermal damage, the power steering control module limits the current to the power steering motor.Aggressive steering may cause reduced steering assist.Discuss with the customer about the driving conditions when the concern occurred.

Circuit/System Verification

NOTE: **A DTC may set depending on certain driving conditions and would not require a component replacement.Aggressive steering may cause reduced steering assist.Discuss with the customer about the driving conditions when the concern occurred.**

1. Operate the vehicle within the Conditions for Running the DTC. Verify the DTC does not set.
    - **If the DTC sets**
    1. Ignition/Vehicle - Off
    2. Verify the following conditions do not exist: Steering = Binding or Sticking
        - If a condition exists - Refer to: **Steering Effort Hard or Too Easy in One or Both Directions**
        - If no condition exists - Replace the component: K43 Power Steering Control Module
    - **If the DTC is not set**
2. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- For control module replacement, programming, and setup refer to: **Control Module References**

DTC C0460: STEERING WHEEL ANGLE SENSOR

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

DTC Descriptor

DTC C0460

Steering Wheel Angle Sensor

Symptom Byte Information: Symptom Byte List

Circuit/System Description

For an overview of the component/system, refer to: **ABS Description and Operation**

Conditions for Running the DTC

- K17 Electronic Brake Control Module = During control module power up
- Ignition Voltage = Greater than 8 V
- Vehicle Speed = Greater than 20 km/h (12 MPH)

Conditions for Setting the DTC

C0460 4B

Steering Wheel Angle Sensor = Calibration Not Learned

C0460 58

Steering Wheel Angle Sensor = Performance

C0460 5A

Steering Wheel Angle Sensor Signal = Not Plausible

Action Taken When the DTC Sets

Active Return and Software Endstops = Not Available

Conditions for Clearing the DTC

- A current DTC will clear on the next malfunction-free ignition cycle.
- A history DTC will clear after 40 consecutive malfunction-free ignition cycles.

Circuit/System Verification

C0460 4B

1. Ignition - On / Vehicle - In Service Mode
2. Verify DTC C0460 is not set.
   - **If the DTC is set**
   1. Perform the following procedure/test: **Power Steering Control Module Calibration**
   2. Verify the DTC does not set.
      - If the DTC sets - Replace the component: Steering Column
      - If the DTC is not set
   3. All OK.
   - **If the DTC is not set**
3. All OK.

C0460 58

NOTE: **Inspect the electrical connectors and the ground circuits of the component for poor connections.**

1.
2. Ignition - On / Vehicle - In Service Mode
3. Verify DTC C0460 58 is not set.
   - **If the DTC is set**

     Replace the component: Steering Gear

   - **If the DTC is not set**
4. Ignition/Vehicle - On
5. Rotate the steering wheel from left to right. Verify the scan tool parameter: Steering Wheel Angle - IncreaseorDecrease
   - If the parameter value does not change

     Replace the component: Steering Gear

   - If the parameter value changes
6. All OK.

C0460 5A

1. Ignition - On / Vehicle - In Service Mode
2. Verify DTC C0460 5A is not set.
   - **If the DTC is set**
   1. Verify the following conditions do not exist: Front wheel alignment - Incorrect adjustment - Refer to: **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment**
   2. Verify the scan tool parameter: Steering Wheel Angle = 0 degrees
      - **If not 0 Â°**
   3. Perform the following procedure/test: **Power Steering Control Module Calibration**
   4. Verify the DTC does not set.
      - If the DTC sets - Replace the component: Steering Gear
      - If the DTC does not set
   5. All OK.
   - **If 0 Â°**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

Steering Column Replacement

For control module replacement, programming, and setup refer to: **Control Module References**

DTC C0545: STEERING WHEEL TORQUE SENSOR

Diagnostic Instructions

NOTE: **Inspect the electrical connectors and the ground circuits of the component for poor connections.**

1. Ignition - On / Vehicle - In Service Mode
2. Verify DTC C0545 is not set.
   - **If the DTC is set**
   1. Rotate the steering wheel from left to right. Verify the scan tool parameter: Steering Input Torque - Increase
      - If the parameter value does not change

        Replace the component: Steering Column

      - If the parameter value changes
   2. All OK.
   - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: Diagnostic Repair Verification

- Steering Column Replacement
- For control module replacement, programming, and setup refer to: Control Module References

DTC C056E: ELECTRONIC CONTROL UNIT SOFTWARE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provide an overview of each diagnostic category.

DTC Descriptors

DTC C056E

Electronic Control Unit Software

For symptom byte information, refer to Symptom Byte List .

Circuit/System Description

After replacement of the power steering control module, the power steering control module must be configured with the proper tuning profile using the service programming system (SPS).

After replacement of the power steering control module, power steering motor, or steering gear, the steering position/torque sensor calibration procedure must be performed.

Conditions for Running the DTC

Ignition OFF, ACCESSORY, or RUN mode.

Conditions for Setting the DTC

The power steering control module has detected missing calibration data, calibration procedure not run or completed, missing VIN, or internal software malfunction.

Actions Taken When DTC Sets

- DTC is stored in memory.
- Steering assist is set to a default level.

Conditions for Clearing the DTC

A current or history DTC will clear after the power steering control module has been programmed and calibrated.

SYMPTOMS - POWER STEERING SYSTEM

NOTE: **Review the system description and operation in order to familiarize yourself with the system functions. Refer to Power Steering System Description and**

Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the power steering system.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Rattle, Clunk, Pop or Shudder Noise from the Power Steering System**
- **Whine or Growl Noise from the Power Steering System**
- **Increase in Effort While Turning Steering Wheel**
- **Poor Return of Steering Wheel**
- **Steering Wheel Surges/Jerks While Turning**
- **Steering Effort Hard or Too Easy in One or Both Directions**

RATTLE, CLUNK, POP OR SHUDDER NOISE FROM THE POWER STEERING SYSTEM

Step	Action	Yes	No
1	Did you review the Power Steering System Symptoms and perform the necessary inspections?	Go to Step 2	Go to **Symptoms - Power Steering System**
2	Verify that a rattle, clunk or shudder noise is present. Is a rattle, clunk or shudder noise present?	Go to Step 3	System OK
3	Inspect the power steering gear for the proper installation. Refer to **Steering Gear Replacement**. Is the power steering gear installation incorrect?	Go to Step 6	Go to Step 4
4	Inspect the intermediate shaft. Is the intermediate shaft worn?	Go to Step 8	Go to Step 5
5	Inspect the suspension. Is the suspension worn?	Go to Step 7	Go to **Noise Diagnosis - Front Suspension**
6	Install the power steering gear correctly. Refer to **Steering Gear Replacement**. Did you complete the repair?	Go to Step 9	-
7	Replace the worn suspension components. Did you complete the repair?	Go to Step 9	-
8	Replace the intermediate shaft. Refer to **Intermediate Steering Shaft Replacement** . Did you complete the repair?	Go to Step 9	-
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to Step 3

WHINE OR GROWL NOISE FROM THE POWER STEERING SYSTEM

Step	Action	Yes	No
1	Did you review the Power Steering System Symptoms and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Power Steering System**.
2	Verify that a whine or a growl noise is present. Is a whine or a growl noise present?	Go to **Step 3**	System OK

Step	Action	Yes	No
3	Inspect the power steering gear for the proper installation. Refer to **Steering Gear Replacement**. Is the power steering gear installation incorrect?	Go to **Step 6**	Go to **Step 4**
4	Inspect the intermediate shaft. Is the intermediate shaft worn?	Go to **Step 8**	Go to **Step 5**
5	Inspect the suspension. Is the suspension worn?	Go to **Step 7**	Go to **Noise Diagnosis - Front Suspension** .
6	Install the power steering gear correctly. Refer to **Steering Gear Replacement**. Did you complete the repair?	Go to **Step 9**	-
7	Replace the worn suspension components. Did you complete the repair?	Go to **Step 9**	-
8	Replace the intermediate shaft. Refer to **Intermediate Steering Shaft Replacement** . Did you complete the repair?	Go to **Step 9**	-
9	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

INCREASE IN EFFORT WHILE TURNING STEERING WHEEL

Step	Action	Yes	No
1	Did you review the Power Steering System Description and Operation and perform the necessary inspections?	Go to **Step 2**	Go to **Power Steering System Description and Operation**
2	Verify that there is an increase in effort while turning is present. Does the system operate normally?	System OK	Go to **Step 3**
3	Check for the following conditions: • Incorrect tire inflation - Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . • Improper tire size Did you find and correct the condition?	Go to **Step 10**	Go to **Step 4**
4	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Check for a binding or worn steering linkage outer tie rod. Is the tie rod binding or worn?	Go to **Step 7**	Go to **Step 5**
5	Check for a worn or binding intermediate steering shaft. Is the intermediate steering shaft worn or binding?	Go to **Step 8**	Go to **Step 6**
6	Check for a worn or binding steering gear. Is the steering gear worn or binding?	Go to **Step 9**	System OK
7	Replace the steering linkage outer tie rod. Refer to **Steering Linkage Outer Tie Rod Replacement**. Did you complete the repair?	Go to **Step 10**	-
8	Replace the intermediate steering shaft. Refer to **Intermediate Steering Shaft Replacement** . Did you complete the repair?	Go to **Step 10**	-

Step	Action	Yes	No
9	Replace the steering gear. Refer to **Steering Gear Replacement**. Did you complete the repair?	Go to **Step 10**	-
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

POOR RETURN OF STEERING WHEEL

Step	Action	Yes	No
DEFINITION: After completing a turn, extra steering input is required for the steering wheel to return to center.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Power Steering System Description and Operation**
2	Verify that poor return of the steering wheel is present. Does the system operate normally?	System OK	Go to **Step 3**
3	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Lubricate the tie rod ends and ball joints, if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. Did you find and correct the condition?	Go to **Step 12**	Go to **Step 4**
4	1. Rotate the steering wheel ONE revolution in both directions. 2. Rotate the steering wheel back to the original position. Was the steering wheel abnormally difficult to rotate in either direction?	Go to **Step 5**	Go to **Step 10**
5	**NOTE:** **Position the wheels straight ahead. Do NOT rotate the steering wheel more than one complete revolution from center.** 1. Disconnect the intermediate shaft from the steering column. 2. Note the position of the steering wheel and rotate the steering wheel ONE revolution in both directions. 3. Rotate the steering wheel back to the original position. Was the steering wheel abnormally difficult to rotate in either direction?	Go to **Step 11**	Go to **Step 6**
6	Inspect the intermediate shaft for stiff or loose joints. Repair or replace as necessary. Refer to **Intermediate Steering Shaft Replacement** . Did you find and complete the repair?	Go to **Step 12**	Go to **Step 7**

Step	Action	Yes	No
7	1. Remove the front tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation** . 2. Disconnect both outer tie rod ends from the steering knuckles. 3. Use your hands in order to move the tie rod end studs. 4. If abnormally difficult to move, replace the tie rod end. Refer to **Steering Linkage Outer Tie Rod Replacement**. Did you find and complete the repair?	Go to **Step 12**	Go to **Step 8**
8	1. Use your hands to rotate the steering knuckle inboard and outboard in order to inspect for a binding strut bearings, ball joints, or axle. 2. Repair or replace any abnormally stiff or loose components. Did you find and complete the repair?	Go to **Step 12**	Go to **Step 9**
9	Inspect for binding in the steering gear. If a binding is present repair or replace the steering gear. Refer to **Steering Gear Replacement**. Did you find and complete the repair?	Go to **Step 12**	Go to **Step 10**
10	Inspect the wheel alignment and adjust as necessary. Refer to **Wheel Alignment Measurement** . Did you find and complete the repair?	Go to **Step 12**	-
11	Inspect the steering column for a binding. If a binding is present, repair or replace the steering column as necessary. Refer to **Steering Column Replacement** . Did you find and complete the repair?	Go to **Step 12**	-
12	Operate the system in order to verify the repair. Did you correct the condition?	System OK	-

STEERING WHEEL SURGES/JERKS WHILE TURNING

Step	Action	Yes	No
1	Did you perform the Diagnostic Starting Point - Power Steering System?	Go to **Step 2**	Go to **Symptoms - Power Steering System**
2	Verify that the steering wheel surges/jerks while turning. Does the system operate normally?	System OK	Go to **Step 3**
3	Check for worn or binding front suspension components. Did you find and correct the condition?	Go to **Step 14**	Go to **Step 4**
4	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** . 2. Check for a binding or worn rack and pinion outer tie rod end. Is the rack and pinion outer tie rod end binding or worn?	Go to **Step 10**	Go to **Step 5**

Step	Action	Yes	No
5	Check for a worn or binding intermediate steering shaft. Is the intermediate steering shaft worn or binding?	Go to **Step 11**	Go to **Step 6**
6	Check for a worn or binding steering gear. Is the steering gear worn or binding?	Go to **Step 12**	Go to **Step 7**
7	Check for a worn or binding steering column. Is the steering column worn or binding?	Go to **Step 13**	Go to **Step 8**
8	Check for excessive heat in the electric power steering (EPS) motor. Does the EPS motor appear to be overheated?	Go to **Step 9**	Go to **Step 13**
9	**NOTE:** **Do not perform excessive parking lot maneuvers during testing, that can cause the EPS motor to heat up.** Allow the EPS motor to cool and retest the system.Did you correct the condition?	Go to **Step 14**	Go to **Step 13**
10	Replace the steering linkage outer tie rod end. Refer to **Steering Linkage Outer Tie Rod Replacement**. Did you complete the repair?	Go to **Step 14**	-
11	Replace the intermediate steering shaft. Refer to **Intermediate Steering Shaft Replacement** . Did you complete the repair?	Go to **Step 14**	-
12	Replace the steering gear. Refer to **Steering Gear Replacement**. Did you complete the repair?	Go to **Step 14**	-
13	Replace the steering column. Refer to **Steering Column Replacement** . Did you complete the repair?	Go to **Step 14**	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

STEERING EFFORT HARD OR TOO EASY IN ONE OR BOTH DIRECTIONS

Condition	Action
The battery power is low.	Ensure proper battery voltage.
One or both of the intermediate steering shaft boots are binding.	Adjust or replace the intermediate steering shaft boots and/or intermediate steering shaft. Refer to **Intermediate Steering Shaft Inner Boot Replacement** , and **Intermediate Steering Shaft Replacement** .
The intermediate steering shaft joints and/or fasteners are worn or binding.	Tighten or replace the intermediate steering shaft joints and/or fasteners. Refer to **Intermediate Steering Shaft Replacement** .
The steering gear is binding.	Replace the steering gear. Refer to **Steering Gear Replacement**.
The upper steering shaft is bent.	Replace the steering column. Refer to **Steering Column Replacement** .
The connectors to the power steering assist motor are damaged or disconnected.	Verify the connectors are properly connected. Verify the connectors are not damaged. If the connectors are damaged, replace the connectors.
The power steering control module is malfunctioning.	Confirm the DTC. Replace the steering column. Refer to **Steering Column Replacement** .
The power steering assist motor shaft is binding.	Confirm the DTC. Replace the steering column. Refer to **Steering Column Replacement** .

REPAIR INSTRUCTIONS

STEERING LINKAGE OUTER TIE ROD REPLACEMENT

1	Steering Linkage Inner Tie Rod **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Place a wrench on the flats of the steering linkage inner tie rod housing. 2. Rotate the steering linkage inner tie rod housing counterclockwise to remove the steering linkage inner tie rod from the steering gear rack. 3. Rotate the steering linkage inner tie rod housing clockwise to install the steering linkage inner tie rod to the steering gear rack. 4. Use the **CH-41240-2** wrench and a torque wrench to tighten the steering linkage inner tie rod to specification. 5. Measure and adjust the front toe. **Wheel Alignment - Steering Wheel Angle and/or Front Toe Adjustment** **Tighten** 80 N.m (59 lb ft) **Special Tools** **CH-41240-2** Wrench Equivalent regional tools: **Special Tools**

POWER STEERING CONTROL MODULE CALIBRATION

Steering Angle Sensor Centering and Software Endstop Learning

WARNING: **An inaccurate or not centered steering angle sensor could limit the operation of the electric power steering and may result in personal injury.**

Centering of the steering angle sensor and software endstop learning might be required after certain service procedures are performed. Some of these procedures are as follows:

- Steering angle sensor replacement
- Steering gear replacement
- Power steering assist motor replacement
- Steering column replacement
- Steering linkage inner tie rod replacement
- Steering linkage outer tie rod replacement

NOTE: **It is necessary to perform the steering angle sensor centering BEFORE the software endstop learning.**

Internal Steering Angle Sensor Centering

NOTE: **Ensure the front wheels are facing straight ahead before turning the engine off.**

The centering procedure of the internal steering angle sensor can be completed with the following steps:

Conditions: Front axle measured and set, engine off, vehicle speed 0 km/h (0 MPH), internal steering angle sensor is activated.

1. Using the steering wheel, align the front wheels in the center forward position.
2. Using a scan tool, perform the Configuration/Reset Functions, Steering Wheel Angle Sensor Centering procedure.
3. Steer from the center position slowly 90Â° to the left.
4. Steer slowly back to the center position and then slowly 90Â° to the right.
5. Steer slowly back to the center position.
6. Perform the steering movements again.
7. Centering procedure is completed.

Software Endstop Learning

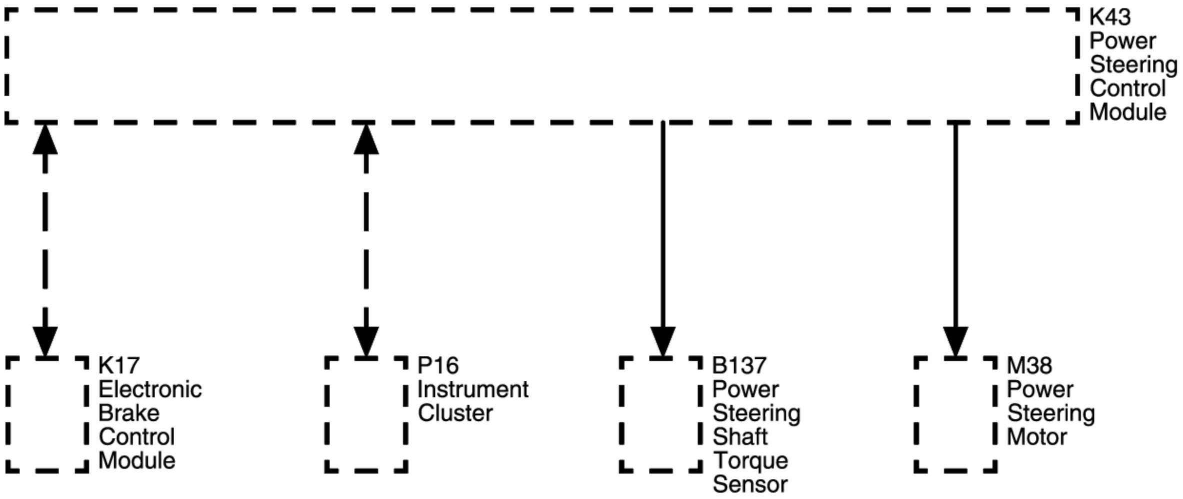
The software endstop learning procedure can be completed with the following steps:

Conditions: Front axle measured and set, vehicle speed 0 km/h (0 MPH), internal steering angle sensor is calibrated or external steering angle sensor sends a valid CAN signal.

1. Using a scan tool, perform the Configuration/Reset Functions, Power Steering Softstops Reset procedure and follow the on-screen instructions.
2. Rotate the steering wheel to the left until the endstop is reached and hold position for 2 seconds.
3. Rotate the steering wheel to the right until the endstop is reached and hold position for 2 seconds.
4. Return the steering wheel to the center position.
5. Software endstop learning procedure is completed.

DESCRIPTION AND OPERATION

POWER STEERING SYSTEM DESCRIPTION AND OPERATION



K43 Power Steering Control Module
K17 Electronic Brake Control Module
P16 Instrument Cluster
B137 Power Steering Shaft Torque Sensor
M38 Power Steering Motor

Fig. 11: Power Steering System Diagram
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
K43	K43 Power Steering Control Module
K17	K17 Electronic Brake Control Module
P16	P16 Instrument Cluster
B137	B137 Power Steering Shaft Torque Sensor
M38	M38 Power Steering Motor

The electric power steering system reduces the amount of effort needed to steer the vehicle. The system uses the body control module, power steering control module, torque sensor, discrete battery voltage supply circuit, electric power steering motor, serial data bus, and the instrument panel cluster message center to perform the system functions. Any electric power steering components diagnosed to be malfunctioning requires replacement of the steering column assembly, also known as the electric power steering assembly.

Torque Sensor

The power steering control module uses a torque sensor as it's main input for determining the amount of steering assist. The steering column has an input shaft, from the steering wheel to the torque sensor, and an output shaft, from the torque sensor to the steering shaft coupler. The input and output shafts are separated by a torsion bar, where the torque sensor is located. The sensor consists of a compensation coil, detecting coil and 3 detecting rings. These detecting rings have toothed edges that face each other. Detecting ring 1 is fixed to the output shaft, detecting rings 2 and 3 are fixed top the input shaft. The detecting coil is positioned around the toothed edges of detecting rings 1 and 2. As torque is applied to the steering column shaft the alignment of the teeth between detecting rings 1 and 2 changes, which causes the detecting coil signal voltage to change. The power steering control module recognizes this change in signal voltage as steering column shaft torque. The compensation coil is used to compensate for changes in electrical circuit impedance due to circuit temperature changes from the electrical current and voltage levels as well as ambient temperatures for accurate torque detection.

EPS Motor

The electric power steering motor is a 12-volt brushed DC reversible motor. The motor assists steering through a worm shaft and reduction gear located in the steering column housing.

Power Steering Control Module

The power steering control module uses a combination of torque sensor inputs, vehicle speed, calculated system temperature and the steering calibration to determine the amount of steering assist. When the steering wheel is turned, the power steering control module uses signal voltage from the torque sensor to detect the amount of torque being applied to the steering column shaft and the amount of current to command to the electric power steering motor. The power steering control module receives serial data from the engine control module to determine vehicle speed. At low speeds more assist is provided for easy turning during parking maneuvers. At high speeds, less assist is provided for improved road feel and directional stability. In this mode the power steering control module will limit the amount of current commanded to the electric power steering motor which reduces steering assist levels. The power steering control module also chooses which steering calibration to use when the ignition is turned ON, based on the production map number stored in the body control module. The power steering control module contains all 8 of the steering calibrations which are different in relation to the vehicles RPOs. The power steering control module has the ability to detect malfunctions within the electric power steering system. Any malfunction detected will cause the instrument panel cluster message center to display a warning message.

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - STEERING WHEEL AND COLUMN

NOTE: **Review the system operation in order to familiarize yourself with the system functions.**

Refer to **Steering Wheel and Column Description and Operation**.

Symptoms List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **High Effort While Tilting Column**
- **Noise in Steering Column**
- **Looseness in Steering Column**

HEATED STEERING WHEEL INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Switch Signal	2	1	-	-
LED Control	3	3	4	-
Switch and LED Ground	-	1	-	-
Module Ground	-	1	-	-
1. Heated Steering Wheel System Inoperative 2. Heated Steering Wheel Always ON 3. LED Inoperative 4. LED Always ON				

Circuit/System Description

The Steering Wheel Heating Control Module controls the heated steering wheel and the heated steering wheel ON indicator based on an input from the heated steering wheel switch. When the heated steering wheel switch is pressed, the switch signal circuit is pulled to ground. This indicates to the heating steering wheel control module that steering wheel heat is requested. When the request is seen, the heated steering module supplies voltage to the indicator lamp and supplies voltage to the heating elements, which are internal to the steering wheel.

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Steering Wheel and Column Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Circuit/System Verification

1. Ignition ON, heated steering wheel OFF.
2. Verify the steering wheel heater indicator on the S70L Steering Wheel Controls Switch - Left is not illuminated and the steering wheel is not warm.
   - **If the steering wheel is warm**

     Refer to Heated Steering Wheel Malfunction

   - **If the steering wheel is not warm and the steering wheel heater indicator is illuminated**

     Refer to Circuit/System Testing

   - **If the steering wheels heater indicator is not illuminated and the steering wheel is not warm**
3. Verify the steering wheel heater indicator turns ON and OFF and the left and right sides of the steering wheel become warm when pressing and releasing the steering wheel heater switch on the S70L Steering Wheels Controls Switch - Left.
   - **If the steering wheel does not become warm**

     Refer to Heated Steering Wheel Malfunction

   - **If the steering wheel becomes warm, but the steering wheel heater indicator does not turn ON and OFF**

     Refer to Circuit/System Testing

   - **If the steering wheel becomes warm and the steering wheel heater indicator turns ON and OFF**
4. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the X85 Steering Wheel Airbag Coil.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 9 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse. Refer to Power Mode Mismatch .
      - If 2 Ω or greater
   3. Verify the in-line fuse is OK and there is voltage at the fuse.
      - If the in-line fuse is open, replace the K32 Steering Wheel Heating Control Module.

    - If the in-line fuse is OK, repair the open/high resistance in the circuit.
  - **If the test lamp does not illuminate and the circuit fuse is open**
  1. Ignition OFF.
  2. Test for infinite resistance between the ignition voltage circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K32 Steering Wheel Heating Control Module.
  - **If the test lamp illuminates**

5. Ignition OFF, connect the X2 harness connector at the X85 Steering Wheel Airbag Coil. Disconnect the harness connector at the S70L Steering Wheel Control Switch - Left. Ignition ON.
6. Test for B+ between the control circuit terminal 4 and ground.
  - **If less than B+**
  1. Ignition OFF, disconnect the harness connector at the S70R Steering Wheel Control Switch - Right.
  2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
  3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the S70R Steering Wheel Control Switch - Right.
  - **If B+**
7. Ignition OFF, connect the harness connector at the S70L Steering Wheel Control Switch - Left. Disconnect the harness connector at the K32 Steering Wheel Heating Control Module.

NOTE: **Verify the instrument panel dimming control is set to bright.**

8. Install a 3 A fused jumper wire between the control circuit terminal 2 and ground. Ignition ON.
9. Verify the steering wheel heat indicator is illuminated.
  - **If the steering wheel heat indicator does not illuminate**

    Replace the S70L Steering Wheel Control Switch - Left

  - **If the steering wheel heat indicator illuminates**
10. Replace the K32 Steering Wheel Heating Control Module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Cruise Control Switch Replacement
- Control Module References for control module replacement, programming and setup.

HEATED STEERING WHEEL MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.

Circuit/System Description

The heated steering wheel control module controls the heated steering wheel and the heated steering wheel ON indicator based on an input from the heated steering wheel switch. When the heated steering wheel switch is pressed, the switch signal circuit is pulled to ground. This indicates to the heating steering wheel control module that steering wheel heat is requested. When the request is seen, the heated steering wheel control module supplies voltage to the indicator lamp and supplies voltage to the heating elements, which are internal to the steering wheel.

Diagnostic Aids

- Before replacing the steering wheel for complaints of not getting hot enough, a reliable infrared temperature gun should be used to measure the temperature at various points around the rim. The steering wheel's normal operating temperature is 32Â°C (89.6Â°F) and takes approximately 10 min to reach that temperature. It may take up to 20 min for the normal operating temperature to stabilize within the steering wheel rim. There may be spike in temperature during the first 3 - 4 min before it stabilizes at normal operating temperature. The steering wheel will take longer to heat up if the vehicle temperature is below -21Â°C (-5.8Â°F). The steering wheel heater will not operate when the steering wheel temperature is above 32Â°C (89.6Â°F).

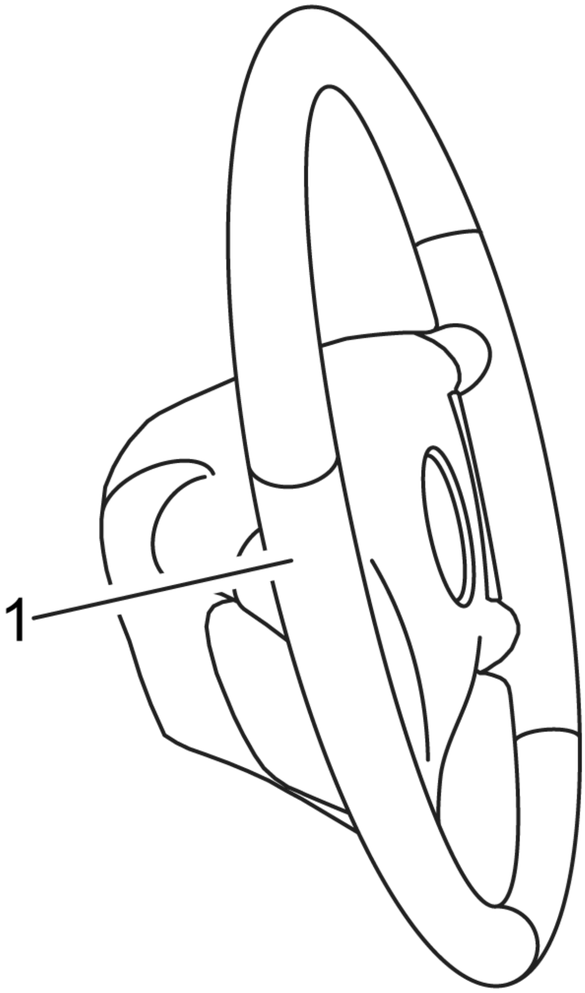

Fig. 3: Steering Wheel Rim Measurement Point
Courtesy of GENERAL MOTORS COMPANY

- The infrared measurements are made at the rim (1) at the 3 and 9 o'clock positions of the steering wheel.

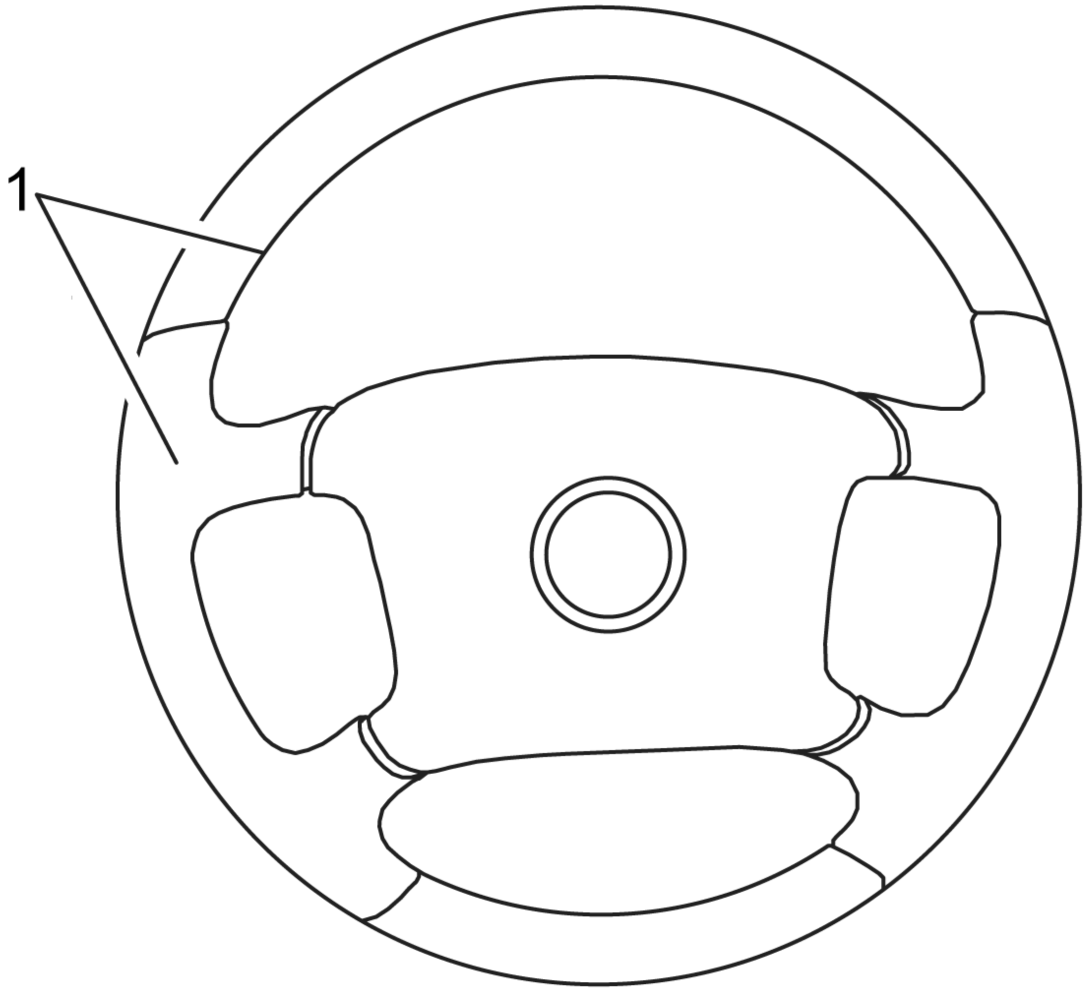

Fig. 4: Temperature Measurement Points
Courtesy of GENERAL MOTORS COMPANY

- The wood sections and the stitching are not heated. Temperature measurements should not be made on the face (1) to insure accurate temperature readings.

- **Wiring Repairs**

Circuit/System Verification

Using an Infrared Temperature Gun

1. Engine running, all accessories OFF.
2. Verify the steering wheel heater switch is OFF and the steering wheel heater indicator should not be illuminated.
    - **If the heater indicator is illuminated**

      Refer to **Heated Steering Wheel Indicator Malfunction**

    - **If the heater indicator is not illuminated**

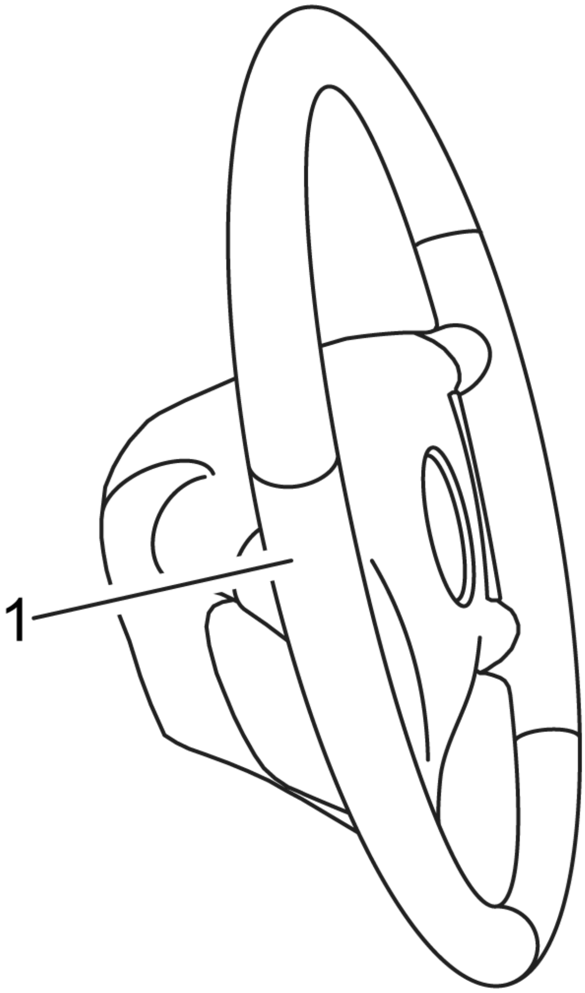

Fig. 5: Steering Wheel Rim Measurement Point
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The Infrared Temperature Gun should be within 50.8mm (2 in) and parallel to the steering wheel rim when taking temperature readings.**

3. Measure the temperature readings at the 3 and 9 o'clock positions on the steering wheel rim (1).
4. Verify that the steering wheel temperature is 25Â°C (77Â°F) or below.
    - **If the steering wheel temperature is greater than 25Â°C (77Â°F)**

      Allow the steering wheel to cool before proceeding to next step.

    - **If the steering wheel temperature is 25Â°C (77Â°F) or below**
5. Press and release the steering wheel heater switch. The steering wheel heater indicator should illuminate. Allow the steering wheel to heat for a minimum of 10 min so that the temperature stabilizes.
    - **If the heater indicator does not illuminate**

      Refer to **Heated Steering Wheel Indicator Malfunction**

- **If the heater indicator illuminates**

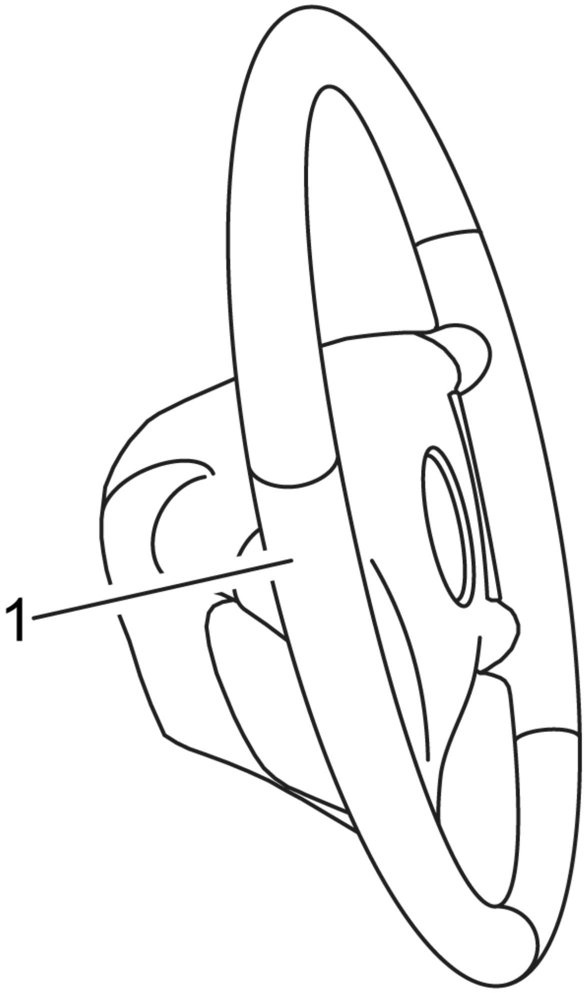

Fig. 6: Steering Wheel Rim Measurement Point
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The Infrared Temperature Gun should be within 50.8mm (2 in) and parallel to the steering wheel rim when taking temperature readings.**

6. Measure the temperature readings at the 3 and 9 o'clock positions on the steering wheel rim (1).
7. Verify that the steering wheel temperature is greater than 28Â°C (82.4Â°F) within 20 min.
    - **If after 20 minutes the measured temperature is less than 28Â°C (82.4Â°F)**

      Refer to Circuit System Testing.

    - **If after 20 minutes the measured temperature is 28Â°C (82.4Â°F) or greater**
8. All OK.

Circuit/System Testing

1. Ignition OFF, disconnect the X2 harness connector at the X85 Steering Wheel Airbag Coil.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**

3. Ignition ON.
4. Verify a test lamp illuminates between the ignition circuit terminal 9 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse. Refer to **Power Mode Mismatch** .
        - If 2 Ω or greater
    3. Verify the in-line fuse is OK and there is voltage at the fuse.
        - If the in-line fuse is open, replace the K32 Steering Wheel Heating Control Module.
        - If the in-line fuse is OK, repair the open/high resistance in the circuit.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF.
    2. Test for infinite resistance between the ignition voltage circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K32 Steering Wheel Heating Control Module.
    - **If the test lamp illuminates**
5. Ignition OFF, connect the X2 harness connector at the X85 Steering Wheel Airbag Coil. Disconnect the harness connector at the S70L Steering Wheel Control Switch - Left.
6. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
7. Ignition ON.
8. Test for B+ between the signal circuit terminal 8 and ground.
    - **If less than B+**
    1. Ignition OFF, disconnect the in-line harness connector at the K32 Steering Wheel Heating Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K32 Steering Wheel Heating Control Module.
    - **If B+**
9. Test for infinite resistance between the S70L Steering Wheel Control Switch - Left signal terminal 8 and the ground terminal 1 with the steering wheel heater switch released.
    - **If less than infinite resistance**

      Replace the S70L Steering Wheel Controls Switch - Left.

    - **If infinite resistance**
10. Test for less than 40 Ω between the S70L Steering Wheel Control Switch - Left signal terminal 8 and the ground terminal 1 with the steering wheel heater switch pressed.
    - **If 40 Ω or greater**

      Replace the S70L Steering Wheel Controls Switch - Left

    - **If less than 40 Ω**

11. Connect the harness connector at the S70L Steering Wheel Control Switch - Left. Disconnect the harness connector at the E15 Steering Wheel Heater.
12. Test for less than 10 Ω between the ground circuits listed below and ground.
    - Terminal 1
    - Terminal 4
    - **If 10 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 10 Ω**
13. Test for 1.5 - 3.0 Ω between the control circuit terminal 3 and the ground terminal 4.
    - **If not within the specified range**

      Replace the E15 Steering Wheel Heater.

    - **If within the specified range**
14. Test for 9 - 11k Ω between the signal circuit terminal 1 and the ground terminal 2.
    - **If not within the specified range**

      Replace the E15 Steering Wheel Heater.

    - **If within the specified range**
15. Replace the K32 Steering Wheel Heating Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Cruise Control Switch Replacement**
- **Control Module References** for control module replacement, programming and setup.

HIGH EFFORT WHILE TILTING COLUMN

Condition	Action
The pivot bolt is damaged or misaligned.	If necessary, replace the steering column. Refer to **Steering Column Replacement**.

NOISE IN STEERING COLUMN

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and perform the necessary inspections?	**Go to Step 2**	Go to **Symptoms - Steering Wheel and Column**
2	Verify that noise is present in the steering column during operation. Is noise present in the steering column during operation?	**Go to Step 3**	System OK
3	Inspect the steering column mounting features for the following conditions: • Steering column mounting fasteners for looseness • Steering column mounting features are sheared Are the steering column mounting features loose?	**Go to Step 9**	**Go to Step 4**
4	Inspect the SIR/SRS coil for noise. Is the SIR/SRS coil noisy?	**Go to Step 10**	**Go to Step 5**

Step	Action	Yes	No
5	Inspect the lock plate retaining ring for correct installation. Is the lock plate retaining ring installed incorrectly?	**Go to Step 11**	**Go to Step 6**
6	Inspect the steering column upper and lower bearings for the following conditions: - Damage - Lubrication - Wear - Proper seating Are the bearings in need of repair or replacement?	**Go to Step 12**	**Go to Step 7**
7	Does the tilt joint need to be lubricated?	**Go to Step 13**	**Go to Step 8**
8	**NOTE:** **This is best evaluated while driving the vehicle, turning the steering and applying the brake pedal.** Inspect the intermediate steering shaft for noise.Is the intermediate steering shaft noisy?	**Go to Step 14**	**Go to Step 15**
9	**NOTE:** **If the steering column mounting is damaged or sheared, the steering column will need to be replaced. Refer to Steering Column Replacement.** Tighten the steering column mounting fasteners to specifications. Refer to **Fastener Specifications**.Did you complete the repair?	**Go to Step 15**	-
10	Replace the SIR/SRS coil. Refer to **Steering Wheel Airbag Coil Replacement** . Did you complete the repair?	**Go to Step 15**	-
11	Install the lock plate retaining ring correctly. Did you complete the repair?	**Go to Step 15**	-
12	**NOTE:** **If the steering column upper and/or lower bearings are not serviceable, the steering column will need to be replaced. Refer to Steering Column Replacement.** Replace the upper and/or lower bearing, if serviceable.Did you complete the repair?	**Go to Step 15**	-
13	Lubricate the tilt joint. Did you complete the repair?	**Go to Step 15**	-
14	Replace the appropriate intermediate steering shaft component. Refer to **Intermediate Steering Shaft Replacement**. Did you complete the repair?	**Go to Step 15**	-
15	Operate the system in order to verify the repair. Did you correct the condition?	System OK	**Go to Step 3**

LOOSENESS IN STEERING COLUMN

Step	Action	Yes	No

Step	Action	Yes	No
1	Did you review the Steering Wheel and Column Description and perform the necessary inspections?	**Go to Step 2**	Go to **Steering Column Replacement**
2	Verify that the steering column is loose. Is the steering column loose?	**Go to Step 3**	System OK
3	Inspect the steering column mounting features for the following conditions. • Steering column mounting fasteners for looseness • Steering column mounting features are sheared Are the steering column mounting features loose?	**Go to Step 5**	**Go to Step 4**
4	Inspect the upper and/or lower bearings for looseness. Are any of the bearings worn or loose?	**Go to Step 6**	**Go to Step 7**
5	**NOTE:** **If the steering column mounting is damaged or sheared, the steering column will need to be replaced. Refer to Steering Column Replacement.** Tighten the steering column mounting fastener to specifications. Refer to **Fastener Specifications**.Did you complete the repair?	**Go to Step 7**	-
6	**NOTE:** **If the steering column mounting is damaged or sheared, the steering column will need to be replaced. Refer to Steering Column Replacement.** Replace the upper and/or lower bearings, if serviceable.Did you complete the repair	**Go to Step 7**	-
7	Operate the system in order to verify the repair. Did you correct the condition?	System OK	**Go to Step 3**

REPAIR INSTRUCTIONS

INTERMEDIATE STEERING SHAFT INNER BOOT REPLACEMENT

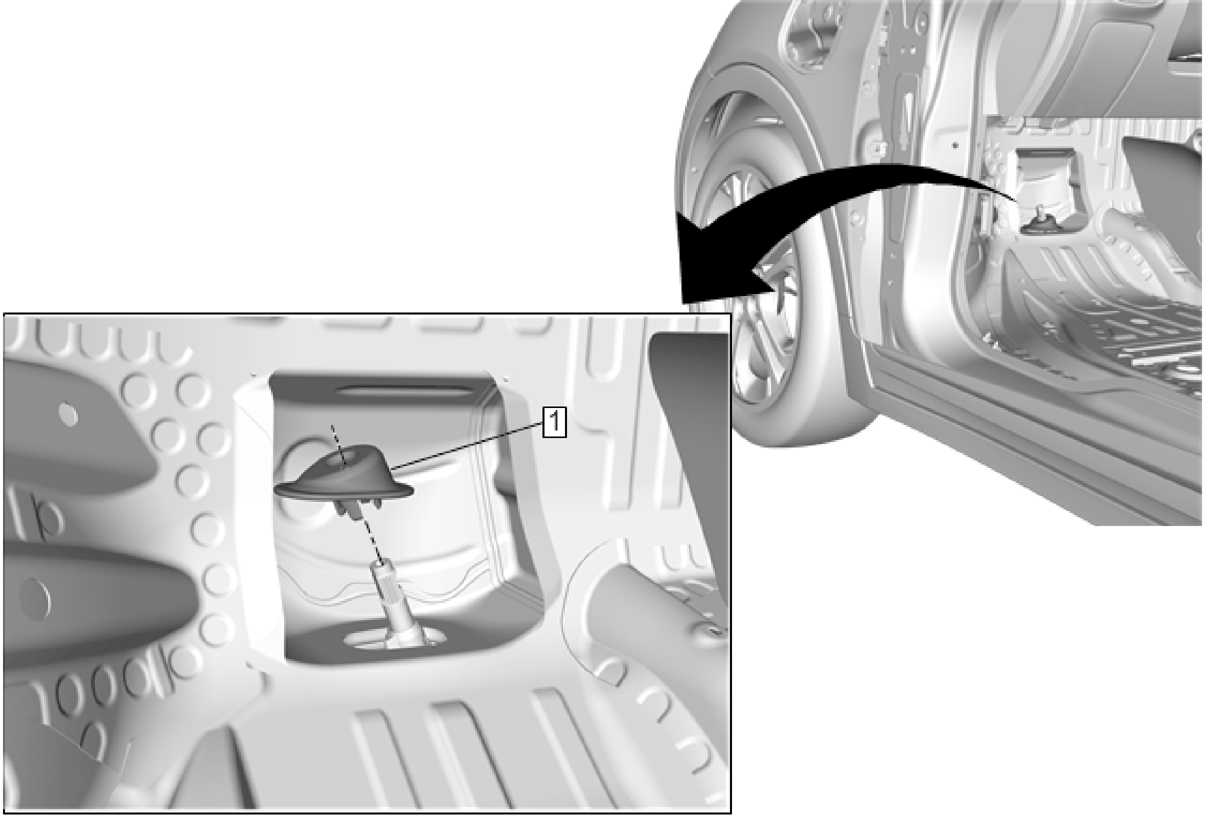

Fig. 7: Intermediate Steering Shaft Inner Boot
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Intermediate Steering Shaft at Steering Gear Pinion Shaft - Disconnect - **Intermediate Steering Shaft Replacement**	
1	Intermediate Steering Shaft Inner Boot **Procedure** 1. Ensure that the steering wheel is set in a straight ahead position and centered. 2. Lift the rubber lip of the intermediate steering shaft inner boot upward to reduce the friction when the intermediate steering shaft inner boot is rotated. 3. Push the intermediate steering shaft inner boot and then rotate it about 45 degrees counterclockwise to release the lock. 4. Remove the intermediate steering shaft inner boot from the steering gear. 5. Position the intermediate steering shaft inner boot over the steering gear and on the dash panel. Ensure the lip on the seal is positioned correctly.

INTERMEDIATE STEERING SHAFT REPLACEMENT

Removal Procedure

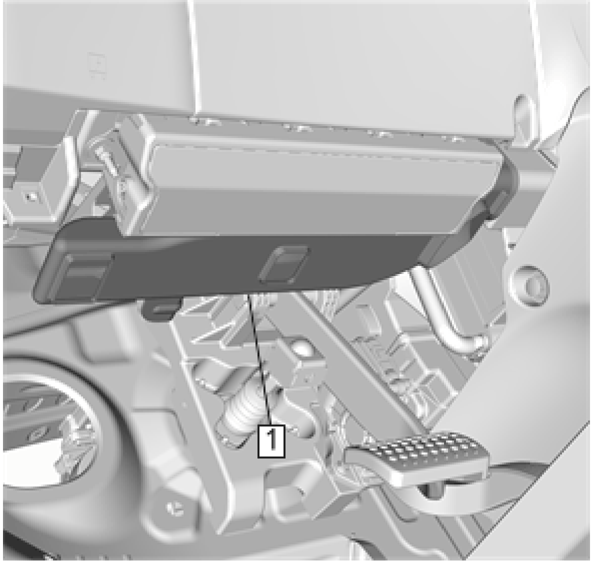

Fig. 8: Floor Front Air Outlet Duct - Left Side
Courtesy of GENERAL MOTORS COMPANY

1. Floor Front Air Outlet Duct - Left Side - Remove - Floor Front Air Outlet Duct Replacement - Left Side

CAUTION: **With wheels of the vehicle facing straight ahead, secure the steering wheel utilizing steering column anti-rotation pin, steering column lock, or a strap to prevent rotation. Locking of the steering column will prevent damage and a possible malfunction of the SIR system. The steering wheel must be secured in position before disconnecting the following components:**

- **The steering column**
- **The intermediate shaft(s)**
- **The steering gear**

After disconnecting these components, do not rotate the steering wheel or move the front tires and wheels. Failure to follow this procedure may cause the SIR coil assembly to become un-centered and cause possible damage to the SIR coil. If you think the SIR coil has become un-centered, refer to your specific SIR coil's centering procedure to re-center SIR Coil.

2. Turn the steering wheel to the straight ahead position and secure the steering wheel from moving.

6. Intermediate Steering Shaft Upper Bolt - Remove
7. Intermediate Steering Shaft at Steering Column Shaft - Disconnect
8. Intermediate Steering Shaft at Vehicle - Remove

Installation Procedure

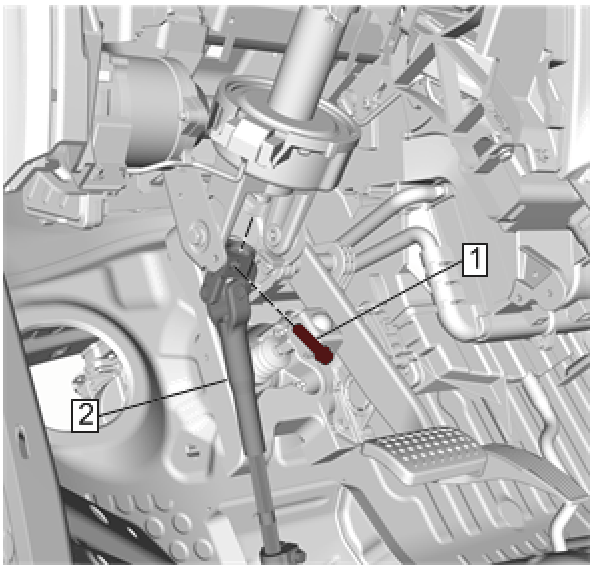

Fig. 11: Intermediate Steering Shaft Upper Bolt
Courtesy of GENERAL MOTORS COMPANY

1. Intermediate Steering Shaft at Vehicle - Install

NOTE: **The recess of the fine tooth in the universal joint have to be precisely aligned to the recess of the fine tooth on the steering column shaft. The bore in the universal joint have to be aligned to the groove on the steering column shaft.**

2. Intermediate Steering Shaft at Steering Column Shaft - Connect

CAUTION: **Refer to Fastener Caution .**

3. Intermediate Steering Shaft Upper Bolt - Install and tighten to 49 N.m (36 lb ft)

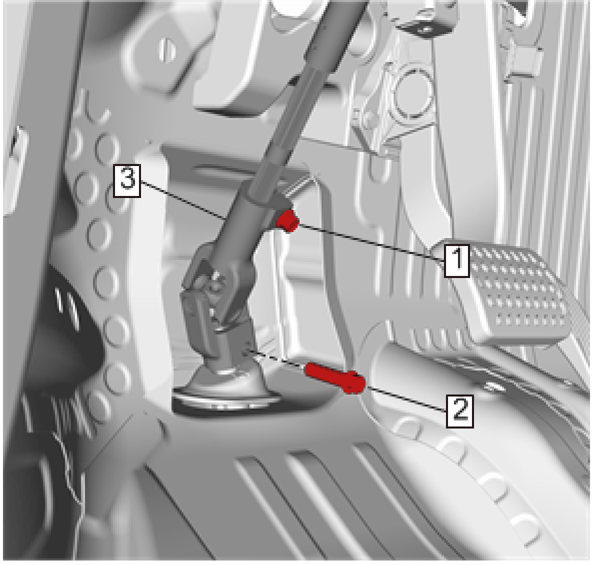

Fig. 12: Intermediate Steering Shaft Middle Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The recess of the fine tooth in the universal joint have to be precisely aligned to the recess of the fine tooth on the steering gear pinion. The bore in the universal joint have to be aligned to the groove on the steering gear pinion.**

4. Intermediate Steering Shaft at Steering Gear Pinion Shaft - Connect
5. Intermediate Steering Shaft Lower Bolt - Install and tighten to 57 N.m (42 lb ft)
6. Intermediate Steering Shaft Middle Bolt - Tighten to 49 N.m (36 lb ft)

4. Instrument Panel Trim Pad-Left Side at Vehicle - Install - **Instrument Panel Trim Pad Replacement - Left Side**

STEERING COLUMN LOWER TRIM COVER REPLACEMENT

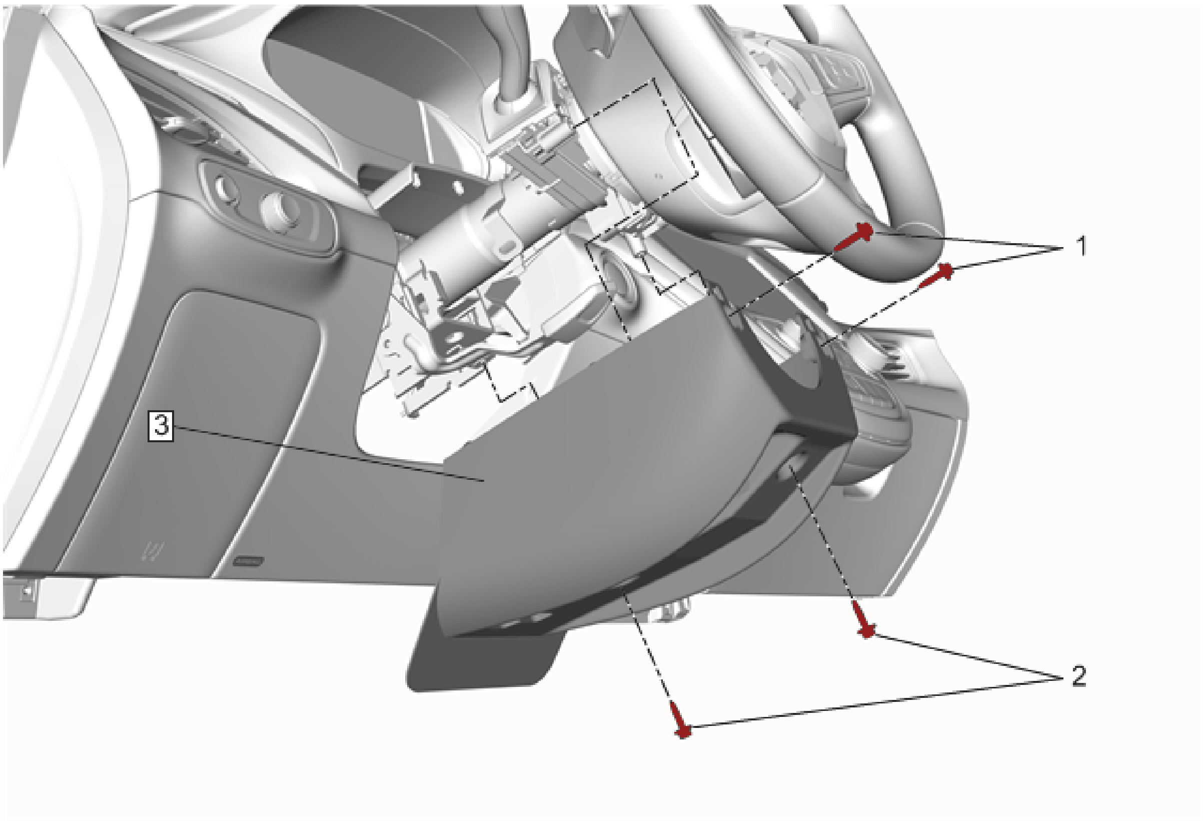

Fig. 20: Steering Column Lower Trim Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Instrument Panel Steering Column Upper Trim Cover at Instrument Panel Steering Column Lower Trim Cover - Separate - **Steering Column Upper Trim Cover Replacement**	

Callout	Component Name
1	Instrument Panel Steering Column Lower Trim Cover Bolt **CAUTION:** **Refer to Fastener Caution .** **Procedure** Rotate the steering wheel left and right to access the fasteners securing the lower trim cover to the turn signal switch bracket. **Tighten** 2.5 N.m (22 lb in)
2	Instrument Panel Steering Column Lower Trim Cover Bolt **Tighten** 2.5 N.m (22 lb in)
3	Instrument Panel Steering Column Lower Trim Cover

TURN SIGNAL SWITCH REPLACEMENT

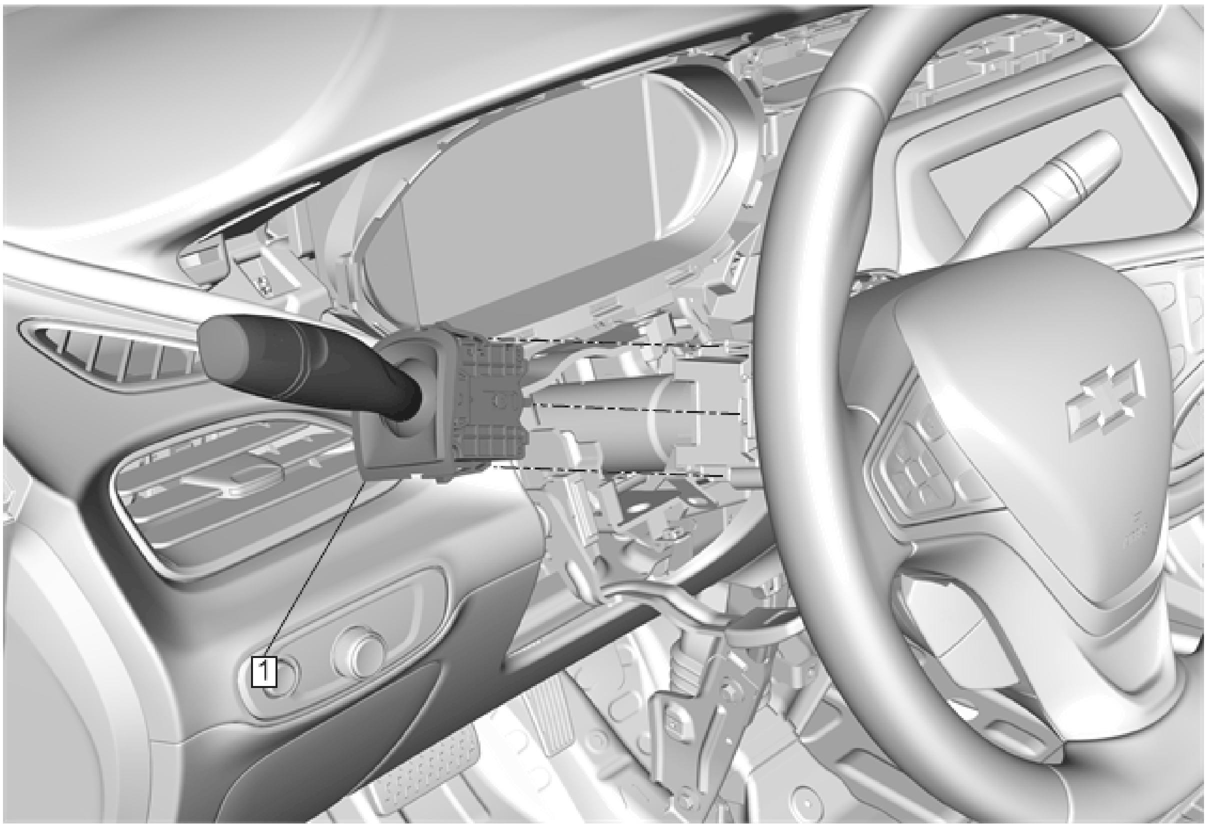

Fig. 21: Turn Signal Switch

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Steering Column Lower Trim Cover Replacement	
1	Turn Signal Switch **Procedure** 1. Disconnect the electrical connector. 2. Release the retaining tabs and remove the turn signal switch from the turn signal switch bracket.

TURN SIGNAL SWITCH BRACKET REPLACEMENT

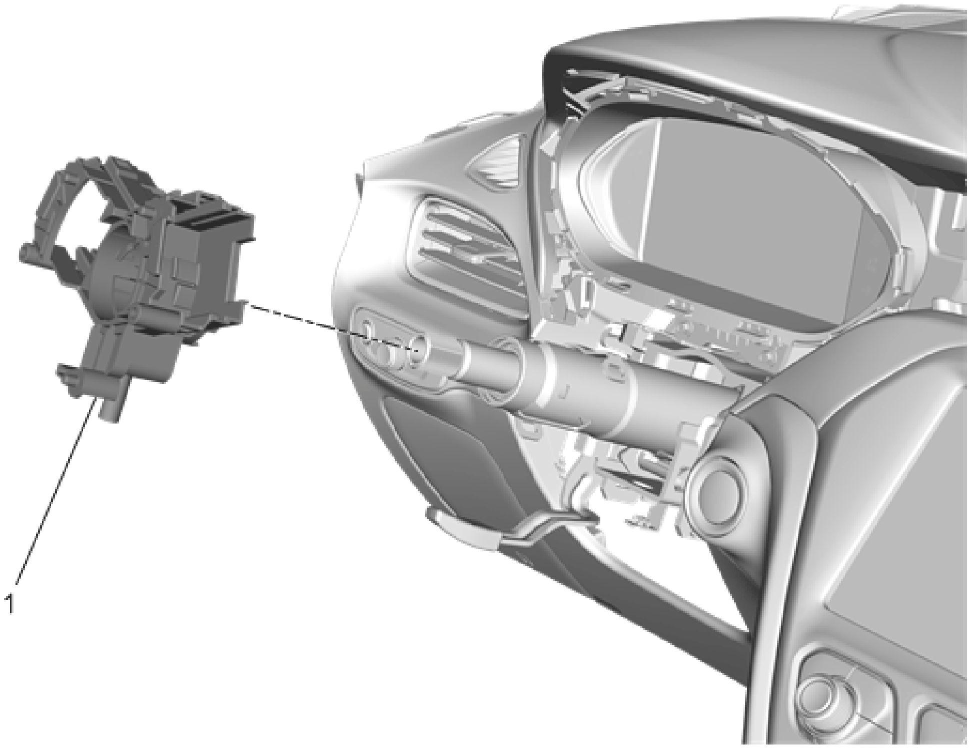

Fig. 22: Turn Signal Switch Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Steering Wheel Airbag Coil Replacement 2. Turn Signal Switch Replacement 3. Windshield Wiper and Washer Switch Replacement	
1	Turn Signal Switch Bracket **Procedure** Release the retaining tabs and remove the turn signal switch bracket from the steering column.

STEERING WHEEL HEAT CONTROL MODULE REPLACEMENT

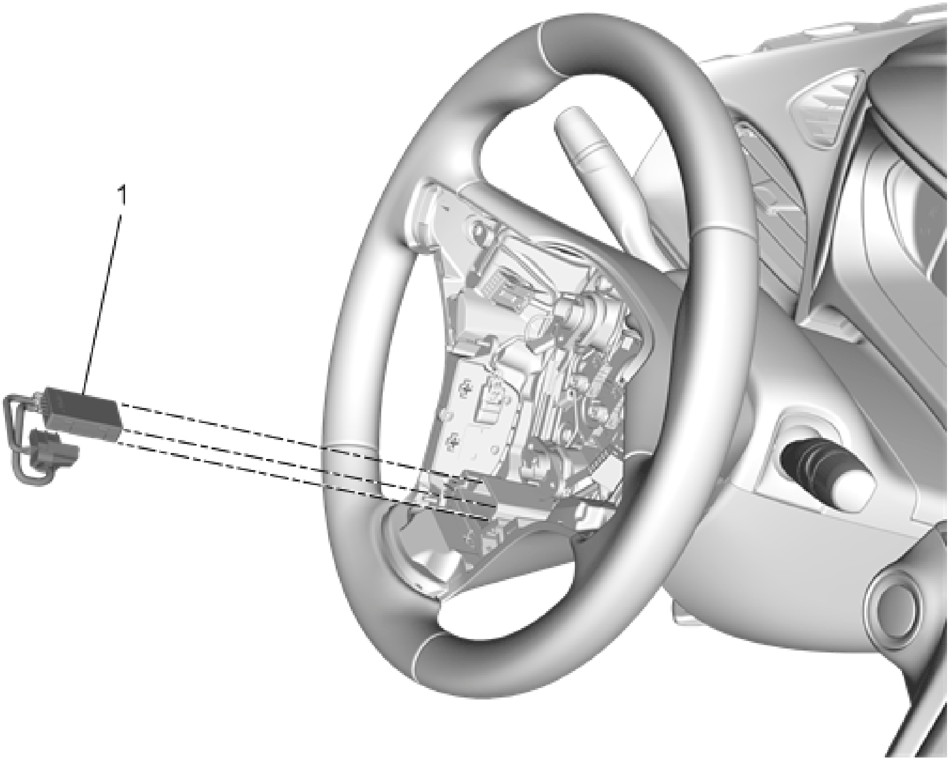

Fig. 23: Steering Wheel Heat Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Steering Wheel Spoke Lower Cover Replacement	
1	Steering Wheel Heat Control Module **Procedure** 1. Remove the steering wheel heat control module in order to expose the electrical connectors. 2. Disconnect the electrical connectors. 3. Remove the steering wheel heat control module from the steering wheel.

STEERING WHEEL REPLACEMENT

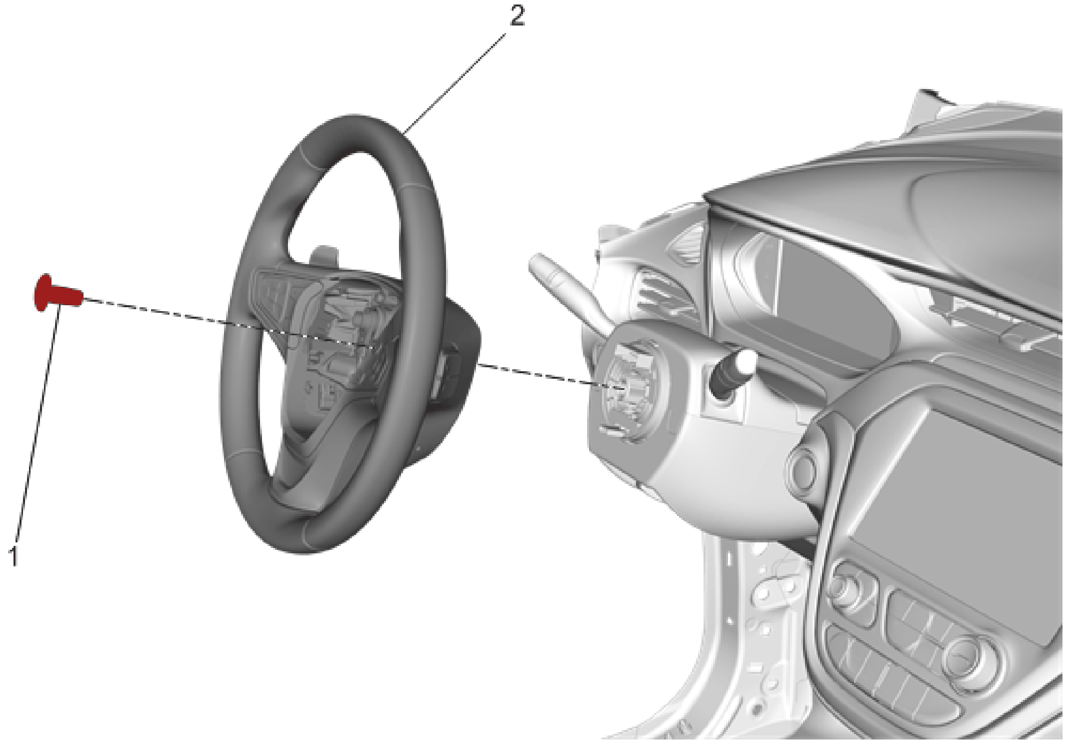

Fig. 24: Steering Wheel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **WARNING:** **Refer to SIR Inflator Module Handling and Storage Warning .** **Preliminary Procedures** 1. SIR Disabling and Enabling 2. Steering Wheel Airbag Replacement	
1	Steering Wheel Bolt **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Clean the threads of the bolt with denatured alcohol or equivalent and allow to dry. 2. Apply thread locking adhesive to the bolt. Adhesives, Fluids, Lubricants, and Sealers **Tighten** 45 N.m (33 lb ft)

Callout	Component Name
2	Steering Wheel **Procedure** 1. Disconnect the electrical connectors. 2. Install the steering wheel bolt until 2 to 3 threads are engaged. 3. Wiggle the steering wheel until the wheel disengages completely. 4. Steering Wheel Bolt - Remove 5. Steering Wheel - Remove 6. Transfer components as necessary.

STEERING WHEEL SPOKE COVER REPLACEMENT

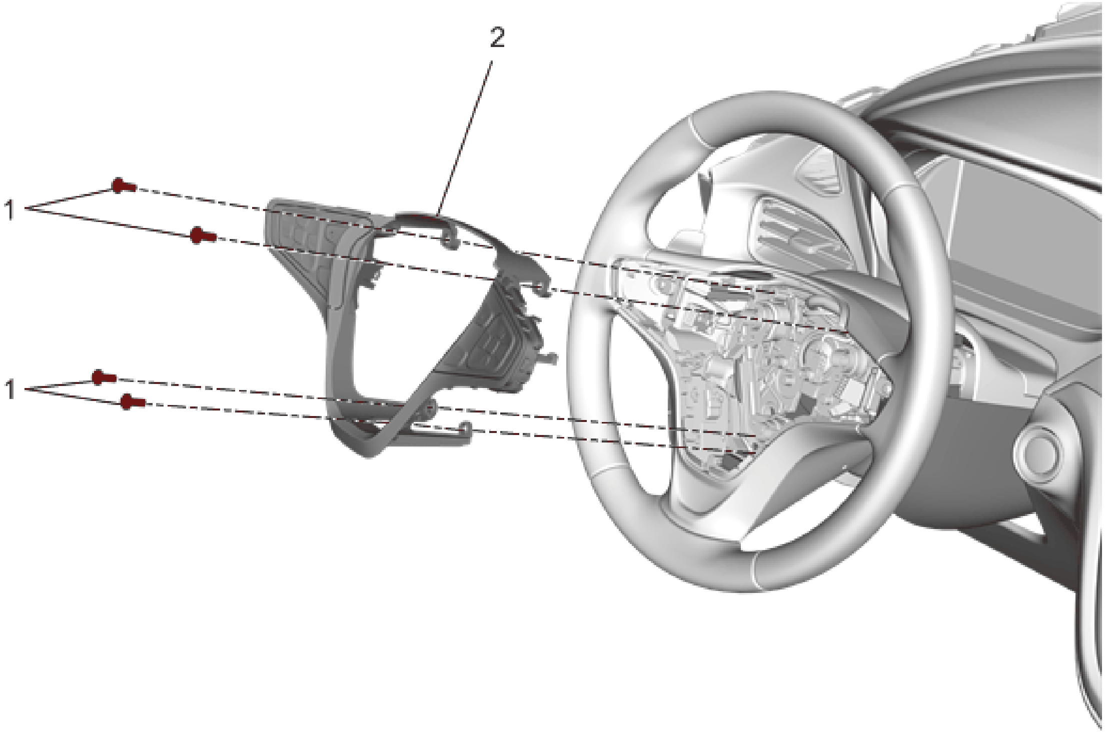

Fig. 25: Steering Wheel Spoke Cover

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Steering Wheel Airbag Replacement	
1	Steering Wheel Spoke Cover Bolt
2	Steering Wheel Spoke Cover **Procedure** 1. Use the appropriate trim tool to release the steering wheel spoke cover from the steering wheel. 2. Disconnect the electrical connectors. 3. Transfer components as necessary.

STEERING WHEEL SPOKE LOWER COVER REPLACEMENT

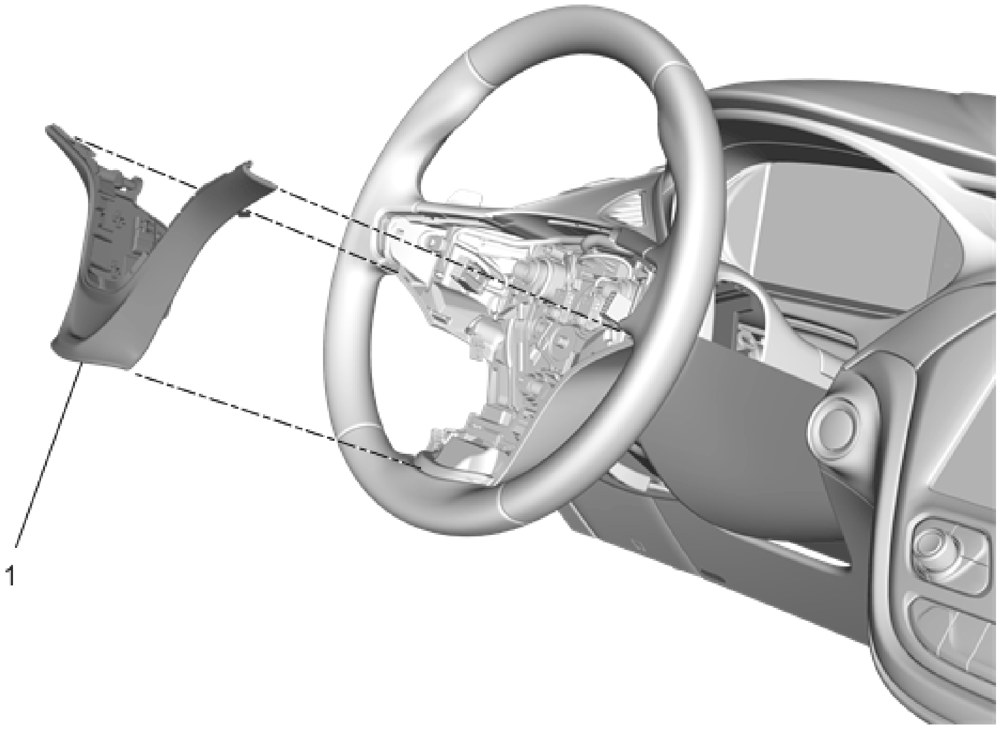

Fig. 26: Steering Wheel Spoke Lower Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Steering Wheel Airbag Replacement 2. Steering Wheel Spoke Cover Replacement	
1	Steering Wheel Spoke Lower Cover **Procedure** 1. Use the appropriate trim tool to release the steering wheel spoke lower cover from the steering wheel. 2. Disconnect the electrical connectors. 3. Transfer components as necessary.

STEERING COLUMN REPLACEMENT

Removal Procedure

WARNING: **Refer to SIR Warning .**

WARNING: **Refer to SIR Inflator Module Handling and Storage Warning .**

1. Disable the SIR system. SIR Disabling and Enabling
2. Steering Wheel Airbag - Remove - Steering Wheel Airbag Replacement
3. Turn the steering wheel to the straight ahead position.
4. Steering Wheel - Remove - Steering Wheel Replacement
5. Steering Column Upper Trim Cover at Steering Column Lower Trim Cover - Separate - Steering Column Upper Trim Cover Replacement

11. Intermediate Steering Shaft - Remove - Intermediate Steering Shaft Replacement
12. Disconnect the electric connectors from the steering column.
13. Remove the instrument panel wiring harness clips from the steering column.

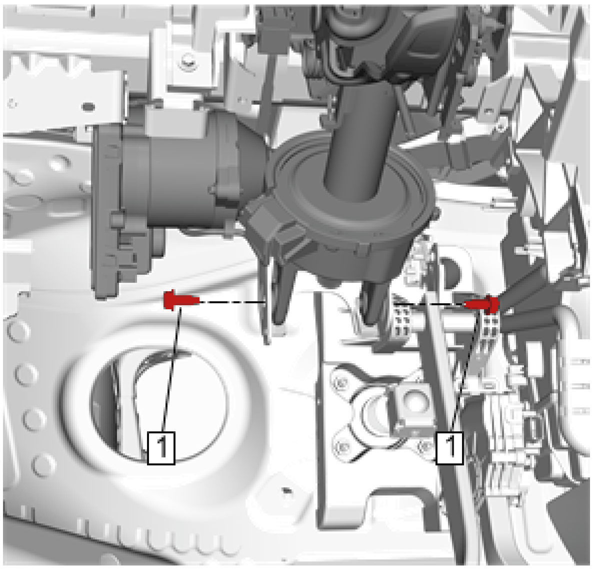

Fig. 33: Steering Column Lower Support Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

14. Steering Column Lower Support Bracket Bolt - Remove

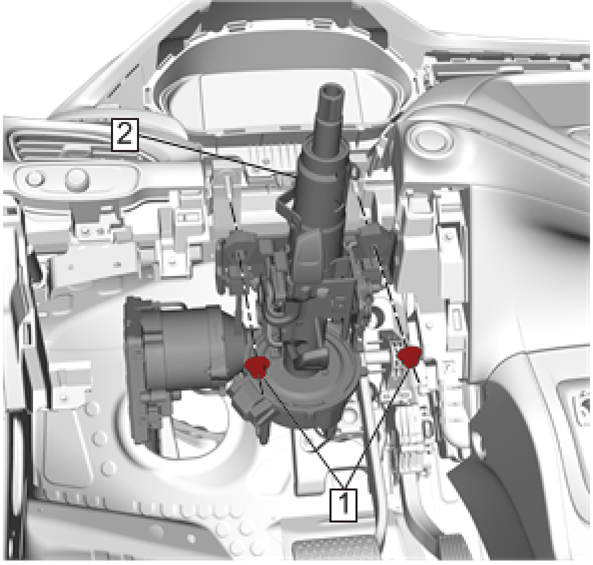

Fig. 34: Steering Column Support Bracket Nuts
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Support the steering column before removing the steering column support bracket nuts.**

CAUTION: **Once the steering column is removed from the vehicle, the column is extremely susceptible to damage. Dropping the column assembly on the end could collapse the steering shaft or loosen the plastic injections, which maintain column rigidity. Leaning on the column assembly could cause the jacket to bend or deform. Any of the above damage could impair the columns collapsible design. Do NOT hammer on the end of the shaft, because hammering could loosen the plastic injections, which maintain column rigidity. If you need to remove the steering wheel, refer to the Steering Wheel Replacement procedure in this section.**

15. Steering Column Upper Support Bracket Nut - Remove
16. Steering Column at Vehicle - Remove

Installation Procedure

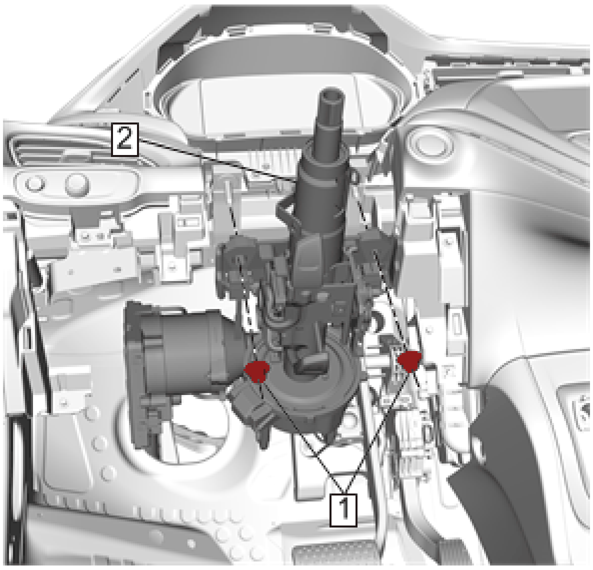

Fig. 35: Steering Column Support Bracket Nuts
Courtesy of GENERAL MOTORS COMPANY

1. Steering Column at Vehicle - Install

CAUTION: **Refer to Fastener Caution .**

2. Steering Column Upper Support Bracket Nut - Install and tighten to 22 N.m (16 lb ft)

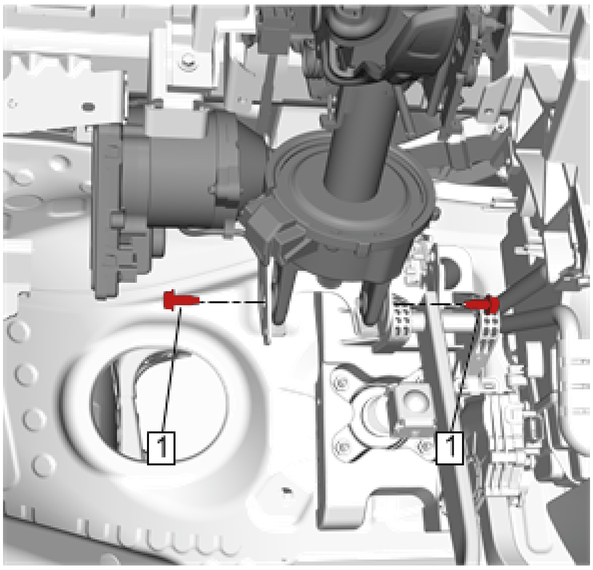

Fig. 36: Steering Column Lower Support Bracket Bolt

15. Enable the SIR System. **SIR Disabling and Enabling**
16. Program the electronic power steering control module. **Control Module References**

17. Calibrate the steering angle sensor. Steering Wheel Angle Sensor Centering

DESCRIPTION AND OPERATION

STEERING WHEEL AND COLUMN DESCRIPTION AND OPERATION

The steering wheel and column has 4 primary functions:

- Vehicle steering
- Vehicle security
- Driver convenience
- Driver safety

Vehicle Steering

The steering wheel is the first link between the driver and the vehicle. The steering wheel is fastened to a steering shaft within the column. At the lower end of the column, the intermediate shaft connects the column to the steering gear.

The steering column can be adjusted vertically and longitudinally.

Vehicle Security

Theft deterrent components are mounted and designed into the steering column. The following components allow the column to be locked in order to minimize theft:

- The ignition switch
- The steering column lock
- The ignition cylinder
- The theft deterrent immobilizer module, if equipped

Driver Convenience

The steering wheel and column may also have driver controls attached for convenience and comfort. The following controls may be mounted on the steering wheel or column.

- The turn signal switch
- The headlamp dimmer switch
- The wiper/washer switch
- The horn pad
- The redundant radio/entertainment system controls
- The tilt functions
- The telephone system controls

Driver Safety

The steering wheel and column has safety features to protect the driver. The following components may be mounted on or near the steering column:

Energy-Absorbing Steering Column: The energy-absorbing steering column compresses in the event of a front-end collision, which reduces the chance of injury to the driver. The energy-absorbing feature, collapsible steering shaft, and break away mounting features help reduce the injury in the event of an accident.

SIR Coil and Module: For additional information on the operation of the SIR coil and module, refer to Supplemental Inflatable Restraint System Description and Operation .

Steering Wheel Angle Sensor: The steering wheel angle sensor is located somewhere along the steering shaft assembly. The sensor measures the position of the steering wheel and the speed at which it is rotated. A signal representing this measurement is provided to the electronic stability control (ESC) in the ABS module.

The Theft Deterrent Immobilizer Module: The immobilizer module is mounted in the steering column lock on cars without Passive Entry Passive Start system (PEPS). Refer to **Immobilizer Description and Operation** .

2017 SUSPENSION

Front Suspension - Bolt EV

SPECIFICATIONS

FASTENER SPECIFICATIONS

Reusable Threaded Fastener Tightening Specifications

Application	Specification
	Metric (English)
NOTE: *All fasteners listed in this table can be reused after removal.*	
Front Lower Control Arm Front Bolt	120 N.m (89 lb ft)
Front Lower Control Arm Rear Nut	100 N.m (74 lb ft)
Front Stabilizer Shaft Link Nut	100 N.m (74 lb ft)
Front Suspension Strut Mount Nut	22 N.m (16 lb ft)
Front Suspension Strut Nut	160 N.m (118 lb ft)
Front Suspension Strut Upper Mounting Nut	85 N.m (63 lb ft)
Front Wheel Hub Bolt	
• First Pass:	65 N.m (48 lb ft)
• Final Pass:	30 - 45 Degrees
Steering Knuckle Nut	
• First Pass:	30 N.m (22 lb ft)
• Final Pass:	120 - 135 Degrees

REPAIR INSTRUCTIONS

STABILIZER SHAFT REPLACEMENT

Removal Procedure

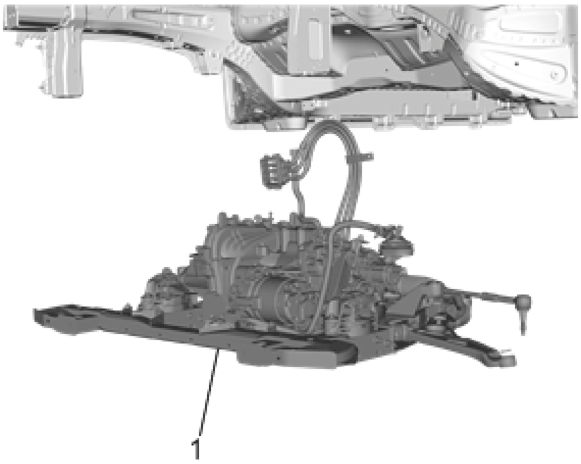

Fig. 1: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove Automatic Transmission and Drivetrain and Front Suspension Frame Assembly (1). Remove - Refer to **Drivetrain and Front Suspension Frame Removal and Installation**

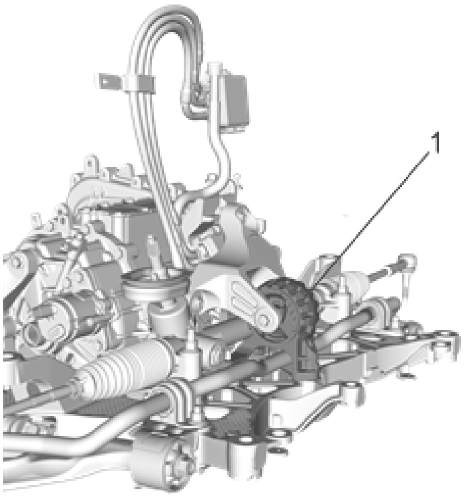

Fig. 2: Drive Motor Rear Mount
Courtesy of GENERAL MOTORS COMPANY

2. Remove Drive Motor Rear Mount (1). Refer to **Drive Motor Rear Mount Replacement**

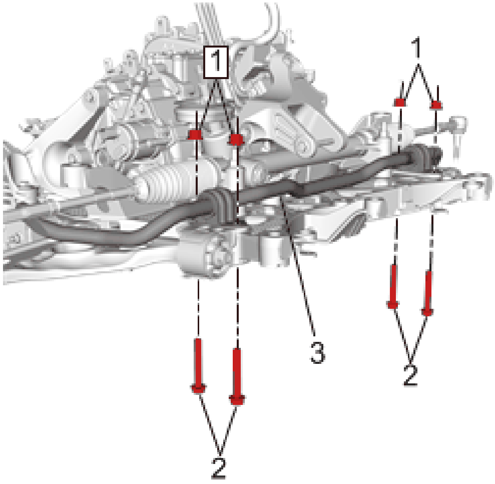

Fig. 3: Front Lower Control Arm Rear Nuts, Bolts And Front Stabilizer Shaft
Courtesy of GENERAL MOTORS COMPANY

3. Remove Front Lower Control Arm Rear Nuts (1) (Qty: 4)
4. Remove Front Lower Control Arm Rear Bolts (2) (Qty: 4)
5. Remove Front Stabilizer Shaft (3) @ Drivetrain and Front Suspension Crossmember

Installation Procedure

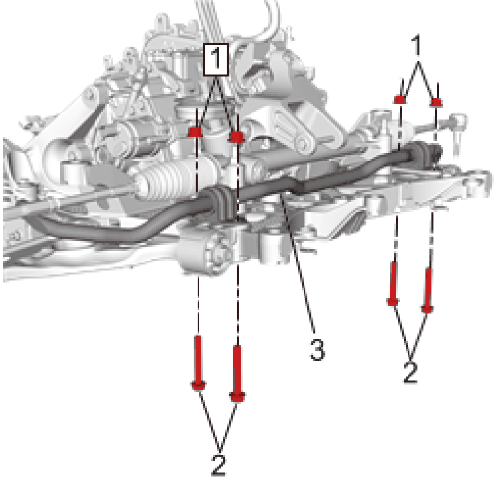

Fig. 4: Front Lower Control Arm Rear Nuts, Bolts And Front Stabilizer Shaft
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Stabilizer Shaft (3) @ Drivetrain and Front Suspension Crossmember
2. Install Front Lower Control Arm Rear Bolts (2) (Qty: 4)

CAUTION: **Refer to Fastener Caution**

3. Install and tighten Front Lower Control Arm Rear Nuts (1) (Qty: 4) to 100 N.m (74 lb ft)

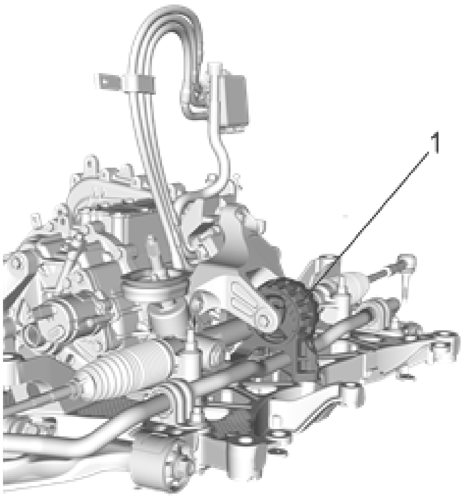

Fig. 5: Drive Motor Rear Mount
Courtesy of GENERAL MOTORS COMPANY

4. Install Drive Motor Rear Mount (1). Refer to Drive Motor Rear Mount Replacement

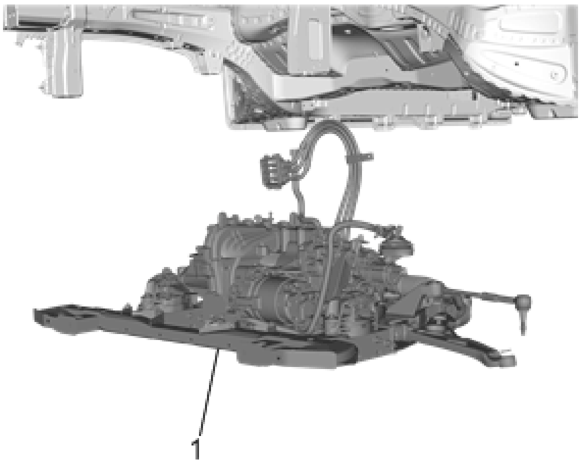

Fig. 6: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

5. Install Automatic Transmission and Drivetrain and Front Suspension Frame Assembly (1). Refer to Drivetrain and Front Suspension Frame Removal and Installation

STABILIZER SHAFT LINK REPLACEMENT

10. Install Steering Linkage Outer Tie Rod (1) @ Steering Knuckle. Refer to **Steering Linkage Outer Tie Rod Replacement**
11. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
12. Lower the vehicle.

STEERING KNUCKLE REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**

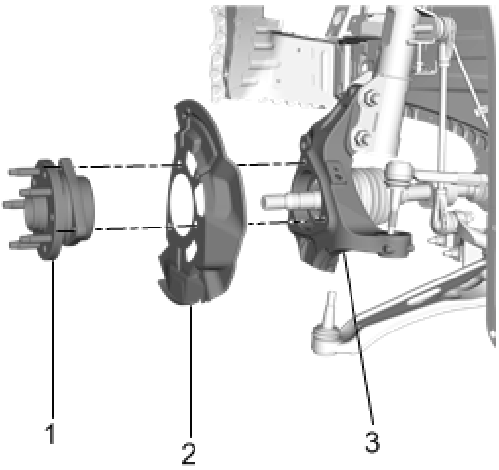

Fig. 24: Front Wheel Bearing/Hub Assembly, Brake Shield And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

3. Remove Front Wheel Bearing and Hub Assembly (1) @ Steering Knuckle (3). Refer to **Front Wheel Bearing and Hub Replacement**
4. Remove Front Brake Shield (2) @ Steering Knuckle (3)

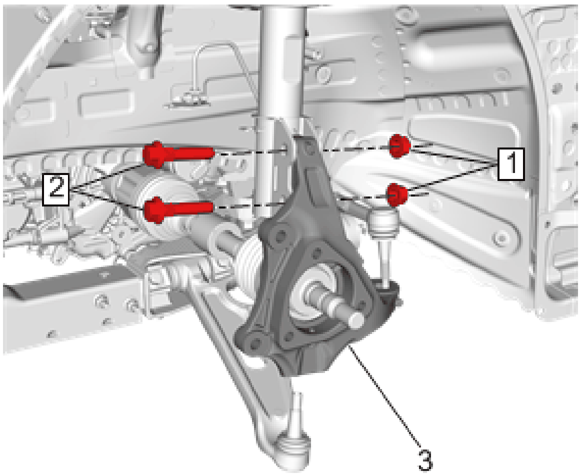

Fig. 25: Front Suspension Strut Nuts, Bolts And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

5. Remove Front Suspension Strut Nuts (1) (Qty: 2)
6. Remove Front Suspension Strut Bolts (2) (Qty: 2)
7. Remove Steering Knuckle (3) @ Vehicle

Installation Procedure

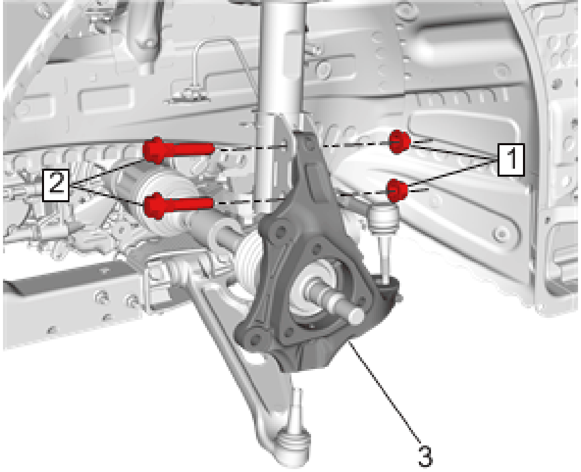

Fig. 26: Front Suspension Strut Nuts, Bolts And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

1. Install Steering Knuckle (3) @ Vehicle
2. Install Front Suspension Strut Bolts (2) (Qty: 2)

CAUTION: **Refer to Fastener Caution**

3. Install and tighten Front Suspension Strut Nuts (1) (Qty: 2) to 160 N.m (118 lb ft)

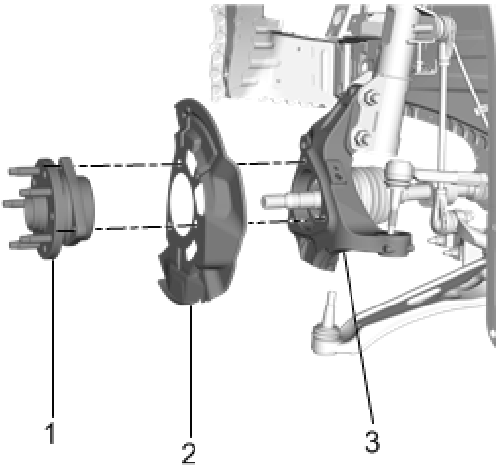

Fig. 27: Front Wheel Bearing/Hub Assembly, Brake Shield And Steering Knuckle
Courtesy of GENERAL MOTORS COMPANY

4. Install Front Brake Shield (2) @ Steering Knuckle (3)
5. Install Front Wheel Bearing and Hub Assembly (1) @ Steering Knuckle (3). Refer to **Front Wheel Bearing and Hub Replacement**
6. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
7. Lower the vehicle.

LOWER CONTROL ARM REPLACEMENT

Special Tools

- **CH-42188-B** Ball Joint Separator
- **J-42188-2A** 6 mm Hex Key

Equivalent regional tools: **Special Tools**

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
3. Remove Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**

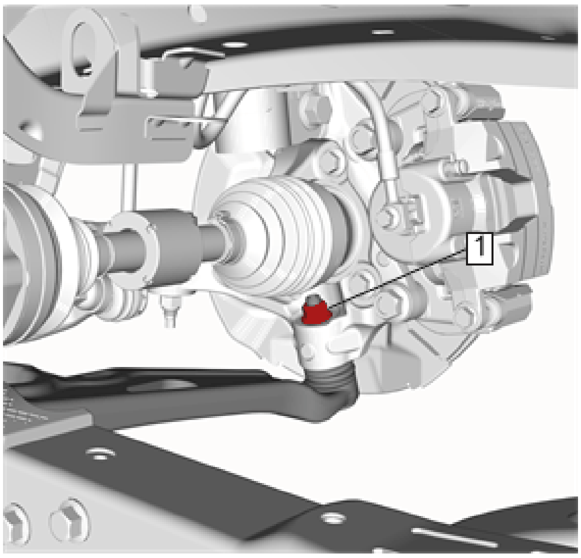

Fig. 28: Steering Knuckle Nut
Courtesy of GENERAL MOTORS COMPANY

4. Loosen Steering Knuckle Nut (1) @ Front Lower Control Arm

   Use the J-42188-2A 6 mm Hex Key to prevent the ball joint pivot from being rotated.

5. Use the CH-42188-B ball joint separator to separate the front lower control arm from the steering knuckle.
6. Remove Steering Knuckle Nut (1) @ Front Lower Control Arm

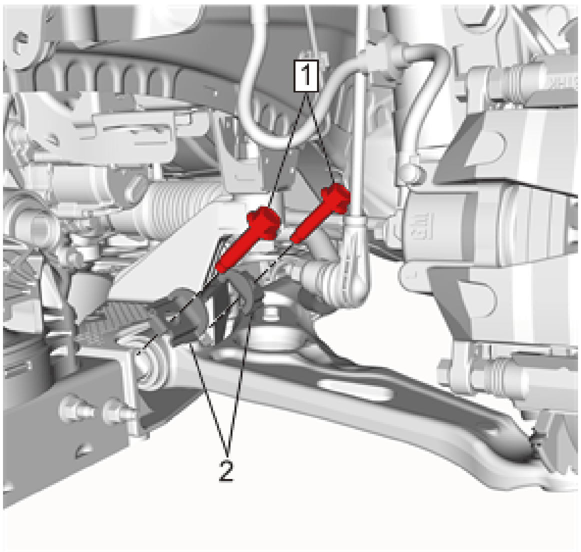

Fig. 29: Front Lower Control Arm Front Bolts And Brackets
Courtesy of GENERAL MOTORS COMPANY

7. Remove Front Lower Control Arm Front Bolts (1) (Qty: 2)
8. Remove Front Lower Control Arm Front Brackets (2) (Qty: 2)

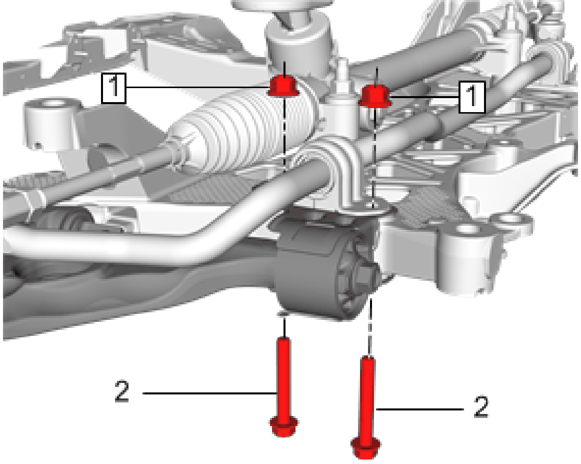

Fig. 30: Front Lower Control Arm Rear Nuts And Bolts
Courtesy of GENERAL MOTORS COMPANY

9. Remove Front Lower Control Arm Rear Nuts (1) (Qty: 2)
10. Remove Front Lower Control Arm Rear Bolts (2) (Qty: 2)

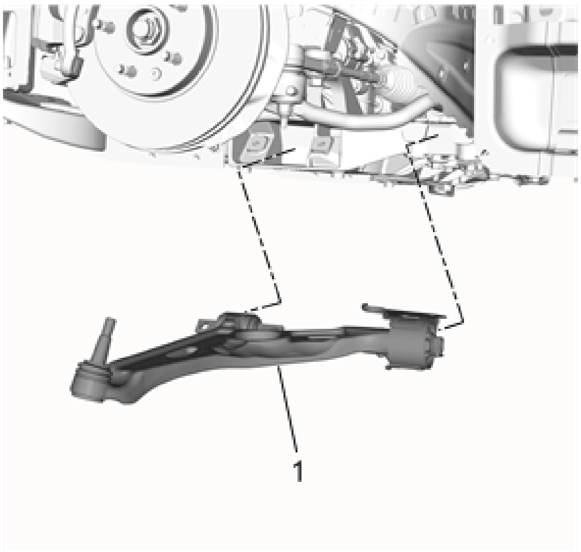

Fig. 31: Front Lower Control Arm
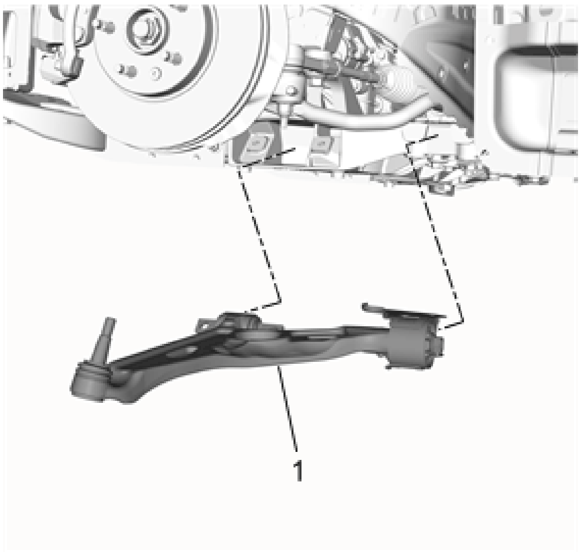
Courtesy of GENERAL MOTORS COMPANY

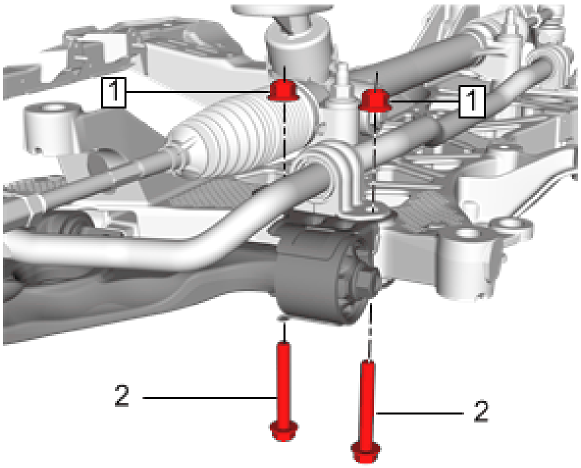
11. Remove Front Lower Control Arm (1) @ Vehicle

Installation Procedure



[Fig. 32: Front Lower Control Arm](#)
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Lower Control Arm (1) @ Vehicle

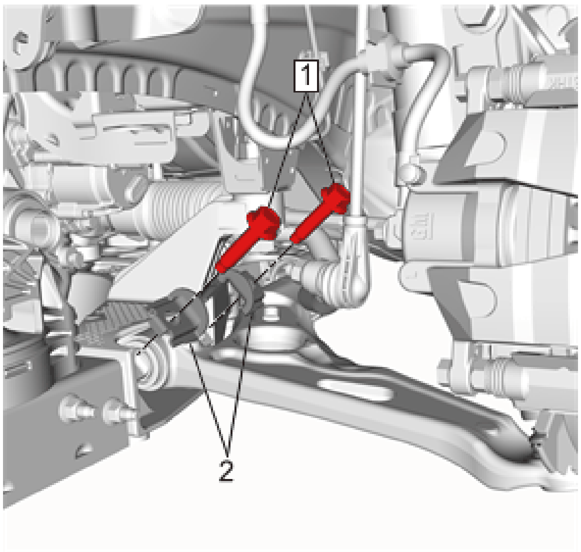


[Fig. 33: Front Lower Control Arm Rear Nuts And Bolts](#)
Courtesy of GENERAL MOTORS COMPANY

2. Install Front Lower Control Arm Rear Bolts (2) (Qty: 2)

CAUTION: **Refer to [Fastener Caution](#)**

3. Install and tighten Front Lower Control Arm Rear Nuts (1) (Qty: 2) to 100 N.m (74 lb ft)



[Fig. 34: Front Lower Control Arm Front Bolts And Brackets](#)
Courtesy of GENERAL MOTORS COMPANY

4. Install Front Lower Control Arm Front Brackets (2) (Qty: 2)
5. Install and tighten Front Lower Control Arm Front Bolts (1) (Qty: 2) to 120 N.m (89 lb ft)

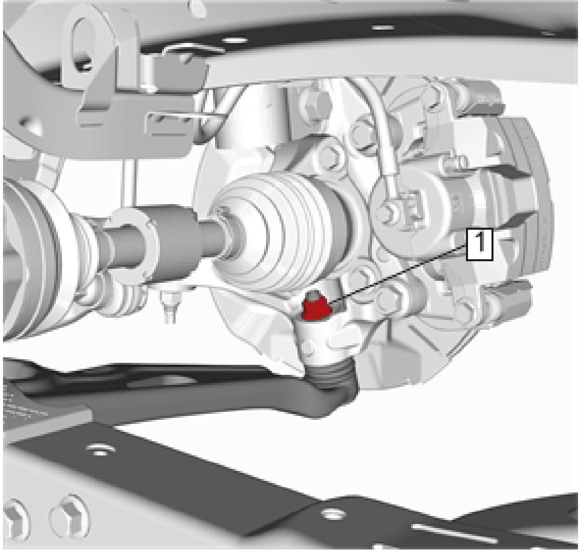


Fig. 35: Steering Knuckle Nut
Courtesy of GENERAL MOTORS COMPANY

6. Install and tighten Steering Knuckle Nut (1) @ Front Lower Control Arm

   Use the J-42188-2A 6 mm Hex Key to prevent the ball joint pivot from being rotated.

   1. First Pass: 30 N.m (22 lb ft)
   2. Final Pass: 120 - 135 Degrees
7. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
8. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
9. Lower the vehicle.

WHEEL STUD REPLACEMENT

Special Tools

CH-43631 Ball Joint Separator

Equivalent regional tools: **Special Tools**

Removal Procedure

1. Remove Front Wheel Bearing and Hub Assembly. Refer to **Front Wheel Bearing and Hub Replacement**

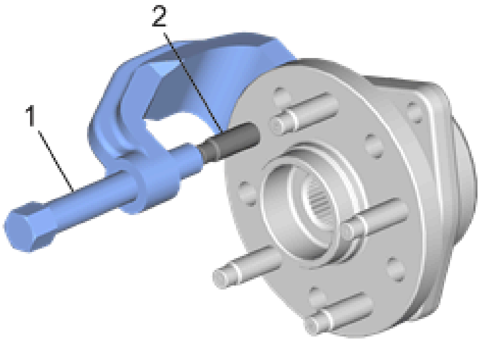

Fig. 36: Separator And Wheel Stud
Courtesy of GENERAL MOTORS COMPANY

2. Use the **CH-43631** separator (1) to remove the wheel stud (2) from the flange on the hub assembly.

   DISCARD the stud.

Installation Procedure

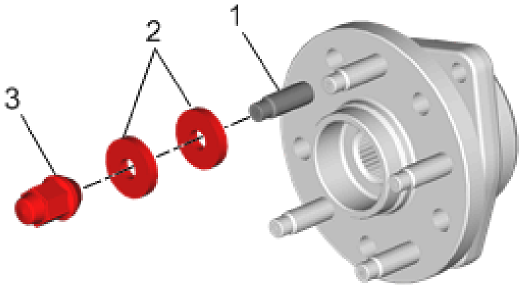

Fig. 37: Wheel Stud, Flat Washers And Wheel Nut
Courtesy of GENERAL MOTORS COMPANY

1. Position the NEW wheel stud (1) in the flange on the hub assembly.
2. Install the CH-45101-100 conical brake rotor washers or flat washers (2) and an OLD wheel nut (3) on the wheel stud.
3. Use a suitable tool to prevent the flange on the hub assembly from rotating.
4. Tighten the wheel nut until the wheel stud is firmly seated.
5. Remove the wheel nut and flat washers.
6. Install Front Wheel Bearing and Hub Assembly. Refer to **Front Wheel Bearing and Hub Replacement**

STRUT AND SHOCK ABSORBER INSPECTION

NOTE: **The strut assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

NOTE: **A light film of oil on the top portion of the strut is normal. DO NOT replace the strut for this condition.**

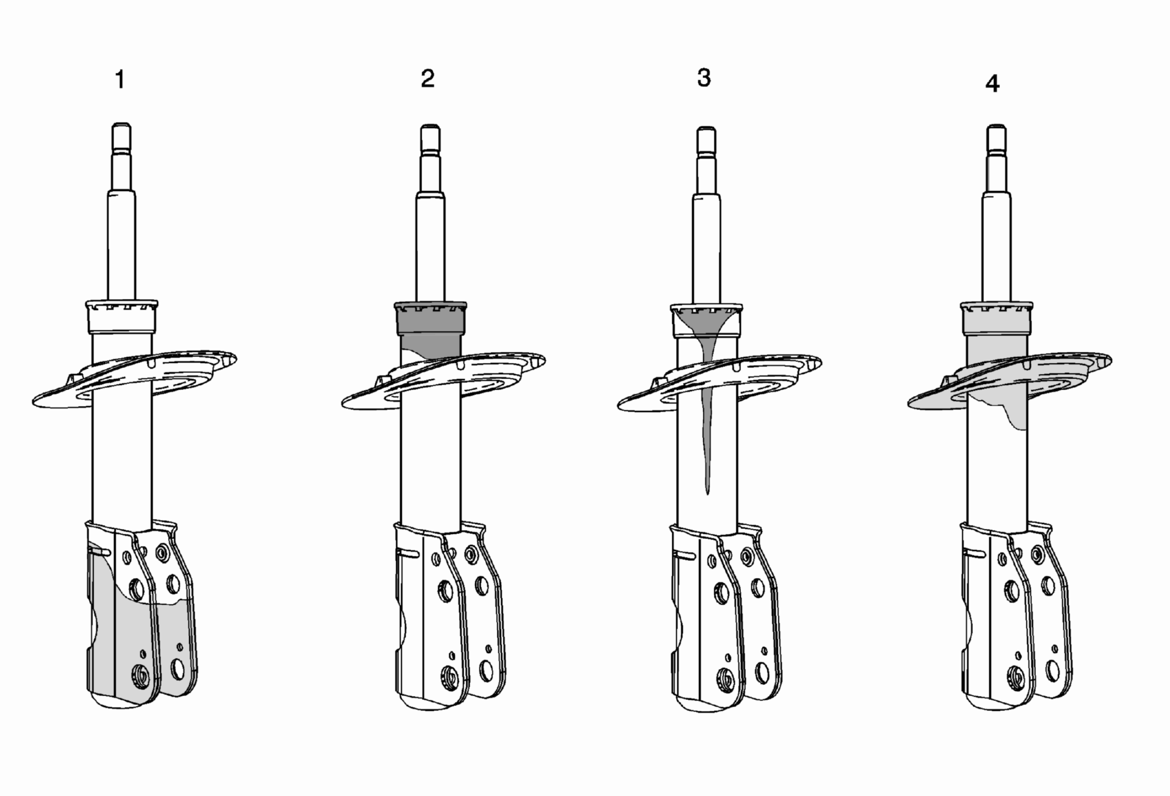

Fig. 38: Strut and Shock Absorber Inspection (Strut)
Courtesy of GENERAL MOTORS COMPANY

Condition 1

Oil or fluid residue only on the bottom of the strut tube or on other strut components and not originating from the shaft seal, is not a strut related problem. DO NOT replace the strut, look for other external leaks.

Condition 2

Light film/residue on the strut tube, but not on the spring seat and originating from the shaft seal, is a NORMAL condition. DO NOT replace the strut.

Condition 3

Oil drip or trail down the strut tube and originating from the shaft seal, is an ABNORMAL condition. Replace the strut.

Condition 4

Extreme wet film of oil covering the strut tube and pooling in the spring seat and originating from the shaft seal, is an ABNORMAL condition. Replace the strut.

Inspection

1. Verify the customer's concern is present. If the concern is present, continue to the next step. If the concern is not present, then the vehicle is operating normally.

NOTE: **The strut assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Visually inspect each of the shock absorbers or struts for external fluid leaks. Refer to the following conditions 1, 2, 3, and 4 for visual inspection.
   - If conditions 1 or 2 are found, continue to step 4.
   - If conditions 3 or 4 are found, replace strut. Refer to Strut Replacement.
4. If equipped with electronic suspension control system, ensure that the system is working properly. Refer to Diagnostic Starting Point-Electronic Suspension Control.
5. Use your hands in order to lift up and push down on each corner of the vehicle 3 times. Remove your hands from the vehicle. If the corner motion exceeds 2 cycles, replace the strut. If the strut does not exceed 2 cycles, NO repair is necessary.

STRUT ASSEMBLY REMOVAL AND INSTALLATION

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**

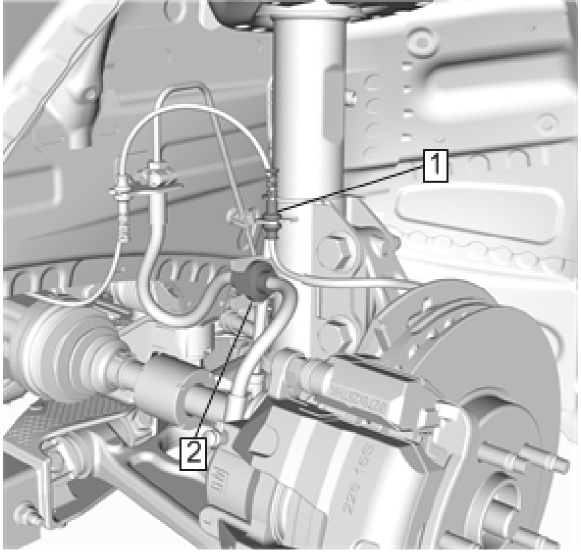

Fig. 39: Front Wheel Speed Sensor Wiring Harness Grommet And Front Brake Hose Grommet
Courtesy of GENERAL MOTORS COMPANY

3. Remove Front Wheel Speed Sensor Wiring Harness Grommet (1) @ Front Suspension Strut
4. Remove Front Brake Hose Grommet (2) @ Front Suspension Strut

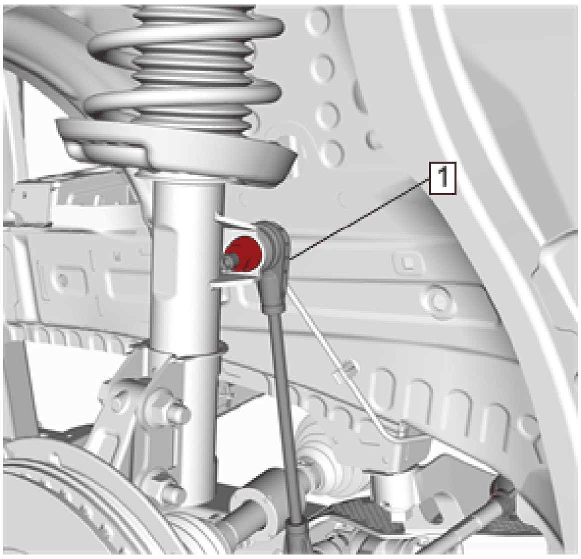

Fig. 40: Front Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

5. Separate Front Stabilizer Shaft Link (1) @ Front Suspension Strut. Refer to Stabilizer Shaft Link Replacement

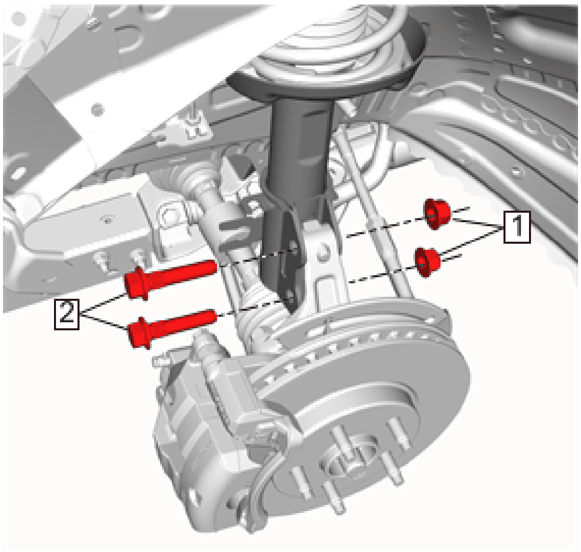

Fig. 41: Front Suspension Strut Nuts And Bolts
Courtesy of GENERAL MOTORS COMPANY

6. Remove Front Suspension Strut Nuts (1) (Qty: 2)
7. Remove Front Suspension Strut Bolts (2) (Qty: 2)
8. Remove Air Inlet Grille Panel. Refer to **Air Inlet Grille Panel Replacement**
9. Remove Windshield Wiper System Module. Refer to **Windshield Wiper System Module Replacement**

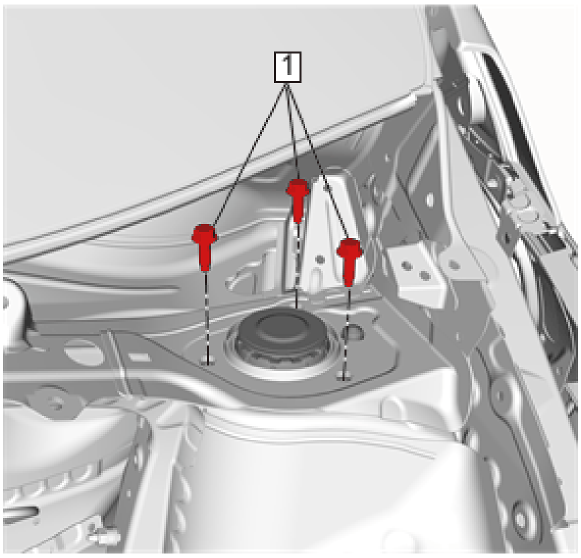

Fig. 42: Front Suspension Strut Mount Nuts
Courtesy of GENERAL MOTORS COMPANY

10. Remove Front Suspension Strut Mount Nuts (1) (Qty: 3)

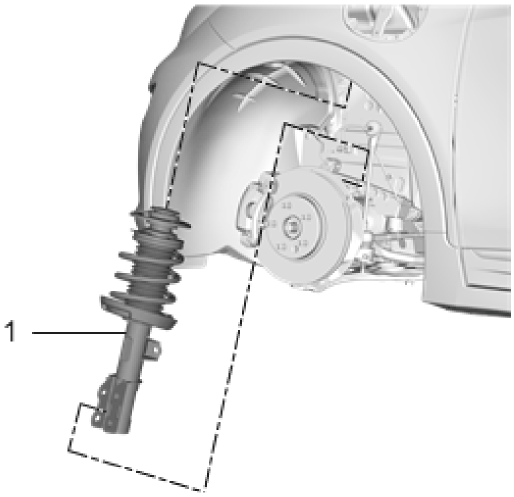

Fig. 43: Front Suspension Strut
Courtesy of GENERAL MOTORS COMPANY

11. Remove Front Suspension Strut (1) @ Vehicle

Installation Procedure

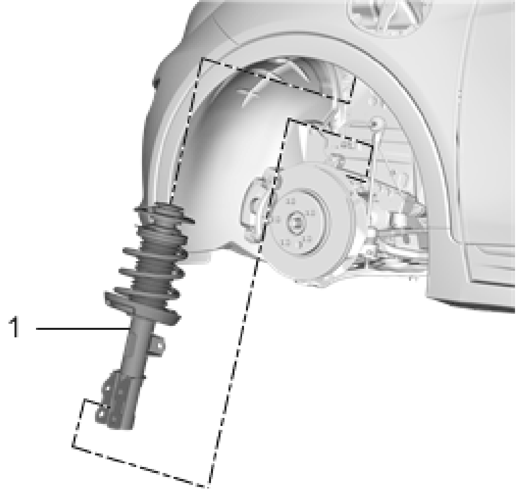

Fig. 44: Front Suspension Strut
Courtesy of GENERAL MOTORS COMPANY

1. Install Front Suspension Strut (1) @ Vehicle

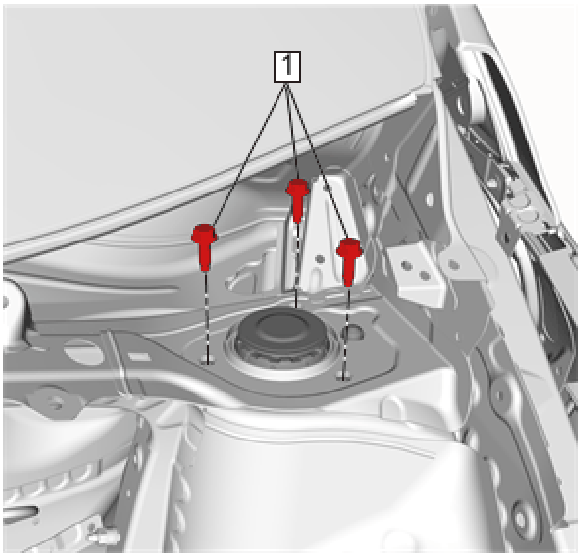

Fig. 45: Front Suspension Strut Mount Nuts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution**

2. Install and tighten Front Suspension Strut Mount Nuts (1) (Qty: 3) to 22 N.m (16 lb ft)
3. Install Windshield Wiper System Module. Refer to **Windshield Wiper System Module Replacement**
4. Install Air Inlet Grille Panel. Refer to **Air Inlet Grille Panel Replacement**

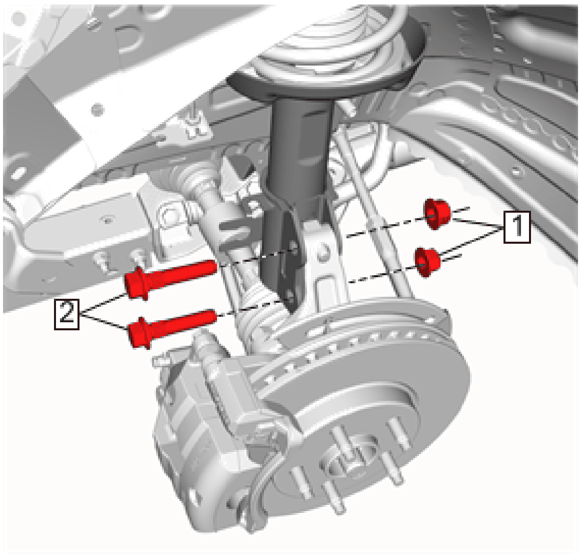

Fig. 46: Front Suspension Strut Nuts And Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Suspension Strut Bolts (2) (Qty: 2)
6. Install and tighten Front Suspension Strut Nuts (1) (Qty: 2) to 160 N.m (118 lb ft)

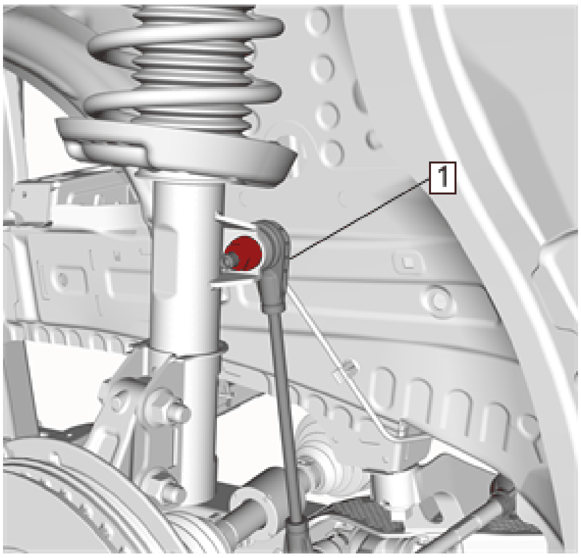

Fig. 47: Front Stabilizer Shaft Link
Courtesy of GENERAL MOTORS COMPANY

7. Install Front Stabilizer Shaft Link (1) @ Front Suspension Strut. Refer to **Stabilizer Shaft Link Replacement**

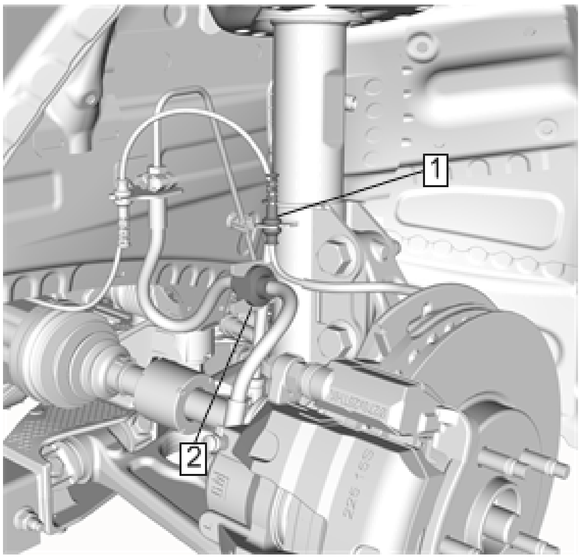

Fig. 48: Front Wheel Speed Sensor Wiring Harness Grommet And Front Brake Hose Grommet
Courtesy of GENERAL MOTORS COMPANY

8. Install Front Brake Hose Grommet (2) @ Front Suspension Strut
9. Install Front Wheel Speed Sensor Wiring Harness Grommet (1) @ Front Suspension Strut
10. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
11. Lower the vehicle.

SUSPENSION SHOCK/STRUT DISPOSAL

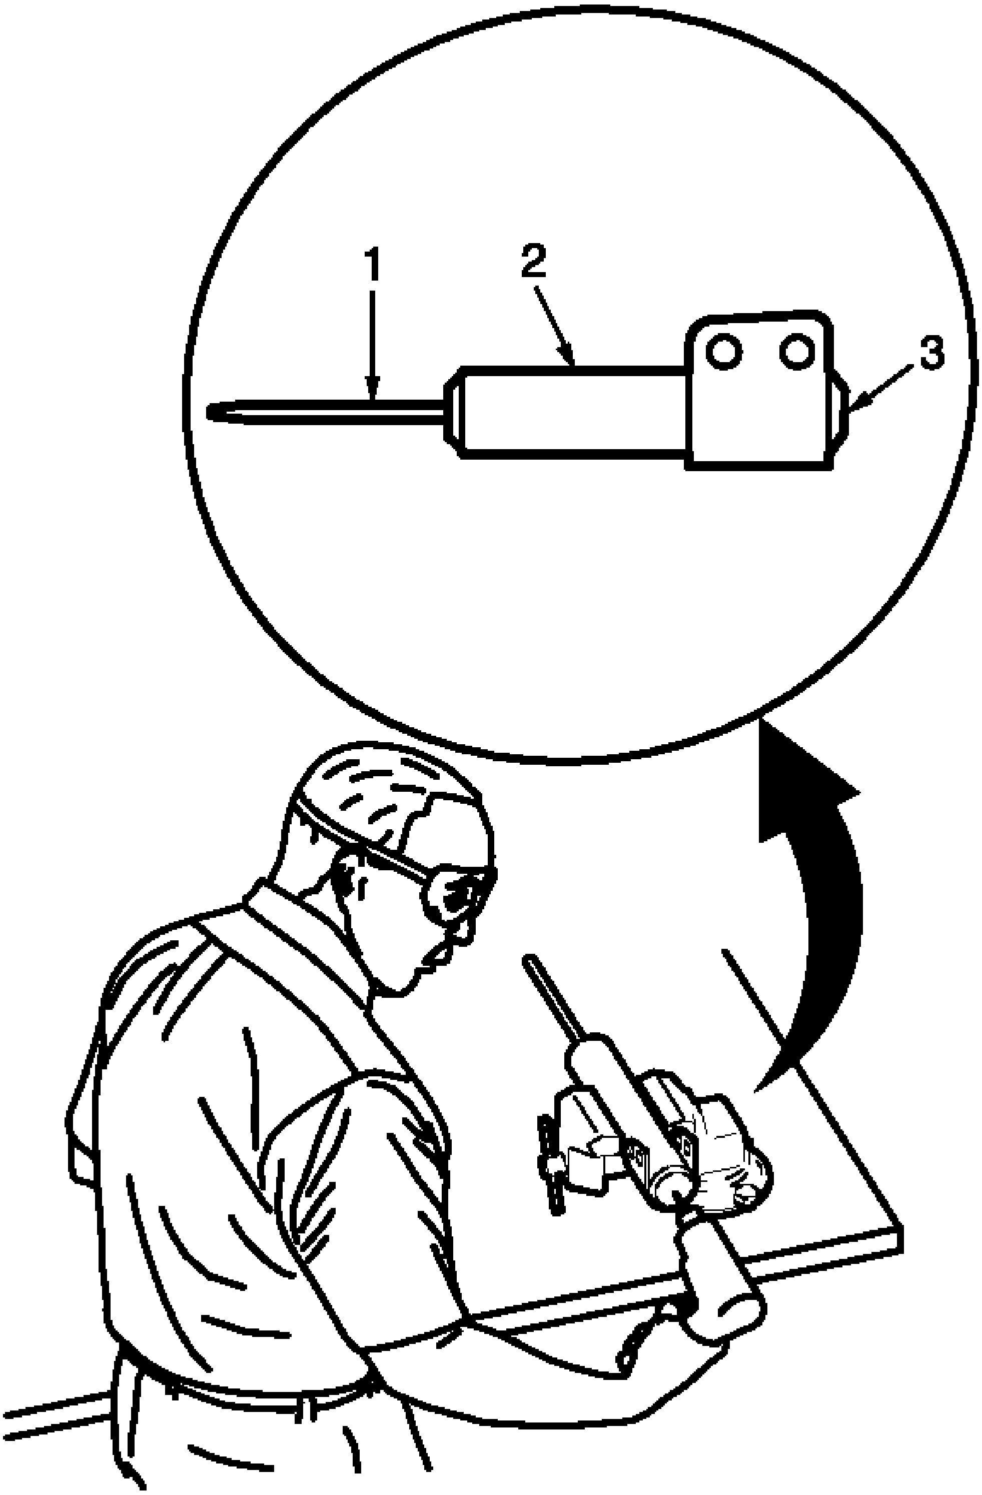

Fig. 49: Drilling Hole In Strut At Center Of End Cap
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Use the proper eye protection when drilling to prevent metal chips from causing physical injury.**

1. Clamp the strut in a vise horizontally with the rod (1) completely extended.
2. Drill a hole in the strut at the center of the end cap (3) using a 5 mm (3/16 in) drill bit. Gas or a gas/oil mixture will exhaust when the drill bit penetrates the strut. Use shop towels in order to contain the escaping oil.
3. Remove the strut from the vise.
4. Hold the strut over a drain pan vertically with the hole down.
5. Move the rod (1) in and out of the tube (2) to completely drain the oil from the strut.

STRUT, STRUT COMPONENT, OR SPRING REPLACEMENT

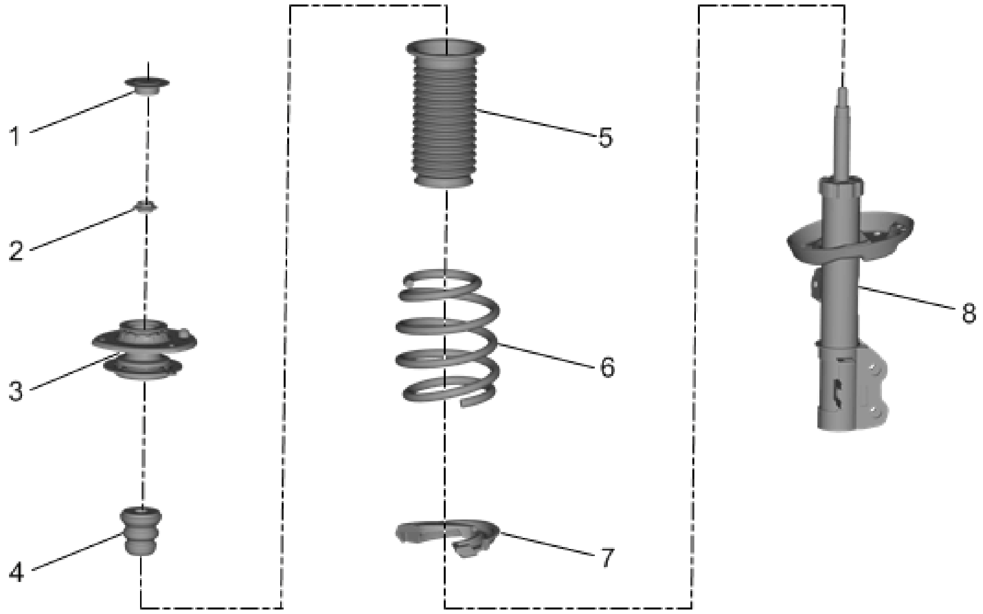

Fig. 50: Strut, Strut Component, or Spring
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **To prevent personal injury and/or component damage, use the proper tools to support and compress the coil spring prior to removal of the strut shaft nut when removing the coil spring. The coil spring is under extreme pressure and can become a projectile should the spring separate from the strut before all of the tension is relieved.**	
Preliminary Procedure Remove Strut Assembly. Refer to Strut Assembly Removal and Installation	
1	Front Suspension Strut Cartridge Upper Cover
2	Front Suspension Strut Upper Mounting Nut **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Use a suitable spring compressor to compress the front coil spring. 2. Use the **CH-49375** strut wrench to remove and install the front suspension strut upper mounting nut. **Tighten** 85 N.m (63 lb ft) **Special Tools** **CH-49375** Strut Wrench Equivalent regional tools: Special Tools
3	Front Suspension Strut Mount
4	Front Suspension Strut Bumper
5	Front Strut Boot
6	Front Coil Spring
7	Front Coil Spring Lower Insulator
8	Front Suspension Strut

DESCRIPTION AND OPERATION

FRONT SUSPENSION DESCRIPTION AND OPERATION

The front suspension has 2 primary purposes:

- Isolate the driver from irregularities in the road surface.
- Define the ride and handling characteristics of the vehicle.

The front suspension absorbs the impact of the tires traveling over irregular road surfaces and dissipates this energy throughout the suspension system. This process isolates the vehicle occupants from the road surface. The rate at which the suspension dissipates the energy and the amount of energy that is absorbed is how the suspension defines the vehicles ride characteristics.

Ride characteristics are designed into the suspension system and are not adjustable. The ride characteristics are mentioned in this description in order to aid in the understanding of the functions of the suspension system. The suspension system must allow for the vertical movement of the tire and wheel assembly as the vehicle travels over irregular road surfaces while maintaining the tire's horizontal relationship to the road.

This requires that the steering knuckle be suspended between a lower control arm and a strut assembly. The lower control arm attaches from the steering knuckle at the outermost point of the control arm. The attachment is through a ball and socket type joint. The innermost end of the control arm attached at 2 points to the vehicle frame through semi-rigid bushings. The upper portion of the steering knuckle is attached to a strut assembly. The strut assembly then connects to the vehicle body by way of an upper bearing. The steering knuckle is allowed to travel up and down independent of the vehicle body structure and frame.

This up and down motion of the steering knuckle as the vehicle travels over bumps is absorbed predominantly by the coil spring. This spring is retained under tension over the strut assembly. A strut is used in conjunction with this system in order to dampen out the oscillations of the coil spring. A strut is a basic hydraulic cylinder.

The strut is filled with oil and has a moveable shaft that connects to a piston inside the strut. Valves inside the shock absorber offer resistance to oil flow and consequently inhibit rapid movement of the piston and shaft. Each end of the shock absorber is connected in such a fashion to utilize this recoil action of a spring alone. Each end of the strut is designed as the connection point of the suspension system to the vehicle and acts as the coil spring seat. This allows the strut to utilize the dampening action to reduce the recoil of a spring alone. The lower control arm is allowed to pivot at the vehicle frame in a vertical fashion. The ball joint allows the steering knuckle to maintain the perpendicular relationship to the road surface.

Front suspensions systems utilize a stabilizer shaft. The stabilizer bar connects between the left and right lower control arm assemblies through the stabilizer link and stabilizer shaft insulators. This bar controls the amount of independent movement of the suspension when the vehicle turns. Limiting the independent movement defines the vehicles handling characteristics on turns.

2017 SUSPENSION

Rear Suspension - Bolt EV

SPECIFICATIONS

FASTENER SPECIFICATIONS

Reusable Threaded Fastener Tightening Specifications

Application	Specification Metric (English)
NOTE: ***All fasteners listed in this table can be reused after removal.***	
Rear Axle Bolt	
• First Pass:	160 N.m (118 lb ft)
• Final Pass:	30 - 45 Degrees
Rear Brake Hose Bracket Bolt	9 N.m (80 lb in)
Rear Shock Absorber Bolt	
• First Pass:	100 N.m (74 lb ft)
• Final Pass:	30 - 45 Degrees
Rear Suspension Shock Absorber Upper Mounting Nut	40 N.m (30 lb ft)
Rear Suspension Strut Bolt	22 N.m (16 lb ft)
Rear Wheel Hub Bolt	58 N.m (43 lb ft)

REPAIR INSTRUCTIONS

REAR WHEEL BEARING AND HUB REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**

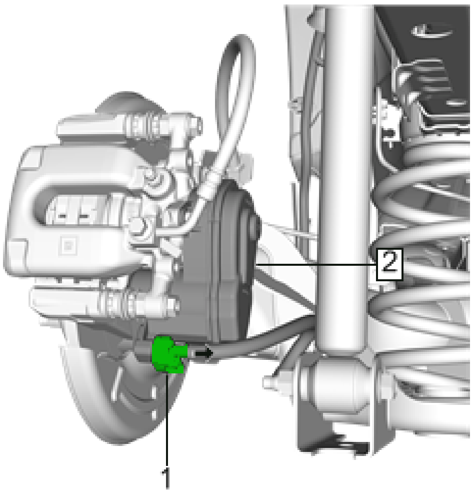

Fig. 1: Electrical Connector And Rear Park Brake Actuator
Courtesy of GENERAL MOTORS COMPANY

3. Disconnect Electrical Connector (1) @ Rear Park Brake Actuator (2)

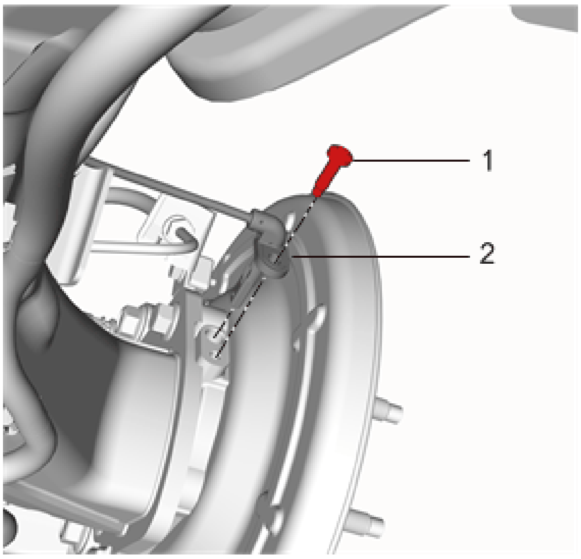

Fig. 2: Rear Wheel Speed Sensor And Bolt

Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Brake Caliper Mount Plate (3) @ Rear Axle
2. Install Rear Brake Shield (2) @ Rear Axle
3. Install Rear Wheel Bearing and Hub Assembly (1) @ Rear Axle

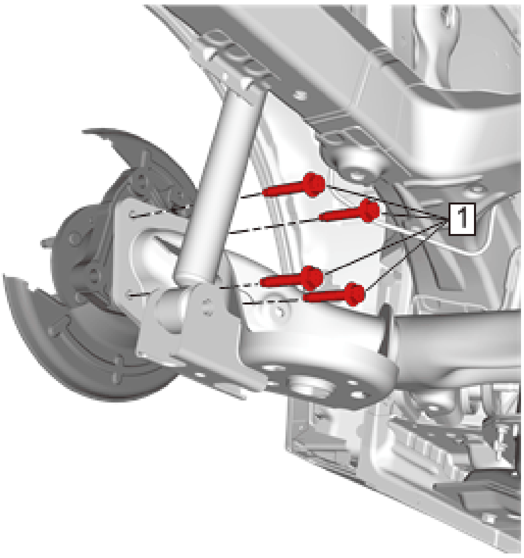

Fig. 8: Rear Wheel Hub Bolts
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution**

4. Install and tighten Rear Wheel Hub Bolts (1) (Qty: 4) to 58 N.m (43 lb ft)

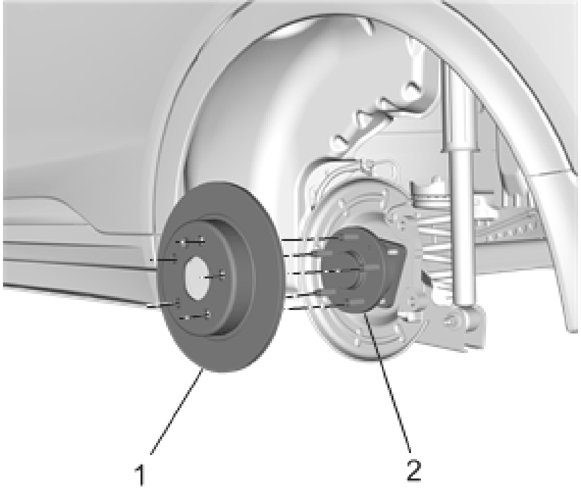

Fig. 9: Rear Brake Rotor And Rear Wheel Hub
Courtesy of GENERAL MOTORS COMPANY

5. Install Rear Brake Rotor (1) @ Rear Wheel Hub (2). Refer to **Rear Brake Rotor Replacement**
6. Install Rear Brake Caliper Bracket @ Vehicle. Refer to **Rear Brake Caliper Bracket Replacement**

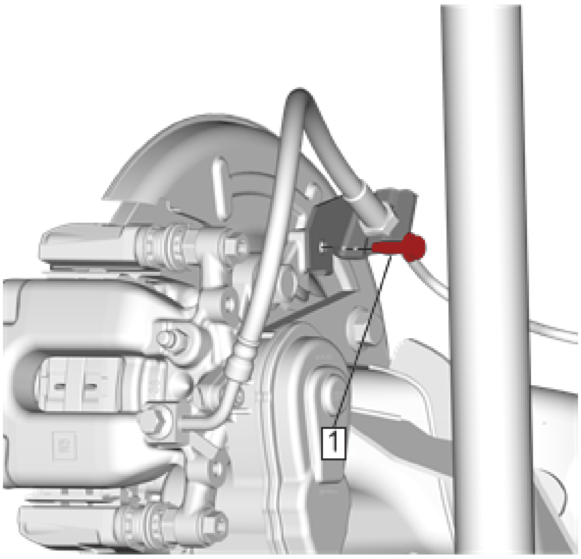

Fig. 10: Rear Brake Hose Bracket And Bolt
Courtesy of GENERAL MOTORS COMPANY

7. Install and tighten Rear Brake Hose Bracket Bolt (1) @ Rear Brake Caliper Mount Plate to 9 N.m (80 lb in)

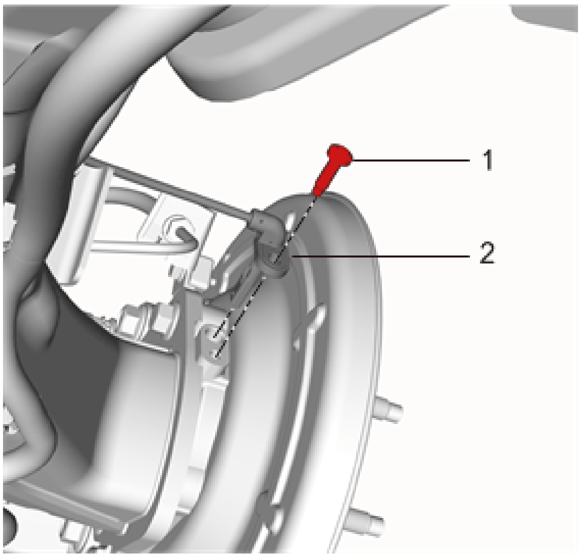

Fig. 11: Rear Wheel Speed Sensor And Bolt
Courtesy of GENERAL MOTORS COMPANY

8. Install Rear Wheel Speed Sensor (2) @ Rear Brake Caliper Mount Plate
9. Install and tighten Rear Wheel Speed Sensor Bolt (1) @ Rear Brake Caliper Mount Plate. Refer to **Rear Wheel Speed Sensor Replacement**

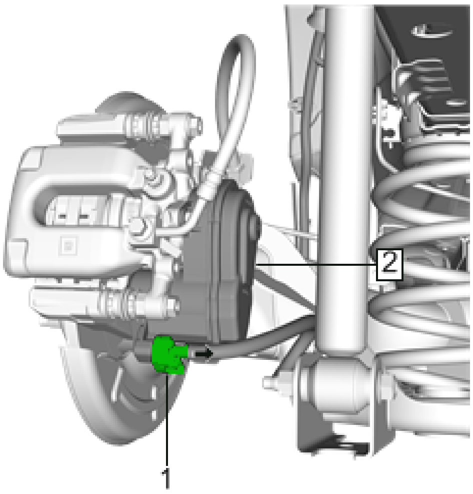

Fig. 12: Electrical Connector And Rear Park Brake Actuator
Courtesy of GENERAL MOTORS COMPANY

10. Connect Electrical Connector (1) @ Rear Park Brake Actuator (2)
11. Install the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
12. Lower the vehicle.

STRUT AND SHOCK ABSORBER INSPECTION

NOTE: **The shock absorber assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

NOTE: **A light film of oil on the top portion of the lower shock absorber tube is normal. DO NOT replace the shock absorber for this condition.**

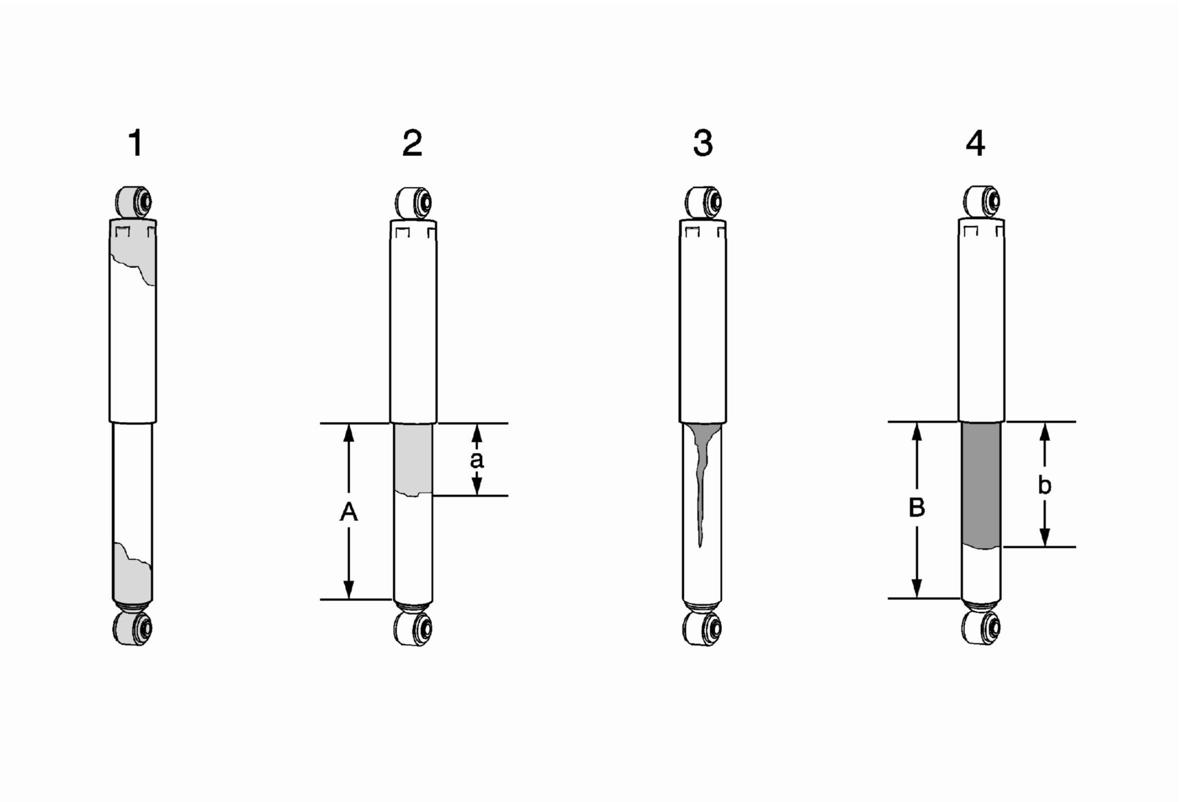

Fig. 13: Identifying Shock Absorber Conditions
Courtesy of GENERAL MOTORS COMPANY

Condition 1

Oil or fluid residue only on the bottom or top of the shock absorber and not originating from the shaft seal, is not a shock absorber related problem. DO NOT replace the shock absorber, look for other external leaks.

Condition 2

Light film/residue on approximately 1/3 (a) or less of the lower shock tube (A) and originating from the shaft seal, is a NORMAL condition. DO NOT replace the shock absorber.

Condition 3

Oil drip or trail down the lower shock tube and originating from the shaft seal, is an ABNORMAL condition. Replace the shock absorber. Refer to **Shock Absorber Replacement**.

Condition 4

An extreme wet film of oil covering more than 1/3 (b) of the lower shock tube and originating from the shaft seal (B), is an ABNORMAL condition. Replace the shock absorber. Refer to **Shock Absorber Replacement**.

Inspection

1. Verify the customer's concern is present. If the concern is present, continue to the next step. If the concern is not present, then the vehicle is operating normally.

NOTE: **The shock absorber assembly DOES NOT have to be removed from the vehicle to perform the following inspection procedure.**

2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** .
3. Visually inspect each of the shock absorbers for external fluid leaks. Refer to the following conditions 1, 2, 3 and 4 for visual inspection.
   - If conditions 1 or 2 are found, continue to step 4.
   - If conditions 3 or 4 are found, replace shock absorber. Refer to **Shock Absorber Replacement**.
4. Use your hands in order to lift up and push down on each corner of the vehicle 3 times. Remove your hands from the vehicle. If the corner motion exceeds 2 cycles, replace the shock absorber. If the shock absorber does not exceed 2 cycles, NO repair is necessary.

REAR SHOCK ABSORBER BUMPER REPLACEMENT

Special Tools

- **CH-51095** Shock Absorber Strut Nut Wrench

Equivalent regional tools: **Special Tools**

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
3. Remove Rear Wheelhouse Liner. Refer to **Rear Wheelhouse Liner Replacement**

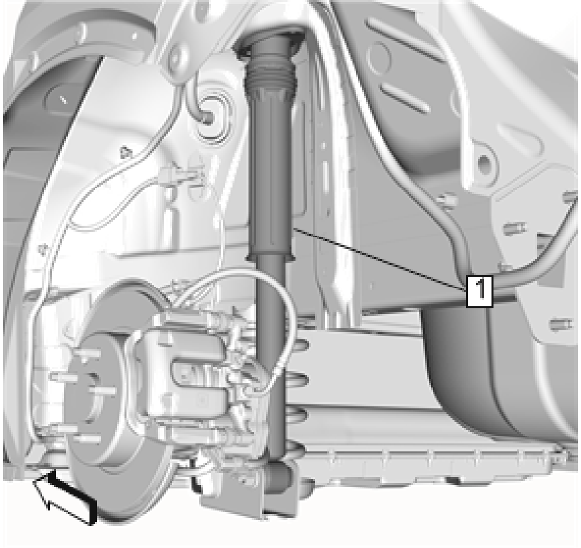

Fig. 14: Rear Shock Absorber
Courtesy of GENERAL MOTORS COMPANY

4. Remove Rear Shock Absorber (1) @ Vehicle. Refer to Shock Absorber Replacement

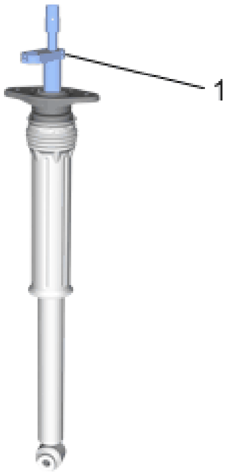

Fig. 15: Shock Absorber Strut Nut Wrench
Courtesy of GENERAL MOTORS COMPANY

5. Use the CH-51095 shock absorber strut nut wrench (1) or equivalent to remove the rear suspension shock absorber upper mounting nut.

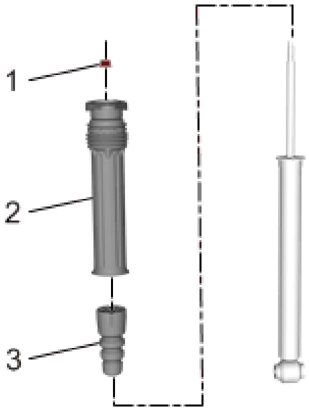

Fig. 16: Rear Shock Absorber Upper Mounting Nut, Mount And Bumper
Courtesy of GENERAL MOTORS COMPANY

6. Remove Rear Suspension Shock Absorber Upper Mounting Nut (1)
7. Remove Rear Shock Absorber Mount (2) @ Rear Shock Absorber
8. Remove Rear Shock Absorber Bumper (3) @ Rear Shock Absorber

Installation Procedure

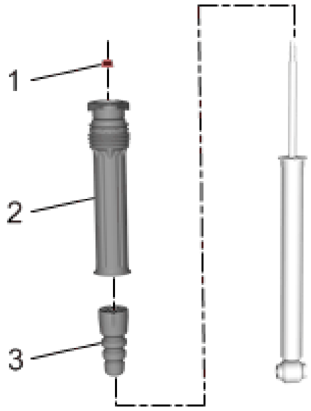

Fig. 17: Rear Shock Absorber Upper Mounting Nut, Mount And Bumper
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Shock Absorber Bumper (3) @ Rear Shock Absorber
2. Install Rear Shock Absorber Mount (2) @ Rear Shock Absorber
3. Install Rear Suspension Shock Absorber Upper Mounting Nut (1)

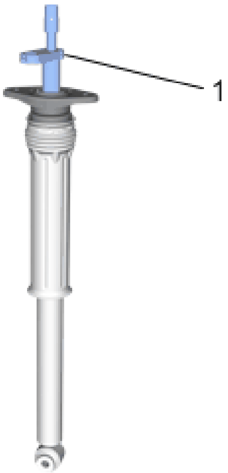

Fig. 18: Shock Absorber Strut Nut Wrench
Courtesy of GENERAL MOTORS COMPANY

4. Use the CH-51095 shock absorber strut nut wrench (1) or equivalent to tighten the rear suspension shock absorber upper mounting nut.

CAUTION: Fastener Caution

5. Install and tighten Rear Suspension Shock Absorber Upper Mounting Nut to 40 N.m (30 lb ft)

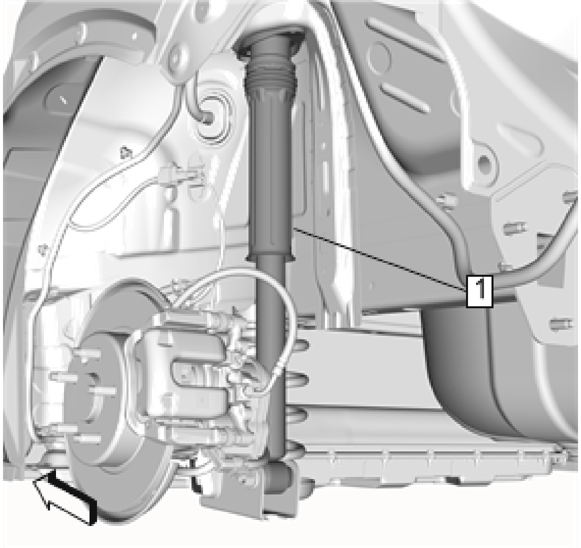

Fig. 19: Rear Shock Absorber
Courtesy of GENERAL MOTORS COMPANY

6. Install Rear Shock Absorber (1) @ Vehicle. Refer to **Shock Absorber Replacement**
7. Install Rear Wheelhouse Liner. Refer to **Rear Wheelhouse Liner Replacement**
8. Install the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
9. Lower the vehicle.

REAR SHOCK ABSORBER MOUNT REPLACEMENT

Special Tools

- **CH-51095** Shock Absorber Strut Nut Wrench

Equivalent regional tools: **Special Tools**

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
3. Remove Rear Wheelhouse Liner. Refer to **Rear Wheelhouse Liner Replacement**

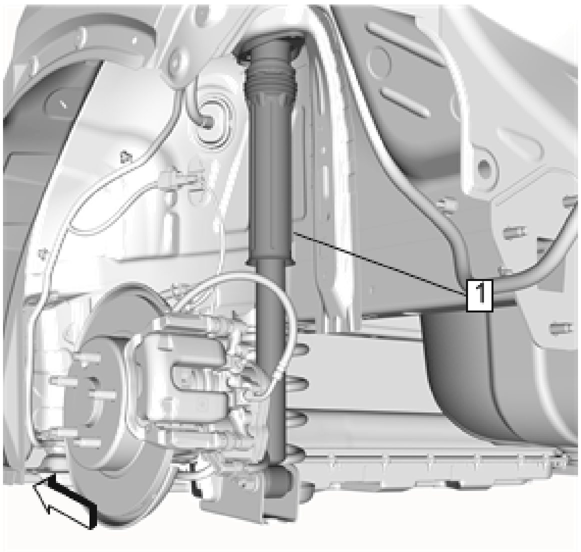

Fig. 20: Rear Shock Absorber
Courtesy of GENERAL MOTORS COMPANY

4. Remove Rear Shock Absorber (1) @ Vehicle. Refer to **Shock Absorber Replacement**

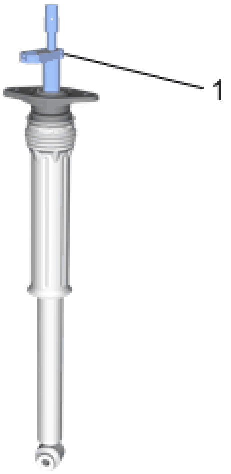

Fig. 21: Shock Absorber Strut Nut Wrench
Courtesy of GENERAL MOTORS COMPANY

5. Use the CH-51095 shock absorber strut nut wrench (1) or equivalent to remove the rear suspension shock absorber upper mounting nut.

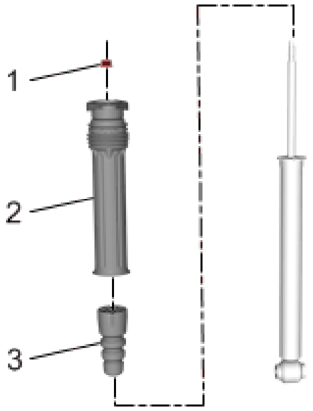

Fig. 22: Rear Shock Absorber Upper Mounting Nut, Mount And Bumper
Courtesy of GENERAL MOTORS COMPANY

6. Remove Rear Suspension Shock Absorber Upper Mounting Nut (1)
7. Remove Rear Shock Absorber Mount (2) @ Rear Shock Absorber

Installation Procedure

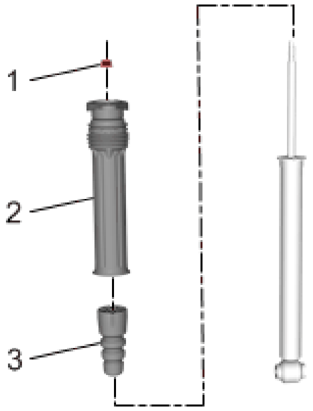

Fig. 23: Rear Shock Absorber Upper Mounting Nut, Mount And Bumper
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Shock Absorber Mount (2) @ Rear Shock Absorber
2. Install Rear Suspension Shock Absorber Upper Mounting Nut (1)

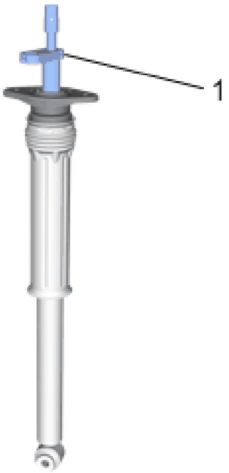

Fig. 24: Shock Absorber Strut Nut Wrench
Courtesy of GENERAL MOTORS COMPANY

3. Use the CH-51095 shock absorber strut nut wrench (1) or equivalent to tighten the rear suspension shock absorber upper mounting nut.

CAUTION: **Refer to Fastener Caution**

4. Install and tighten Rear Suspension Shock Absorber Upper Mounting Nut to 40 N.m (30 lb ft)

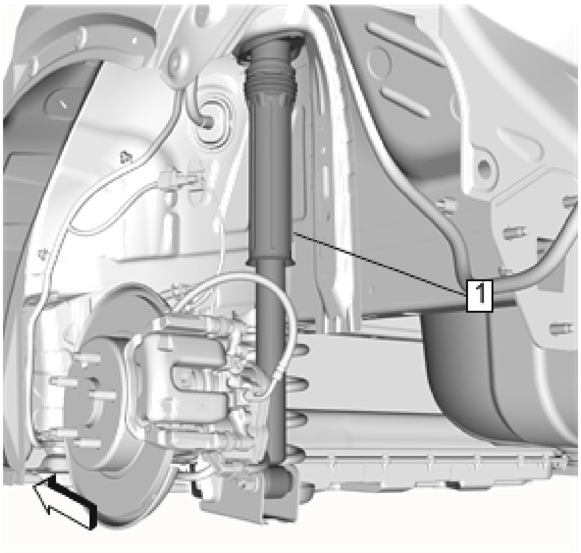

Fig. 25: Rear Shock Absorber
Courtesy of GENERAL MOTORS COMPANY

5. Install Rear Shock Absorber (1) @ Vehicle. Refer to Shock Absorber Replacement
6. Install Rear Wheelhouse Liner. Refer to Rear Wheelhouse Liner Replacement
7. Install the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation
8. Lower the vehicle.

SHOCK ABSORBER REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle
2. Remove the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation

3. Remove Rear Wheelhouse Liner. Refer to **Rear Wheelhouse Liner Replacement**
4. Support the rear axle with a hydraulic jack stand.

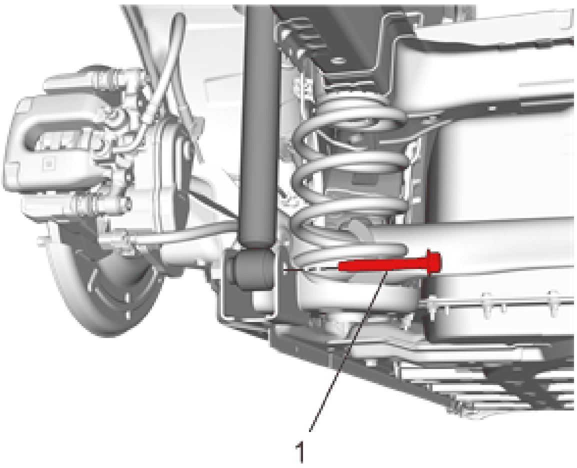

Fig. 26: Rear Shock Absorber Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Remove Rear Shock Absorber Bolt (1) @ Rear Axle
6. Remove the hydraulic jack stand from the vehicle.

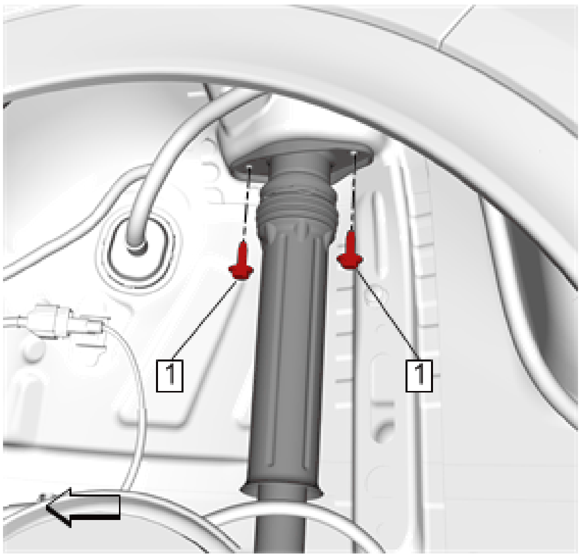

Fig. 27: Rear Suspension Strut Bolts
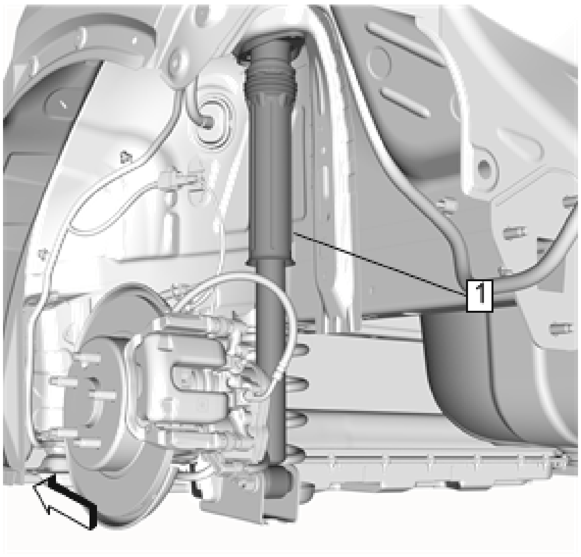
Courtesy of GENERAL MOTORS COMPANY

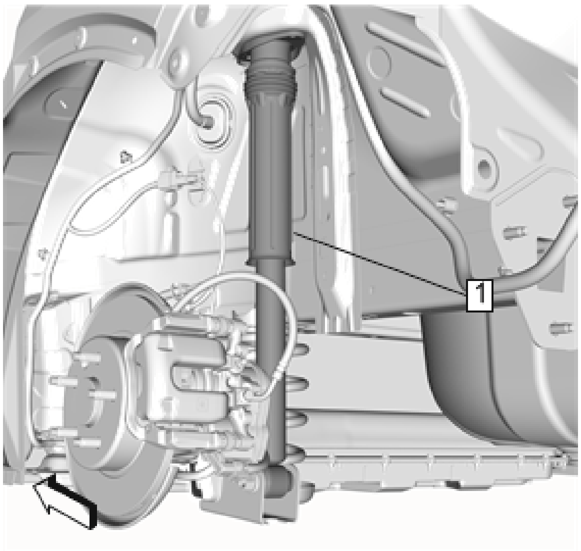
7. Remove Rear Suspension Strut Bolts (1) (Qty: 2)



[Fig. 28: Rear Shock Absorber](#)
Courtesy of GENERAL MOTORS COMPANY

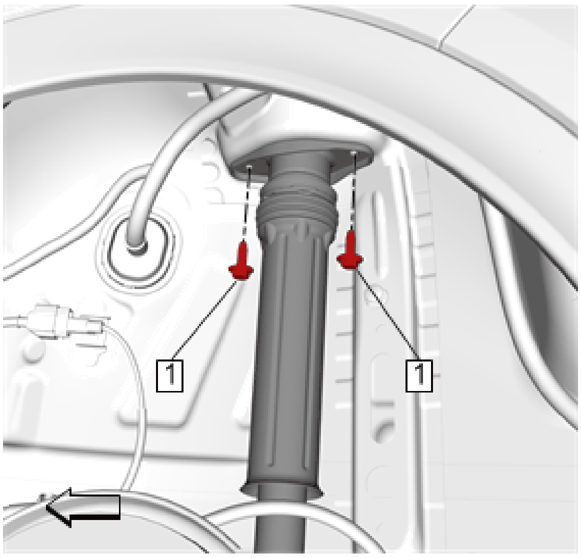
8. Remove Rear Shock Absorber (1) @ Vehicle

Installation Procedure



[Fig. 29: Rear Shock Absorber](#)
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Shock Absorber (1) @ Vehicle



[Fig. 30: Rear Suspension Strut Bolts](#)
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to [Fastener Caution](#)**

2. Install and tighten Rear Suspension Strut Bolts (1) (Qty: 2) to 22 N.m (16 lb ft)
3. Raise and support the rear axle with a hydraulic jack stand.

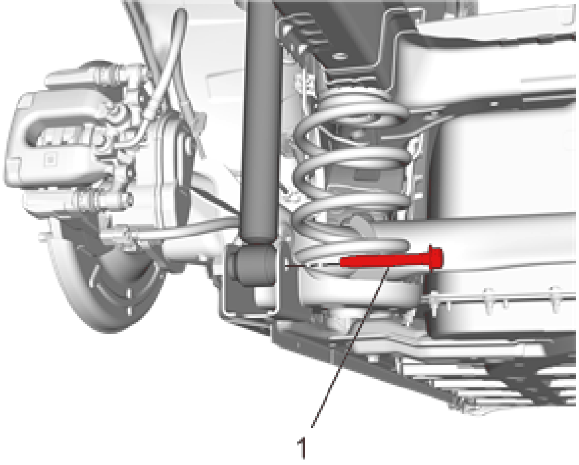


Fig. 31: Rear Shock Absorber Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install and tighten Rear Shock Absorber Bolt (1) @ Rear Axle
    1. First Pass: 100 N.m (74 lb ft)
    2. Final Pass: 30 - 45 Degrees
5. Remove the hydraulic jack stand from the vehicle.
6. Install Rear Wheelhouse Liner. Refer to **Rear Wheelhouse Liner Replacement**
7. Install the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
8. Lower the vehicle.

REAR COIL SPRING REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation**

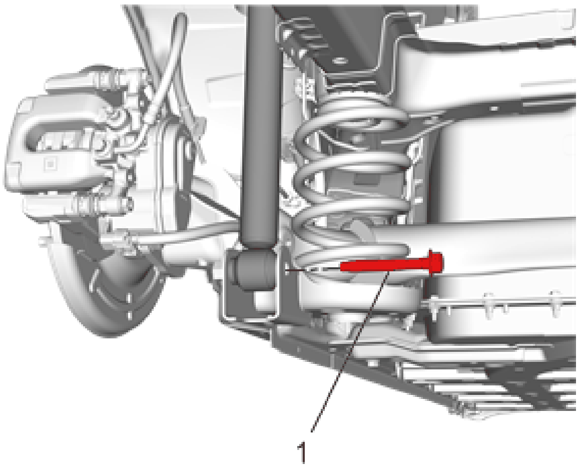

Fig. 32: Rear Shock Absorber Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Support the rear axle with a hydraulic jack stand.
4. Remove Rear Shock Absorber Bolt (1) @ Rear Axle

NOTE: **KEEP supporting the rear axle with the hydraulic jack stand to prevent the rear brake hose and rear wheel speed sensor harness from being damaged.**

5. Using the hydraulic jack stand, slowly lower the rear axle until the tension is not applied to the rear brake hose and rear wheel speed sensor harness.

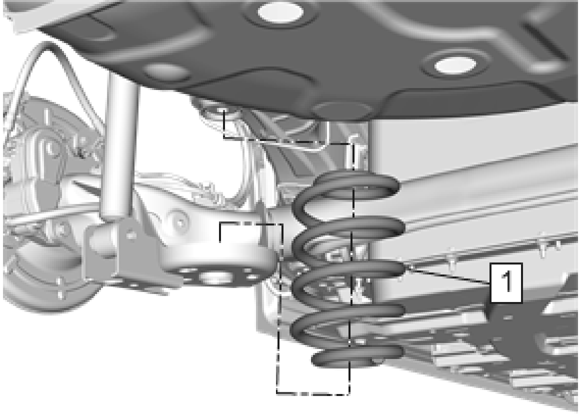

Fig. 33: Rear Coil Spring
Courtesy of GENERAL MOTORS COMPANY

6. Remove Rear Coil Spring (1) @ Vehicle

Installation Procedure

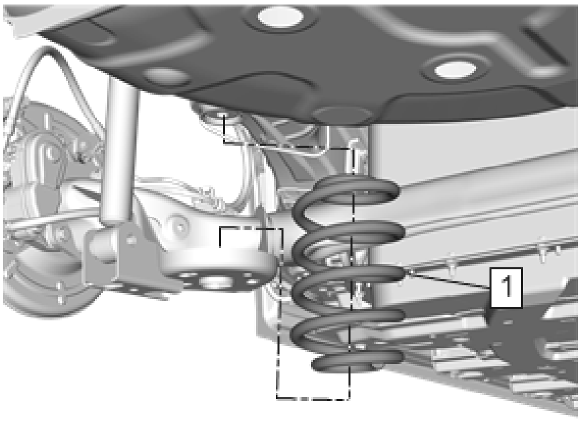

Fig. 34: Rear Coil Spring
Courtesy of GENERAL MOTORS COMPANY

1. Install Rear Coil Spring (1) @ Vehicle

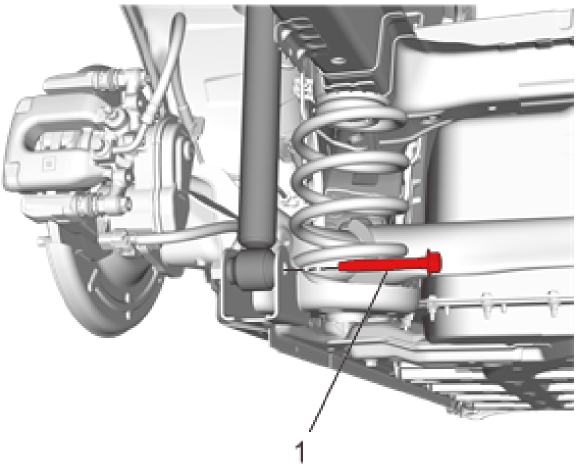

Fig. 35: Rear Shock Absorber Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Raise the hydraulic jack stand in order to install the rear shock absorber bolt.
3. Install and tighten Rear Shock Absorber Bolt (1) @ Rear Axle. Refer to **Shock Absorber Replacement**
4. Remove the hydraulic jack stand.
5. Install the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation**
6. Lower the vehicle.

REAR COIL SPRING INSULATOR REPLACEMENT

9. Remove Rear Brake Pipe Fitting (1) (Qty: 2) @ Rear Brake Hose (3)
10. Remove Rear Brake Hose Retainer (1) (Qty: 2)
11. Separate Rear Brake Hose (3) (Qty: 2) @ Rear Axle
12. Remove Rear Brake Caliper (Qty: 2) @ Vehicle. Refer to **Rear Brake Caliper Replacement**
13. Remove Rear Brake Caliper Bracket (Qty: 2) @ Vehicle. Refer to **Rear Brake Caliper Bracket Replacement**

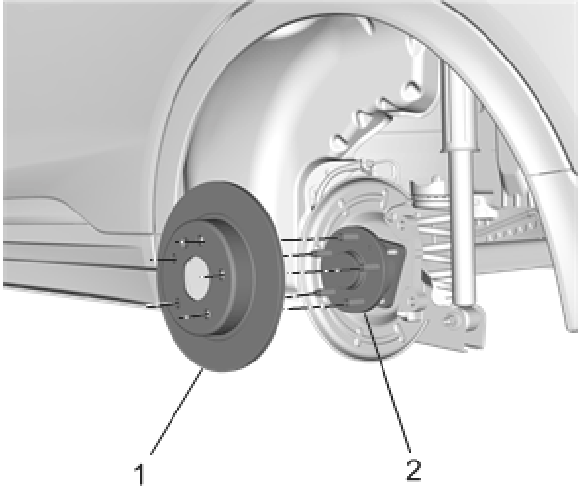

Fig. 43: Rear Brake Rotor And Rear Wheel Hub
Courtesy of GENERAL MOTORS COMPANY

14. Remove Rear Brake Rotor (1) (Qty: 2) @ Rear Wheel Hub (2). Refer to **Rear Brake Rotor Replacement**
15. Remove the body wiring harness clips from the rear axle.

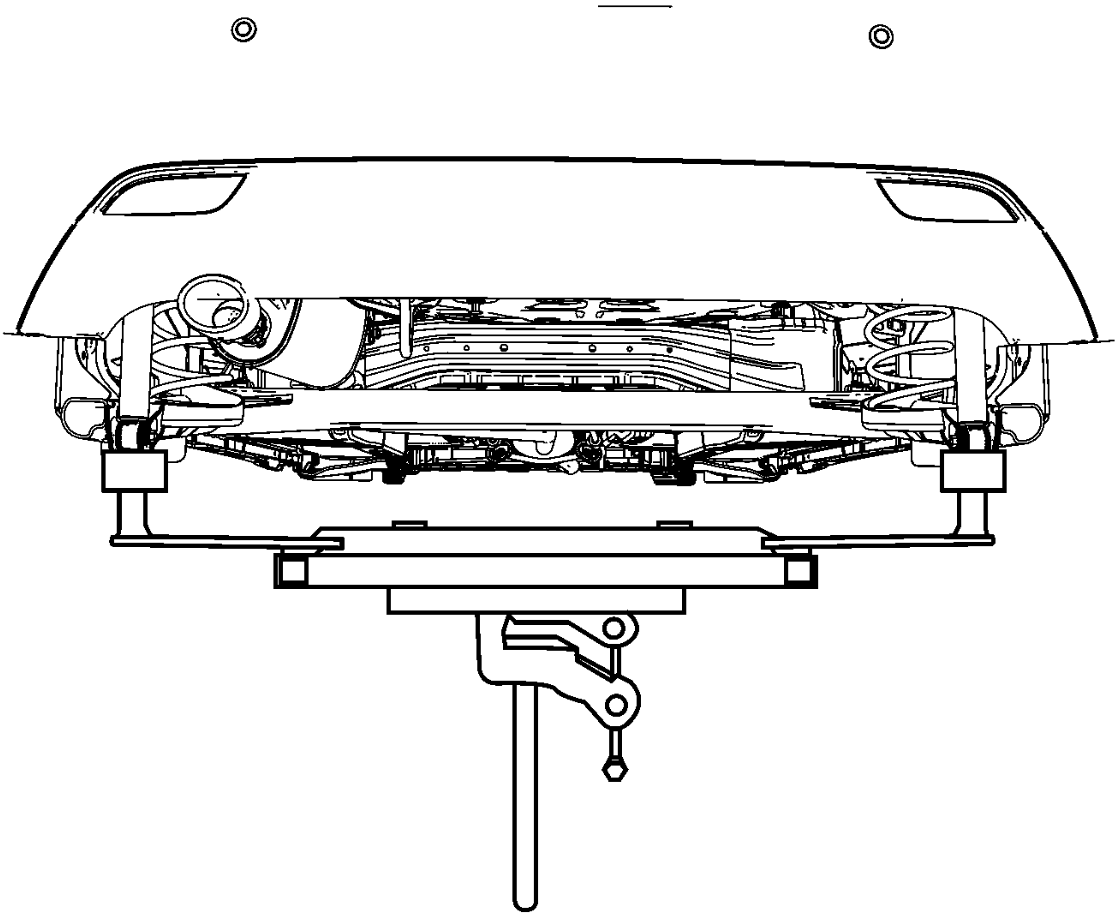

Fig. 44: Hydraulic Jack Stand And DT-50187
Courtesy of GENERAL MOTORS COMPANY

16. Support the rear axle with the DT-50187 rear axle supporter and a hydraulic jack.

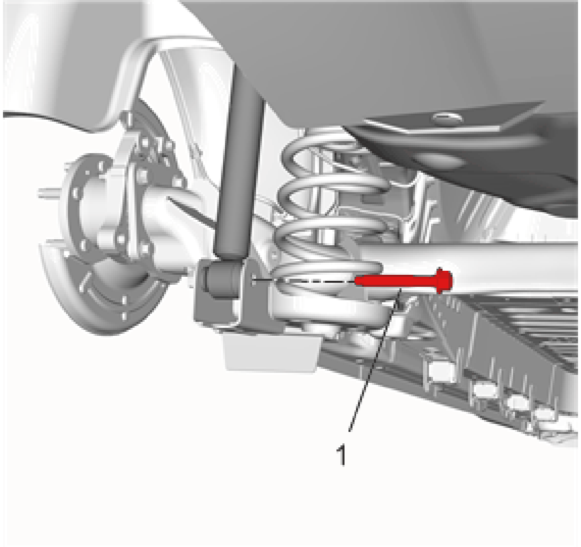

Fig. 45: Rear Shock Absorber Bolt
Courtesy of GENERAL MOTORS COMPANY

17. Remove Rear Shock Absorber Bolt (1) (Qty: 2) @ Rear Axle
18. Lower the hydraulic jack stand.
19. Remove Rear Coil Spring (Qty: 2). Refer to **Rear Coil Spring Replacement**
20. Remove Rear Coil Spring Lower Insulator (Qty: 2). Refer to **Rear Coil Spring Lower Insulator Replacement**

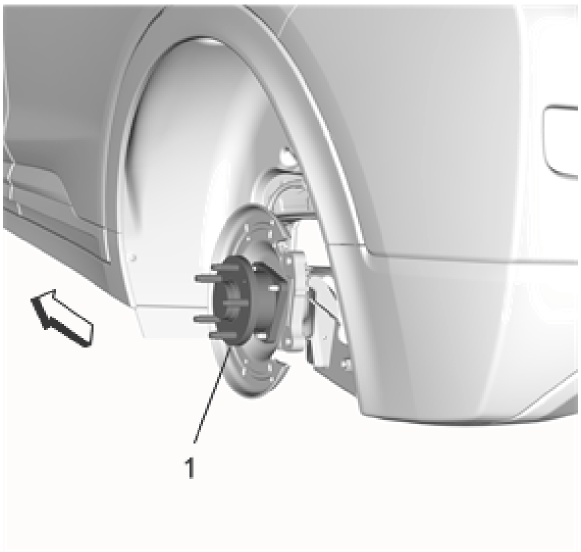

Fig. 46: Rear Wheel Bearing and Hub Assembly
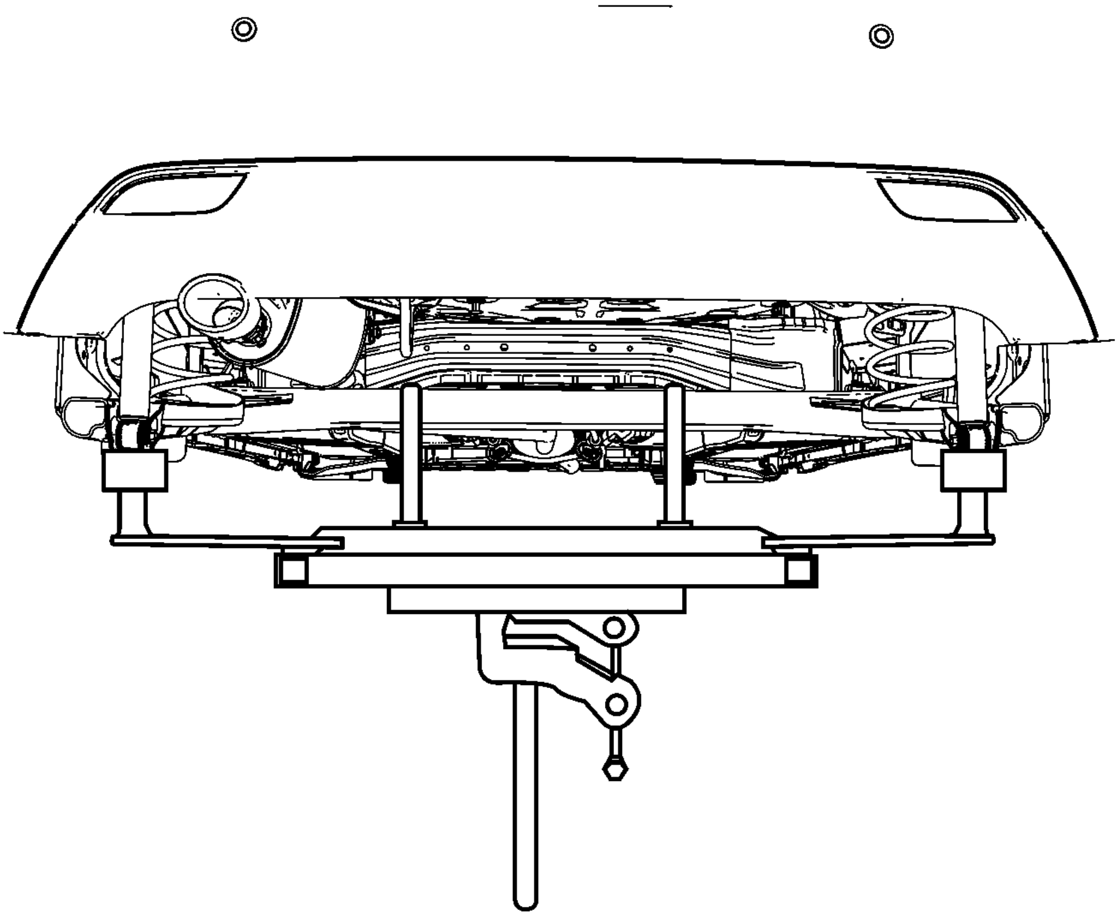
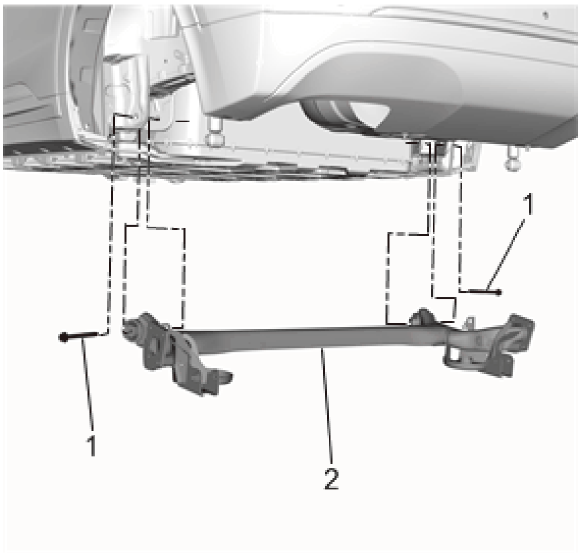
Courtesy of GENERAL MOTORS COMPANY

21. Remove Rear Wheel Bearing and Hub Assembly (1) (Qty: 2) @ Rear Axle. Refer to **Rear Wheel Bearing and Hub Replacement**



[Fig. 47: Hydraulic Jack Stand And DT-50187](#)
Courtesy of GENERAL MOTORS COMPANY

22. Support the DT-50187 rear axle with the rear axle supporter and hydraulic jack.



[Fig. 48: Rear Axle And Bolts](#)
Courtesy of GENERAL MOTORS COMPANY

23. Remove Rear Axle Bolts (1) (Qty: 2)
24. Slowly lower the hydraulic jack stand to remove the rear axle (2) from the vehicle.
25. Remove the rear axle from the hydraulic jack stand with the DT-50187 rear axle supporter.

Installation Procedure

1. Place the rear axle on the hydraulic jack stand with the DT-50187 rear axle supporter.

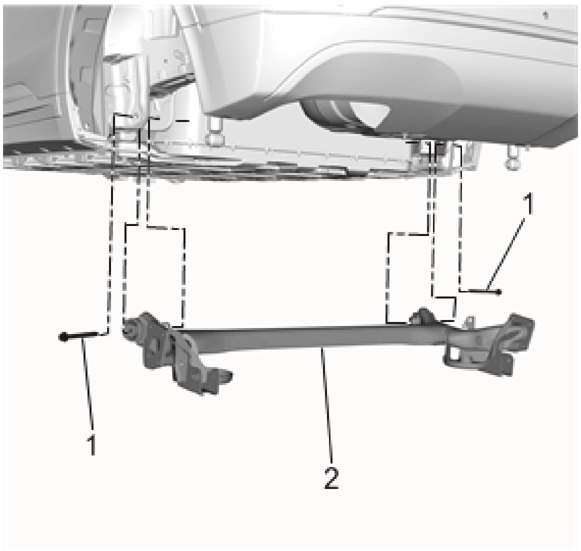


Fig. 49: Rear Axle And Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Using the hydraulic jack stand, raise the rear axle (2) to the correct position.
3. Hand tighten Rear Axle Bolts (1) (Qty: 2)

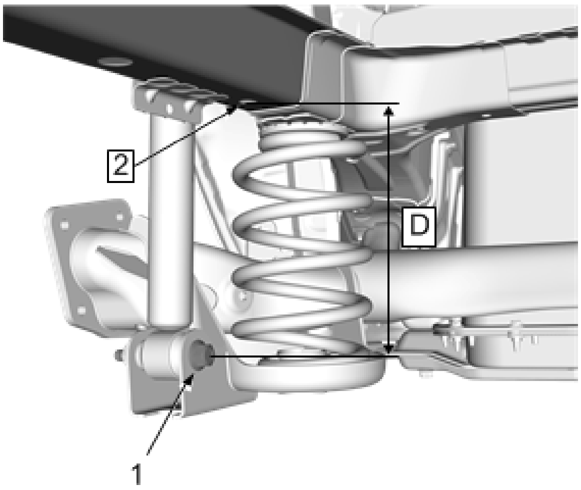

Fig. 50: Identifying D Dimension
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The rear axle to body retaining bolts must be tightened with the axle at the correct suspension height.**

4. Using the rear axle supporter and the hydraulic jack stand, raise the rear axle to the right suspension height specification (D). Refer to **Trim Height Specifications**

CAUTION: **Refer to Fastener Caution**

5. Tighten Rear Axle Bolts (Qty: 2)
    1. First Pass: 160 N.m (118 lb ft)
    2. Final Pass: 30 - 45 Degrees
6. Lower the hydraulic jack stand.
7. Install the body wiring harness clips to the rear axle.

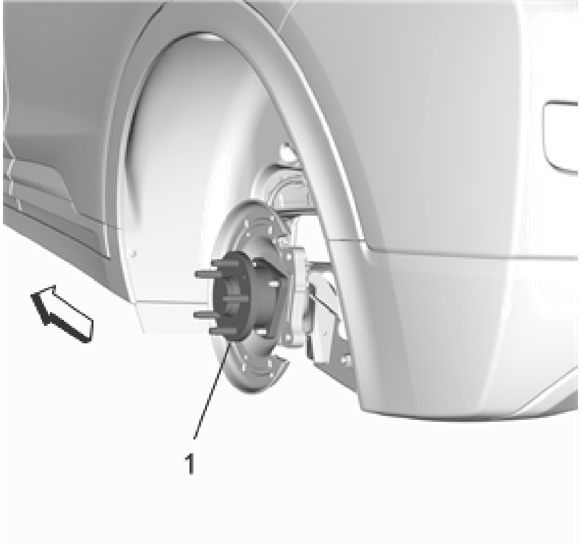

Fig. 51: Rear Wheel Bearing and Hub Assembly
Courtesy of GENERAL MOTORS COMPANY

8. Install Rear Wheel Bearing and Hub Assembly (1) (Qty: 2) @ Rear Axle. Refer to **Rear Wheel Bearing and Hub Replacement**
9. Install Rear Coil Spring Lower Insulator (Qty: 2). Refer to **Rear Coil Spring Lower Insulator Replacement**
10. Install Rear Coil Spring (Qty: 2). Refer to **Rear Coil Spring Replacement**

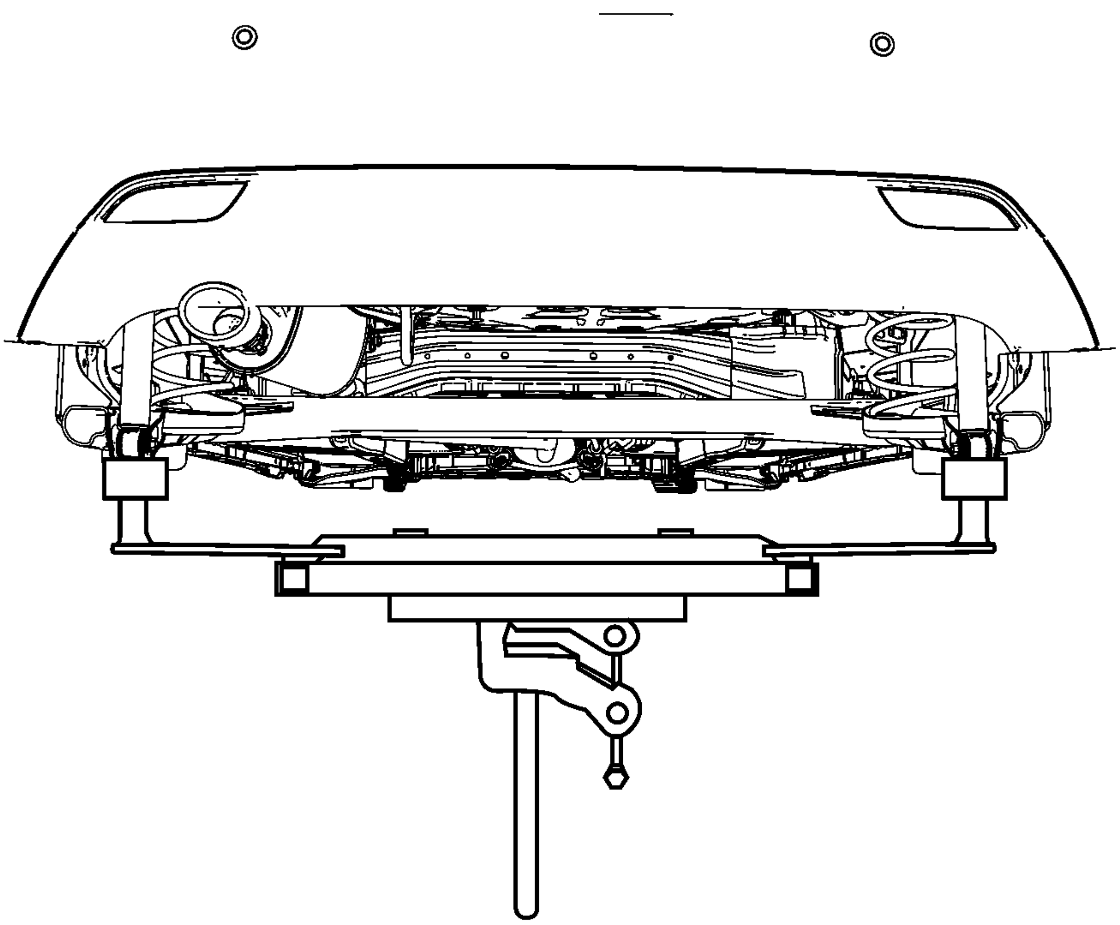

Fig. 52: Hydraulic Jack Stand And DT-50187
Courtesy of GENERAL MOTORS COMPANY

11. Support the rear axle with the DT-50187 rear axle supporter and hydraulic jack.

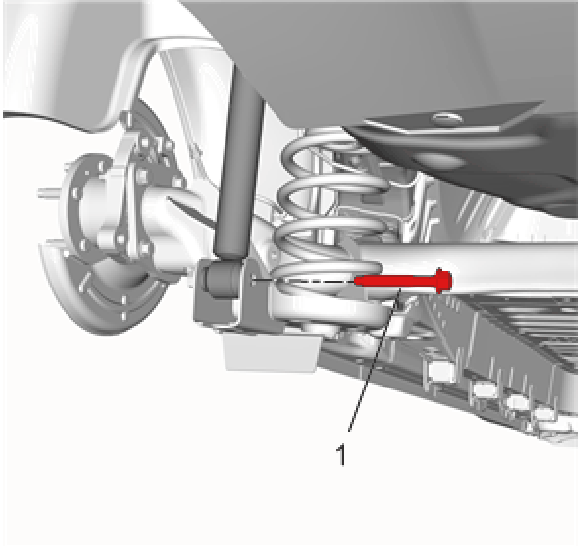

Fig. 53: Rear Shock Absorber Bolt
Courtesy of GENERAL MOTORS COMPANY

12. Install and tighten Rear Shock Absorber Bolt (1) (Qty: 2) @ Rear Axle
    1. First Pass: 100 N.m (74 lb ft)
    2. Final Pass: 30 - 45 Degrees
13. Remove the hydraulic jack with the rear axle supporter from the rear axle.

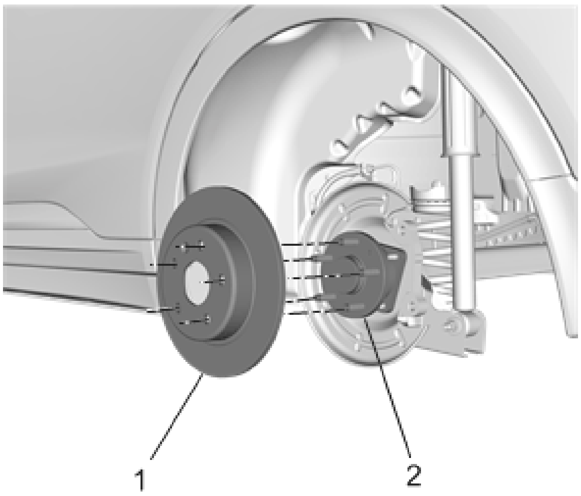

Fig. 54: Rear Brake Rotor And Rear Wheel Hub
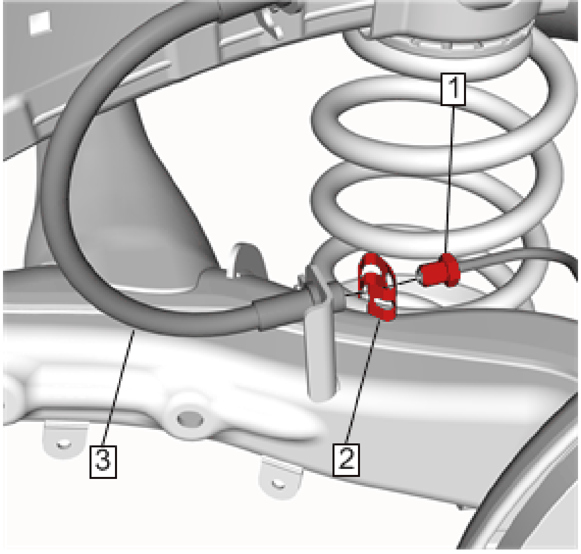
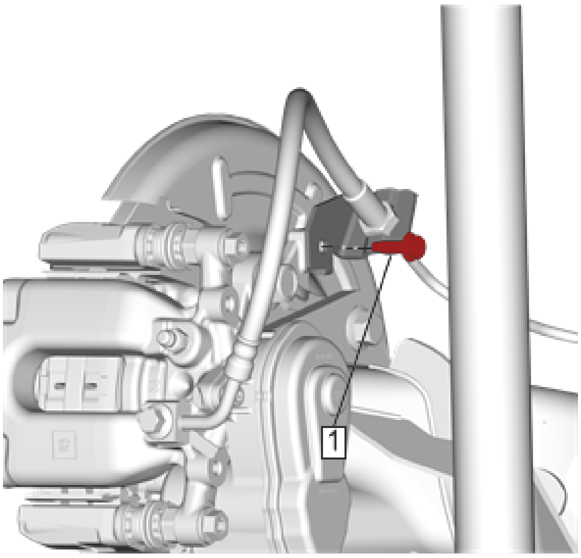
Courtesy of GENERAL MOTORS COMPANY

14. Install Rear Brake Rotor (1) @ Rear Wheel Hub (2). Refer to **Rear Brake Rotor Replacement**
15. Install Rear Brake Caliper Bracket (Qty: 2) @ Vehicle. Refer to **Rear Brake Caliper Bracket Replacement**
16. Install Rear Brake Caliper (Qty: 2) @ Vehicle. Refer to **Rear Brake Caliper Replacement**



[**Fig. 55: Rear Brake Pipe Fitting, Rear Brake Hose And Retainer**]()
Courtesy of GENERAL MOTORS COMPANY

17. Install Rear Brake Hose (3) (Qty: 2) @ Rear Axle
18. Install Rear Brake Hose Retainer (2) (Qty: 2)
19. Install and tighten Rear Brake Pipe Fitting (1) (Qty: 2) @ Rear Brake Hose (3). Refer to [**Rear Brake Hose Replacement**]()



[**Fig. 56: Rear Brake Hose Bracket And Bolt**]()
Courtesy of GENERAL MOTORS COMPANY

20. Install and tighten Rear Brake Hose Bracket Bolt (1) (Qty: 2) @ Rear Brake Caliper Mount Plate to 9 N.m (80 lb in)

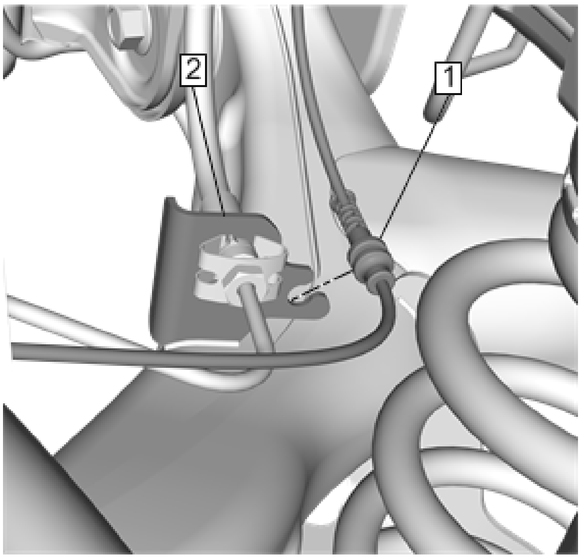


Fig. 57: Rear Wheel Speed Sensor Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

21. Install Rear Wheel Speed Sensor Wiring Harness (1) (Qty: 2) @ Rear Axle Mounted Bracket

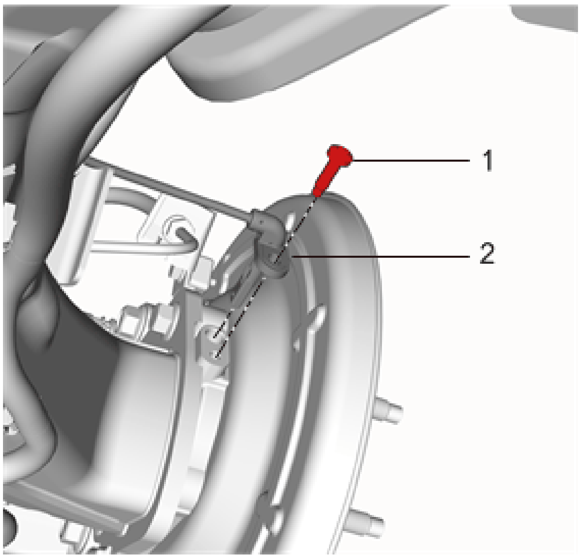

Fig. 58: Rear Wheel Speed Sensor And Bolt
Courtesy of GENERAL MOTORS COMPANY

22. Install Rear Wheel Speed Sensor (2) (Qty: 2) @ Rear Brake Caliper Mount Plate
23. Install and tighten Rear Wheel Speed Sensor Bolt (1) (Qty: 2) @ Rear Brake Caliper Mount Plate. Refer to **Rear Wheel Speed Sensor Replacement**

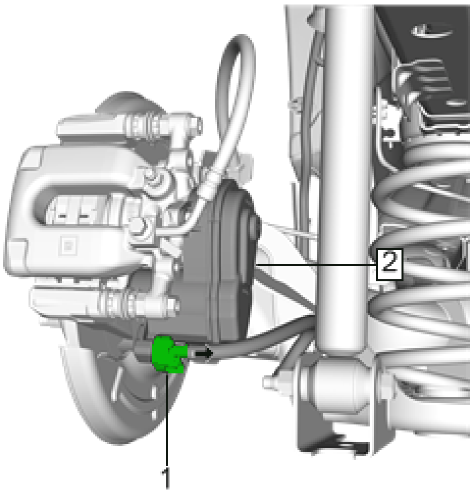

Fig. 59: Electrical Connector And Rear Park Brake Actuator
Courtesy of GENERAL MOTORS COMPANY

24. Connect Electrical Connector (1) (Qty: 2) @ Rear Park Brake Actuator (Qty: 2)
25. Install Rear Wheelhouse Liner (Qty: 2) @ Vehicle. Refer to **Rear Wheelhouse Liner Replacement**
26. Install the rear tire and wheel assemblies. Refer to **Tire and Wheel Removal and Installation**
27. Lower the vehicle.

WHEEL STUD REPLACEMENT

Special Tools

- **CH-43631** Ball Joint Remover

Equivalent regional tools: **Special Tools**

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**

2. Remove the rear tire and wheel assembly. Refer to Tire and Wheel Removal and Installation

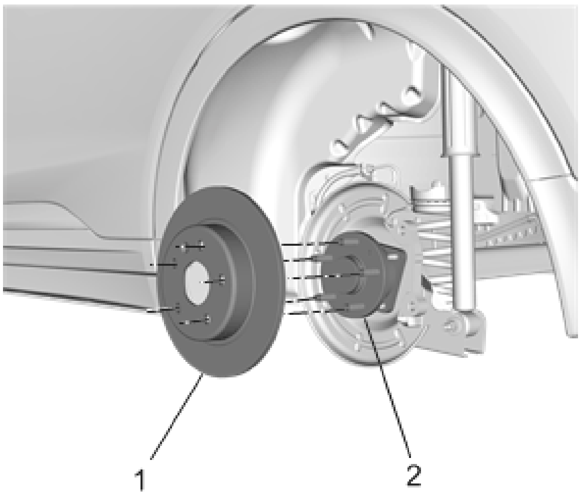

Fig. 60: Rear Brake Rotor And Rear Wheel Hub
Courtesy of GENERAL MOTORS COMPANY

3. Remove Rear Brake Rotor (1) @ Rear Wheel Hub (2). Refer to Rear Brake Rotor Replacement

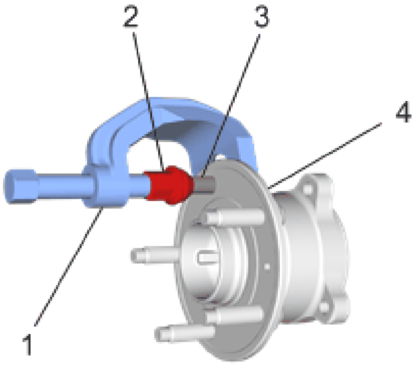

Fig. 61: Ball Joint Remover, Wheel Hub, Wheel Stud And Wheel Nut
Courtesy of GENERAL MOTORS COMPANY

4. Install a wheel nut (2) flush with the end of the wheel stud (3).
5. Using the **CH-43631** ball joint remover (1), remove the wheel stud (3) from the wheel hub (4).

Installation Procedure

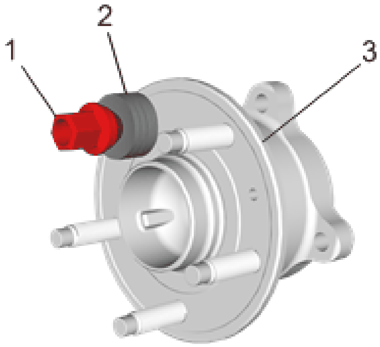

Fig. 62: Wheel Bearing/Hub Flange, Flat Washers And Wheel Nut
Courtesy of GENERAL MOTORS COMPANY

1. Install the NEW wheel stud into the wheel bearing/hub (3).
2. Add enough washers (2) in order to draw the stud into the hub.
3. Install and tighten the wheel nut (1) until the head of the wheel stud is fully seated against the back of the bearing hub flange (3).
4. Remove the wheel nut (1) and the washers (2).

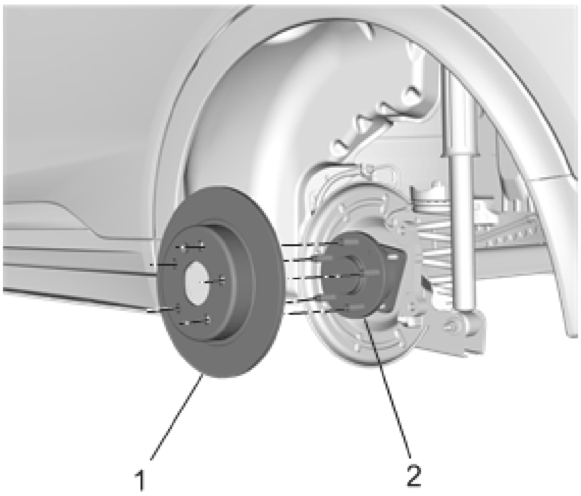

Fig. 63: Rear Brake Rotor And Rear Wheel Hub
Courtesy of GENERAL MOTORS COMPANY

5. Install Rear Brake Rotor (1) @ Rear Wheel Hub (2). Refer to **Rear Brake Rotor Replacement**
6. Install the rear tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
7. Lower the vehicle.

DESCRIPTION AND OPERATION

REAR SUSPENSION DESCRIPTION AND OPERATION

This vehicle has a semi-independent twist-beam rear suspension system consisting of the following components:

- An axle with integral trailing arms
- A "V" shaped twisting cross beam
- Two coil springs
- Two shock absorbers

Axle Assembly

The axle assembly attaches to the underbody through a rubber bushing and bracket located at the front of each integral trailing arm. The brackets are integrated to the underbody side rails. The axle structure itself maintains the geometrical relationship of the wheels relative to the centerline of the body.

2017 SUSPENSION

Suspension General Diagnosis - Bolt EV

SPECIFICATIONS

TRIM HEIGHT SPECIFICATIONS

For description see Trim Height Inspection, refer to Trim Height Inspection

Model	Tire Size	Z +/ - 10 mm (0.39 in)	D +/ - 10 mm (0.39 in)	P +/ - 12 mm (0.47 in)	R +/ - 12 mm (0.47 in)
1FB48/0FB48	215/50R17	22 mm (0.87 in)	207 mm (8.15 in)	687.1 mm (27.05 in)	686.9 mm (27.04 in)
0FB48	205/55R16	22 mm (0.87 in)	207 mm (8.15 in)	679.1 mm (26.74 in)	678.9 mm (26.73 in)
The conditions refers to full fluid levels (fuel, windshield washer fluid and etc.) with no driver or passenger mass, and no luggage/cargo mass.					

DIAGNOSTIC INFORMATION AND PROCEDURES

SYMPTOMS - SUSPENSION GENERAL DIAGNOSIS

NOTE: **The following step must be completed before using the symptom tables.**

Review the system description and operation in order to familiarize yourself with the system functions. Refer to the appropriate description and operation:

- Front Suspension Description and Operation
- Rear Suspension Description and Operation

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of any of the suspension subsystems.
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.
- Inspect for correct tire size and inflation pressure.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Ride Diagnosis
- Vehicle Leads/Pulls
- Body Leans or Sways in Corners
- Suspension Bottoms
- Torque Steer
- Memory Steer
- Noise Diagnosis - Front Suspension
- Noise Diagnosis - Rear Suspension

RIDE DIAGNOSIS

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	**NOTE:** **Verify the vehicle suspension package RPO.** Verify that the ride is too soft or too hard.Does the vehicle ride normally?	System OK	Go to **Step 3**
3	Inspect the tire inflation and adjust to specifications. Refer to **Tire Inflation Description** Did you adjust the tire pressure?	Go to **Step 6**	Go to **Step 4**
4	Inspect the vehicle trim height. Refer to **Trim Height Inspection** Did you find and correct the condition?	Go to **Step 6**	Go to **Step 5**
5	Inspect the following suspension components for wear or damage: • Shock absorbers - **Suspension Strut and Shock Absorber Testing - On Vehicle** • Springs Did you find and correct the condition?	Go to **Step 6**	-
6	Drive the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

VEHICLE LEADS/PULLS

Step	Action	Yes	No
DEFINITION: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle straight path.			
1	Did you review the General Description and perform the visual/physical inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Road test the vehicle in order to verify the complaint. Does the vehicle operate normally?	System OK	Go to **Step 3**
3	Inspect the tire/wheel assemblies for the following conditions: • Correct tire pressure - Refer to the tire placard. • Correct tire size - Refer to the tire placard. • Abnormal tire wear or damage Did you find and correct the condition?	Go to **Step 9**	Go to **Step 4**
4	Perform the radial tire lead/pull correction procedure. Refer to **Radial Tire Lead/Pull Correction** Did you find and correct the condition?	Go to **Step 9**	Go to **Step 5**

Step	Action	Yes	No
5	Inspect and correct/adjust the suspension and steering systems for the following conditions: • Vehicle trim height - **Trim Height Specifications** • Excessively worn, loose, or damaged components Did you find and correct the condition?	Go to **Step 9**	Go to **Step 6**
6	Inspect the brake system for brake drag. With the vehicle suspended on a hoist, brake drag can be identified by rotating each wheel several times and observing whether more force is needed to rotate the left wheel or the right wheel. Did you find and correct the condition?	Go to **Step 9**	Go to **Step 7**
7	Inspect the wheel alignment and adjust as necessary. Refer to **Wheel Alignment Measurement** Did you correct the condition?	Go to **Step 9**	Go to **Step 8**
8	Inspect the steering gear for unequal effort. The vehicle must be suspended on a hoist, the engine running, and the transmission in PARK or NEUTRAL. Grasp the tire assembly and manually simulate a turn from the left of center and the right of center observing whether more force is needed to turn to the left or to the right. If this condition exists replace the steering gear. Did you correct the condition?	System OK	Go to **Step 3**
9	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

BODY LEANS OR SWAYS IN CORNERS

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Verify the vehicle leans or sways in corners. Does the vehicle operate normally?	System OK	Go to **Step 3**
3	Inspect the following components for wear or damage: • Front coil springs • Rear coil springs Are the components worn or damaged?	Go to **Step 5**	Go to **Step 4**
4	1. Inspect the stabilizer shaft link for wear or damage. 2. Replace as necessary. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 2**
5	Replace the springs as necessary. Did you complete the repair?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

SUSPENSION BOTTOMS

Step	Action	Yes	No
DEFINITION: A loud bang or thump that can usually be felt and/or heard when the vehicle is driven over bumps. This condition is commonly noticed when the vehicle trim height is too low.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Verify that the suspension bottoms. Does the vehicle operate normally?	System OK	Go to **Step 3**
3	Inspect for vehicle overloading and correct the overloading condition as necessary. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 4**
4	Inspect the following components: • Inspect the shock absorbers. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle** • Inspect for damaged coil springs and torsion bar, and replace as necessary. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 5**
5	Inspect the vehicle trim height. Refer to **Trim Height Inspection** Did you complete the trim height inspection procedure?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

TORQUE STEER

Step	Action	Yes	No
DEFINITION: On a dry, smooth, flat road, the vehicle has a left or right steering force only during acceleration.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	1. Drive the vehicle on a straight, smooth, flat road. 2. Press the accelerator and determine if any additional steering input is required to maintain a straight ahead direction. 3. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal. Does the vehicle exhibit torque steer when the accelerator is pressed?	Go to **Step 3**	System OK

Step	Action	Yes	No
3	1. Drive the vehicle on a straight, smooth, flat road at 64 - 97 km/h (40 - 60 mph). 2. Remove your foot from the accelerator. 3. Shift the transmission into NEUTRAL in order to allow the vehicle to coast. 4. Is any additional steering input required to maintain a straight ahead direction? 5. Repeat this test with the vehicle traveling in the opposite direction in order to eliminate crosswind effects. Lead/pull caused by unlevel roads and crosswinds are considered normal.Does the vehicle direction change when the steering wheel is momentarily released?	Go to **Vehicle Leads/Pulls**	Go to **Step 4**
4	Inspect the front suspension and powertrain mounts for worn or damaged components and repair as necessary. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 5**
5	Inspect the vehicle trim height. Refer to **Trim Height Inspection** Did you find and correct the condition?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

MEMORY STEER

Step	Action	Yes	No
DEFINITION: A lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Verify that memory steer is present. Does the system operate normally?	System OK	Go to **Step 3**
3	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Lubricate the tie rod ends and the ball joints if applicable. 3. Inspect the suspension system for worn or damaged components. 4. Repair as necessary. Did you find and correct the condition?	Go to **Step 7**	Go to **Step 4**
4	Inspect for binding strut bearings. 1. Disconnect the strut from the steering knuckle. 2. If the strut is abnormally difficult to rotate, repair or replace the upper bearing mount. Did you find and complete the repair?	Go to **Step 7**	Go to **Step 5**

Step	Action	Yes	No
5	Inspect for binding in the lower ball joints. If the joint is binding, replace the joint. Did you find and complete the repair?	Go to **Step 7**	Go to **Step 6**
6	Inspect the wheel alignment and adjust as necessary. Refer to **Wheel Alignment Measurement** Did you complete the wheel alignment?	Go to **Step 7**	-
7	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	-

NOISE DIAGNOSIS - FRONT SUSPENSION

Step	Action	Yes	No
DEFINITION: Any noise emitted from the front of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the front suspension.			
1	Did you review the General Description and perform the necessary Inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to **Step 3**	System OK
3	Is the noise reactive to vehicle load or speed?	Go to **Step 4**	Go to **Step 7**
4	Inspect the tires for the following condition: • Proper tire inflation and adjust as necessary - **Tire Inflation Description** • Unusual tire wear - **Tire Diagnosis - Irregular or Premature Wear** • Inspect the wheel nuts for looseness and tighten as necessary. **Fastener Specifications** Did you find and correct the condition?	Go to **Step 14**	Go to **Step 5**
5	Inspect the front wheel bearings. Refer to **Wheel Bearings Diagnosis** Did you find and correct the condition?	Go to **Step 14**	Go to **Step 6**
6	Inspect for front axle or transaxle noises. Refer to **Symptoms - Automatic Transmission** Did you find and correct the condition?	Go to **Step 14**	Go to **Step 7**
7	Bounce the front of the vehicle in order to duplicate the noise. Did you duplicate the noise?	Go to **Step 8**	Go to **Step 9**
8	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Inspect the front suspension components for looseness. Refer to **Fastener Specifications** 3. Inspect the front suspension components for damage and repair as necessary. Did you find and correct the condition?	Go to **Step 14**	Go to **Step 9**

Step	Action	Yes	No
9	1. Install the **CH-39570** chassis ear or equivalent. 2. Bounce the front of the vehicle, using **CH-39570** chassis ear or equivalent in order to locate the source of the noise. If necessary road test the vehicle. 3. Repair or replace any damaged components as necessary. Did you find and correct the condition?	Go to **Step 14**	Go to **Step 10**
10	Inspect the ball joints and steering components for the following conditions: - Lack of lubrication where applicable - Looseness in the ball joints - Looseness in the tie rods Did you find and correct the condition?	Go to **Step 14**	Go to **Step 11**
11	Inspect for damaged shock absorbers. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle** Did you find and correct the condition?	Go to **Step 14**	Go to **Step 12**
12	Inspect the front stabilizer shaft and stabilizer shaft links for damage and repair as necessary. Refer to **Stabilizer Shaft Replacement** , or **Stabilizer Shaft Link Replacement** Did you find and correct the condition?	Go to **Step 14**	Go to **Step 13**
13	Inspect for control arm damage and repair as necessary. Refer to **Lower Control Arm Replacement** Did you find and correct the condition?	Go to **Step 14**	-
14	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

NOISE DIAGNOSIS - REAR SUSPENSION

Step	Action	Yes	No
DEFINITION: Any noise emitted from the rear of the vehicle that is induced by VEHICLE SPEED or DRIVING TERRAIN as related to the rear suspension.			
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Attempt to duplicate the condition. Road test the vehicle. Did you duplicate the condition?	Go to **Step 3**	System OK
3	Is the noise reactive to vehicle load or speed?	Go to **Step 4**	Go to **Step 6**

Step	Action	Yes	No
4	Perform the following inspections: • Inspect and adjust the tire inflation. Refer to **Tire Inflation Description** • Inspect for unusual tire wear. Refer to **Tire Diagnosis - Irregular or Premature Wear** • Inspect the wheel nuts for looseness. Refer to **Fastener Specifications** Did you find and correct the condition?	Go to **Step 10**	Go to **Step 5**
5	Inspect the rear wheel bearings. Refer to **Wheel Bearings Diagnosis** Did you find and correct the condition?	Go to **Step 10**	Go to **Step 6**
6	Bounce the rear of the vehicle in order to duplicate the noise. Did you duplicate the noise?	Go to **Step 7**	Go to **Step 9**
7	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Inspect the rear suspension components for looseness. Refer to **Fastener Specifications** 3. Inspect the rear suspension components for damage and repair as necessary. Did you find and correct the condition?	Go to **Step 10**	Go to **Step 8**
8	Inspect the rear shock absorber. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle** Did you find and correct the condition?	Go to **Step 10**	Go to **Step 9**
9	1. Install the **CH-39570** chassis ear or equivalent. 2. Bounce the rear of the vehicle, using **CH-39570** chassis ear or equivalent, in order to locate the source of the noise. If necessary, road test the vehicle. 3. Repair or replace any defect component as necessary. Did you find and correct the condition?	Go to **Step 10**	System OK
10	Operate the system in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

SUSPENSION STRUT AND SHOCK ABSORBER TESTING - ON VEHICLE

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Verify that the customer concern is present. Does the vehicle operate normally?	System OK	Go to **Step 3**

Step	Action	Yes	No
3	**NOTE:** **A light film of oil on the top portion of the shock reservoir is normal.** Inspect each strut or shock absorber for external fluid leakage.Is a strut or shock absorber leaking?	Go to **Step 5**	Go to **Step 4**
4	1. Use your hands in order to lift up and push down each corner of the vehicle 3 times. 2. Remove your hands from the vehicle. 3. Locate a shock or strut that exceeds 2 cycles. Did you locate a shock or strut that exceeds 2 cycles?	Go to **Step 5**	Go to **Step 6**
5	**NOTE:** **Inspect the vehicle trim height in order to correct any possible causes of shock/strut failures. Refer to Trim Height Inspection** Replace the strut or shock absorber. Refer to **Strut, Strut Component, or Spring Replacement** , or **Shock Absorber Replacement** Did you complete the repair?	Go to **Step 6**	-
6	Operate the vehicle in order to verify the repair. Did you correct the condition?	System OK	Go to **Step 3**

WHEEL BEARINGS DIAGNOSIS

Step	Action	Yes	No
1	Did you review the General Description and perform the necessary inspections?	Go to **Step 2**	Go to **Symptoms - Suspension General Diagnosis**
2	Road test the vehicle in order to verify the customer's complaint. Does the vehicle operate normally?	System OK	Go to **Step 3**
3	1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Inspect for tire or wheel damage. Did you find and correct the condition?	Go to **Step 7**	Go to **Step 4**
4	1. Install the **CH-39570** chassis ear. 2. Road test the vehicle to verify the location of the wheel bearing noise. Did you find and correct the condition?	Go to **Step 6**	Go to **Step 5**

Step	Action	Yes	No
5	**NOTE:** **Support the vehicle by the lower control arms or the rear axle to prevent movement during wheel bearing/hub inspection.** 1. Mount and secure the **J-8001** dial indicator. 2. Ensure that the dial indicator contacts the vertical surface of the wheel as close as possible to the top wheel stud. 3. Push and pull on the top of the tire in order to inspect the total travel indicated by the dial indicator. **Specification** Maximum allowable wheel bearing end play: 0.127 mm (0.005 in) Is the measurement greater then the specified value?	Go to **Step 6**	System OK
6	Replace the wheel bearing. Refer to **Front Wheel Bearing and Hub Replacement** , or **Rear Wheel Bearing and Hub Replacement** Did you complete the repair?	Go to **Step 7**	-
7	Road test the vehicle to verify the repair. Does the vehicle operate normally?	System OK	Go to **Step 3**

TRIM HEIGHT INSPECTION

Trim Height Measurement

Trim height is a predetermined measurement relating to vehicle ride height. Incorrect trim heights can cause the vehicle to bottom out over bumps, damage to the suspension components and symptoms similar to wheel alignment problems. Check the trim heights when diagnosing suspension concerns and before checking the wheel alignment.

Perform the following before measuring the trim heights:

- Set the tire pressure to the specifications shown on the certification label. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .
- Check the fuel level. Add additional weight if necessary to simulate a full tank.
- Make sure the passenger and rear compartments are empty, except for the spare tire.
- Make sure the vehicle is on a flat and level surface, such as an alignment rack.
- Check that all the vehicle doors are securely closed.
- Check that the vehicle hood and rear deck lids are securely closed.
- Check for installed after market accessories or modifications that could affect trim height measurement:
  - Larger or smaller than production wheels and tires.
  - Lifting or Lowering Kits
  - Wheel Opening Flares or Ground Affects

Measuring the P and R Dimension

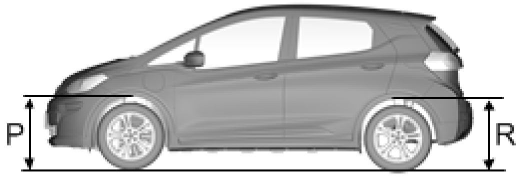

Fig. 1: Identifying P and R Dimensions
Courtesy of GENERAL MOTORS COMPANY

Measurement Definitions

P Height: The vertical distance from the ground to the top of the front wheel opening through the center line of the front wheel

R Height: The vertical distance from the ground to the top of the rear wheel opening through the center line of the rear wheel

Use the following procedures to measure the P and R dimensions:

NOTE:

- **Measure from the center of the wheel well opening to the ground.**
- **The left and right P and R height differences should be no more than 10 mm (0.39 in).**

1. Push the front bumper down a minimum of 38 mm (1.59 in) and release. Perform this step three times.
2. Measure and record the trim height per the "Measurement Definitions" above.
3. Lift the bumper up a minimum of 38 mm (1.59 in) and release. Perform this step three times.
4. Measure and record the trim height per the "Measurement Definitions" above.
5. The true P height measurement is the average of the measurements taken in step 2 and 4. Refer to **Trim Height Specifications**
6. Repeat the above steps at the rear of the vehicle for the R heights.

If the P and R heights are outside of the specifications, measure the Z & D heights.

Measuring the Z Dimension

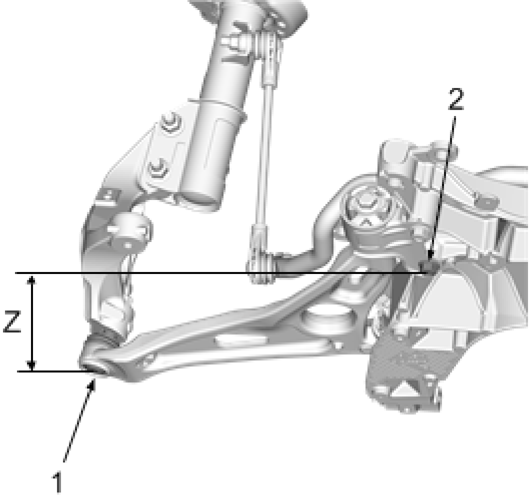

Fig. 2: Identifying Z Dimension
Courtesy of GENERAL MOTORS COMPANY

Measurement Definitions

The Z Height: The vertical distance from the center of lower control arm rear bolt head (2) to the center of the ball joint cup (1)

The Z Height dimension measurement determines the proper ride height for the front end of the vehicle. There is no adjustment procedure. Repair may require replacement of suspension parts.

Use the following procedures to check the Z height dimension:

1. Using your hands, lift the front bumper approximately 38 mm (1.59 in).
2. Gently remove your hands and allow the vehicle to settle.
3. Repeat the jouncing operation a total of 3 times.
4. Measure and record the suspension height per the "Measurement Definitions" above.
5. Using your hands, jounce the front of the vehicle downward approximately 38 mm (1.59 in).
6. Gently remove your hands and allow the vehicle to settle.
7. Repeat the jouncing operation a total of 3 times.
8. Measure and record the suspension height per the "Measurement Definitions" above.
9. The true Z height dimension number is the average of the measurements taken in steps 4 and 8. Refer to **Trim Height Specifications**.

Measuring the D Dimension

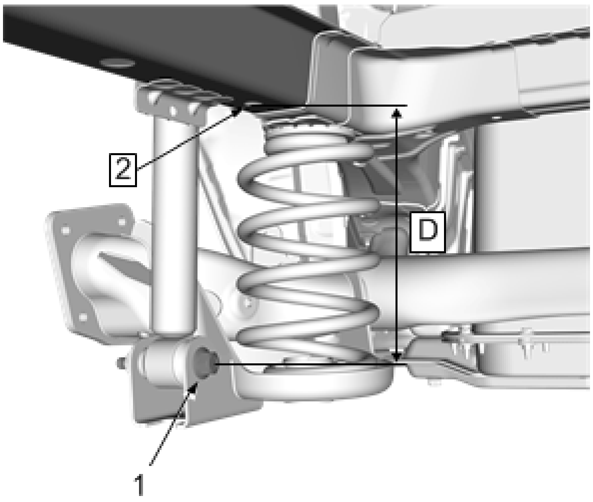

Fig. 3: Identifying D Dimension
Courtesy of GENERAL MOTORS COMPANY

Measurement Definitions

The D Height: The vertical distance from the bottom surface of underbody side rail (2) which is vertically located above the shock absorber lower bolt head to the center of rear shock absorber lower bolt (1)

The D Height dimension measurement determines the proper rear end ride height. There is no adjustment procedure. Repair may require replacement of suspension parts.

Use the following procedure to check the D height dimension:

1. With the vehicle on a flat surface, lift upward on the rear bumper 38 mm (1.59 in).
2. Gently remove your hands and allow the vehicle to settle.
3. Repeat the jouncing operation a total of 2 times.
4. Measure and record the suspension height per the "Measurement Definitions" above.
5. Repeat this task for the other side of the vehicle.
6. Using your hands, jounce the front of the vehicle downward approximately 38 mm (1.59 in).
7. Gently remove your hands and allow the vehicle to settle.
8. Repeat the jouncing operation a total of 2 times.
9. Measure and record the suspension height per the "Measurement Definitions" above.
10. The true D height dimension number is the average of the high and the low measurements. Refer to **Trim Height Specifications**.
11. If these measurements are out of specifications, inspect for the following conditions:
    - Worn or damaged suspension components
    - Collision damage

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C0569: SYSTEM CONFIGURATION MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0569 00

System Configuration Malfunction

Circuit/System Description

If the tire type and pressure information is not entered during the body control module (BCM) setup, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the ignition is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0569 will be set and the tire type and pressure information will need to be entered for the system to function correctly.

Conditions for Running the DTC

Ignition On/Vehicle in Service Mode.

Conditions for Setting the DTC

The tire type and pressure information is not entered into the BCM during programming and setup.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has undergone the tire type and pressure selection setup procedure and one ignition cycle has occurred.

Diagnostic Aids

A newly replaced BCM will set DTC C0569 after programming on it's initial ignition ON cycle if the module setup information has not been entered.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.
2. Enter the tire type and pressure information into the K9 Body Control Module with a scan tool. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .
3. Ignition OFF, then Ignition On/Vehicle in Service Mode.
4. Verify DTC C0569 is not set.
    - **If the DTC is set**

      Replace the K9 Body Control Module.

    - **If the DTC is not set.**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming, and setup.

DTC C0750, C0755, C0760, OR C0765: TIRE PRESSURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC C0765 39

Right Rear Tire Pressure Sensor Internal Malfunction

Circuit/System Description

The tire pressure monitor system has a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force puts the sensor into Drive mode. The sensors send the tire pressure data to the remote control door lock receiver (RCDLR) which in turn translates the received sensor data into sensor presence, sensor mode, and tire pressure before passing it onto the body control module (BCM). Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the first sensor to go into Drive mode, then checks if all sensors have gone into Drive mode. If one or more sensors does not go into these modes, or does not transmit at all, the BCM will set DTC C0750, C0755, C0760, or C0765 respectively.

Conditions for Running the DTC

Vehicle speed is greater than 40 km/h (25 MPH).

Conditions for Setting the DTC

- A sensor does not transmit or transmits invalid data to the BCM.
- A sensor low battery condition.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster flashes for 1 min and then remains illuminated after the ignition switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type message.

Conditions for Clearing the DTC

A current DTC will clear when the malfunction is no longer present and one ignition cycle occurs.

Diagnostic Aids

- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool is placed along the tire sidewall and no further than 15 cm (6 in) from the sensor and the antenna is aiming upward.
- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.

- Occasionally sensor transmissions are not received by the BCM due to vehicle level radio frequency interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal being blocked by another component.
- Occasionally sensors can become mislocated due to previous tire rotations where the sensor learn procedure was not performed. Always learn the sensors to ensure the DTC set is for that actual physical corner of the vehicle. Refer to **Tire Pressure Indicator Sensor Learn (UJM)**.
- A sensor low battery condition will set a sensor DTC but will not illuminate the low tire pressure indicator or display a message on the driver information center, if equipped. The sensor battery condition can be verified in the scan tool BCM data list. If a sensor low battery condition is indicated on the scan tool, the sensor will need to be replaced. Refer to **Tire Pressure Indicator Sensor Replacement**.
- The Hit Rate of the sensor will help confirm the success rate at which the sensor transmission is being received. A low Hit Rate will signal that there may be interference.

Circuit/System Verification

1. Verify there are no communication DTCs set along with DTC C0750, C0755, C0760, and C0765.
    - **If a communication DTC is set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
    - **If a communication DTC is not set**
2. Verify the scan tool Tire Pressure Sensor Rolling Count parameter of all 4 tire pressure sensors is above 50%.
    - **If the Tire Pressure Sensor Rolling Count parameter is below 50% on one or more tires**

      NOTE: **When moving the tire pressure sensor to a different location on the vehicle, keep the tire pressure sensor with the original tire it is installed in.**

      1. Move the appropriate tire to a different location on the vehicle and verify the Tire Pressure Sensor Rolling Count has increased. Refer to **Tire and Wheel Removal and Installation** .
          - If Tire Pressure Sensor Rolling Count parameter does not increase after moving tire to different location, replace the appropriate B2 Tire Pressure Sensor and perform the **Tire Pressure Indicator Sensor Learn (UJM)**.
          - If Tire Pressure Sensor Rolling Count parameter does increase after moving tire to different location, check for any aftermarket devices that could be causing interference to the tire pressure sensor signal.
    - **If the Tire Pressure Sensor Rolling Count parameter is above 50% on one or more tires**
3. Verify if all 4 tire monitor pressure sensor DTCs are not set.
    - If 2 or more tire monitor pressure sensor DTCs are set, test the keyless entry antenna for proper operation, or if antenna is properly seated. Refer to **Keyless Entry System Malfunction**
4. Perform the **Tire Pressure Indicator Sensor Learn (UJM)**.
5. Verify the scan tool Tire Pressure Sensor Mode parameters change to Drive while driving the vehicle above 40 km/h (25 mph) for greater than 2 min.
    - **If a Tire Pressure Sensor Mode parameter does not change to Drive**

    1. Replace the appropriate B2 Tire Pressure Sensor.
    2. Perform the **Tire Pressure Indicator Sensor Learn (UJM)**.

- **If the Tire Pressure Sensor Mode parameter changes to Drive**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Tire Pressure Indicator Sensor Replacement**
- **Tire Pressure Indicator Sensor Learn (UJM)**

DTC C0775: TIRE PRESSURE MONITORING SYSTEM SENSORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C0775 00

Tire Pressure Monitoring System Sensors Malfunction

Circuit/System Description

If the body control module (BCM) has been reprogrammed or replaced and the tire pressure sensor learn procedure has not been performed, the tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete. If equipped, the driver information center will also display a service tire monitor type message. Under these circumstances, DTC C0775 will be set in the BCM and the tire pressure sensor learn procedure will need to be performed for the system to function correctly.

Conditions for Running the DTC

Vehicle ON or Vehicle in Service Mode.

Conditions for Setting the DTC

The body control module (BCM) has not learned tire pressure sensor ID and location information from the tire pressure sensors.

Action Taken When the DTC Sets

- The tire pressure monitor system indicator icon on the instrument cluster will flash for 1 min and then remain illuminated after the power switch is cycled ON and the instrument cluster bulb check is complete.
- If equipped, the driver information center displays a service tire monitor type warning message.

Conditions for Clearing the DTC

A current DTC will clear when the BCM has received tire pressure sensor ID and location after tire pressure sensor indicator learn procedure has been performed.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Perform the **Tire Pressure Indicator Sensor Learn (UJM)**.

2. Verify DTC C0775 is not set.
    - **If the DTC is set**
    1. Test the keyless entry antenna for proper operation. Refer to **Keyless Entry System Malfunction** .
    2. Clear DTC.
    3. Verify DTC does not set.
        - If the DTC sets, replace the K9 Body Control Module.
        - If the DTC does not set.

          All OK.
    - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming, and setup.

SYMPTOMS - TIRE PRESSURE MONITORING

1. Perform the **Diagnostic System Check - Vehicle** , before using the Symptom Tables in order to verify that all of the following are true:
    - The control modules can communicate via the serial data link.
    - If one of the current or previous sensor learn is not successful.
    - If there are dashes displayed in the driver information center. Refer to **Tire Pressure Rolling Count Procedure**
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Tire Pressure Monitor Description and Operation**.

Visual/Physical Inspection

- Inspect if tires are inflated per placard values.
- Inspect for aftermarket devices which could affect the operation of the Tire Pressure Monitoring (TPM) System. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Low Tire Pressure Indicator Malfunction** in order to diagnose the symptom.

LOW TIRE PRESSURE INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The tire pressure monitor system has a radio frequency transmitting pressure sensor in each wheel/tire assembly. As vehicle speed increases, centrifugal force puts the sensor into Drive mode. The sensors send the tire pressure data to the remote control door lock receiver (RCDLR), using radio frequency (RF) transmissions. The RCDLR then decodes the RF data and passes it to the body control module (BCM). In turn, the BCM translates the data contained in the tire pressure sensor radio frequency transmissions into sensor presence, sensor mode, and tire pressure. Once vehicle speed is greater than 40 km/h (25 MPH), the BCM waits for the sensors to go into Drive mode.

Each sensor has its own unique identification (ID) code, which it transmits as part of each RF message, that must be learned into the BCM memory. Once all 4 IDs have been learned and vehicle speed is greater than 40 km/h (25 mph), the BCM continuously compares IDs and pressure data in the received transmissions to the learned IDs and vehicle placard pressures to determine if all 4 sensors are present and if one or more tires are low. If the BCM detects a low tire pressure condition or a malfunction in the system, it will send a serial data message to the instrument cluster requesting the appropriate tire pressure monitor indicator illumination and also to display the appropriate data message on the driver information center, if equipped.

Diagnostic Aids

- If unsure about the condition, cycle the ignition and observe the tire pressure monitor indicator icon. If the tire pressure monitor indicator icon is continuously illuminated after the instrument cluster bulb check is completed, a low tire pressure condition is present. Check the tires for damage or leaks and inflate to the tire placard specifications. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** . If the tire pressure monitor indicator icon flashes for 1 min after the instrument cluster bulb check is completed and then remains illuminated, a tire pressure monitor system DTC is set. Perform the **Diagnostic System Check - Vehicle** to proceed with the proper diagnosis.
- Temperature can greatly effect tire pressures. Low tire pressure on a cold morning may cause the tire pressure monitor indicator icon to turn ON. The air pressure in the tire increases as the ambient temperature rises or as the tire warms up while the vehicle is driven. The pressure may increase enough to exceed the predetermined low pressure threshold which will turn OFF the tire pressure monitor indicator icon.
- Some aftermarket wheel valve stem holes are located further from the wheel rim than original equipment wheels. When using the tire pressure monitor special tool to activate a sensor, ensure the tool antenna is no further than 15 cm (6 in) from the sensor and is aiming upward.
- Aftermarket wheel value stem locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event. This is a courtesy item as it is not covered by warranty.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**.
- The sensor activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning. In the event a particular sensor's information is displayed on the special tool upon activation but the horn does not chirp, it may be necessary to rotate the wheel valve stem to a different position due to the RF signal is being blocked by another component.
- Occasionally sensor transmissions are not received by the BCM due to vehicle level RF interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting.
- The Hit Rate of the sensor will help confirm the success rate at which the sensor transmission is being received. A low Hit Rate will signal that there may be interference. Refer to **Tire Pressure Rolling Count Procedure**.

Reference Information

Description and Operation

Tire Pressure Monitor Description and Operation

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

NOTE: **Low tire pressure in one or more tires is indicated by a continuously illuminated tire pressure monitor indicator icon after the instrument cluster bulb check is completed. If equipped with a driver information center, a check tire pressure type message will also be displayed.**

When a tire pressure monitor DTC is set, the tire pressure monitor indicator icon will flash for 1 min after the instrument cluster bulb check is completed and then remains illuminated. If equipped with a driver information center, a service tire monitor type message will also be displayed.

1. Adjust all tire pressures to the correct pressure. Refer to **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .
2. Drive the vehicle over 40 km/h (25 mph) for greater than 2 min.
3. Verify the low tire pressure indicator is OFF.
   - **If the low tire pressure indicator is ON**
   1. Perform the **Tire Pressure Indicator Sensor Learn (UJM)**.
   2. Record all 4 Tire Pressure Parameters values from the scan tool.
   3. Check and record the tire pressures with a known accurate hand held tire pressure gauge.
   4. Verify that the scan tool Tire Pressure parameters do not differ more than 27.6 kPa (4 psi) from the actual tire pressure readings.
      - If the scan tool Tire Pressure parameters differ more than 27.6 kPa (4 psi), replace the appropriate B2 Tire Pressure Sensor then perform the **Tire Pressure Indicator Sensor Learn (UJM)**.
      - If the scan tool Tire Pressure parameters do not differ more than 27.6 kPa (4 psi)
   5. Verify the BCM Tire Type and Pressure selections are setup correctly with a scan tool. Refer to the **Vehicle Certification, Tire Placard, Anti-Theft, and Service Parts ID Label** .
      - If the BCM Tire Type and Pressure selections are incorrect, input the proper placard values for the vehicle with the scan tool then drive the vehicle over 40 km/h (25 mph) for greater than 2 min.
      - If the BCM Tire Type and Pressure selections are correct
   6. Ignition On/Vehicle in Service Mode..
   7. Verify the low tire pressure monitor indicator icon turns ON and OFF when commanding All Indicators ON and OFF with a scan tool.
      - If the low tire pressure monitor icon does not turn ON and OFF, replace the P16 Instrument Cluster.
      - If the low tire pressure monitor icon turns ON and OFF
   8. All OK
   - **If the tire pressure indicator is OFF**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Tire Pressure Indicator Sensor Replacement**
- **Tire Pressure Indicator Sensor Learn (UJM)**
- **Control Module References** for control module replacement, programming, and setup.

TIRE PRESSURE ROLLING COUNT PROCEDURE

Introduction

The Tire Pressure Rolling Count parameter for each sensor can be used to help confirm if the sensor transmissions are being received. As the vehicle is being driven, the Tire Pressure Rolling Count increments with every received TPM sensor transmission. If a suspected Sensor is not incrementing, incrementing very slowly compared to others or not at all, that could be a result of interference from aftermarket devices. The sensor transmission success rate (the rate at which each sensors transmission is being received by the RCDLR) can be verified in the scan tool.

NOTE: **Scan tool procedure will be used if Tire Pressure Sensor exhibits "no Signal or poor intermittent signal reception" Before proceeding, check for the following:**

Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

- A sensor does not transmit or transmits invalid data to the RCDLR.
- A sensor might exhibit low battery condition.

- If equipped, the driver information center displays " dashes" for the suspected sensor.
- Aftermarket wheel valve system locations can cause a sensor to not function correctly.
- A sensor may have been damaged due to a previous wheel/tire service or flat tire event.
- The use of other than GM approved tire sealants can obstruct the sensor pressure sensing port and cause inaccurate tire pressure readings. If this condition is verified, remove the sealer from the tire and replace the sensor. Refer to **Tire Pressure Indicator Sensor Replacement**
- Occasionally sensor transmissions are not received by the RCDLR due to vehicle level radio frequency interference from items such as but not limited to aftermarket ignition systems, DVD players, CB radios, or metallic type window tinting

How to determine if Sensor Signal is poor or has no signal

Use Scan Tool and follow on screen instructions:

1. Select Module Diagnosis
2. Select Body Control Module
3. Select Configuration/Reset Functions
4. Select Tire Pressure Sensor Signal Reset
5. The Tire Pressure Sensor Rolling Count parameters will be displayed

If the Tire Pressure Sensor Rolling Count parameter is below 50% on one or more tires

NOTE: **When moving the tire pressure sensor to a different location on the vehicle, keep the tire pressure sensor with the original tire it is installed in.**

- Move the appropriate tire to a different location on the vehicle and verify the Tire Pressure Sensor Rolling Count has increased. Refer to **Tire and Wheel Removal and Installation** .
- If Tire Pressure Sensor Rolling Count parameter does not increase after moving tire to different location, replace the appropriate B2 Tire Pressure Sensor and perform the **Tire Pressure Indicator Sensor Learn (UJM)**.
- If Tire Pressure Sensor Rolling Count parameter does increase after moving tire to different location, check for any aftermarket devices that could be causing interference to the tire pressure sensor signal. Unplug the device and re-run test.

If the Tire Pressure Sensor Rolling Count parameter is above 50% on one or more tires (Follow normal TPM troubleshooting in Service information)

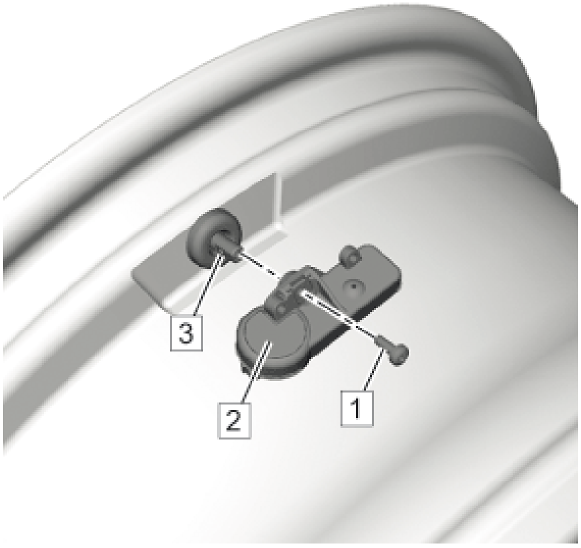
1. Verify if all 4 tire monitor pressure sensor DTCs are not set.
2. If 2 or more tire monitor pressure sensor DTCs are set, test the keyless entry antenna for proper operation, or if antenna is properly seated. Refer to **Keyless Entry System Malfunction** .
3. Perform the **Tire Pressure Indicator Sensor Learn (UJM)**.
4. Verify the scan tool Tire Pressure Sensor Mode parameters change to Drive while driving the vehicle above 40 km/h (25 mph) for greater than 2 min.
5. If a Tire Pressure Sensor Mode parameter does not change to Drive.
6. Replace the appropriate B2 Tire Pressure Sensor.
7. Perform the **Tire Pressure Indicator Sensor Learn (UJM)**.
8. If the Tire Pressure Sensor Mode parameter changes to Drive.
9. All OK.

REPAIR INSTRUCTIONS

TIRE PRESSURE INDICATOR SENSOR REPLACEMENT

Removal Procedure

1. Raise and support the vehicle. **Lifting and Jacking the Vehicle**
2. Remove the tire and wheel assembly. **Tire and Wheel Removal and Installation**
3. Dismount the tire from the rim. **Tire Dismounting and Mounting**



[Fig. 1: Tire Pressure Transmitter And Valve Stem]
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Never fit the tire pressure indicator sensor on unapproved wheel rims.**

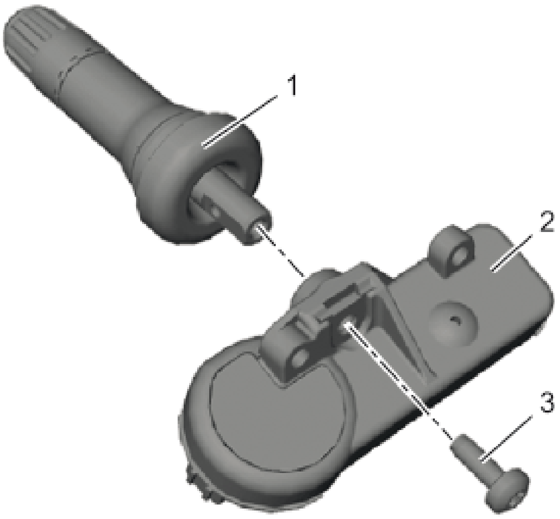
NOTE: **Whenever the tire will be removed from the rim, install a new valve stem and a new bolt. Do not reuse the old parts.**

4. Remove and DISCARD the bolt (1) from the tire pressure transmitter (2) and pull it straight off the tire pressure valve stem (3).

CAUTION: **Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.**

5. Remove and DISCARD the tire pressure valve stem by pulling it through the rim.

Installation Procedure



[Fig. 2: Tire Pressure Transmitter And Valve Stem]
Courtesy of GENERAL MOTORS COMPANY

NOTE:

- **Ensure the flat of the valve lines up with the flats of the snap in the enclosure.**
- **Valve stems and bolts are single use items.**

1. Assemble the tire pressure transmitter (2) to the NEW valve stem (1) and install the NEW bolt (3).

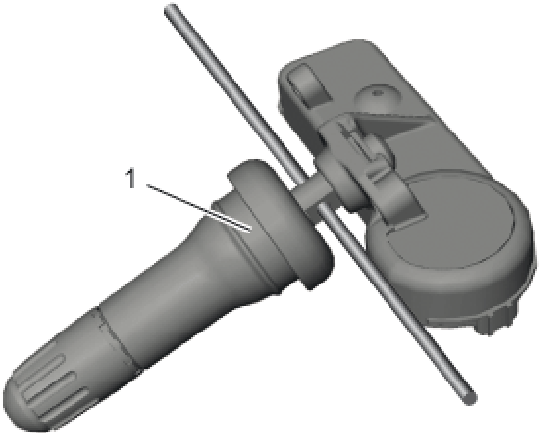


Fig. 3: Anti Rotation Pin
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

2. Insert an anti rotation pin (1) through the cross-drilled hole in the valve stem and tighten the bolt to 1.4 N.m (12.4 lb in).

NOTE: **When mounting the tires, use an approved tire mounting lubricant.**

3. Apply tire soap to the rubber portion of the valve stem (2).

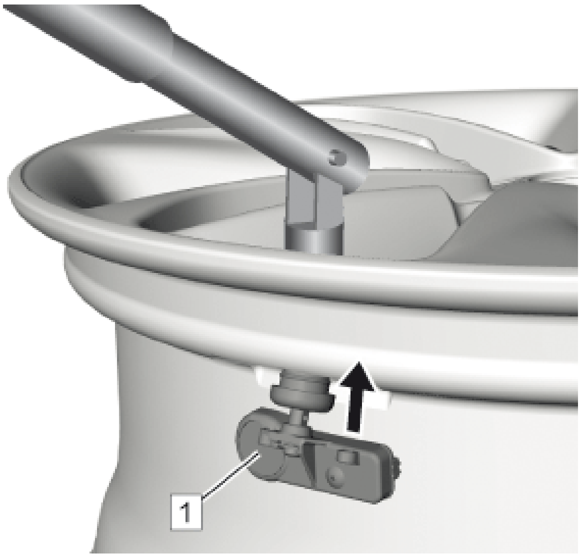

Fig. 4: Valve Stem
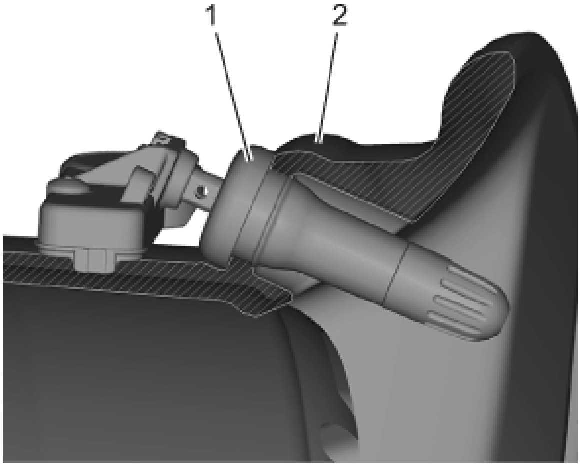
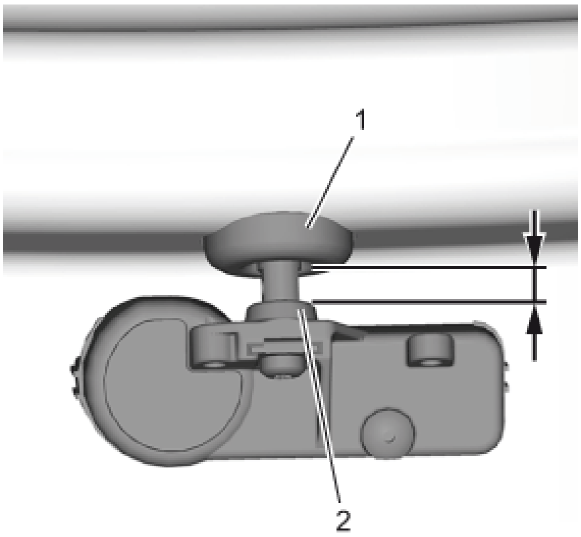
Courtesy of GENERAL MOTORS COMPANY

4. Using a tire valve stem mounting tool, pull the valve stem through in a direction parallel to the valve hole on the rim.



[Fig. 5: Valve Stem](#)
Courtesy of GENERAL MOTORS COMPANY

5. Check the valve stem (1) for correct seat on the rim (2).
    - The rim hole edge has to be completely in the notch of the valve stem.
    - The valve and the rim hole have to be concentric.



[Fig. 6: Tire Pressure Transmitter](#)
Courtesy of GENERAL MOTORS COMPANY

6. Make sure that there is a gab between the valve stem (1) and the tire pressure transmitter (2).

NOTE: **The tire should not have contact with the tire pressure indicator sensor during installation to prevent a damage of the tire pressure indicator sensor.**

7. Mount the tire to the rim. **Tire Dismounting and Mounting**
8. Inflate the tire to the specified pressure as stated on the tire placard.
9. Install the NEW dust cap.
10. Balance the tire and wheel assembly.
11. Install the tire and wheel assembly. **Tire and Wheel Removal and Installation**
12. Learn the tire pressure indicator sensor. **Tire Pressure Indicator Sensor Learn (UJM)**.
13. Lower the vehicle.

TIRE PRESSURE INDICATOR SENSOR LEARN (UJM)

Special Tools

- **EL-46079** Tire Pressure Monitor Diagnostic Tool

- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to Special Tools (UJM).

Learn Mode Description

The tire pressure monitor system uses the instrument cluster, body control module (BCM), 4 radio frequency transmitting pressure sensors, remote control door lock receiver (RCDLR) and the serial data circuit to perform the tire pressure monitor learn mode functions. The sensor learn procedure must be performed after every tire rotation, BCM replacement, or sensor replacement. Once the Learn mode has been enabled, each of the sensors unique identification codes can be learned into the BCM memory. When a sensor ID has been learned, the BCM sounds a horn chirp indicating the sensor has transmitted its ID and the BCM has received and learned it. The BCM must learn the sensor IDs in the proper sequence to determine correct sensor location. The first learned ID is assigned to the left front location, the second to right front, the third to right rear and the fourth to left rear. The turn signals will individually illuminate indicating which location is to be learned in the proper sequence.

Sensor Functions Using EL-46079, EL-50448, or Equivalent

Each sensor has an internal low frequency coil. When the tire pressure monitor special tool is used in activate mode, it produces a low frequency transmission that activates the sensor. The sensor responds to a low frequency activation by transmitting in Learn Mode-Remotely Triggered. When the BCM receives a learn mode transmission while in Learn mode, it will assign that sensors ID to the location on the vehicle relative to the order in which it was learned.

Learn Mode Cancellation

The Learn mode will cancel if the ignition is cycled to OFF or if more than 2 minutes has elapsed for any sensor or 5 min overall has elapsed to match all four sensors. If the relearn mode is cancelled before the first sensor is learned, the original sensor IDs will be maintained. If the relearn mode is canceled after the first sensor is learned, the following will occur:

- All stored sensor IDs will be invalidated in the BCM memory.
- If equipped, the driver information center will display dashes instead of tire pressures.
- DTC C0775 will be set.

These conditions will now require the Learn procedure to be repeated for the system to function properly.

Tire Pressure Monitor Learn Procedure

NOTE: **In the event a particular sensor is activated and the horn does not chirp, it may be necessary to rotate the wheel so that the valve stem is in a different position due to the sensor signal is being blocked by another component. Make sure the TPM tool battery is sufficient to complete TPM learn process. Do not place the TPM tool directly on the valve stem. The TPM tool should be placed against the tire sidewall near the valve stem. The TPM sensor learn activation procedure may have to be repeated up to 3 times before determining a sensor is malfunctioning.**

1. Apply park brake (manual transmission only).
2. Ignition On/Vehicle in Service Mode, using a scan tool or driver information center buttons (refer to owners manual), initiate the Tire Pressure Sensors Learn mode. A double horn chirp will sound indicating the Learn mode has been enabled. The left front turn signal will also be illuminated.
3. Starting with the left front tire, active the sensor by holding the antenna of the tire pressure monitor special tool aimed upward against the tire sidewall close to the wheel rim at the valve stem location. Press and release the activate button. Ensure that the transmit indicator on the special tool indicates that the sensor activation signal is being transmitted. Wait for a horn chirp. If the horn does not chirp, repeat the sensor activation sequence with the tool. Once the horn chirp has sounded, the sensor information is learned and the turn signal in the next location to be learned will illuminate.
4. After the horn chirp has sounded and the right front turn signal is illuminated, repeat step 3 for the remaining 3 sensors in the following order:
    1. Right front
    2. Right rear
    3. Left rear

5. When the left rear sensor has been learned and a double horn chirp has sounded, the learn process is complete and the BCM exits the Learn mode.

Special Tools

- **EL-46079/J-46079** Tire Pressure Monitor Diagnostic Tool
- **EL-50448** Tire Pressure Monitor Sensor Activation Tool

For equivalent regional tools, refer to **Special Tools (UJM)**.

The tire pressure monitor system warns the driver when a significant loss of tire pressure occurs in any of the 4 tires and allows the driver to display the individual tire pressures and their locations on the driver information center.

The system uses the body control module (BCM), driver information center, instrument cluster, remote control door lock receiver (RCDLR), and a radio frequency (RF) transmitting pressure sensor in each wheel/tire assembly, and the serial data circuit to perform the system functions. Each sensor has an internal power supply with an approximate 10 year service life.

When the vehicle is stationary, the sensor's internal accelerometer is inactive, which puts the sensors into a Stationary state. In this state the sensors sample tire pressure once every 30 seconds and do not transmit at all if the tire pressure does not change. As vehicle speed increases, centrifugal force activates the sensors internal accelerometer causing the sensors to go into Wake and then Drive mode. In Drive mode, the sensors sample tire pressure once every 30 seconds and transmit in Drive mode once every 60 seconds. The RCDLR receives and translates the data contained in each sensors RF transmission into sensor presence, sensor mode, and tire pressure and passes it to the BCM. In turn, the BCM sends the tire pressure and tire location data to the driver information center via the serial data circuit where they are displayed.

The sensors continuously compare their last pressure sample to their current pressure sample and will transmit in Learn Mode-Pressure Triggered if a 8.3 kPa (1.2 psi) change in tire pressure has been detected in either a Stationary or Drive state. When the tire pressure monitor system detects a significant loss of tire pressure, the tire pressure monitor indicator icon is illuminated on the instrument cluster and if equipped, a tire pressure low, add air to tire type message is displayed on the driver information center. Both the indicator icon and driver information center message can be cleared by adjusting the tire pressures to the recommended pressures and driving the vehicle above 40 km/h (25 mph) for at least 2 minutes.

If power is disconnected from the BCM or if the vehicle battery is disconnected, each tire pressure monitor sensor ID is retained but all of the tire pressure information is lost. Under these circumstances the BCM cannot assume that the tire pressures were maintained over an unknown period of time. If equipped, the driver information center will display all dashes and the scan tool will indicate a default tire pressure value of 1020 kPa (148 psi) for each tire. Driving the vehicle above 40 km/h (25 mph) for at least 2 minutes will activate the sensors causing the driver information center to display the current tire pressures. The **EL-46079/J-46079** tire pressure monitor diagnostic tool, **EL-50448** tire pressure monitor sensor activation tool, or equivalent may also be used to activate the sensors as well.

The BCM has the ability to detect malfunctions within the tire pressure monitor system. In the event a DTC is set, the tire pressure monitor indicator icon on the instrument cluster, if equipped will flash for 1 minute and then remain illuminated after the ignition is turned ON and the instrument cluster bulb check has been completed. Any malfunction detected will cause the driver information center to display a service tire monitor system type message. For more information on other functions of the BCM, refer to **Keyless Entry System Description and Operation** .

DIAGNOSTIC INFORMATION AND PROCEDURES

TIRE DIAGNOSIS - IRREGULAR OR PREMATURE WEAR

Tire Wear

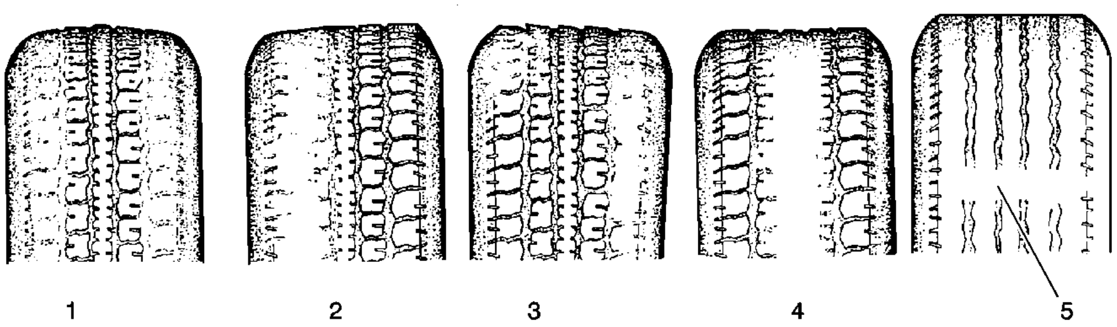

Fig. 1: Identifying Types Of Tire Wear
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Under-Inflation, Hard Cornering, Lack of Regular Rotation
2	Incorrect Wheel Alignment, Hard Cornering, Lack of Regular Rotation
3	Incorrect Wheel Alignment
4	Over-Inflation, Heavy Acceleration, Lack of Regular Rotation

Callout	Component Name
5	Normal Wear to the Wear Indicator

Inspection Procedure

1. Inspect the front tire wear.
2. Inspect the rear tire wear.
3. Rotate the tires if any of the following conditions exist:
    - The amount of time or mileage since the last tire rotation matches the maintenance schedule.
    - The outer tread blocks are worn more than the middle tread blocks (1).
    - The outer tread blocks are worn more than the inner tread blocks (2).
    - The middle tread blocks are worn more than the outer tread blocks (4).
4. Measure the wheel alignment if any of the following conditions exist:
    - The tread blocks have feathered edges (3).
    - The outer tread blocks are worn more than the inner tread blocks (2).
    - The inner tread blocks are worn more than the outer tread blocks (2).
5. Inspect the struts or the shock absorbers if the tire tread exhibits a cupped appearance (3).

TIRE DIAGNOSIS - WADDLE COMPLAINT

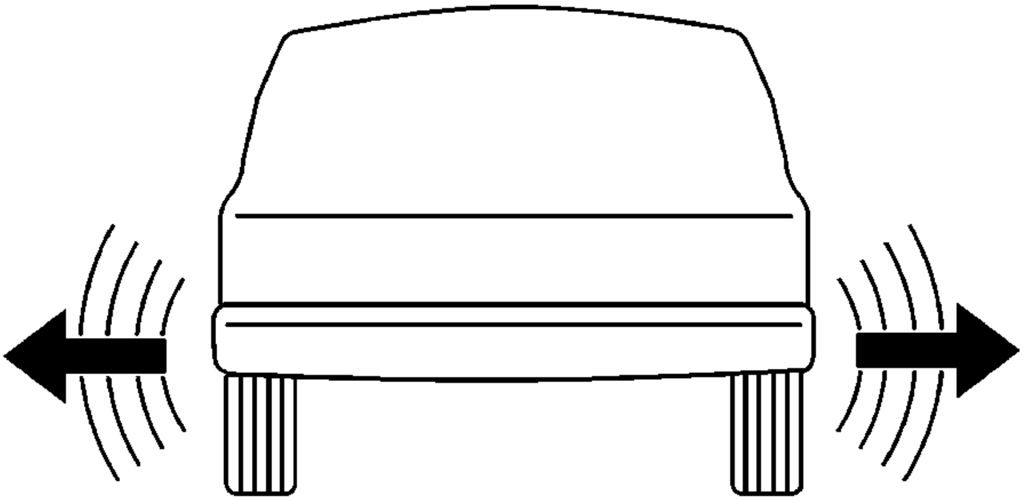

Fig. 2: Identifying Tire Wobble/Waddle
Courtesy of GENERAL MOTORS COMPANY

Tire waddle is a side to side movement at the front of the vehicle and/or the rear of the vehicle. Tire waddle can be caused by the following conditions:

- A steel belt not being straight within the tire
- Excessive lateral runout of the tire
- Excessive lateral runout of the wheel

The tire waddle is most noticeable at a low speed of about 8 - 48 km/h (5 - 30 mph). Tire waddle may appear as ride roughness at 80 - 113 km/h (50 - 70 mph). Tire waddle may appear as a vibration at 80 - 113 km/h (50 - 70 mph).

Inspection Procedure

1. Raise and support the vehicle with safety stands. Refer to **Lifting and Jacking the Vehicle**

   WARNING: **Wear gloves when inspecting the tires in order to prevent personal injury from steel belts sticking through the tire.**

2. Perform the following preliminary inspection:
   1. Mark the tire with a crayon in order to note the start and the stop position.
   2. Rotate each tire and wheel by hand.
   3. Inspect the tire for bulges or bent wheels. Replace as necessary.
3. Use tire substitution in order to identify the faulty tire. Perform the following steps for a tire substitution check:
   1. Use a comparable tire in order to replace each tire, one at a time.
   2. Test drive the vehicle.
   3. If the problem is tire or wheel related, you will eliminate the problem when you remove the faulty tire from the vehicle.

RADIAL TIRE LEAD/PULL CORRECTION

Lead/pull is the deviation of the vehicle from a straight path on a level road with no pressure on the steering wheel. Lead is usually caused by:

- Incorrect alignment
- Uneven brake adjustment
- Tire construction

The way in which a tire is built can produce lead/pull in the vehicle. Off-center belts on radial tires can cause the tire to develop a side force while the vehicle rolls straight down the road. If one side of the tire has even a little larger diameter than the diameter of the other side, the tire will tend to roll to one side. Unequal diameters will cause the tire to develop a side force which can produce vehicle lead/pull.

The radial lead/pull diagnosis chart should be used to determine whether the problem originates from an alignment problem or from the tires. Part of the lead diagnosis procedure calls for tire rotation that is different from the proper tire rotation pattern. If a medium-mileage to high-mileage tire is moved to the other side of the vehicle, be sure to check for ride roughness. Rear tires will not cause lead/pull.

Step	Action	Yes	No
1	1. Perform wheel alignment preliminary inspection. 2. Check the brakes for dragging. 3. Road test the vehicle. Does the vehicle lead/pull?	Go to **Step 2**	System OK
2	1. Cross switch the front tire and wheel assemblies. 2. Road test the vehicle. Does the vehicle lead/pull?	Go to **Step 3**	System OK

Step	Action	Yes	No
3	Check the front wheel alignment. Is the alignment within specifications?	Go to **Step 4**	Adjust alignment
4	Compare the front camber and front caster to specifications. Are they within specifications?	Go to **Step 7**	Go to **Step 5**
5	Check the vehicle frame. Is the frame bent?	Go to **Step 6**	Go to **Step 1**
6	Straighten the frame. Is the repair complete?	Go to **Step 3**	-
7	1. The probable cause is the tires. 2. Switch the left front tire and wheel assembly with the left rear tire and wheel assembly. 3. Road test the vehicle. Does the vehicle still lead/pull?	Go to **Step 9**	Go to **Step 8**
8	Switch the left front tire and wheel assembly with the left rear tire and wheel assembly, and replace the left front tire. Is the repair complete?	System OK	Go to **Step 1**
9	1. Switch the right front tire and wheel assembly with the right rear tire and wheel assembly. 2. Road test the vehicle. Does the vehicle still lead/pull?	Go to **Step 1**	Go to **Step 10**
10	Switch the right front tire and wheel assembly with the right rear tire and wheel assembly, and replace the right front tire. Is the repair complete?	System OK	Go to **Step 1**

REPAIR INSTRUCTIONS

ALUMINUM WHEEL POROSITY REPAIR

1. Remove the tire and wheel. Refer to **Tire and Wheel Removal and Installation**
2. Inflate the tire to the manufactures specified pressure as stated on the tire.
3. Submerge the tire/wheel into a water bath in order to locate the leak.
4. Inscribe a mark on the wheel in order to indicate the leak areas.
5. Inscribe a mark on the tire at the valve stem in order to indicate the orientation of the tire to the wheel.

NOTE: **Do not damage the exterior surface of the wheel.**

6. Remove the tire from the wheel. Refer to **Tire Dismounting and Mounting**
7. Use number 80 grit sandpaper to scuff the inside of the rim surface at the leak area.
8. Use general purpose cleaner to clean the leak area.
9. Apply 3 mm (0.12 in) thick layer of adhesive/sealant to the leak area.
10. Allow for the adhesive/sealant to dry.
11. Align the inscribed mark on the tire with the valve stem on the wheel.
12. Install the tire to the wheel. Refer to **Tire Dismounting and Mounting**
13. Pressurize the tire to 276 kPa (40 psi).
14. Submerge the tire/wheel into a water bath in order to ensure the leak is sealed.

15. Inflate the tire to the specified pressure as stated on the tire placard.
16. Balance the tire and wheel. Refer to **Tire and Wheel Assembly Balancing - Off Vehicle**
17. Install the tire and wheel. Refer to **Tire and Wheel Removal and Installation**

ALUMINUM WHEEL REFINISHING

Finish Damage Evaluation Procedure

NOTE:

- **If the wheels are chrome-plated, do not re-plate or refinish the wheels.**
- **If the wheels are polished aluminum, do not refinish the wheels in the dealer environment. Utilize a refinisher that meets manufacturer guidelines.**

1. Inspect the wheels for damage from uncoated wheel balance weights or from automatic car wash facilities.
2. Inspect the wheels for the following conditions:
   - Corrosion
   - Scrapes
   - Gouges
3. Verify the damage is not deeper than what sanding can remove.
4. Inspect the wheels for cracks. If a wheel has cracks, discard the wheel.
5. Inspect the wheels for bent rim flanges. If a rim flange is bent, discard the wheel.

Refinishing Procedure

WARNING: **To avoid serious personal injury when applying any two part component paint system, follow the specific precautions provided by the paint manufacturer. Failure to follow these precautions may cause lung irritation and allergic respiratory reaction.**

1. Remove the tire and wheel assembly from the vehicle. Refer to **Tire and Wheel Removal and Installation**
2. Remove the balance weights from the wheel.
3. Remove the tire from the wheel. Refer to **Tire Dismounting and Mounting**

NOTE:

- **Do not re-machine the wheel.**
- **Do not use chemicals in order to strip the paint from the wheel.**

4. Use a suitable cleaner in order to remove the following contaminants from the wheel:
   - Lubricants
   - Wax
   - Dirt
5. Use plastic media blasting in order to remove the paint from the wheel.
6. If the wheel had a machined aluminum finish, spin the wheel and use sand paper in order to restore the circular machined appearance.

NOTE: **The wheel mounting surface and the wheel nut contact surface must remain free of paint.**

7. Mask the wheel mounting surface and the wheel nut contact surface.
8. Follow the paint manufacturer instructions for painting the wheel.
9. Install a new valve stem.

NOTE: **Use new coated balance weights in order to balance the wheel.**

10. Install the tire to the wheel. Refer to **Tire Dismounting and Mounting**
11. Use a suitable cleaner in order to remove the following contaminants from the wheel mounting surface:
    - Corrosion
    - Overspray
    - Dirt
12. Install the tire and wheel assembly to the vehicle. Refer to **Tire and Wheel Removal and Installation**

TIRE AND WHEEL REMOVAL AND INSTALLATION

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**

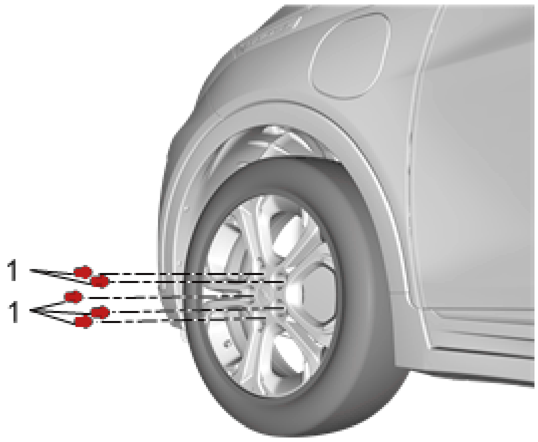

Fig. 3: Wheel Nuts
Courtesy of GENERAL MOTORS COMPANY

2. Remove Wheel Nuts (1) (Qty: 5)

WARNING: **If penetrating oil gets on the vertical surfaces between the wheel and the rotor or drum, it could cause the wheel to work loose as the vehicle is driven, resulting in a loss of control and an injury accident.**

CAUTION: **Removing the wheel may be difficult because of foreign materials or a tight fit between the wheel and the hub/rotor. Slightly tap the tire side wall with a rubber mallet in order to remove the wheel. Failure to follow these instructions may result in damage to the wheel.**

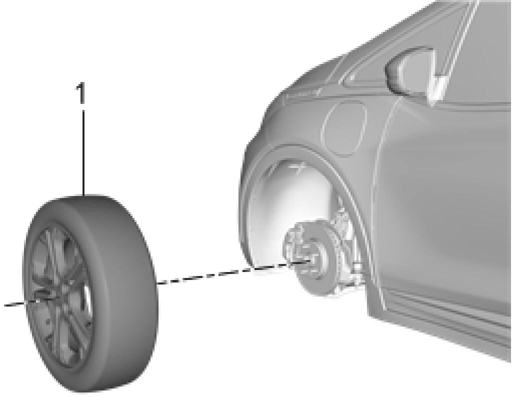

Fig. 4: Tire and Wheel Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Remove Tire and Wheel Assembly (1) @ Vehicle

Installation Procedure

WARNING: **Before installing the wheels, remove any buildup of corrosion on the wheel mounting surface and brake drum or disc mounting surface. Installing wheels with poor metal-to-metal contact at the mounting surfaces can cause wheel nuts to loosen. This can cause a wheel to come off when the vehicle is moving, causing loss of control and possibly personal injury.**

NOTE: **Wheel nuts, studs, and mounting surfaces must be clean and dry.**

1. Remove any corrosion or foreign material from the wheel and the hub mounting surfaces.
2. Clean the threads on the wheel studs and wheel nuts.

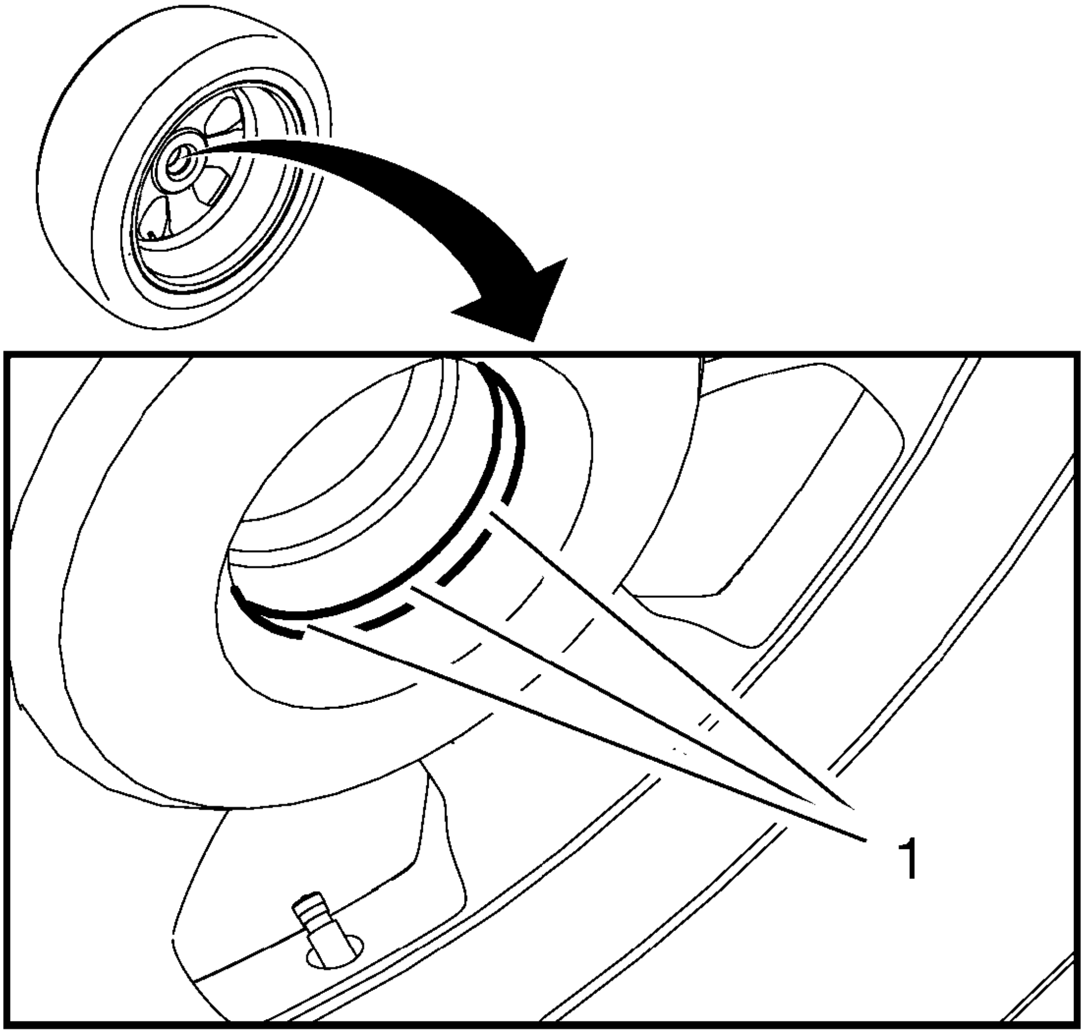

Fig. 5: Wheel Hub Pilot Hole
Courtesy of GENERAL MOTORS COMPANY

3. Apply a small amount of lubricant to the inner diameter of the wheel hub pilot hole (1) where it contacts the wheel hub flange.

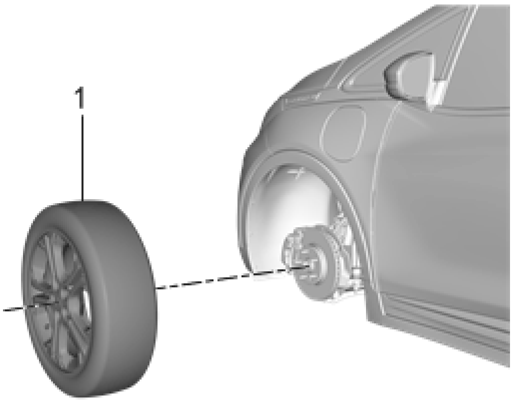

Fig. 6: Tire and Wheel Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Install Tire and Wheel Assembly (1) @ Vehicle

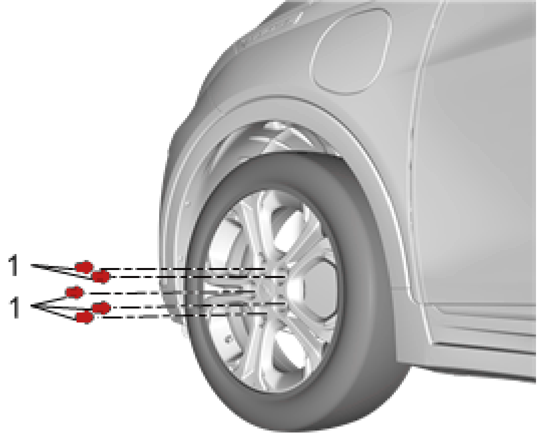

Fig. 7: Wheel Nuts
Courtesy of GENERAL MOTORS COMPANY

5. Install and hand tighten Wheel Nuts (1) (Qty: 5)

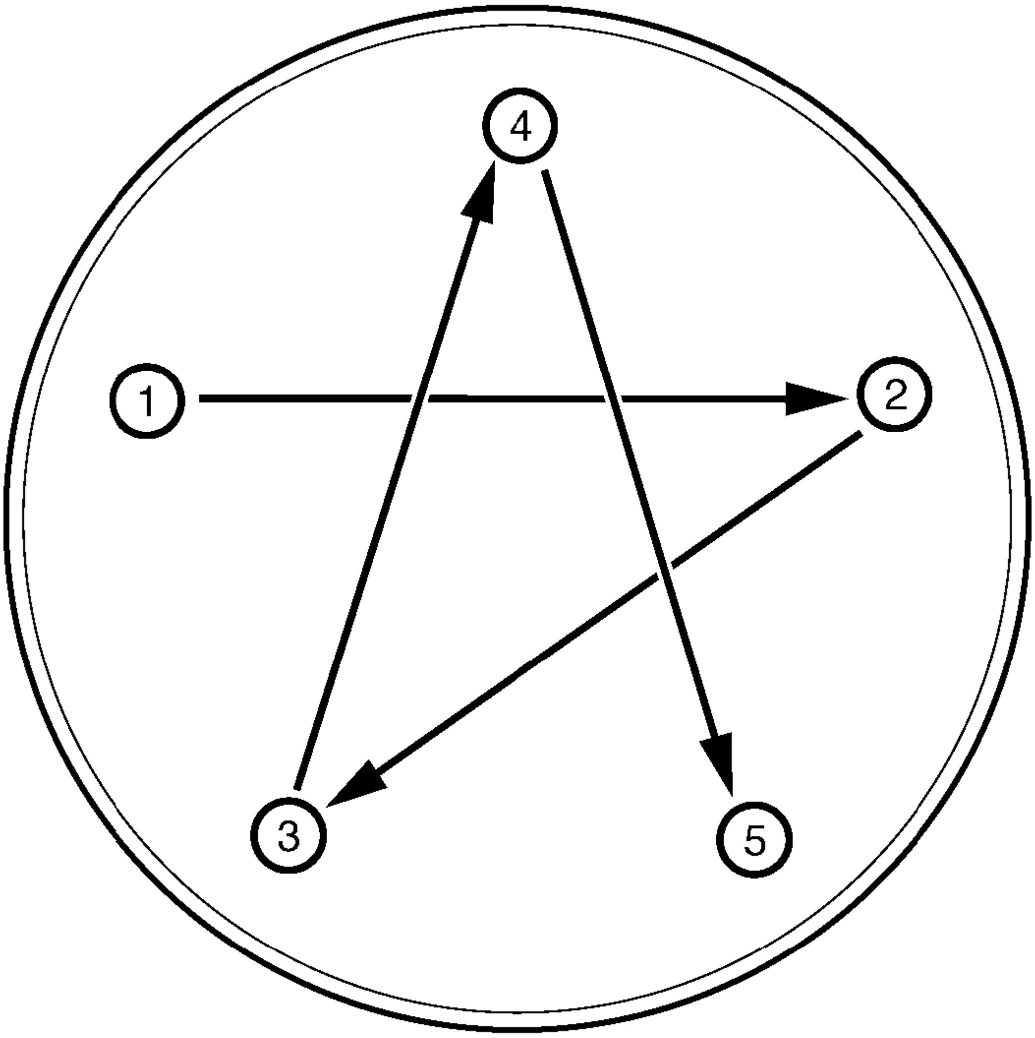

Fig. 8: Wheel Nut Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Improperly tightened wheel bolts or nuts can lead to brake pulsation and rotor damage. In order to avoid expensive brake repairs, evenly tighten the wheel bolts or nuts to the proper torque specification.**

CAUTION: **Refer to Fastener Caution .**

6. Using a torque wrench and the appropriate socket, alternately and evenly tighten the wheel nuts to 140 N.m (103 lb ft) in the sequence illustrated.
7. Lower the vehicle.

ALUMINUM WHEEL HUB CAP REPLACEMENT

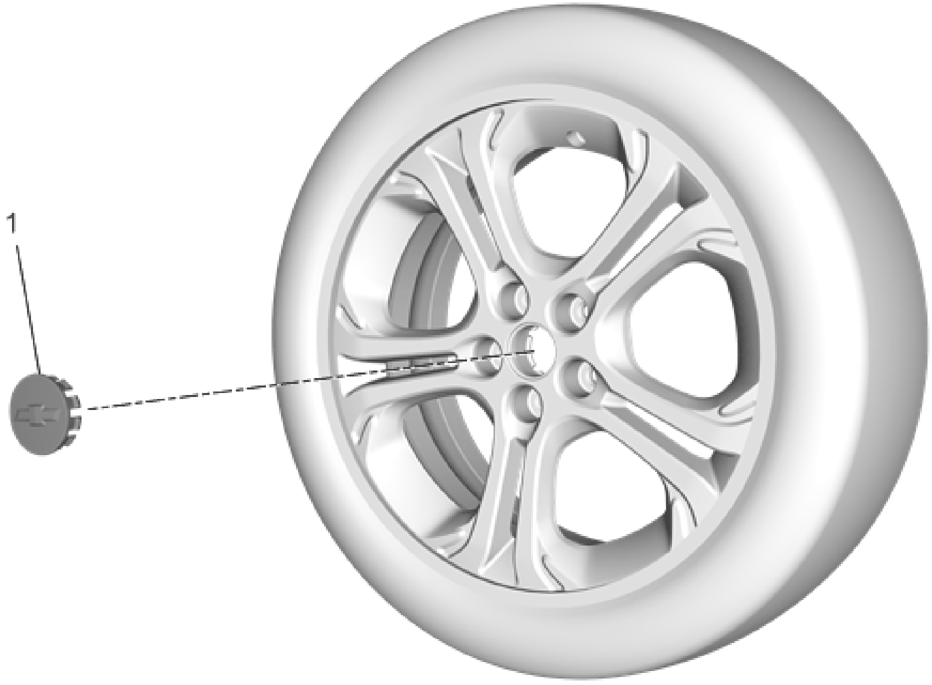

Fig. 9: Aluminum Wheel Hub/Trim Cap
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Remove Tire and Wheel. Refer to **Tire and Wheel Removal and Installation**	
1	Wheel Trim Cap

TIRE REPAIR

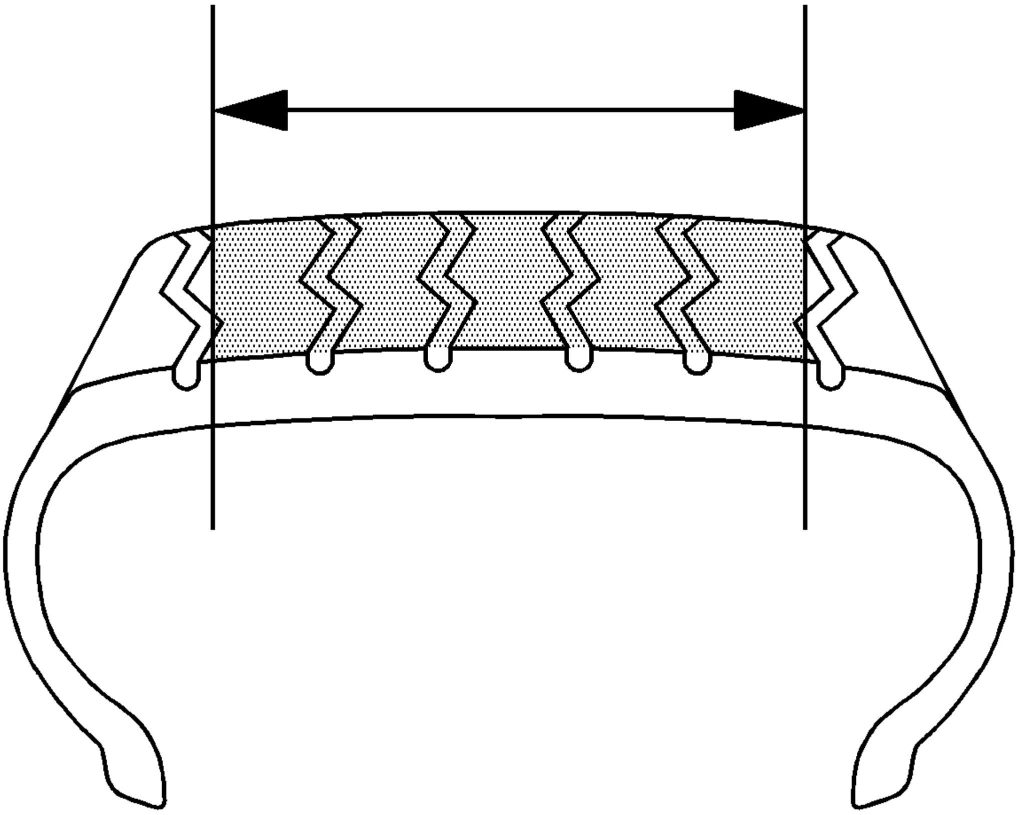

Fig. 10: Identifying Repairable Area On Radial Tire
Courtesy of GENERAL MOTORS COMPANY

WARNING:

- **Tire changing can be dangerous and should be done by trained professionals using proper tools and procedures. Always read and understand any manufacturer's warnings contained in their customers literature or molded into the tire sidewall.**
- **Serious eye and ear injury may result from not wearing adequate eye and ear protection while repairing tires.**
- **NEVER inflate beyond 275 kPa (40 pounds) pressure to seat beads.**
- **NEVER stand, lean or reach over the assembly during inflation.**

NOTE: **Repairable area on a radial tire.**

- **NEVER repair tires worn to the tread indicators 1.59 mm (2/32 in) remaining depth.**
- **NEVER repair tires with a tread puncture larger than 6.35 mm (1/4 in).**
- **NEVER substitute an inner tube for a permissible or non-permissible repair.**
- **NEVER perform an outside-in tire repair (plug only, on the wheel).**
- **Every tire must be removed from the wheel for proper inspection and repair.**
- **Regardless of the type of repair used, the repair must seal the inner liner and fill the injury.**

- **Consult with repair material supplier/manufacturer for repair unit application procedures and repair tools/repair material recommendations.**

Three basic steps for tire puncture repair:

1. Remove the tire from the wheel for inspection and repair.
2. Fill the injury (puncture) to keep moisture out.
3. Seal the inner liner with a repair unit to prevent air loss.

External Inspection

1. Prior to demounting, inspect the tire surface, the valve and the wheel for the source of the leak by using a water and soap solution. Mark the injured area and totally deflate the tire by removing the valve core.
2. Demount the tire from the wheel and place the tire on a well-lighted spreader.

Internal Inspection

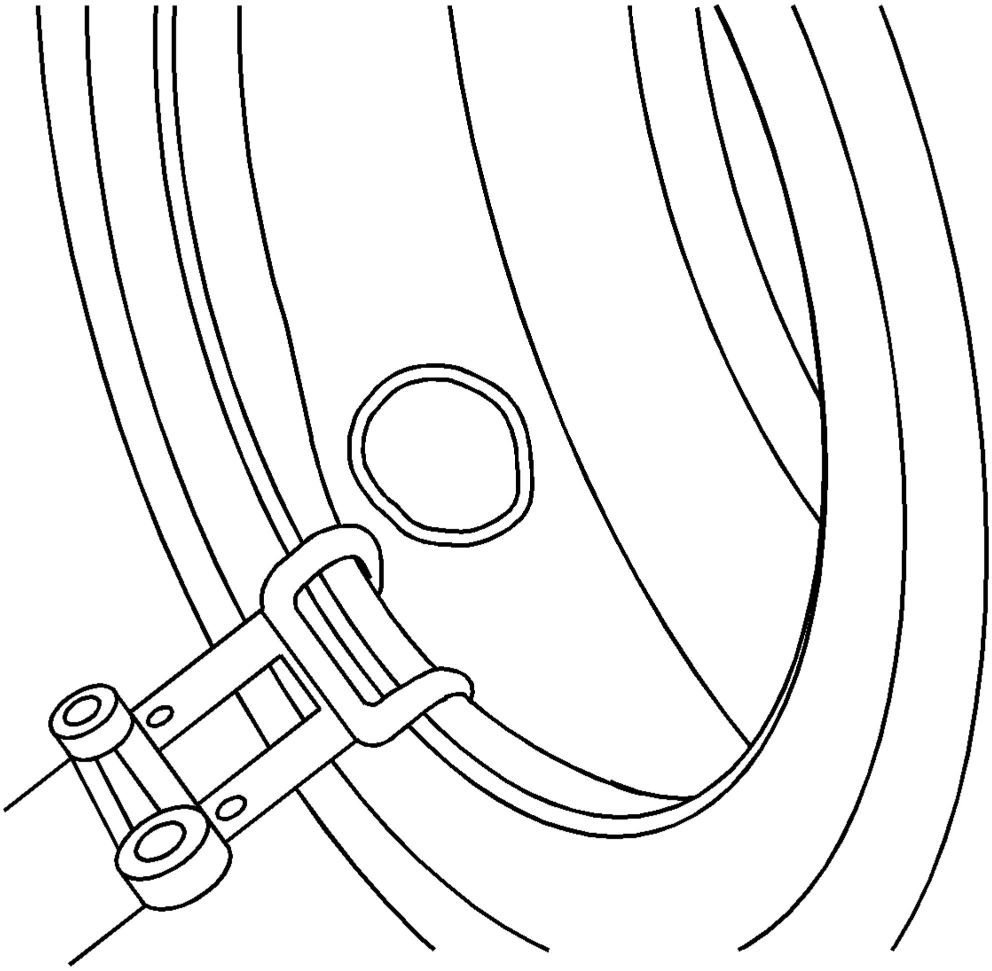

Fig. 11: Marking Tire Puncture Location
Courtesy of GENERAL MOTORS COMPANY

1. Spread the beads and mark the puncture with a tire crayon.
2. Inspect the inner tire for any signs of internal damage.
3. Remove the puncturing object, noting the direction of the penetration.
4. Probe the injury with a blunt awl in order to determine the extent and direction of the injury.
5. Remove any loose foreign material from the injury.
6. Punctures exceeding 6.35 mm (1/4 in) should not be repaired.

Cleaning

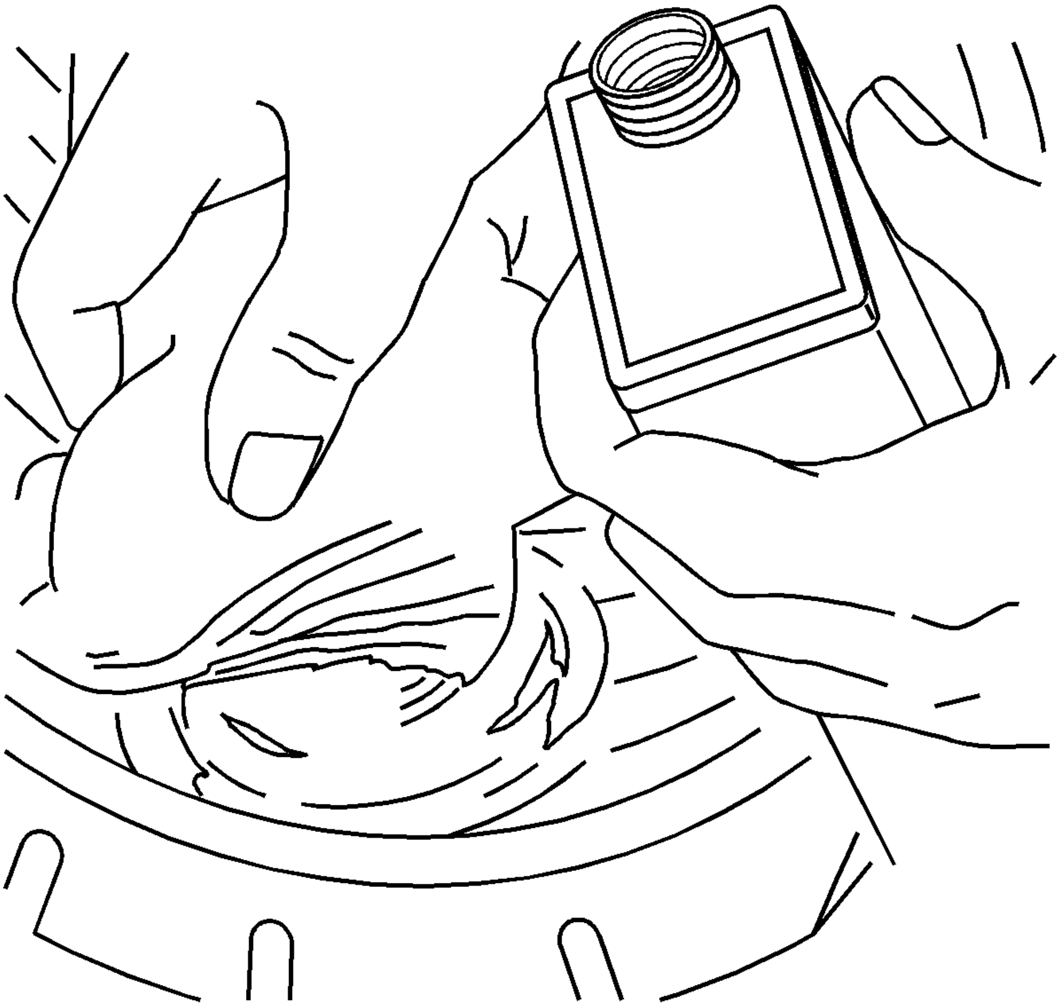

Fig. 12: Cleaning Repair Area
Courtesy of GENERAL MOTORS COMPANY

1. Clean the area around the puncture thoroughly with a proper liner cleaner, clean cloth and a scraper. This step serves to remove dirt and mold lubricants to insure proper adhesion and non-contamination of the buffing tool.
2. Refer to information on the product or manufacturer's Material Safety Data Sheet and follow guidelines for handling and disposal.

Clean the Injury Channel

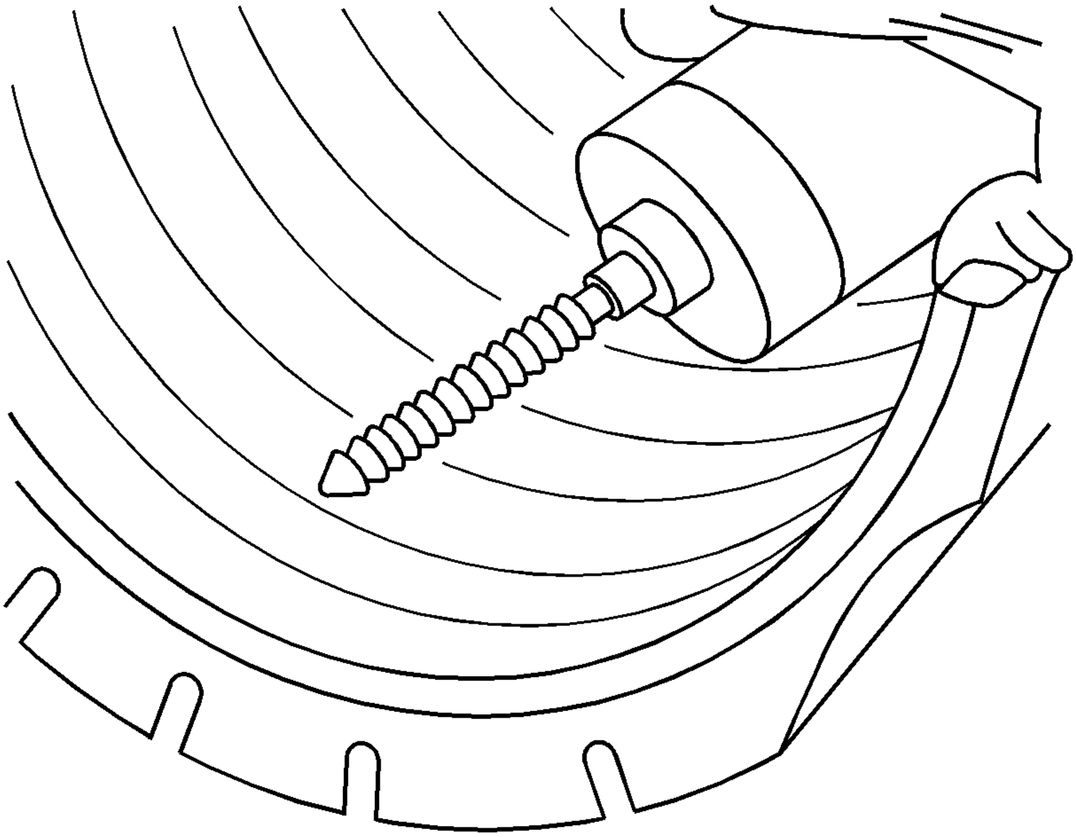

Fig. 13: Identifying Drill Bit
Courtesy of GENERAL MOTORS COMPANY

1. Use a proper hand reamer, carbide cutter or drill bit to ream the puncture channel from the inside of the tire in order to clean the injury.
2. Remove steel wires protruding above the liner surface to prevent damage to the repair unit.
3. Consult your repair material supplier for recommended reaming tool(s).

Fill the Injury

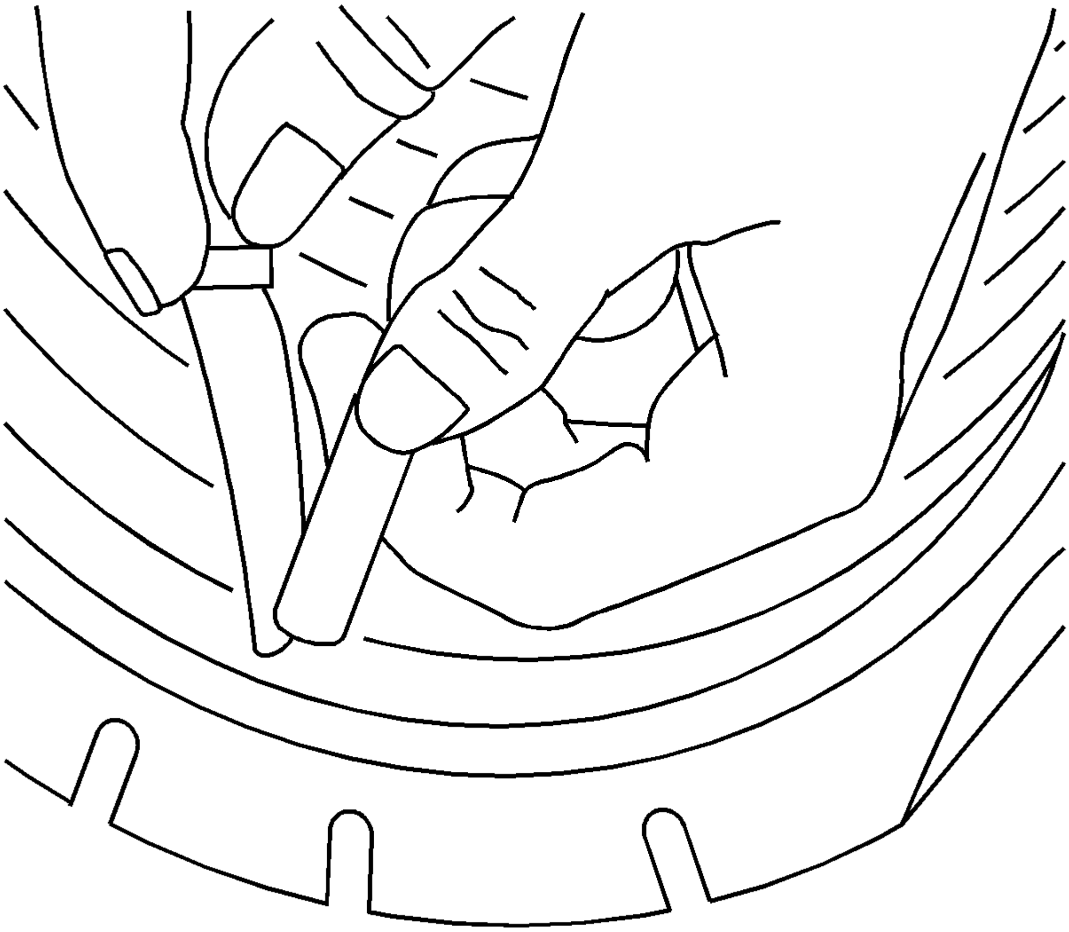

Fig. 14: Filling Injury Channel
Courtesy of GENERAL MOTORS COMPANY

1. It is necessary to fill the injury channel to provide back up for the repair unit and to prevent moisture from entering the tire fabric and steel wires.
2. For combination repair/plug units skip this step. Cement the injured channel and fill the injury from the inside of the tire with the repair plug per repair material manufacturer's recommendations. Without stretching the plug, cut the plug off just above the inside tire surface.
3. Consult your repair material supplier for proper repair material selection.

Repair Unit Selection

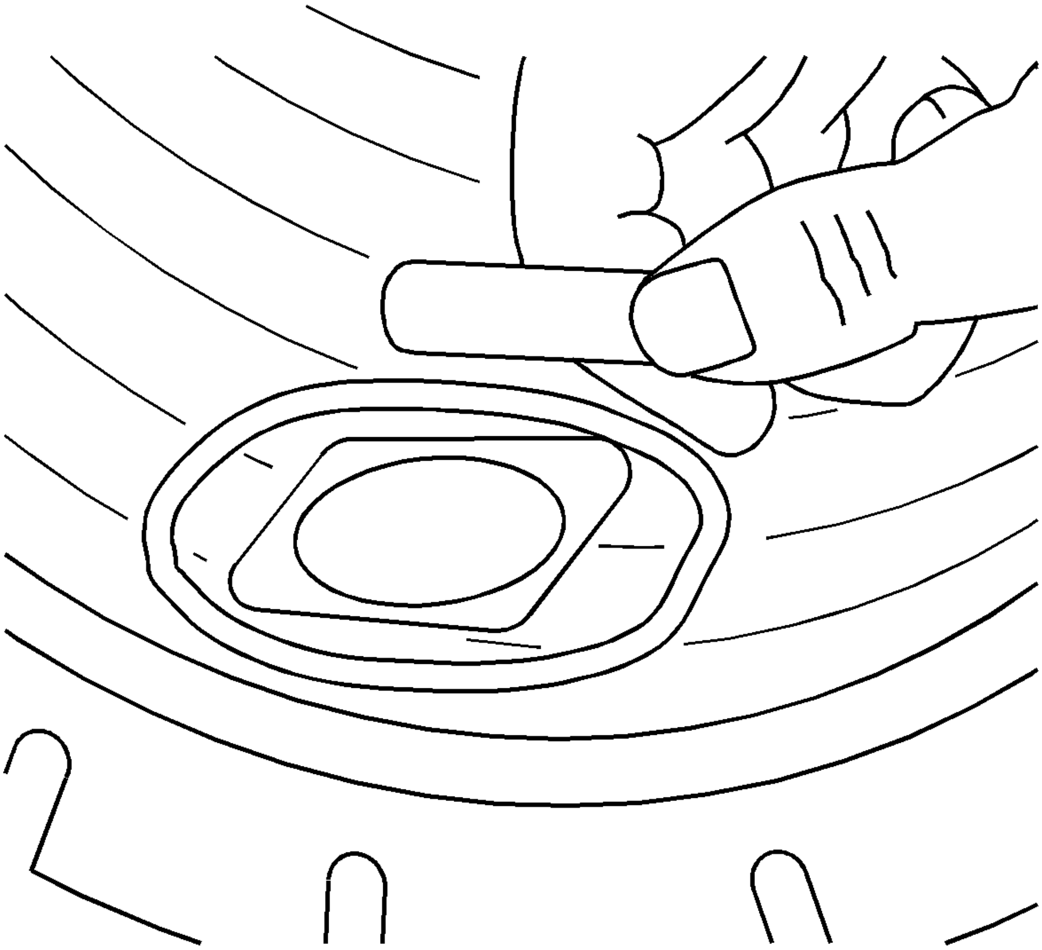

Fig. 15: Outlining Tire Injury Area
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not install the repair unit in this step.**

1. Center the repair unit over the injury as a reference and outline an area larger than the unit so that buffing will not remove the crayon marks.
2. Remove the repair unit.
3. DO NOT overlap previous or multiple repair units.
4. Consult your repair material supplier for proper repair unit selection.

Buffing

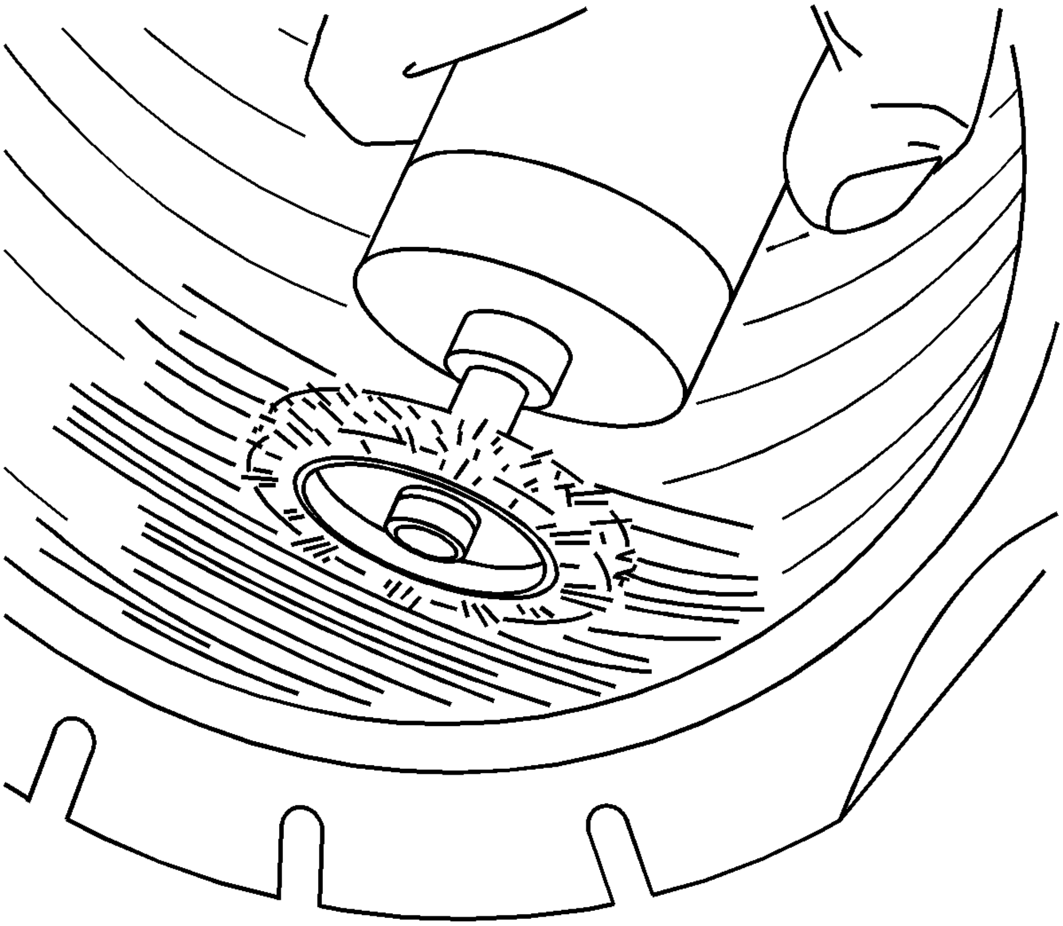

Fig. 16: Buffing Within Marked Area
Courtesy of GENERAL MOTORS COMPANY

1. To prevent contamination and preserve the outline, buff within the marked area thoroughly and evenly with a low speed buffing tool using a fine wire brush or gritted rasp.
2. Buff to a smooth velvet surface (RMA #1 or #2 buffed texture).
3. Use caution not to gouge the inner liner or expose casing fabric.
4. Remove any buffing dust with a vacuum cleaner.
5. Consult your repair material supplier for a proper buffing tool.

Cementing

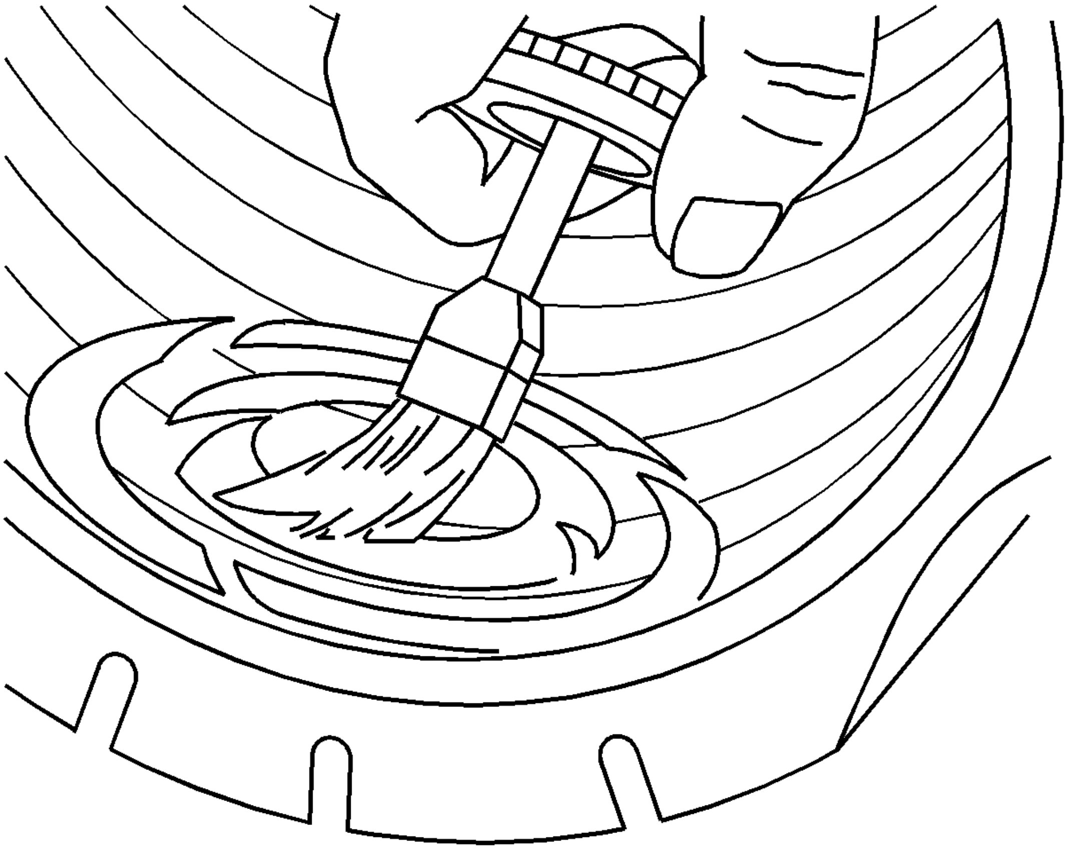

Fig. 17: Applying Chemical Cement
Courtesy of GENERAL MOTORS COMPANY

Apply chemical cement according to the repair material manufacturer's procedures.

Repair Unit Application

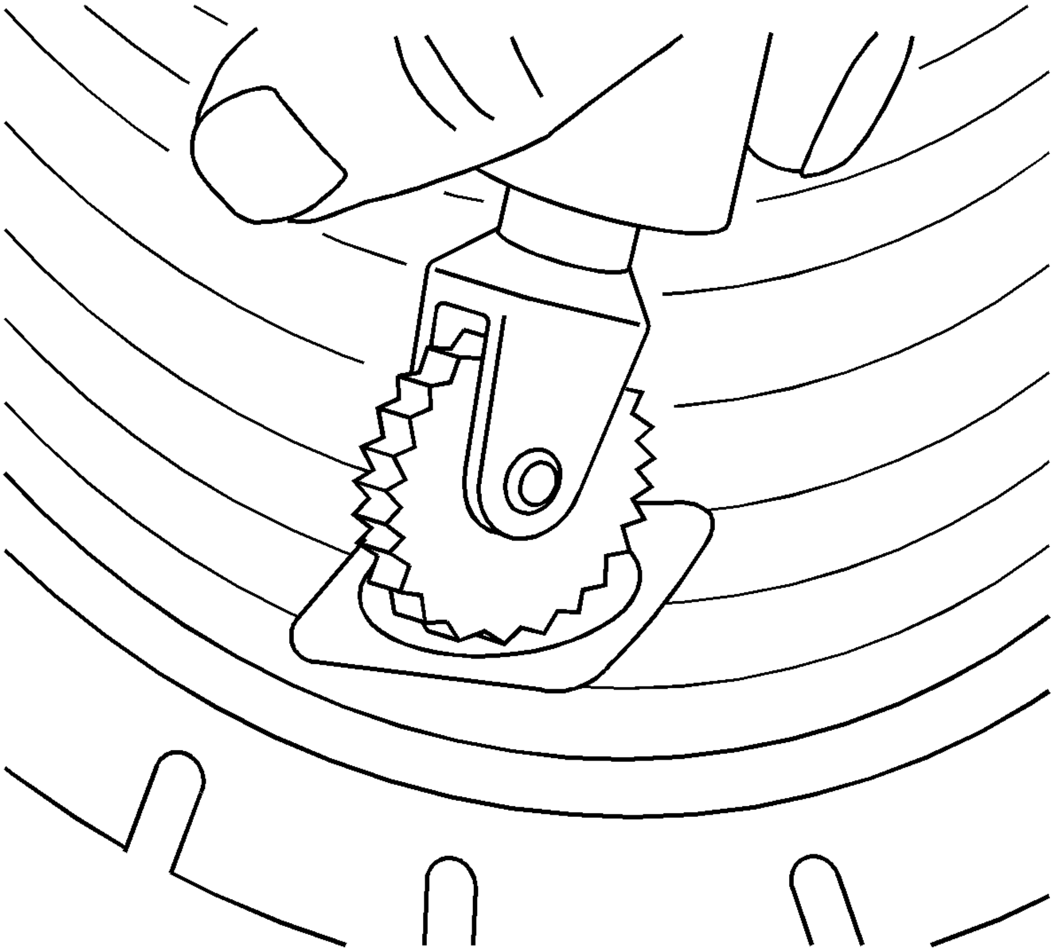

Fig. 18: Stitching Repair Unit
Courtesy of GENERAL MOTORS COMPANY

The tire must be in the relaxed position when the repair unit is installed. Do not spread the beads excessively.

Two-Piece Plug and Repair Units

1. If applicable, install the repair unit so that the alignment is correct.
2. Center the repair unit over the injury and stitch down thoroughly with the stitching tool, working from the center out.

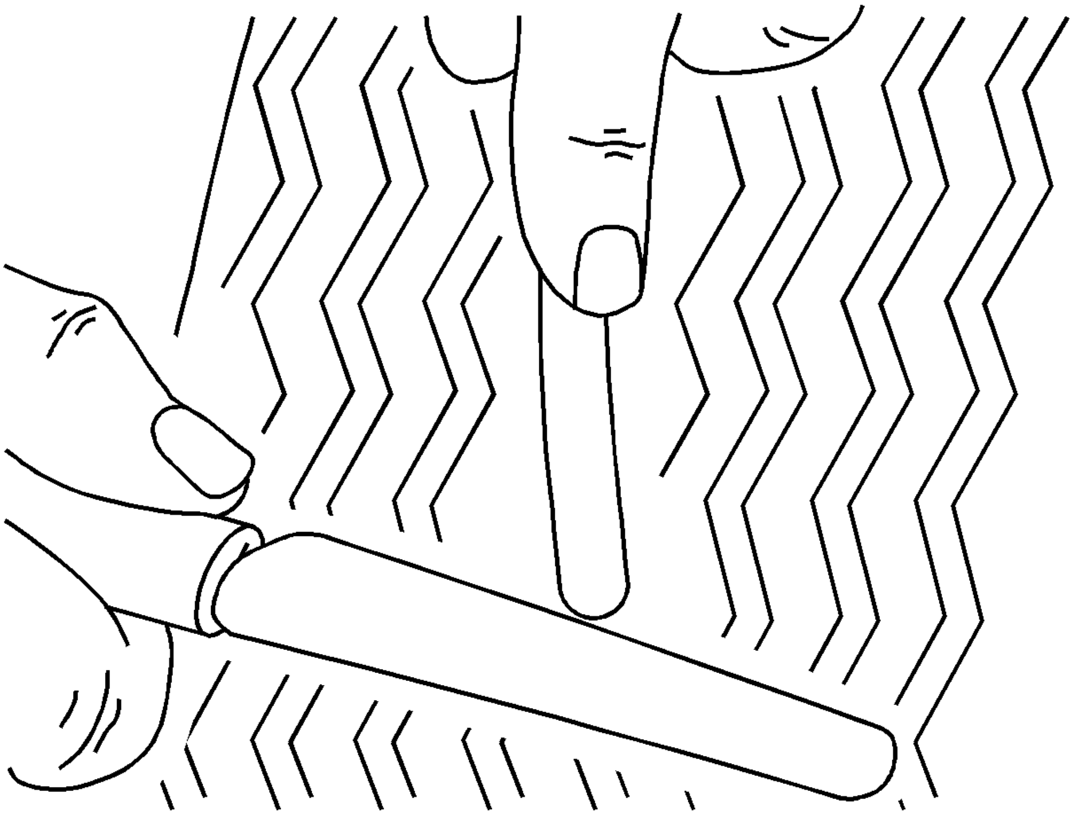

Fig. 19: Cutting Plug Material
Courtesy of GENERAL MOTORS COMPANY

3. Being careful not to stretch the plug material, cut the plug flush with the outer tread.

Combination Repair/Plug Units

1. Pull the plug through the injury until the repair just reaches the liner. Stitch down thoroughly.
2. Follow the repair material manufacturer's recommendations for further installation instructions.

   Consult your repair material supplier for the proper stitching tool.

Safety Cage

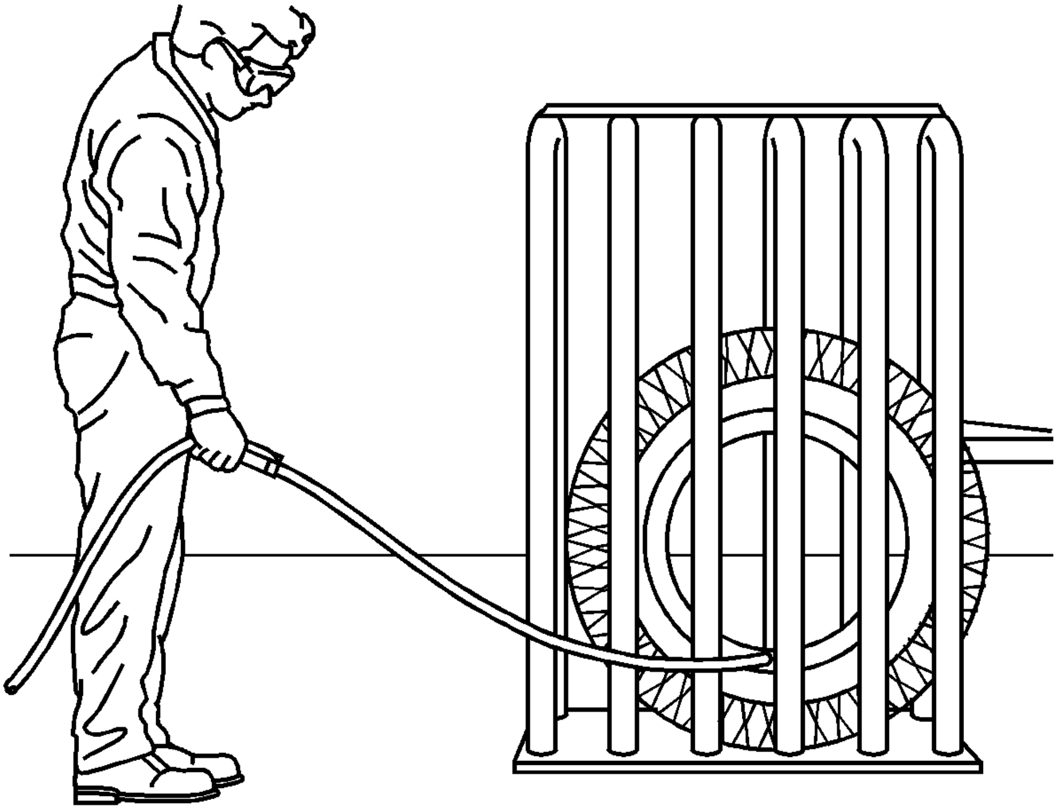

Fig. 20: Using Safety Cage
Courtesy of GENERAL MOTORS COMPANY

Some run flat tires and high performance tires may require more than 275 kPa (40 psi) to seat the bead. In such a case, a tire safety cage must be used. Consult the tire manufacturer for its individual repair policy.

Final Inspection

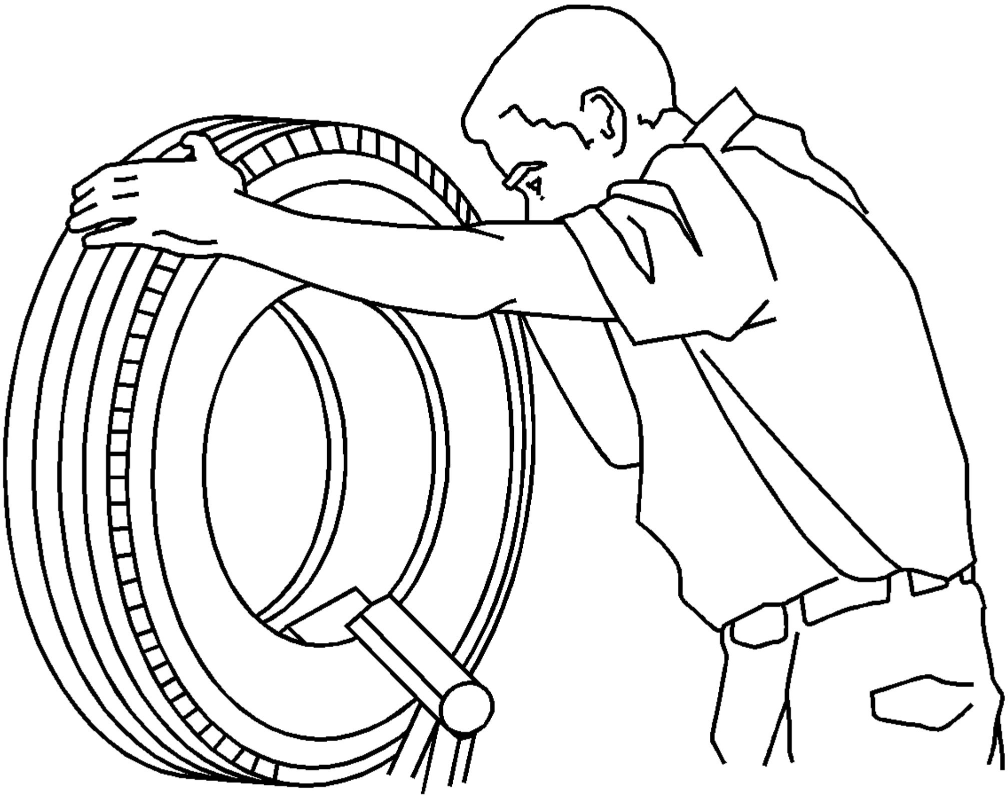

Fig. 21: Performing Final Inspection
Courtesy of GENERAL MOTORS COMPANY

1. After remounting and inflating the tire, check both beads, the repair and the valve with a water and soap solution in order to detect leaks.
2. If the tire continues to lose air, the tire must be demounted and reinspected.
3. Balance the tire and wheel assembly. Refer to Tire and Wheel Assembly Balancing - Off Vehicle .

TIRE DISMOUNTING AND MOUNTING

CAUTION: **Use a tire changing machine in order to dismount tires. Do not use hand tools or tire irons alone in order to remove the tire from the wheel. Damage to the tire beads or the wheel rim could result.**

CAUTION: **Do not scratch or damage the clear coating on aluminum wheels with the tire changing equipment. Scratching the clear coating could cause the aluminum wheel to corrode and the clear coating to peel from the wheel.**

CAUTION: **Damage to either the tire bead or the wheel mounting holes can result from the use of improper wheel attachment or tire mounting procedures. It takes up to 70 seconds for all of the air to completely exhaust from a large tire. Failure to follow the proper procedures could cause the tire changer to put enough force on the tire to bend the wheel at the mounting surface. Such damage may result in vibration and/or shimmy, and under severe usage lead to wheel cracking.**

1. Deflate the tire completely.
2. Use the tire changer in order to remove the tire from the wheel.
3. Use a wire brush or coarse steel wool in order to remove any rubber, light rust or corrosion from the wheel bead seats.

CAUTION: **When mounting the tires, use an approved tire mounting lubricant. DO NOT use silicon or corrosive base compounds to lubricate the tire bead and the wheel rim. A silicon base compound can cause the tire to slip on the rim. A corrosive type compound can cause tire or rim deterioration.**

4. Apply an approved lubricant to the tire bead and the wheel trim.
5. Use the tire changer in order to install the tire to the wheel.

WARNING: **To avoid serious personal injury, do not stand over tire when inflating. The bead may break when the bead snaps over the safety hump. Do not exceed 275 kPa (40 psi) pressure when inflating any tire if beads are not seated. If 275 kPa (40 psi) pressure will not seat the beads, deflate, relubricate the beads and reinflate. Overinflation may cause the bead to break and cause serious personal injury.**

6. Inflate the tire to the proper air pressure.
7. Ensure that the locating rings are visible on both sides of the tire in order to verify that the tire bead is fully seated on the wheel.

TIRE AND WHEEL BALANCING

WARNING: **Failure to adhere to the following precautions before tire balancing can result in personal injury or damage to components:**

- **Clean away any dirt or deposits from the inside of the wheels.**
- **Remove any stones from the tread.**
- **Wear eye protection.**
- **Use coated weights on aluminum wheels.**

Tire and Wheel Assembly Balancer Calibration

Tire and wheel balancers can drift out of calibration over time, or can become inaccurate as a result of heavy use. There will likely not be any visual evidence that a calibration problem exists. If a balancer is not calibrated within specifications, and a tire and wheel assembly is balanced on that machine, the assembly may actually be imbalanced.

Tire and wheel assembly balancer calibration should be checked approximately every 2 weeks, if the machine is used frequently, and/or whenever the balance readings are questionable.

Tire and Wheel Assembly Balancer Calibration Test

NOTE: **If the balancer fails any of the steps in this calibration test, the balancer should be calibrated according to the manufacturer's instructions. If the balancer cannot be calibrated, contact the manufacturer for assistance.**

Inspect the calibration of the tire and wheel assembly balancer according to the manufacturer's recommendations, or perform the following test.

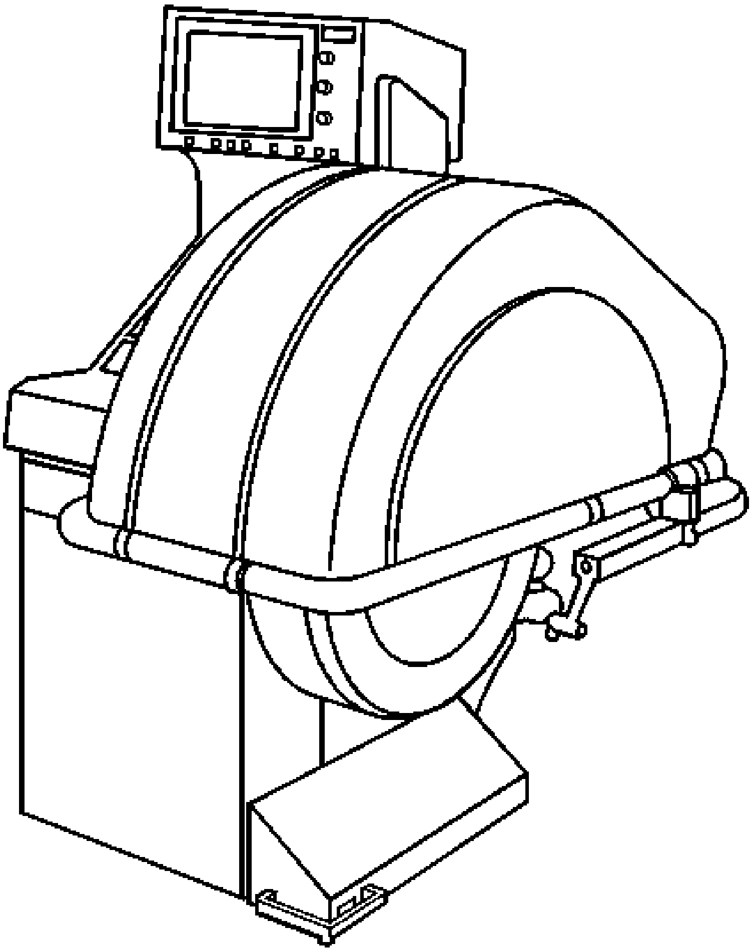

Fig. 22: Tire And Wheel Assembly Balancer
Courtesy of GENERAL MOTORS COMPANY

1. Spin the balancer without a wheel or any of the adapters on the shaft.
2. Inspect the balancer readings.

   Specification

   Zero within 7 g (1/4 oz)

3. If the balancer is within the specification range, balance a tire and wheel assembly - that is within radial and lateral runout tolerances - to ZERO, using the same balancer.
4. After the tire and wheel assembly has been balanced, add an 85 g (3 oz) test weight to the wheel at any location.
5. Spin the tire and wheel assembly again. Note the readings.
   - In the static and dynamic modes, the balancer should call for 85 g (3 oz) of weight, 180 degrees opposite the test weight.
   - In the dynamic mode, the weight should be called for on the flange of the wheel opposite the test weight.
6. With the assembly imbalanced to 85 g (3 oz), cycle the balancer 5 times.
7. Inspect the balancer readings:

Specification

Maximum variation: 7 g (1/4 oz)

8. Index the tire and wheel assembly on the balancer shaft, 90 degrees from the previous location.
9. Cycle the balancer with the assembly at the new location.
10. Inspect the balancer readings:

    Specification

    Maximum variation: 7 g (1/4 oz)

11. Repeat steps 8 through 10 until the tire and wheel assembly has been cycled and checked at each of the 4 locations on the balancer shaft.

Tire and Wheel Assembly Balancing Guidelines

NOTE: **Tire and wheel assemblies which exhibit excessive runout can produce vibrations even if the assemblies are balanced.**

It is strongly recommended that the tire and wheel assembly runout be measured and corrected if necessary BEFORE the assemblies are balanced.

If the runout of the tire and wheel assemblies has not yet been measured, refer to Tire and Wheel Assembly Runout Measurement - Off Vehicle before proceeding.

There are 2 types of tire and wheel balance:

Static Balance

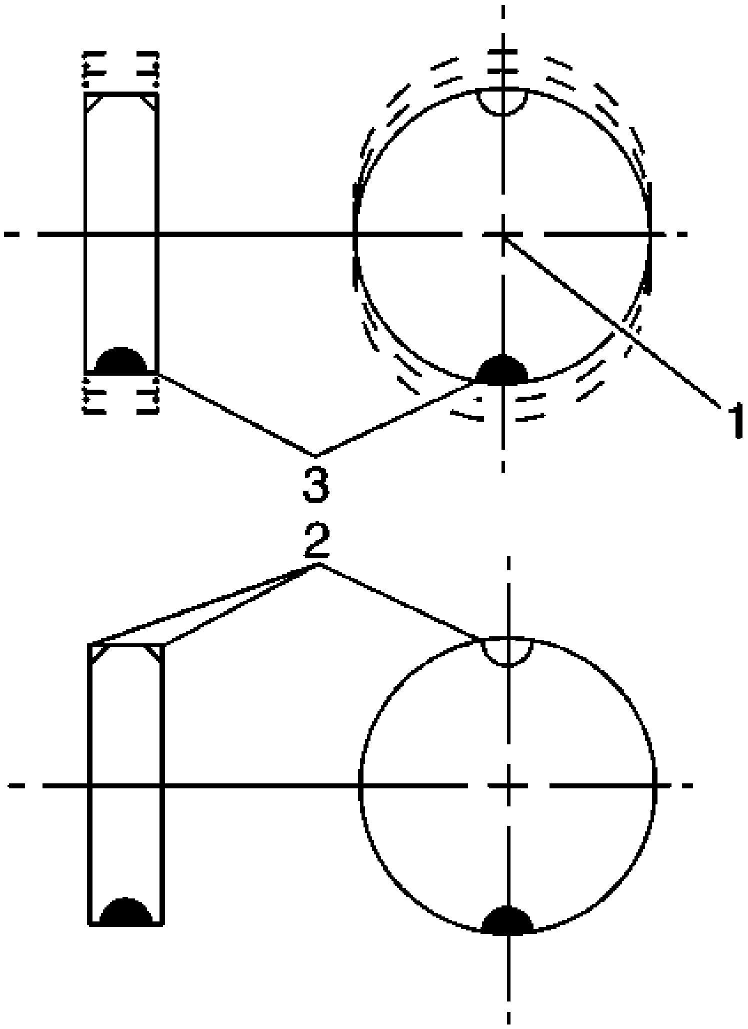

Fig. 23: Static Balance
Courtesy of GENERAL MOTORS COMPANY

Static balance is the equal distribution of weight around the wheel circumference. The wheel balance weights (2) are positioned on the wheel in order to offset the effects of a heavy spot (3). Wheels that have static imbalance can produce a bouncing action called tramp.

Dynamic Balance

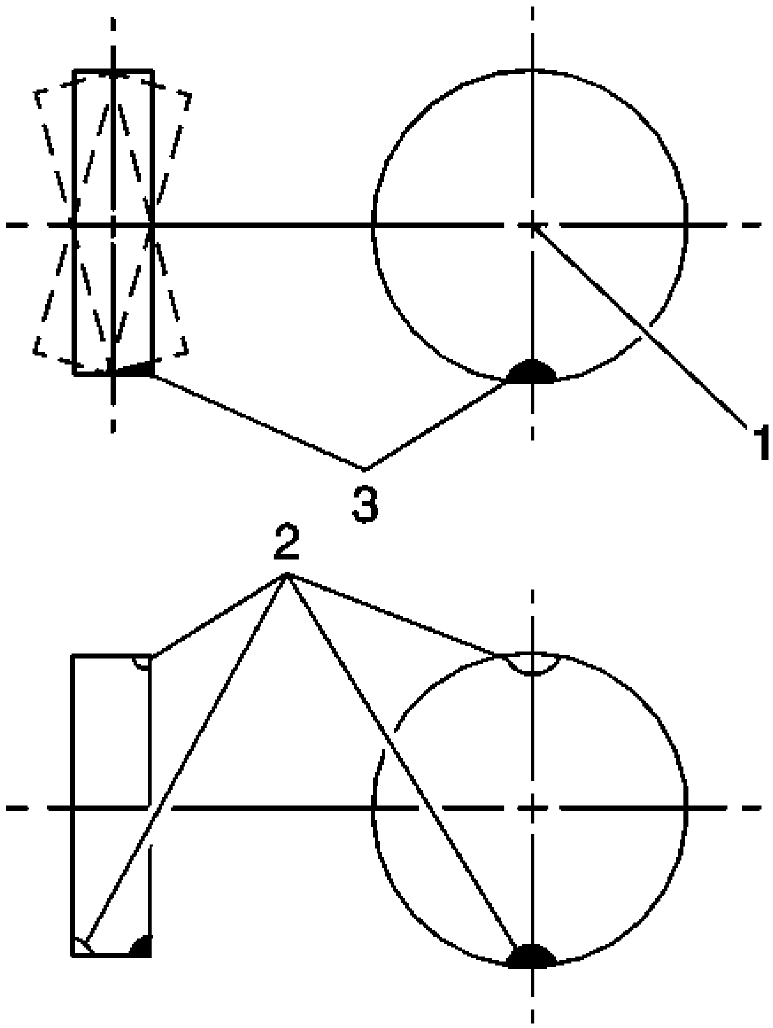

Fig. 24: Dynamic Balance
Courtesy of GENERAL MOTORS COMPANY

Dynamic balance is the equal distribution of weight on each side of the tire and wheel assembly centerline. The wheel balance weights (2) are positioned on the wheel in order to offset the effects of a heavy spot (3). Wheels that have dynamic imbalance have a tendency to move from side to side and can cause an action called shimmy.

Most off-vehicle balancers are capable of checking both types of balance simultaneously.

As a general rule, most vehicles are more sensitive to static imbalance than to dynamic imbalance; however, vehicles equipped with low profile, wide tread path, high performance tires and wheels are susceptible to small amounts of dynamic imbalance. As little as 14 - 21 g (1/2 - 3/4 oz) imbalance is capable of inducing a vibration in some vehicle models.

Balancing Procedure

NOTE: **When balancing tire and wheel assemblies, use a known good, recently calibrated, off-vehicle, two-plane dynamic balancer set to the finest balance mode available.**

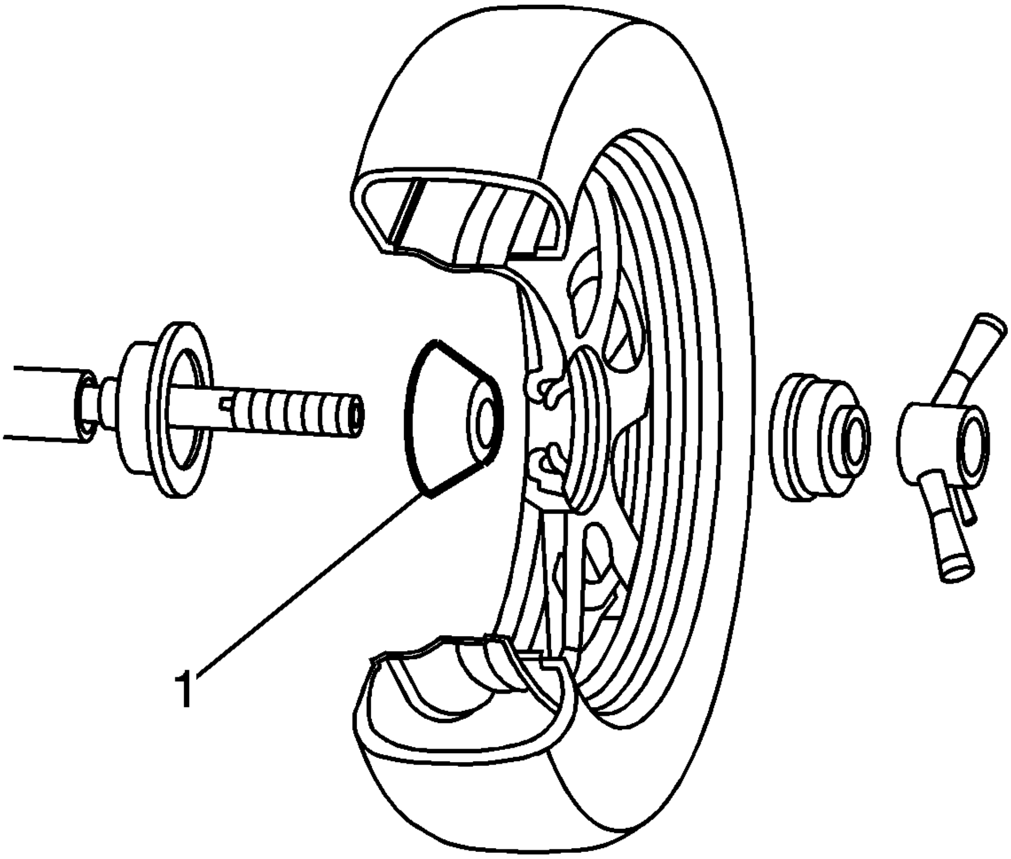

Fig. 25: Wheel Balancer Center Cone
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Carefully follow the wheel balancer manufacturers's instructions for proper mounting of the center cone (1).**

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Mark the location of the wheels to the wheel studs and mark the specific vehicle position on each tire and wheel - LF, LR, RF, RR.
3. Remove the tire and wheel assemblies one at a time and mount on a spin-type wheel balancer. Refer to **Tire and Wheel Removal and Installation**
4. Carefully follow the wheel balancer manufacturer's instructions for proper mounting techniques to be used on different types of wheels.

   Regard aftermarket wheels, especially those incorporating universal lug patterns, as potential sources of runout and mounting concerns.

5. Be sure to use the correct type of wheel balance weights for the type of wheel rim being balanced. Be sure to use the correct type of coated wheel balance weights on aluminum wheels. Refer to Wheel Weight Usage.
6. Balance all four tire and wheel assemblies as close to zero as possible.
7. Using the matchmarks made prior to removal, install the tire and wheel assemblies to the vehicle. Refer to **Tire and Wheel Removal and Installation**
8. Lower the vehicle.

Wheel Weight Usage

Tire and wheel assemblies can be balanced using either the static or dynamic method.

Clip-on Weights

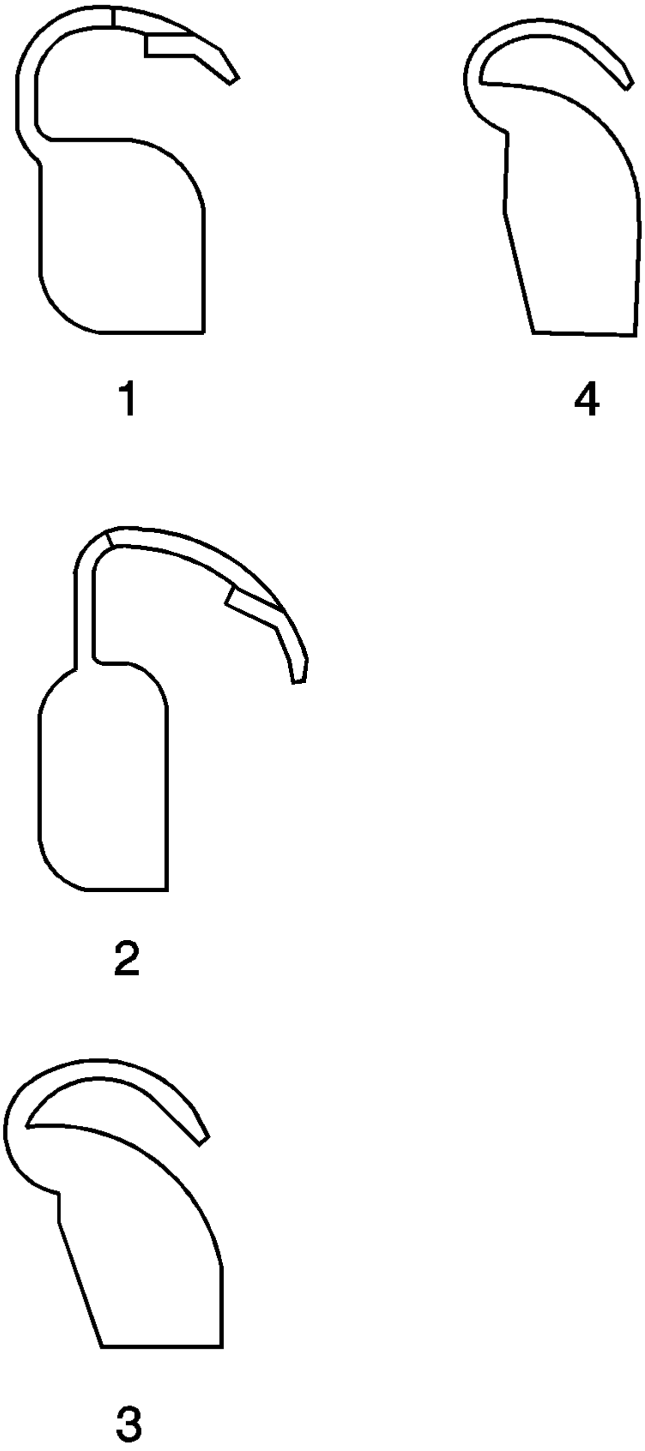

Fig. 26: Identifying Clip-On Wheel Weight Types
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When balancing factory aluminum wheels with clip-on wheel balance weights, be sure to use special polyester-coated weights. These coated weights reduce the potential for corrosion and damage to aluminum wheels.**

These coated weights reduce the potential for corrosion and damage to aluminum wheels.

- MC (1) and AW (2) series weights are approved for use on aluminum wheels.
- P (3) series weights are approved for use on steel wheels only.
- T (4) series coated weights are approved for use on both steel and aluminum wheels.

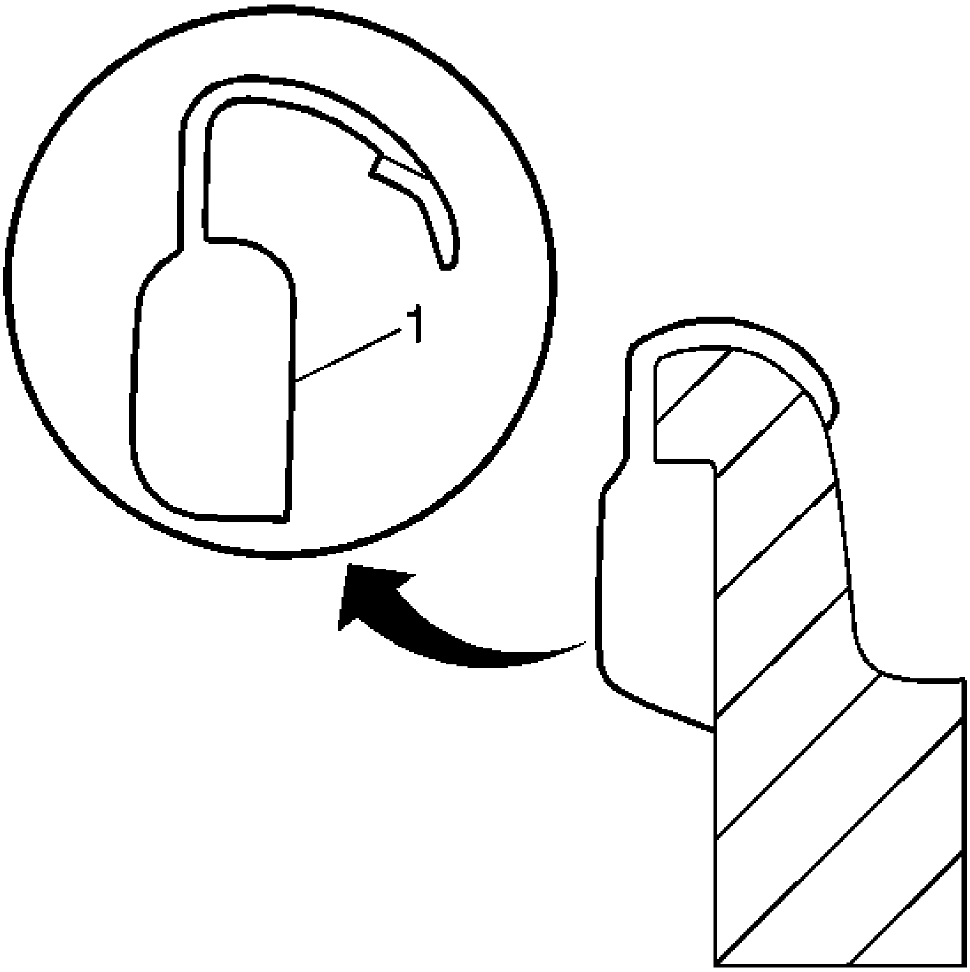

Fig. 27: Attaching Clip-On Wheel Weight
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use a nylon or plastic-tipped hammer when installing coated clip-on wheel balance weights to minimize the possibility of damage to the polyester coating.**

The contour and style of the wheel rim flange will determine which type of clip-on wheel weight (1) should be used. The weight should follow the contour of the rim flange. The weight clip should firmly grip the rim flange.

Wheel Weight Placement - Clip-on Weights

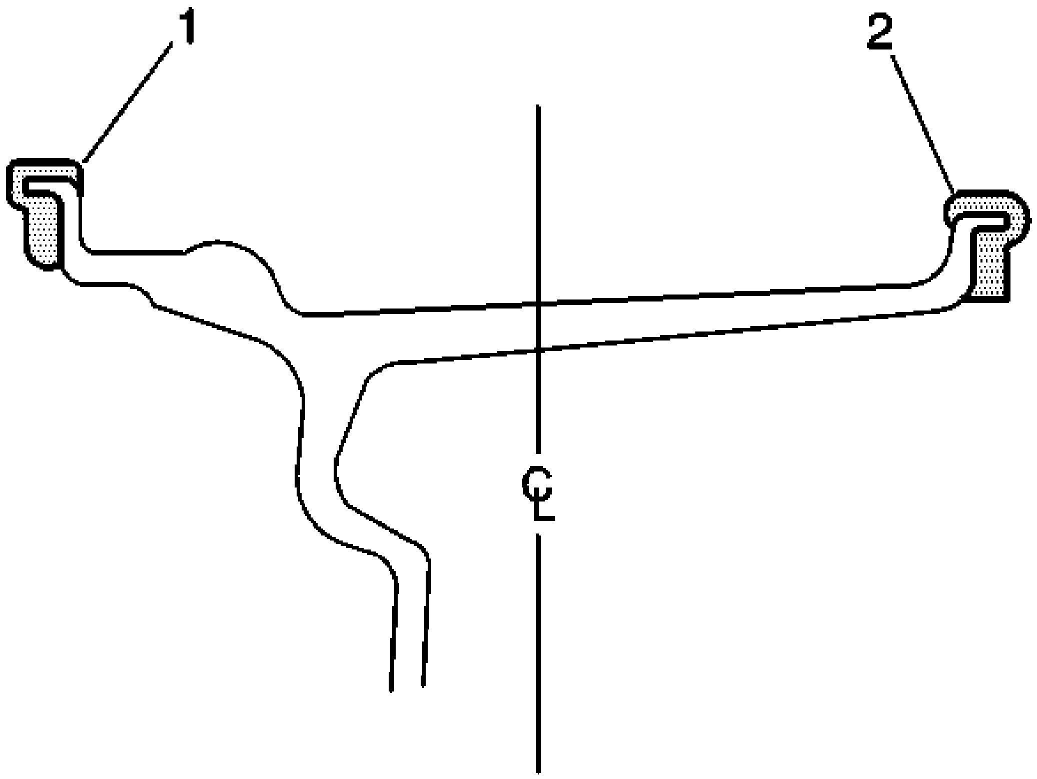

Fig. 28: Clip-On Wheel Weight Placement
Courtesy of GENERAL MOTORS COMPANY

When static balancing, locate the wheel balance weights on the inboard flange (2) if only 28 g (1 oz) or less is called for. If more than 28 g (1 oz) is called for, split the weights as equally as possible between the inboard (2) and outboard (1) flanges.

When dynamic balancing, locate the wheel balance weights on the inboard (2) and outboard (1) rim flanges at the positions specified by the wheel balancer.

Adhesive Weights

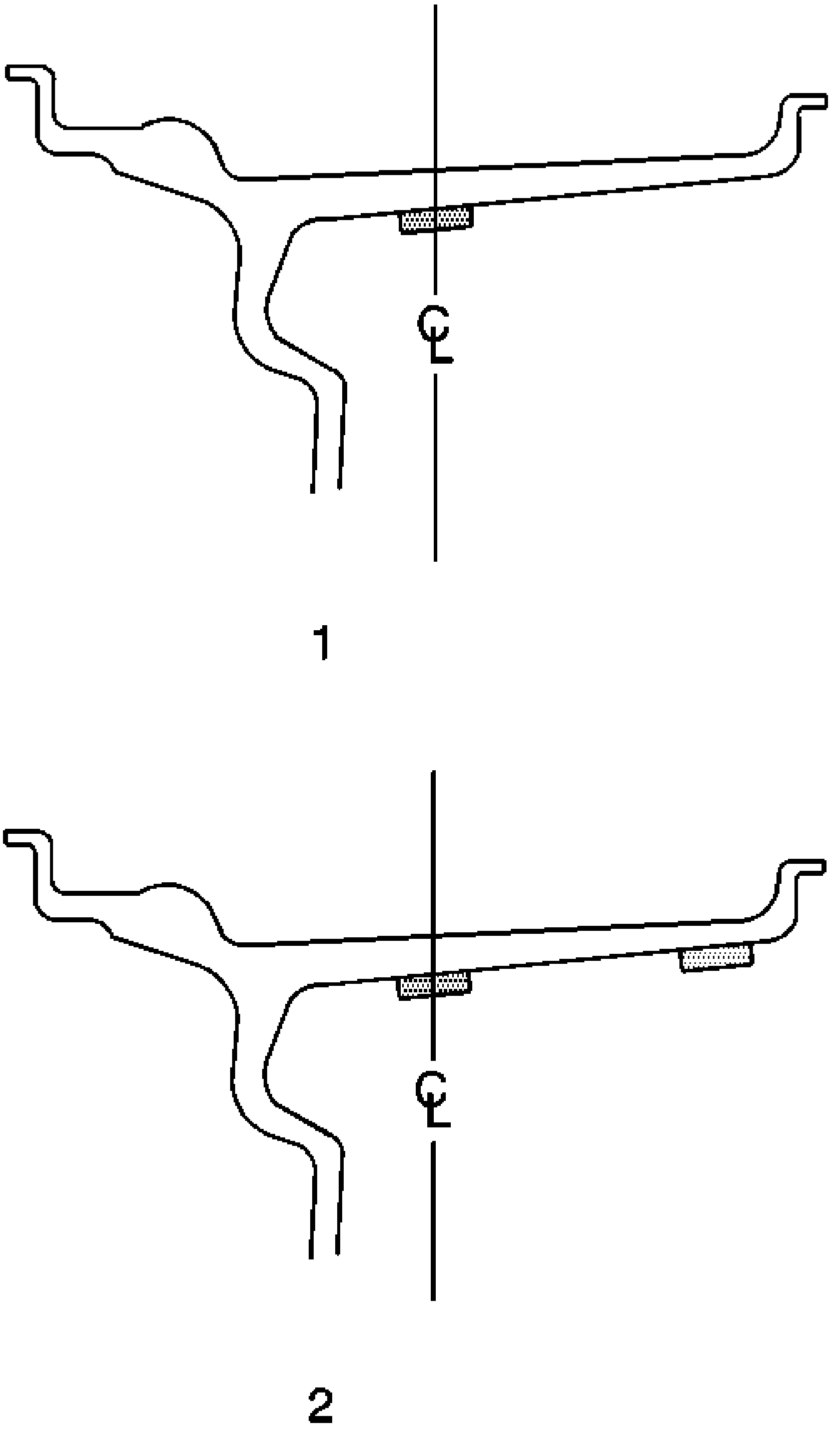

Fig. 29: Adhesive Wheel Weight Placement
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When installing adhesive balance weights on flangeless wheels, do NOT install the weight on the outboard surface of the rim.**

Adhesive wheel balance weights may be used on factory aluminum wheels. Perform the following procedure to install adhesive wheel balance weights.

1. Determine the correct areas for placement of the wheel weights on the wheel.
   - When static balancing, locate the wheel balance weights along the wheel centerline (1) on the inner wheel surface if only 28 g (1 oz) or less is called for. If more than 28 g (1 oz) is called for, split the weights as equally as possible between the wheel centerline and the inboard edge of the inner wheel surface (2).
   - When dynamic balancing, locate the wheel balance weights along the wheel centerline and the inboard edge of the inner wheel surface (2) at the positions specified by the wheel

balancer.

2. Ensure that there is sufficient clearance between the wheel weights and brake system components.

NOTE: **Do not use abrasives to clean any surface of the wheel.**

3. Using a clean cloth or paper towel with a general purpose cleaner, thoroughly clean the designated balance weight attachment areas of any corrosion, overspray, dirt or any other foreign material.
4. To ensure there is no remaining residue, wipe the balance weight attachment areas again, using a clean cloth or paper towel with a mixture of half isopropyl alcohol and half water.
5. Dry the attachment areas with hot air until the wheel surface is warm to the touch.
6. Warm the adhesive backing on the wheel balance weights to room temperature.
7. Remove the protective covering from the adhesive backing on the back of the balance weights. DO NOT touch the adhesive surface.
8. Apply the wheel balance weights to the wheel, press into place with hand pressure.
9. Secure the wheel balance weights to the wheel with a 90 N (21 lb) force applied with a roller.

DESCRIPTION AND OPERATION

GENERAL DESCRIPTION

The factory installed tires are designed to operate satisfactorily with loads up to and including the full rated load capacity when these tires are inflated to the recommended pressures.

The following factors have an important influence on tire life:

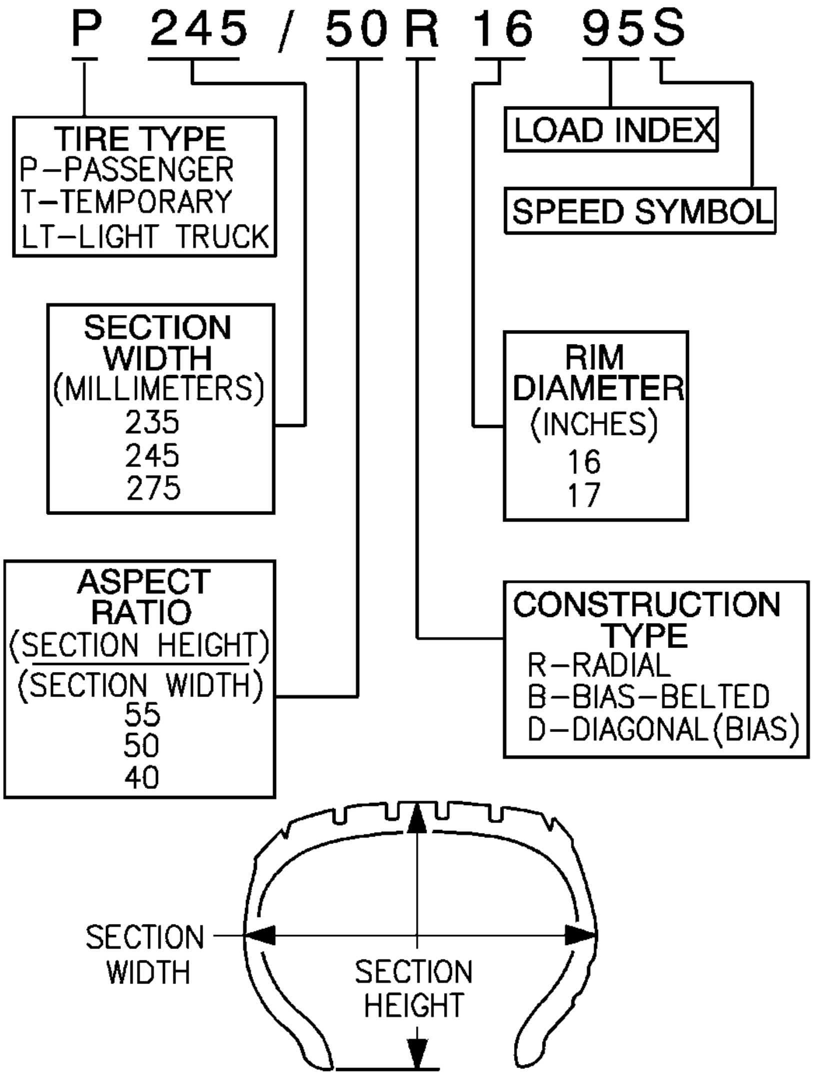
- Correct tire pressures
- Correct wheel alignment
- Proper driving techniques
- Tire rotation

The following factors increase tire wear:

- Heavy cornering
- Excessively rapid acceleration
- Heavy braking

P-METRIC SIZED TIRES DESCRIPTION

The tire sidewall has a coded marking system, which provides information about the tire.



P 245 / 50 R 16 95S

Tire Marking Example:		
P 245 50 R 16 95 S		
P	Passenger Vehicle Designation	
245	Section Width in mm (245 mm)	
50	Aspect Ratio % (Section Height to Section Width) (50 = 50%)	
R	Tire Construction (R = Radial)	
16	Rim Diameter in inches (16 = 16")	
95	Max Load Index	91 = 615 kg
		92 = 630 kg
		93 = 650 kg
		94 = 670 kg
		95 = 690 kg
		96 = 710 kg
		97 = 730 kg
		99 = 775 kg
		104 = 900 kg
		106 = 950 kg
S	Speed Rating	R = 170 km/h

	Tire Marking Example:	
		S = 180 km/h
		H = 210 km/h
		V = 240 km/h
		W = 270 km/h

Most P-metric tire sizes do not have exact corresponding alphanumeric tire sizes. Replacement tires should be of the same tire performance criteria TPC specification number including the same size, the same load range, and the same construction as those originally installed on the vehicle.

Consult a tire dealer if you must replace the P-metric tire with other sizes. Tire companies can best recommend the closest match of alphanumeric to P-metric sizes within their own tire lines.

The above illustration may not correspond with your vehicle, but is meant as an example.

REPLACEMENT WHEELS DESCRIPTION

Replace the wheel if any of the following conditions exist:

- The wheel exhibits excessive runout.
- The wheel is bent.
- The wheel is cracked.
- The wheel is severely rusted.
- The wheel is severely corroded.

NOTE: **Air leaks caused by porosity on aluminum wheels are repairable.**

- The wheel leaks air.

WARNING: **If you are replacing the wheel(s), the wheel stud(s), the wheel nut(s) or the wheel bolt(s), install only new GM original equipment parts. Installation of used parts or non-GM original equipment parts may cause the wheel to loosen, loss of tire air pressure, poor vehicle handling and loss of vehicle control resulting in personal injury.**

CAUTION: **The use of non-GM original equipment wheels may cause:**

- **Damage to the wheel bearing, the wheel fasteners and the wheel**
- **Tire damage caused by the modified clearance to the adjacent vehicle components**
- **Adverse vehicle steering stability caused by the modified scrub radius**
- **Damage to the vehicle caused by the modified ground clearance**
- **Speedometer and odometer inaccuracy**

Replace the wheel, the wheel studs and the wheel nuts, if any of the following conditions exist:

- The wheel has elongated wheel stud holes.
- The wheel nuts loosen repeatedly.

TIRE INFLATION DESCRIPTION

This vehicle has been engineered to operate up to the stated load capacity with wheel and tire assemblies of the type, size, construction, and configuration as originally installed. Maintenance of the tire inflation pressures is critical to the continued satisfactory performance, handling, and operating economy of the vehicle.

Operating the vehicle with improperly inflated tires can adversely affect vehicle performance and may contribute to the following:

- Reduced fuel economy
- Tire overloading
- Shortened tire life
- Excessive tire wear
- Uneven tire wear
- Vehicle handling concerns

Inspect the tire pressures when the vehicle has not been driven for at least 3 hours or not more than 1.6 km (1 mi) and when the tires are cool to the touch.

Tire inflation pressures should be inspected monthly and before an extended trip and adjusted to meet the specifications listed for the particular vehicle. Replace any missing or damaged tire valve stem extensions and/or caps to prevent the intrusion of water and contaminates.

One pound per square inch (psi) equals 6.9 kilopascals (kPa). The following table illustrates the conversion of kilopascals to pounds per square inch:

Inflation Pressure Conversion (Kilopascals to PSI)

kPa	psi	kPa	psi
140	20	215	31
145	21	220	32
155	22	230	33
160	23	235	34
165	24	240	35
170	25	250	36
180	26	275	40
185	27	310	45
190	28	345	50
200	29	380	55
205	30	415	60
Conversion: 6.9 kPa = 1 psi			

For the correct inflation pressures refer to the vehicle Tire Placard.

Tires inflated to a higher than recommended pressure can contribute to the following conditions:

- A hard ride
- Tire bruising
- Rapid tread wear at the center of the tire

Tires inflated to a lower than recommended pressure can contribute to the following conditions:

- Tire squeal on turns
- Hard steering
- Rapid and/or uneven wear on the outer edges of the tread
- Tire rim bruises and tire rim rupture
- Tire cord breakage
- High tire temperatures
- Sluggish vehicle handling
- Higher fuel consumption

Unequal pressure on the same axle can cause the following conditions:

- Uneven braking action

- Steering lead
- Imprecise vehicle handling

REPAIR INSTRUCTIONS

WHEEL ALIGNMENT MEASUREMENT

Steering and vibration concerns are not always the result of incorrect alignment. One possible cause is wheel and tire imbalance. Another possibility is tire lead due to worn or improperly manufactured tires. Lead/pull is defined as follows: At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path. Lead is the vehicle deviation from a straight path on a level road without pressure on the steering wheel. Refer to Radial Tire Lead/Pull Correction .

Before performing any adjustments affecting wheel alignment, perform the following inspections in order to ensure correct alignment readings:

- Inspect for visible damage to the suspension components and replace as necessary.
- Inspect the tires for the proper inflation and irregular tire wear. Refer to Tire Diagnosis - Irregular or Premature Wear .
- Inspect the runout of the wheels and the tires. Refer to Tire and Wheel Runout Specifications .
- Inspect the wheel bearings for backlash and excessive play. Refer to Wheel Bearings Diagnosis .

- Inspect the ball joints for looseness or wear.
- Inspect the tie rod ends for looseness or wear.
- Inspect the control arms and stabilizer shaft for looseness or wear.
- Inspect the steering gear for looseness at the frame. Refer to **Fastener Specifications** .
- Inspect the struts/shock absorbers for wear, leaks, and any noticeable noises. Refer to **Suspension Strut and Shock Absorber Testing - On Vehicle** .
- Inspect the vehicle trim height. Refer to **Trim Height Inspection** .
- Inspect the steering wheel for excessive drag or poor return due to stiff or rusted linkage or suspension components.
- Inspect the fuel level. The fuel tank should be full or the vehicle should have a compensating load added.

Give consideration to excess loads, such as tool boxes, sample cases, etc. If normally carried in the vehicle, these items should remain in the vehicle during alignment adjustments. Give consideration also to the condition of the equipment being used for the alignment. Follow the equipment manufacturer's instructions.

Satisfactory vehicle operation may occur over a wide range of alignment settings. However, if the setting exceeds the service allowable specifications, correct the alignment to the service preferred specifications. Refer to **Wheel Alignment Specifications**.

Perform the following steps in order to measure the front and rear alignment angles:

1. Install the alignment equipment according to the manufacturer's instructions.
2. Jounce the front and the rear bumpers 3 times prior to checking the wheel alignment.
3. Measure the alignment angles and record the readings.

NOTE: **Record the "Before" and "After" alignment measurements.**

4. Adjust alignment angles to vehicle specifications, if necessary. Refer to **Wheel Alignment Specifications**.

FRONT CASTER ADJUSTMENT

The front caster is not adjustable. If the front caster angle is not within specifications, inspect for suspension support misalignment or front suspension damage. Replace any damaged suspension components as necessary.

FRONT CAMBER ADJUSTMENT

The front camber is not adjustable. If the front camber angle is not within specifications, inspect for suspension support misalignment or front suspension damage. Replace any damaged suspension components as necessary.

WHEEL ALIGNMENT - STEERING WHEEL ANGLE AND/OR FRONT TOE ADJUSTMENT

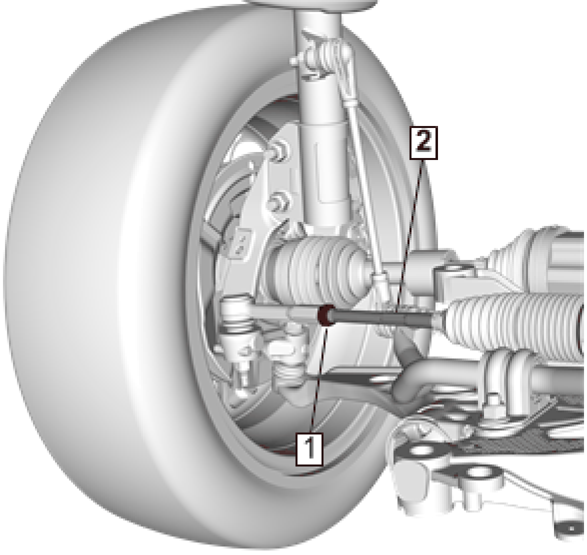

Fig. 1: Steering Linkage Inner Tie Rod Nut And Adjuster
Courtesy of GENERAL MOTORS COMPANY

1. Ensure that the steering wheel is set in a straight ahead position and centered.
2. Loosen Steering Linkage Inner Tie Rod Nut (1)
3. Adjust the toe to specification by turning the adjuster (2). Refer to **Wheel Alignment Specifications**.

CAUTION: **Refer to Fastener Caution .**

4. Tighten Steering Linkage Inner Tie Rod Nut (1) to 75 N.m (55 lb ft)
5. Check and center the steering angle sensor. Refer to **Steering Wheel Angle Sensor Centering** .

DESCRIPTION AND OPERATION

CAMBER DESCRIPTION

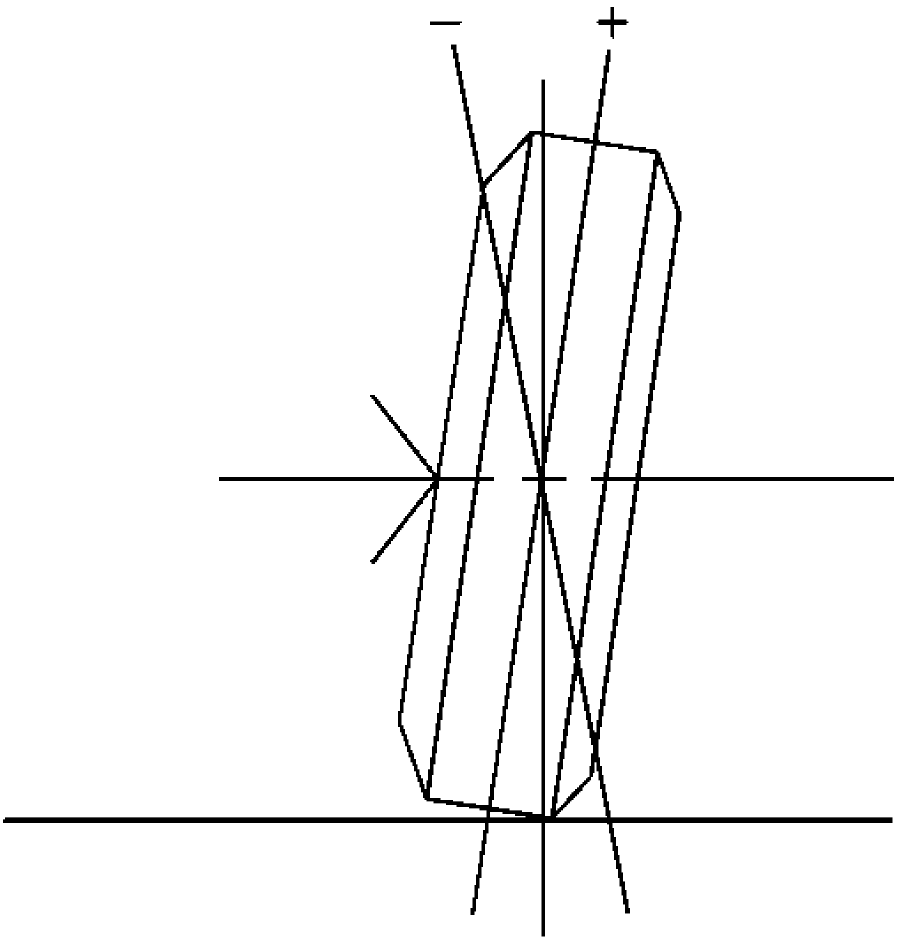

Fig. 2: Illustrating Camber Angle
Courtesy of GENERAL MOTORS COMPANY

Camber is the tilting of the wheels from the vertical when viewed from the front of the vehicle. When the wheels tilt outward at the top, the camber is positive (+). When the wheel tilts inward at the top, the camber is negative (-). The amount of tilt is measured in degrees from the vertical. Camber settings influence the directional control and the tire wear.

Too much positive camber will result in premature wear on the outside of the tire and cause excessive wear on the suspension parts.

Too much negative camber will result in premature wear on the inside of the tire and cause excessive wear on the suspension parts.

Unequal side-to-side camber of 1 degree or more will cause the vehicle to pull or lead to the side with the most positive camber.

Cross Camber is the difference between the left camber value and the right camber value.

Cross Camber = L camber - R camber

CASTER DESCRIPTION

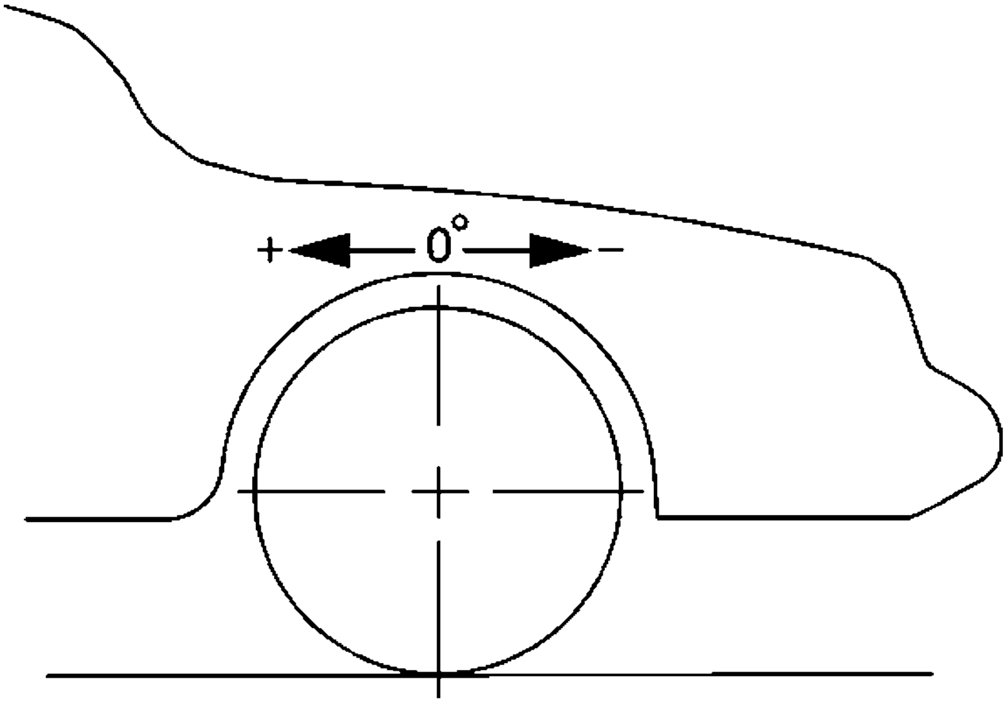

Fig. 3: Illustrating Caster
Courtesy of GENERAL MOTORS COMPANY

Caster is the tilting of the uppermost point of the steering axis either forward or backward, when viewed from the side of the vehicle. A backward tilt is positive (+) and a forward tilt is negative (-). Caster influences directional control of the steering but does not affect the tire wear. Caster is affected by the vehicle height, therefore it is important to keep the body at its designed height.

Overloading the vehicle or a weak or sagging rear spring will affect caster. When the rear of the vehicle is lower than its designated trim height, the front suspension moves to a more positive caster. If the rear of the vehicle is higher than its designated trim height, the front suspension moves to a less positive caster.

With too little positive caster, steering may be touchy at high speed and wheel returnability may be diminished when coming out of a turn. If one wheel has more positive caster than the other, that wheel will pull toward the center of the vehicle. This condition will cause the vehicle to pull or lead to the side with the least amount of positive caster.

LEAD/PULL DESCRIPTION

At a constant highway speed on a typical straight road, lead/pull is the amount of effort required at the steering wheel to maintain the vehicle's straight path.

IMPORTANT:	Vehicles will tend to lead/pull in the direction of the road slope as part of normal operation.

Lead/pull is usually caused by the following factors:

- Road slope

- Variability in tire construction
- Wheel alignment (front cross caster and camber)
- Unbalanced steering gear
- Electronic Power Steering (EPS) steering position and torque sensors not calibrated correctly, if equipped.

MEMORY STEER DESCRIPTION

Memory steer is when the vehicle wants to lead or pull in the direction the driver previously turned the vehicle. Additionally, after turning in the opposite direction, the vehicle will want to lead or pull in that direction.

SCRUB RADIUS DESCRIPTION

Ideally, the scrub radius is as small as possible. Normally, the SAI angle and the centerline of the tire and the wheel intersect below the road surface, causing a positive scrub radius. With struts, the SAI angle is much larger than the long arm/short arm type of suspension. This allows the SAI angle to intersect the camber angle above the road surface, forming a negative scrub radius. The smaller the scrub radius, the better the directional stability. Installing aftermarket wheels that have additional offset will dramatically increase the scrub radius. The newly installed wheels may cause the centerline of the tires to move further away from the spindle. This will increase the scrub radius.

A large amount of scrub radius can cause severe shimmy after hitting a bump. Four-wheel drive vehicles with large tires use a steering damper to compensate for an increased scrub radius. Scrub radius is not directly measurable by the conventional methods. Scrub radius is projected geometrically by engineers during the design phase of the suspension.

THRUST ANGLES DESCRIPTION

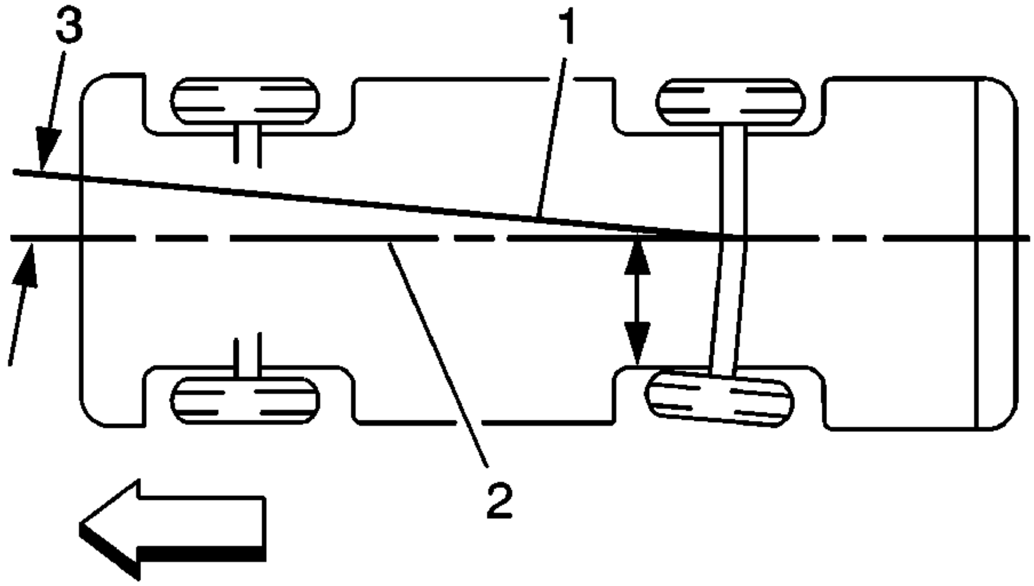

Fig. 4: Illustrating Thrust Angles
Courtesy of GENERAL MOTORS COMPANY

The front wheels aim or steer the vehicle. The rear wheels control tracking. This tracking action relates to the thrust angle (3). The thrust angle is the path that the rear wheels take. Ideally, the thrust angle is geometrically aligned with the body centerline (2).

In the illustration, toe-in is shown on the left rear wheel, moving the thrust line (1) off center. The resulting deviation from the centerline is the thrust angle.

If the thrust angle is not set properly the vehicle may "dog track", the steering wheel may not be centered or it could be perceived as a bent axle. Thrust angle can be checked during a wheel alignment.

Positive thrust angle means the thrust line is pointing to the right hand side (RHS) of the vehicle.

Negative thrust angle means the thrust line is pointing to the left hand side (LHS) of the vehicle.

If the thrust angle is out of specification, moving the axle to body relationship will change the thrust angle reading.

If the vehicle is out in the Positive (+) direction-moving the RHS forward and/or LHS rearward will move the thrust angle towards zero degrees.

If the vehicle is out in the Negative (-) direction-moving the RHS rearward and/or LHS forward will move the thrust angle towards zero degrees.

TOE DESCRIPTION

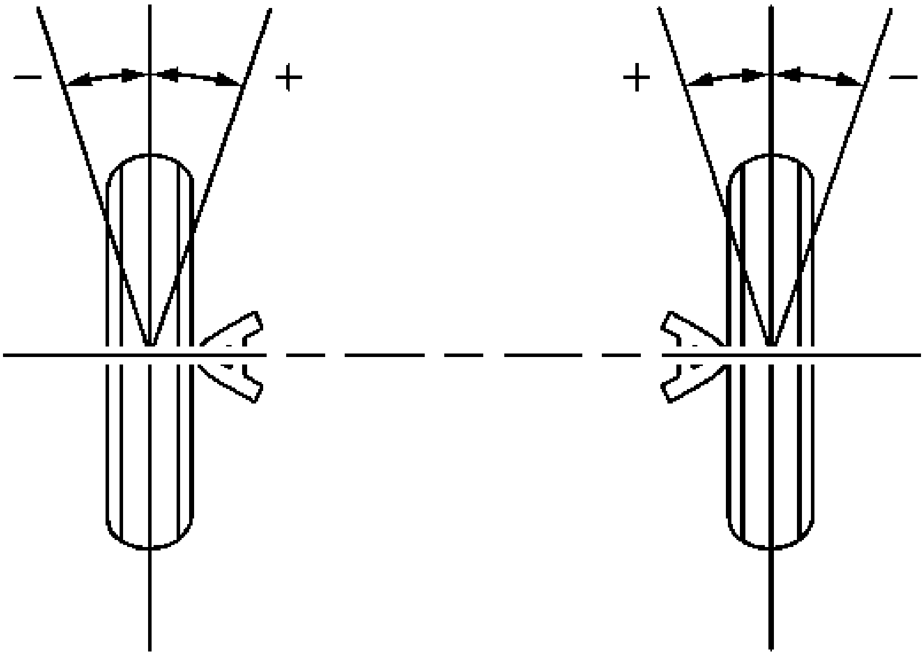

Fig. 5: Illustrating Toe Angle
Courtesy of GENERAL MOTORS COMPANY

Toe is a measurement of how much the front and/or rear wheels are turned in or out from a straight-ahead position. When the wheels are turned in, toe is positive (+). When the wheels are turned out, toe is negative (-). The actual amount of toe is normally only a fraction of a degree. The purpose of toe is to ensure that the wheels roll parallel.

Toe also offsets the small deflections of the wheel support system that occur when the vehicle is rolling forward. In other words, with the vehicle standing still and the wheels set with toe-in, the wheels tend to roll parallel on the road when the vehicle is moving.

Improper toe adjustment will cause premature tire wear and cause steering instability.

TORQUE STEER DESCRIPTION

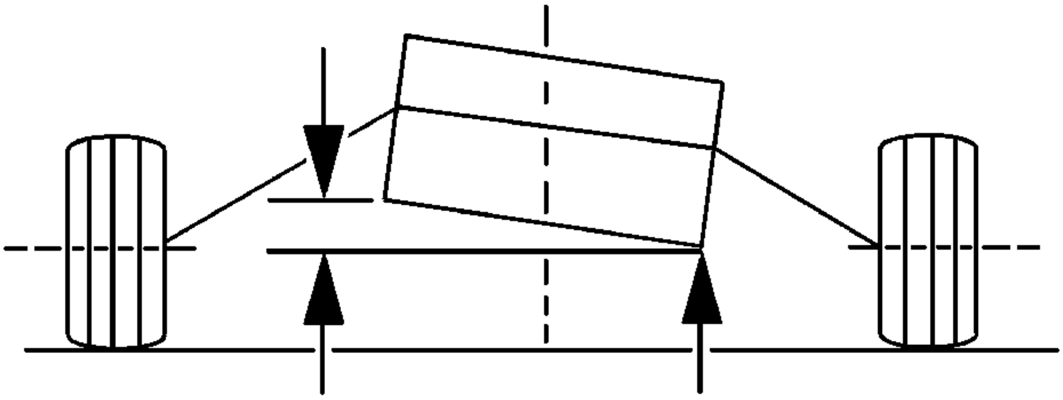

Fig. 6: Identifying Torque Steer
Courtesy of GENERAL MOTORS COMPANY

A vehicle pulls or leads in one direction during hard acceleration. A vehicle pulls or leads in the other direction during deceleration.

The following factors may cause torque steer to be more apparent on a particular vehicle:

- A slightly smaller diameter tire on the right front increases a right torque lead. Inspect the front tires for differences in the brand, the construction, or the size. If the tires appear to be similar, change the front tires from side-to-side and retest the vehicle. Tire and wheel assemblies have the most significant effect on torque steer correction.
- A large difference in the right and left front tire pressure
- Left-to-right differences in the front view axle angle may cause significant steering pull in a vehicle. The pull will be to the side with the most downward sloping axle from the differential to the wheels. Axles typically slope downward from the differential. The slope of the transaxle pan to level ground may be used as an indication of bias axle angles. The side with the higher

transaxle pan (shown on the left side of the illustration) has the most downward sloping axle angle.

WANDER DESCRIPTION

Wander is the undesired drifting or deviation of a vehicle to either side from a straight path with hand pressure on the steering wheel. Wander is a symptom of the vehicle's sensitivity to external disturbances, such as road crown and crosswind, and accentuated by poor on-center steering feel.

TRACTION CONTROL, 4WD, & AWD

Chevrolet - 1980-19

TRACTION CONTROL DISABLE

WARNING: **Placing a non-compatible vehicle on a single-axle dynamometer could result in a safety hazard to technicians and damage to vehicle. Vehicles which use All-Wheel Drive (AWD) or traction control may not be clearly marked. Use common sense and take all necessary precautions when placing any vehicle on the dynamometer. Determine between full-time 4WD and All-Wheel Drive (AWD) for testing purposes. The following tables include information related to full-time 4WD and AWD vehicles, and how to disable the traction control system (if disengageable).**

WARNING: **DO NOT operate vehicle on a 2-wheel dynamometer if the DO NOT TEST column is marked.**

Application	FWD	RWD	Part Time 4WD	Full Time 4WD	AWD	TCS	Do Not Test

(1) Press ASR button, located on console. ASR OFF indicator light will illuminate when system is disabled.

(2) ETS system will not operate when A/T selector is in 1 or 2 position. ETS indicator light will stay on when system is disabled.

(3) Traction control is disabled when transaxle is in 1st or 2nd gear only. TRAC OFF indicator light will illuminate when system is disabled.

(4) To turn the ETS off, shift to L (Low) or R (Reverse). The ETS indicator/warning light will come on and stay on and the TRACTION OFF message will be displayed when the gear shift is in L (Low).

(5) Press sliding car icon on the console. The TCS indicator will illuminate when system is disabled.

(6) Press TRAC OFF button on left side of dash. Chime will sound. SERVICE TRACTION SYSTEM indicator light will illuminate when system is disabled.

(7) Press TC button near A/C-heater controls or in front of the shift lever. Indicator light will illuminate when system is disabled.

(8) Press TRAC ON/OFF button on instrument panel or center console. TRACTION CONTROL indicator light will illuminate when system is disabled.

(9) Press and hold the TCS/StabiliTrak button until the Traction Control Off light and the StabiliTrak Off light come on in the instrument panel cluster. The TCS/StabiliTrak button is located near the shift lever.

(10) The TCS Switch allows the driver to shut off the TCS and Active Handling (RPO JL4 - if equipped), by pressing and releasing the switch. If the vehicle is equipped with Active Handling, the TCS switch can be pressed and held for 5 seconds; this places the system in Competitive driving mode. Competitive driving mode turns the TCS off but still allows Active Handling to be active. The switch is located in the center console.

(11) If the Tire Pressure Monitor (TPM) system detects a flat tire and the Driver Information Center (DIC) displays TIRE FLAT, or if the TPM system is malfunctioning and the DIC displays SERVICE TIRE MONITOR, the Active Handling System cannot be turned off by the driver. If the Active Handling System is off, it will be turned back on automatically.

(12) The ESC/TCS button is located on the instrument panel or on console. Press and hold the ESC/TCS button briefly to disable both traction control and ESC. TRACTION OFF and ESC OFF messages will appear, and the ESC/TCS light will be on solid.

(13) Traction Control system turns on automatically whenever the vehicle is on and cannot be turned off.

(14) Press and hold the TCS/StabiliTrak button until the Traction Control Off light and the StabiliTrak Off light come on in the instrument panel cluster. The TCS/StabiliTrak button is located on the overhead console or to the left of the steering wheel.

(15) Press and hold the TCS/StabiliTrak button until the Traction Control Off light and the StabiliTrak Off light come on in the instrument panel cluster. The TCS/StabiliTrak button is located on the center console.

Application	FWD	RWD	Part Time 4WD	Full Time 4WD	AWD	TCS	Do Not Test

(1) All wheel drive is optional.

(2) Press switch with sliding car icon, located left of steering wheel on instrument panel. TRACTION OFF will illuminate when system is disabled.

(3) Traction Assist (TAS) or Traction Control (TCS) can be turned off by pressing TAS or TCS button on instrument panel. TCS light on instrument panel will illuminate.

(4) 4WD With Shift Lever Selector: Shift transfer case to 2WD or 2H mode. 4WD With A/T or M/T Push Button Shift Selector: Press button on instrument panel to select 2HI position. Switch indicator light will flash until new position is active. Indicator light will stay on.

(5) Information from manufacturer is not available.

(6) Press TRACTION ASSIST switch located on dashboard, left of steering wheel. TRACTION OFF indicator light will illuminate when system is disabled.

(7) To turn off both TCS and StabiliTrak, press and hold the TRACTION OFF button until the traction off light and the StabiliTrak OFF light come on and stay on in the instrument cluster.

(8) Press and hold the traction control switch located on instrument panel or center console. When the TCS is turned off, the StabiliTrak light goes on, and an appropriate traction control off message will be displayed on the DIC.

(9) Press the TRACTION OFF button (located on the instrument panel or center console) for more than five seconds to turn off StabiliTrak and TCS. The StabiliTrak light comes on the instrument panel cluster when the system is turned off.

(10) Press the TRACTION OFF button (located on the instrument panel) once to turn off the Traction Control System (TCS). Press and hold the StabiliTrak button for more than five seconds to turn off StabiliTrak and TCS. The StabiliTrak light comes on the instrument panel cluster when the system is turned off.

(11) Press TRACTION OFF button located on instrument panel. The appropriate message displays on Driver Information Center (DCI).

(12) The button for TCS and StabiliTrak is on the center stack. To turn off both TCS and StabiliTrak, press and hold the TRACTION OFF button until the Traction Off Light and StabiliTrak Off Light come on and stay on in the instrument cluster.

(13) TCS and StabiliTrak can be turned OFF or ON using the DIC controls on the steering wheel. On the DIC list of applications, go to Options > Traction & Stability. TCS and StabiliTrack are turned off separately.

(14) To turn off TCS and Electronic Stability Control, press and release the TRACTION OFF button. The Electronic Stability Control (ESC) Off Light comes on and stays on in the instrument cluster. The TRACTION OFF button is on the instrument panel, to the left of the steering wheel.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC C1217, C1301, OR C1302: TRANSMISSION RANGE STATUS/ONE PEDAL DRIVING PARK BRAKE AUTONOMOUS APPLY REQUEST/ONE PEDAL DRIVING SHIFT TO PARK REQUEST - MESSAGE COUNTER(S) INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC C1217

Transmission Range Status Message Counter Incorrect

DTC C1301

One Pedal Driving Park Brake Autonomous Apply Request Message Counter Incorrect

DTC C1302

One Pedal Driving Shift To Park Request Message Counter Incorrect

Circuit/System Description

The Multi-Axis Acceleration sensor sends the amount or rate of acceleration to the Electronic Brake Control Module (EBCM). To improve vehicle performance, the EBCM is constantly sending the K114B Hybrid/EV Powertrain Control Module 2 serial data messages with information regarding the rate of vehicle acceleration. The K114B Hybrid/EV Powertrain Control Module sets this DTC when it detects a discrepancy in the structure of the message, causing the signal message integrity to be questioned.

Conditions for Running the DTC

The system voltage is greater than 10.2 V.

Conditions for Setting the DTC

C1217

The K114B Hybrid/EV Powertrain Control Module detects 74 errors out of 101 samples in the rolling count value sent by the EBCM for 2.5 s.

OR

The K114B Hybrid/EV Powertrain Control Module detects calculated protection value signal does not match the calculated protection value signal sent by the EBCM for 2.5 s.

C1301

The K114B Hybrid/EV Powertrain Control Module detects 60 errors out of 80 samples in the calculated one pedal driving park brake autonomous apply request signal active rolling count value sent by the EBCM for 2 s.

OR

The K114B Hybrid/EV Powertrain Control Module detects calculated one pedal driving park brake protection value signal that does not match the calculated one pedal driving park brake protection value signal sent by the EBCM for 2 s.

C1302

The K114B Hybrid/EV Powertrain Control Module detects 60 errors out of 80 samples in the calculated one pedal driving shift to park requested signal active rolling count value sent by the EBCM for 2 s.

OR

The K114B Hybrid/EV Powertrain Control Module detects calculated one pedal driving shift to park requested protection value signal does not match the one pedal driving shift to park requested protection value signal sent by the EBCM for 2 s.

Action Taken When the DTC Sets

C1217, C1301, and C1302 are Type A DTCs.

C1217

DC fast charging is disabled.

C1301 and C1302

One Pedal Driving function is disabled.

Conditions for Clearing the DTC

C1217, C1301, and C1302 are Type A DTCs.

Circuit/System Verification

NOTE:

- **C1217, C1301, and C1302 are informational DTCs.**
- **Diagnose all other T6 Power Inverter Module and K17 Electronic Brake Control Module DTCs prior to DTC P175F.**

1. Verify there are no other T6 Power Inverter Module or K17 Electronic Brake Control Module DTCs set.
   - **If a DTC is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If a DTC is not set**
2. Complete the diagnosis by looking for a serial data fault. Refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device** .
   - **If a serial data circuit fault is found**

     Repair as necessary.

   - **If a serial data circuit fault is not found**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P0711-P0713: TRANSMISSION FLUID TEMPERATURE SENSOR

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

Transmission Fluid Temperature Sensor Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Transmission Fluid Temperature Sensor Signal	P0712	P0713	P0713	P0711
Low Reference	-	P0713	-	P0711

Typical Scan Tool Data

Transmission Fluid Temperature

Circuit	Short to Ground	Open/High Resistance	Short to Voltage
Operating Conditions: Engine running in Park, normal operating temperature **Parameter Normal Range:** -39 to +160Â°C (-38 to +320Â°F)			
Transmission Fluid Temperature Sensor Signal	Greater than 160Â°C (320Â°F)	Less than -39Â°C (-38Â°F)	Less than -39Â°C (-38Â°F)*
Low Reference	-	Less than -39Â°C (-38Â°F)	Less than -39Â°C (-38Â°F)*
* Internal Transmission Fluid Temperature Sensor damage may result if shorted to B+			

Circuit/System Description

The primary source of heat in the transmission is the drive motor generator. The drive motor generator is cooled by the transmission fluid. Hot fluid exits the drive motor generator and flows to the transmission cooler supply line. The supply line connects to the transmission cooler, which is internal to the radiator. The transmission fluid cooler pipe assembly is equipped with an internal thermostat that opens at 80Â°C (176Â°F) for optimum transmission operation and efficiency. The transmission cooler pipe thermostat is part of the transmission fluid cooler pipe assembly, located near the transmission and is not serviced separately. From the cooler, the fluid returns through the transmission fluid cooler pipe assembly and enters the lubrication circuits. The transmission fluid temperature sensor is part of the transmission control wire harness.

Conditions for Running the DTC

The system voltage is greater than or equal to 9 V.

P0711

- Cold soak average temperature is greater than or equal to -40Â°C (-40Â°F).
- DTC P0712 or P0713 is not set.
- Vehicle Off time is greater than 43,200 s.
- HV battery charging off time is greater than 25,200 s.
- HV battery thermal conditioning off time is greater than 25,200 s.
- Transmission Fluid Temperature is -40 to +80Â°C (-40 to +176Â°F).
- Vehicle is On for greater than or equal to 4.5 s.

P0712 and P0713

Vehicle is On.

Conditions for Setting the DTC

P0711

The difference between the Transmission Fluid Temperature and the cold soak average temperature is greater than 20Â°C (68Â°F) for 0.1 s:

- Drive Motor Inverter Temperature
- Auxiliary Transmission Fluid Pump Inverter Temperature
- Hybrid/EV electronics coolant temperature

P0712

The Transmission Fluid Temperature parameter is greater than 149Â°C (300.2Â°F) for greater than 2 s.

P0713

The Transmission Fluid Temperature parameter is less than or equal to -40Â°C (-40Â°F) for greater than 2 s.

Action Taken When the DTC Sets

- DTCs P0711, P0712 and P0713 are Type A DTCs.
- The auxiliary transmission fluid pump is commanded to maximum speed.
- Reduced propulsion is commanded.

Conditions for Clearing the DTC

DTCs P0711, P0712 and P0713 are Type A DTCs.

Diagnostic Aids

While driving, the Transmission Fluid Temperature parameter on the scan tool should rise steadily to a normal operating temperature, and then stabilize.

Special Tools

DT-44152 Jumper Harness

For equivalent regional tools, refer to **Special Tools**.

Circuit/System Verification

1. Vehicle ON.
2. Verify the scan tool Transmission Fluid Temperature Sensor parameter is between -39 to +120Â°C (-38 to +248Â°F) and changes with vehicle drive time.
   - **If not between -39 to +120Â°C (-38 to +248Â°F) or does not change**

     Refer to Circuit/System Testing.

   - **If between -39 to +120Â°C (-38 to +248Â°F) and changes**
3. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
4. Verify the DTC does not set.

- **If the DTC sets**

  Refer to Circuit/System Testing.

- **If the DTC does not set**

5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the X2 harness connector at the T12 Automatic Transmission Assembly. It may take up to 2 minutes for all vehicle systems to power down.
2. Connect **DT-44152** jumper harness to the vehicle harness.
3. Test for less than 5 Ω between the Transmission Fluid Temperature Sensor low reference circuit terminal 3 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF, disconnect the harness connector at the T6 Power Inverter Module.
    2. Test for less than 2 Ω in the Transmission Fluid Temperature Sensor low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the T6 Power Inverter Module.
    - **If less than 5 Ω**
4. Vehicle ON.
5. Verify the scan tool Transmission Fluid Temperature Sensor parameter is colder than -39Â°C (-38Â°F).
    - **If warmer than -39Â°C (-38Â°F)**
    1. Vehicle OFF, disconnect the harness connector at the T6 Power Inverter Module.
    2. Test for infinite resistance between the Transmission Fluid Temperature Sensor signal circuit terminal 2 and ground.
        - If less than infinite resistance, repair the short to ground on the Transmission Fluid Temperature Sensor signal circuit.
        - If infinite resistance, replace the T6 Power Inverter Module.
    - **If colder than -39Â°C (-38Â°F)**
6. Install a 3 A fused jumper wire between the Transmission Fluid Temperature Sensor signal circuit terminal 2 and the Transmission Fluid Temperature Sensor low reference circuit terminal 3.
7. Verify the scan tool Transmission Fluid Temperature sensor parameter is warmer than 149Â°C (300Â°F).
    - **If colder than the 149Â°C (300Â°F)**
    1. Vehicle OFF, disconnect the harness connector at the T6 Power Inverter Module, vehicle ON.
    2. Test for less than 1 V between the Transmission Fluid Temperature Sensor signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the Transmission Fluid Temperature Sensor signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the T6 Power Inverter Module.
    - **If warmer than 149Â°C (300Â°F)**
8. Test the Transmission Control Wiring Harness circuits 585 and 586 for a short to voltage, short to ground, an open/high resistance, or short together.
    - If not OK, replace the Transmission Control Wiring Harness.
    - If OK, test or replace the B13 Transmission Fluid Temperature Sensor.

Component Testing

Static Test

1. Vehicle OFF, disconnect the X2 transmission connector.

   NOTE: A thermometer can be used to test the sensor off vehicle.

2. Test the B13 Transmission Fluid Temperature Sensor by comparing the sensor temperature to a known temperature while monitoring the sensor resistance. Compare the readings with the Temperature Versus Resistance (Transmission Fluid Temperature Sensor) table and verify that the resistance is within the specification.
   - **If the transmission fluid temperature resistance does not match the specified value**
   1. Test the Transmission Control Wiring Harness circuits 585 and 586 for a short to voltage, short to ground, an open/high resistance, or short together.
      - If not OK, replace the Transmission Control Wiring Harness.
      - If OK, test or replace the B13 Transmission Fluid Temperature Sensor.
   - **If transmission fluid temperature resistance tests OK**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Automatic Transmission Control Wiring Harness Removal - Transmission Case for transmission control wiring harness or transmission fluid temperature sensor replacement.
- Refer to Control Module References for T6 Power Inverter Module replacement, programming, and setup.

DTC P152A OR P152D: REGENERATIVE BRAKING CONTROL SWITCH 1-2 CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC P152A

Regenerative Braking Control Switch 1 Circuit

DTC P152D

Regenerative Braking Control Switch 1 and 2 Circuit

Diagnostic Fault Information

Regenerative Braking On Demand

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Normal Range = Inactive/Active				
Tap Up/Tap Down Switch Signal 2 Circuit	P152D	Regenerative Braking On Demand Malfunction	Regenerative Braking On Demand Malfunction	P152A, P152C

Circuit/System Description

Regenerative Braking On Demand enables drivers to actively re-capture energy when slowing down, such as when approaching slower traffic or setting up for a tight turn. To engage Regenerative Braking On Demand, the driver releases the accelerator pedal and pulls back on the left steering-wheel paddle to begin regenerating electricity. When engaged, Regenerative Braking On Demand provides vehicle deceleration that is more than what a typical vehicle experiences while coasting or when the transmission shifter is in the L position, providing control and dynamic performance characteristics similar to downshifting in a manual-transmission vehicle. The feature does not bring the vehicle to a complete stop. Releasing the paddle cancels the Regeneration on Demand request, allowing the vehicle to coast normally. The driver can engage and disengage Regeneration on Demand as desired and as traffic conditions allow. When Regenerative Braking On Demand is requested, a signal is sent to the Body Control Module and then to the hybrid/EV powertrain control module 1 via serial data. The Regenerative Braking On Demand parameter is displayed as Inactive and Active on the scan tool. The Regenerative Braking On Demand parameter states are listed below:

- Inactive - when the S151 automatic transmission manual shift switch-left switch is not pressed
- Active - when the S151 automatic transmission manual shift switch-left is pressed

Conditions for Running the DTC

Propulsion system is active.

DTC P152A

DTC P152D is not set.

Conditions for Setting the DTC

P152A

The hybrid/EV powertrain control module 1 detects the Regenerative Braking On Demand is active for greater than 600 s.

P152D

The hybrid/EV powertrain control module 1 detects an invalid voltage regenerative braking on demand switch - left circuit for 60 s.

Action Taken When the DTC Sets

- DTC P152A and P152D are Type C DTCs.
- The hybrid/EV powertrain control module 1 disables regenerative braking on demand.

Conditions for Clearing the DTC

DTC P152A and P152D are Type C DTCs.

Diagnostic Aids

DTC P152A can be customer induced by holding regenerative braking control switch in the regeneration on demand position while driving for greater than 600 s. Verify the customer is not pressing the switch for greater than 600 s.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON, verify with a scan tool the following hybrid/EV powertrain control module 1 parameter displays the correct values the S151 automatic transmission manual shift switch-left state:
    - Regenerative Braking On Demand displays Inactive when not pressed.
    - Regenerative Braking On Demand displays Active when pressed.
    - **If the hybrid/EV powertrain control module 1 parameter is incorrect**

      Refer to Circuit/System Testing.

    - **If the hybrid/EV powertrain control module 1 Regenerative Braking On Demand parameter is correct**
2. After performing the above step, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure, then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S151 automatic transmission manual shift switch-left. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify the scan tool Regenerative Braking On Demand parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K9 BCM X3 connector.
    2. Test for infinite resistance between the signal circuit terminal X3 21 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 BCM.
    - **If Active**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
6. Verify the scan tool Regenerative Braking On Demand parameter is Active.

  - **If not Inactive**
    1. Vehicle OFF, remove the jumper wire, disconnect the X3 harness connector at the K9 BCM, vehicle ON.
    2. Test for less than 1 V between the signal circuit terminal 21 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 BCM.
  - **If Active**

7. Test or replace the S151 automatic transmission manual shift switch-left.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- Refer to **Steering Wheel Replacement** for S151 automatic transmission manual shift switch-left replacement.
- Refer to **Control Module References** for K9 BCM replacement, programming, and setup.

DTC P152C: REGENERATIVE BRAKING CONTROL SWITCH SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P152C

Regenerative Braking Control Switch Signal Message Counter Incorrect

Circuit/System Description

Hybrid Low Mode enables drivers to actively re-capture energy when slowing down, such as when approaching slower traffic or setting up for a tight turn. To engage hybrid low mode the shift lever is placed in low (L), the driver shift request, also known as the tap shift function, is activated. The driver shift request allows the vehicle operator to switch from L2 to L1 pressing the minus (-) button and back to L2 by pressing the plus (+) button. The body control module (BCM) supplies a signal circuit to the automatic transmission manual shift switch. The automatic transmission manual shift switch has switches connected to a resistor array. When the lever is in the L position, a voltage drop occurs across the resistor network. When the plus or minus button is pressed, a corresponding voltage drop occurs across the resistor network. This voltage drop is monitored by the BCM. The BCM will send the request to the hybrid/EV powertrain control module 1 to perform the transition from L2 to L1 or if already in L1 then back to L2. When the shifter is moved to the L position, the instrument cluster will display L2, the hybrid/EV powertrain control module 1 will command a higher level of regenerative braking than what is commanded in the D position. When the minus (-) button is pressed, the L1 mode is commanded by the hybrid/EV powertrain control module 1. When the plus (+) button is pressed when in L1 mode, the system will transition back to L2.

Conditions for Running the DTC

The propulsion system is active.

Conditions for Setting the DTC

The hybrid/EV powertrain control module 1 has detected a drive mode signal rolling count error for 10.0 s.

Action Taken When the DTC Sets

- DTC P152C is a Type C DTC.
- The hybrid/EV powertrain control module 1 disables regenerative braking on demand.

Conditions for Clearing the DTC

DTC P152C is a Type C DTC.

Diagnostic Aids

When attempting to set hybrid/EV powertrain control module serial data DTCs, run the vehicle in propulsion system active mode for at least 1 minute, and then shut the vehicle off for 30 seconds. Following this procedure will allow for a complete hybrid/EV powertrain control module shutdown.

Circuit/System Verification

1. Run the vehicle in propulsion system active mode for 1 minute, then vehicle OFF for 30 seconds.
2. Verify DTC P152C is not set.
   - **If the DTC is set**
   1. Program the K114A Hybrid Powertrain Control Module.
   2. Verify the DTC does not set.
      - If the DTC is set, replace the T6 Power Inverter Module.
      - If the DTC does not set
   3. All OK.
   - **If the DTC is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for T6 Power Inverter Module replacement, programming and setup.

DTC P152E: UNEXPECTED VEHICLE MOVEMENT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P152E

Unexpected Vehicle Movement

Circuit/System Description

The vehicle provides One-Pedal Driving modes that are selectable using the drive unit shifter or Regen on Demand. One-Pedal Driving modes allow for increased deceleration without use of the brake and will bring the vehicle to a complete stop in many cases. The brake pedal should still be used to hold the vehicle at a stop, even when it may not seem necessary. The brake pedal may be required to bring the vehicle to a stop on sloped surfaces.

Regen on Demand enables One-Pedal Driving by pressing and holding the steering wheel paddle in either D (Drive) or L (Low). The accelerator pedal must be less than halfway engaged for Regen on Demand to work. In addition to this, the Low gear also enables One-Pedal Driving, and used together with Regen on Demand will provide an even higher level of deceleration. When any of these One-Pedal Driving modes are enabled, the brake lights may illuminate during increased deceleration.

The deceleration provided by the One-Pedal Driving modes in Low and in Regen on Demand provide 100% regenerative braking and help to increase energy efficiency.

In One-Pedal Driving modes, the accelerator pedal can be used to control the deceleration rate of the car all the way to a stop. Completely lifting off of the accelerator pedal will result in an aggressive deceleration. However, by slowly lifting off of the accelerator pedal and making adjustments lightly on the accelerator pedal, the deceleration of the vehicle can be adjusted as desired.

If the vehicle begins to move after coming to a complete stop, the Electric Parking Brake may apply to prevent undesired movement. Applying the accelerator pedal will automatically release the Electric Parking Brake as the car moves forward.

Conditions for Running the DTC

- One-Pedal Driving feature is active.
- Holding torque is greater than 90 for 3 s.
- Drive Motor torque is greater than 5.
- Holding torque and vehicle speed are in the same direction and output torque difference is greater than 40.

Conditions for Setting the DTC

The Hybrid/EV Powertrain Control Module 1 detects a 0.08 g torque acceleration greater than the requested torque for 0.1875 s.

Action Taken When the DTC Sets

- P152E is a Type A DTC.
- The Hybrid/EV Powertrain Control Module 1 requests the hybrid/EV powertrain control module 2 to open the high voltage contactor relays.

Conditions for Clearing the DTC

P152E is a Type A DTC.

Diagnostic Aids

This DTC may set if the vehicle is in One-Pedal Driving mode and is bumped or pushed while at a stop.

DTC P175F: ACCELERATION SENSOR SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P175F

Acceleration Sensor Signal Message Counter Incorrect

Circuit/System Description

The Multi-Axis Acceleration sensor sends the amount or rate of acceleration to the Electronic Brake Control Module (EBCM). To improve vehicle performance and transmission shift feel, the EBCM is constantly sending the Hybrid/EV Powertrain Control Module 1 serial data messages with information regarding the rate of vehicle acceleration. The Hybrid/EV Powertrain Control Module 1 sets this DTC when it detects a discrepancy in the structure of the message, causing the signal message integrity to be questioned.

Conditions for Running the DTC

- Battery voltage is between 10-11 V.
- Run/Crank voltage is greater than or equal to 11 V.
- No other serial data errors are present.

Conditions for Setting the DTC

The Hybrid/EV Powertrain Control Module 1 detects an error in the rolling count value that does not match with the rolling count value sent by the EBCM.

Action Taken When the DTC Sets

- P175F is a Type C DTC.
- The estimated drive motor temperature will rise and possible de-rate drive motor torque.

Conditions for Clearing the DTC

P175F is a Type C DTC.

- **Diagnose all other T6 Power Inverter Module and K17 Electronic Brake Control Module DTCs prior to DTC P175F.**

1. Verify there are no other T6 Power Inverter Module or K17 Electronic Brake Control Module DTCs set.
    - **If a DTC is set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If a DTC is not set**
2. Complete the diagnosis by looking for a serial data fault. Refer to Scan Tool Does Not Communicate with Low Speed GMLAN Device .
    - **If a serial data circuit fault is found**

      Repair as necessary.

    - **If a serial data circuit fault is not found**
3. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC P1762: TRANSMISSION MODE SWITCH SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1762

Transmission Mode Switch Signal Message Counter Incorrect

Circuit/System Description

The ECM monitors the state of the drive mode switch signal message from the body control module (BCM), over the serial data circuits. The ECM uses this message to determine the following driver selected mode of operation:

- Normal
- Sport

Conditions for Running the DTC

The propulsion system is active.

Conditions for Setting the DTC

The ECM has detected a drive mode signal rolling count error for 10 s.

Action Taken When the DTC Sets

- DTC P1762 is a Type C DTC.
- Driver cannot transition to Sport mode.

Conditions for Clearing the DTC

DTC P1762 is a Type C DTC.

Diagnostic Aids

When attempting to set ECM serial data DTCs, run the vehicle in propulsion system active mode for at least 1 minute, and then shut the vehicle off for 30 seconds. Following this procedure will allow for a complete ECM shutdown.

DTC P1775: TRANSMISSION RANGE REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P1775

Transmission Range Request Signal Message Counter Incorrect

Circuit/System Description

The Hybrid/EV Powertrain Control Module 1 monitors the serial data messages from the K173 Transmission Range Control Module with information regarding the transmission range state. The Hybrid/EV Powertrain Control Module 1 sets this DTC when it detects a count error of the message.

Conditions for Running the DTC

- Vehicle is On for greater than 3 s.
- Run/Crank voltage is greater than 11 V.

Conditions for Setting the DTC

The Hybrid/EV Powertrain Control Module 1 detects an error in the alive rolling count value that does not match with the alive rolling count value sent by the K173 Transmission Range Control Module.

Action Taken When the DTC Sets

- P1775 is a Type B DTC.
- The Hybrid/EV Powertrain Control Module 1 inhibits the K173 Transmission Range Control Module from shifting to Low (L).

Conditions for Clearing the DTC

P1775 is a Type B DTC.

Internal Mode Switch S	1.62 V - 2.49 V	Less than 0.66 V	Greater than 2.49 V	Greater than 2.49 V
Valid High = Switch open = 1.62 V - 2.49 V Valid Low = Switch Closed = 0.66 V - 1.02 V				

Transmission Internal Mode Switch Logic

Gear Selector Position	Signal A	Signal B	Signal C	Signal P	Signal S
Park (P)	High	Low	High	Low	High
Reverse (R)	Low	High	Low	Low	High
Neutral (N)	High	High	Low	High	Low
Drive (D)	High	Low	High	High	Low
Low (L)	Low	Low	High	High	Low

Circuit/System Description

The transmission internal mode switch, often referred to as the automatic transmission manual shift shaft position switch, is a hall-effect switch attached to the transmission case within the transmission. The 5 outputs from the switch indicate which position is selected by the transmission manual shaft. Five outputs (A, B, C, P, S) are range selection inputs to the hybrid/EV powertrain control module 1. The input voltage at the modules is high when the switch is open and low when the switch is closed to ground. The state of each input is displayed on the scan tool as Internal Mode Switch A/B/C/P/S. The Internal Mode Switch Range input parameters represented are transmission range signal A, signal B, signal C, and signal P signal S. The hybrid/EV powertrain control module 1 is internal to the power inverter module, often referred to as the drive motor generator power inverter module, and is not serviced separately.

Conditions for Running the DTC

P1824, P182A-P182F, P1838-P1841, P18B5-P18BA, P18BC, P18C0, P18C2, or P18C3

- Ignition voltage is greater than or equal to 9 V.
- Run/Crank voltage is greater than 5 V.

P18BF

- Ignition voltage is greater than or equal to 9 V.
- Run/Crank voltage is greater than 5 V.
- Shift lever is in Park.

  And

- Internal Mode Switch signal A is not High for 1.5 s.

P18C0

- Ignition voltage is greater than or equal to 9 V.
- Run/Crank voltage is greater than 5 V.
- Shift lever is in Drive.

  And

- Internal Mode Switch signal B is not High for 1.5 s.

P18C3

- Ignition voltage is greater than or equal to 9 V.
- Run/Crank voltage is greater than 5 V.
- Shift lever is in Park.

  And

- Internal Mode Switch signal S is not High for 1.5 s.

Conditions for Setting the DTC

P1824

Internal Mode Switch P circuit voltage is greater than 2.49 V for 1.75 s in a 2 s window.

P182A

Internal Mode Switch A circuit voltage is less than or equal to 0.66 V for 1.75 s in a 2 s window.

P182B

Internal Mode Switch B circuit voltage is less than or equal to 0.66 V for 1.75 s in a 2 s window.

P182C

Internal Mode Switch B circuit voltage is greater than 2.49 V for 1.75 s in a 2 s window.

P182D

Internal Mode Switch P circuit voltage is less than or equal to 0.66 V for 1.75 s in a 2 s window.

P182E

The Hybrid/EV Powertrain Control Module 1 has detected an invalid Internal Mode Switch range for 2.7 s in a 3.13 s window.

P182F

Internal Mode Switch C circuit voltage is greater than 2.49 V for 1.75 s in a 2 s window.

P1838

Internal Mode Switch A circuit voltage is greater than 2.49 V for 1.75 s in a 2 s window.

P1839

Internal Mode Switch C circuit voltage is less than or equal to 0.66 V for 1.75 s in a 2 s window.

P1840

Internal Mode Switch S circuit voltage is less than or equal to 0.66 V for 1.75 s in a 2 s window.

P1841

Internal Mode Switch S circuit voltage is greater than 2.49 V for 1.75 s in a 2 s window.

P18B5

Internal Mode Switch A circuit voltage is 1.01 - 1.62 V for 1.75 s in a 2 s window.

P18B6

Internal Mode Switch B circuit voltage is 1.01 - 1.62 V for 1.75 s in a 2 s window.

P18B7

Internal Mode Switch C circuit voltage is 1.01 - 1.62 V for 1.75 s in a 2 s window.

P18B8

Internal Mode Switch P circuit voltage is 1.01 - 1.62 V for 1.75 s in a 2 s window.

P18B9

Internal Mode Switch S circuit voltage is 1.01 - 1.62 V for 1.75 s in a 2 s window.

P18BA

Internal Mode Switch A circuit is Low when it is expected to be High for 2.7 s in a 3.13 s window.

P18BC

Internal Mode Switch C circuit is Low when it is expected to be High for 2.7 s in a 3.13 s window.

P18BF

Internal Mode Switch A circuit is High when it is expected to be Low for 2.7 s in a 3.13 s window.

P18C0

Internal Mode Switch B circuit is High when it is expected to be Low for 2.7 s in a 3.13 s window.

P18C2

Internal Mode Switch P circuit is High when it is expected to be Low for 2.7 s in a 3.13 s window.

P18C3

Internal Mode Switch S circuit is High when it is expected to be Low for 2.7 s in a 3.13 s window.

Action Taken When the DTC Sets

DTCs P1824, P182A-P182D, P182F, P1838-P1841, P18B5-P18BA, P18BC, P18BF, P18C0, P18C2, or P18C3

- DTCs P1824, P182A-P182D, P182F, P1838-P1841, P18B5-P18BA, P18BC, P18BF, P18C0, P18C2, or P18C3 are Type B DTCs.
- No creep or coast torque from the drive motor. The BCM will keep the vehicle awake due to an invalid transmission range signal.

DTC P182E

- DTC P182E is a Type A DTC
- No creep or coast torque from the drive motor but pedal torque is still available.

Conditions for Clearing the DTC

- DTC P182E is a Type A DTC.
- DTCs P1824, P182A-P182D, P182F, P1838-P1841, P18B5-P18B9, P18BA, P18BC, P18BF, P18C0, P18C2, and P18C3 are Type B DTCs.

Diagnostic Aids

The transmission Internal Mode Switch connects electrically to the hybrid/EV powertrain control 1. Inspect the transmission internal mode switch, harness, connector, and hybrid/EV powertrain control module 1 pins for metallic debris. Use a terminal test kit for any test that requires probing the control solenoid assembly harness connector or a component harness connector. The transmission internal mode switch can be damaged by currents exceeding 2 mA. Test the transmission internal mode switch for an open condition whenever a short to voltage condition is observed.

Control Module References for scan tool information.

Circuit/System Verification

1. Vehicle ON, observe the scan tool Internal Mode Switch A/B/C/P/S parameter while moving the gear shift lever from Park, through all gear selector positions, and back to Park. The parameter should match each gear range that is selected. Refer to **Transmission Internal Mode Switch Logic**.

2. Verify all the Internal Mode Switch Status parameters display Valid while moving the gear shift lever from Park, through all gear selector positions, and back to Park.
    - **If any of the parameters display Invalid**

      Refer to Circuit/System Testing.

    - **If all the parameters display valid**
3. Verify all the Internal Mode Switch parameters display 1.62 V - 2.49 V when High and 0.66 V - 1.02 V when Low.
    - **If any of the parameters display outside of the specified range**

      Refer to Circuit/System Testing.

    - **If all the parameters display within the specified range**
4. Operate the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data.
5. Verify **DTC P1824, P182A-P182F, P1838-P1841, P18B5-P18B9, P18BA, P18BC, P18BF, P18C0, P18C2, or P18C3** is not set.
    - **If any of the DTCs are set**

      Refer to Circuit/System Testing.

    - **If none of the DTCs are set**
6. All OK

Circuit/System Testing

NOTE: **You must perform the Circuit/System Verification before proceeding with Circuit/System Testing.**

1. Vehicle OFF.
2. Disconnect the transmission X1 connector.
3. Vehicle in Service Mode.
4. Test for 8.3 V to 9.4 V between both 9 V reference circuits X1 terminal 4, X1 terminal 10 and ground.
    - **If not within the specified range**

      Test the reference circuits for an open/high resistance or short to ground end to end.

    - If 2 Ω or greater, replace the A/Trans Wiring Extension Harness Assembly.
    - If 2 Ω or less, replace the T6 Power Inverter Module.
    - **If within the specified range**
5. Vehicle ON.
6. Install a 3 A fused jumper wire between each signal circuit listed below and the 9 V reference circuit:
    - Switch Signal A: X1 terminal 5 and X1 terminal 4
    - Switch Signal B: X1 terminal 8 and X1 terminal 10
    - Switch Signal C: X1 terminal 6 and X1 terminal 4
    - Switch Signal P: X1 terminal 9 and X1 terminal 10
    - Switch Signal S: X1 terminal 7 and X1 terminal 10
7. Verify each scan tool Internal Mode Switch A/B/C/P/S voltage parameter displays 4.88 - 5.12 V when jumped.
    - **If any parameter does not display 4.88 - 5.12 V when jumped**

      Test the signal circuit for an open/short to voltage or short together.

    - If an open/short to voltage or short together is not found, replace the T6 Power Inverter Module.
    - **If each signal circuit parameter displays 4.88 - 5.12 V when jumped**
8. Test the transmission control wiring harness for open/short to voltage, short to ground or short together.
    - If a circuit concern is found, replace the transmission control wiring harness, do not repair.
    - If the transmission control wiring harness tests OK, replace the B15 Transmission Internal Mode Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Automatic Transmission Control Wiring Harness Removal - Transmission Case** for Transmission Control Wiring Harness replacement.
- Refer to **Manual Shift Shaft Position Switch Removal** for B15 Transmission Internal Mode Switch, often referred to as the Automatic Transmission Manual Shift Detent Lever with Shaft Position Switch Assembly, replacement.
- Refer to **Control Module References** for T6 Power Inverter Module, often referred to as the Drive Motor Generator Power Inverter Module, replacement, programming and setup.

DTC P215B: VEHICLE SPEED - OUTPUT SHAFT SPEED NOT PLAUSIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P215B

Vehicle Speed - Output Shaft Speed Not Plausible

Circuit/System Description

The ECM determines vehicle speed based on drive motor speed. This signal is interpreted by the hybrid/EV powertrain control module 1, for speed and direction and is transmitted through the serial data circuits to the ECM module. The ECM and hybrid/EV powertrain control module 1 compare the output speed signal with the anti-lock brake system (ABS) wheel speed sensor signal from the electronic brake control module.

Conditions for Running the DTC

- Serial data communication is active for greater than 1 s.
- The vehicle is not in Park or neutral.

Conditions for Setting the DTC

The ECM OSS signal and the ABS wheel speed sensor signals differ by greater than 20 km/h (12 mph) for 0.125 s in a 0.2 s window.

Action Taken When the DTC Sets

PROPULSION POWER REDUCED message is displayed on the driver information center.

Conditions for Clearing the DTC

P215B is a Type A DTC.

Diagnostic Aids

The propulsion system is very sensitive to the vehicle speed signal for overall operation. The following conditions listed below may cause this DTC to set:

- Transmission mechanical concern such as a broken differential or axle.
- Certain slippery road conditions resulting in erratic wheel spin.
- Certain vehicle spin out or loss of control conditions.

Reference Information

Schematic Reference

Automatic Transmission Controls Schematics

Connector End View Reference

COMPONENT CONNECTOR END VIEWS - INDEX

Electrical Information Reference

- **Circuit Testing**

- **Wiring Repairs**

DTC Type Reference

Powertrain Diagnostic Trouble Code (DTC) Type Definitions

Scan Tool Reference

Control Module References for scan tool information.

Circuit/System Verification

1. Verify DTC C1207-C1210, C1221-C1228, C1232-C1235, U0073, U0074, or U0129 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If the DTCs are not set**
2. Verify there are no transmission mechanical concerns such as a broke axle or differential.
    - **If a transmission mechanical concern exists**

      Refer to **Symptoms - Automatic Transmission**.

    - **If no mechanical concerns**

      Refer to Circuit/System Testing.

Circuit/System Testing

1. Program the control module which set the DTC with the latest software version and retest for DTCs.
    - **If the DTC resets**

      Replace the control module which set the DTC.

    - **If the DTC does not reset**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for K20 ECM or Drive Motor Generator Power Inverter Module, also called the T6 Power Inverter Module replacement, programming, and setup.

SYMPTOMS - AUTOMATIC TRANSMISSION

NOTE: **Use the symptom tables only if the following conditions are met:**

- **Refer to Diagnostic Starting Point - Vehicle .**
- **There are no DTCs set.**
- **The control modules can communicate via the serial data link.**
- **Review the system operation in order to familiarize yourself with the system functions. Refer to Transmission General Description, and Transmission Component and System Description.**

Visual/Physical Inspection

Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Fluid Diagnosis
  - **Transmission Fluid Level and Condition Check**
  - **Fluid Leak Diagnosis**
  - **Automatic Transmission Fluid Leaks**
- Noise and Vibration Diagnosis
  - **Whine/Growl Noise That Changes with Vehicle Speed**
  - **Noise in Drive or Reverse Gear**
  - **Vibration**
  - **Noise and Vibration Analysis**
- Range Performance Diagnosis
  - **No Park or Drive**
  - **No Drive in All Ranges**
  - **No Reverse**
- **No Drive in All Ranges**
- Symptom Not Found or No Symptom Detected
  - **Transmission Fluid Level and Condition Check**
  - **Drive Motor Power Inverter Module 3 Phase Cable Inspection**
  - **Road Test**
  - **Case Porosity Repair**

REGENERATIVE BRAKING ON DEMAND MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Regenerative Braking On Demand

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Normal Range = Inactive/Active				
Tap Up/Tap Down Switch Signal 2 Circuit	P152D	Regenerative Braking On Demand Malfunction	Regenerative Braking On Demand Malfunction	P152A, P152C

Circuit/System Description

Regenerative Braking On Demand enables drivers to actively re-capture energy when slowing down, such as when approaching slower traffic or setting up for a tight turn. To engage Regenerative Braking On Demand, the driver releases the accelerator pedal and pulls back on the left steering-wheel paddle to begin regenerating electricity. When engaged, Regenerative Braking On Demand provides vehicle deceleration that is more than what a typical vehicle experiences while coasting or when the transmission shifter is in the L position, providing control and dynamic performance characteristics similar to downshifting in a manual-transmission vehicle. The feature does not bring the vehicle to a complete stop. Releasing the paddle cancels the Regeneration on Demand request, allowing the vehicle to coast normally. The driver can engage and disengage Regeneration on Demand as desired and as traffic conditions allow. When Regenerative Braking On Demand is requested, a signal is sent to the Body Control Module and then to the hybrid/EV powertrain control module 1 via serial data. The Regenerative Braking On Demand parameter is displayed as Inactive and Active on the scan tool. The Regenerative Braking On Demand parameter states are listed below:

- Inactive - when the S151 automatic transmission manual shift switch-left is not pressed
- Active - when the S151 automatic transmission manual shift switch-left is pressed

Diagnostic Aids

The Regenerative Braking On Demand feature has a maximum of 60 kW charging power. Performance may be reduced when the high voltage battery is cold and/or the high voltage battery is fully charged. The following conditions listed below will reduce or inhibit Regenerative Braking On Demand performance:

- The high voltage battery is warmer than 20Â°C (68Â°F), and battery state of charge is greater than 80%.
- The high voltage battery is warmer than 10Â°C (50Â°F), and battery state of charge is greater than 75%.
- The high voltage battery is warmer than 0Â°C (32Â°F), and battery state of charge is greater than 60%.
- The high voltage battery is colder than -10Â°C (+14Â°F).
- If the battery state of charge is greater than 90%, Regenerative Braking On Demand is inhibited.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON, verify with a scan tool the following hybrid/EV powertrain control module 1 parameter displays the correct values the S151 automatic transmission manual shift switch-left state:
    - Regenerative Braking On Demand displays Inactive when not pressed.
    - Regenerative Braking On Demand displays Active when pressed.
    - **If the hybrid/EV powertrain control module 1 parameter is incorrect**

      Refer to Circuit/System Testing.

    - **If the hybrid/EV powertrain control module 1 Regenerative Braking On Demand parameter is correct**
2. After performing the above step, verify that the DTC does not reset by operating the vehicle within the Conditions for Running the DTC. You may also operate the vehicle within the conditions that you observed from the Freeze Frame/Failure Records data. If the vehicle passes the Circuit/System Verification procedure then STOP. Do not perform the Circuit/System Testing or Component Testing as this may result in an unnecessary part replacement. Refer to Testing for Intermittent Conditions and Poor Connections .

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S151 automatic transmission manual shift switch-left. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 1 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle ON.
4. Verify the scan tool Regenerative Braking On Demand parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the harness connector at the K9 BCM X3 connector.
    2. Test for infinite resistance between the signal circuit terminal X3 21 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 BCM.
    - **If Active**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 1.
6. Verify the scan tool Regenerative Braking On Demand parameter is Active.
    - **If not Inactive**
    1. Vehicle OFF, remove the jumper wire, disconnect the X3 harness connector at the K9 BCM, vehicle ON.
    2. Test for less than 1 V between the signal circuit terminal 21 and ground.

        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 BCM.
  - **If Active**

7. Test or replace the S151 automatic transmission manual shift switch-left.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- Refer to **Steering Wheel Replacement** for S151 automatic transmission manual shift switch-left replacement.
- Refer to **Control Module References** for K9 BCM replacement, programming, and setup.

TRANSMISSION FLUID LEVEL AND CONDITION CHECK

This procedure checks both the transmission fluid level, as well as the condition of the fluid itself. Since the transmission on this vehicle is not equipped with a fill tube and dipstick, a fill plug in the top of the transmission and level set plug is used to set the fluid level.

CAUTION: **The transmission fluid level must be checked when the transmission fluid temperature is at 15 - 35Â°C (59 - 95Â°F). If the transmission fluid temperature is not at this range, operate the vehicle or allow the fluid to cool as required. Setting the transmission fluid level with fluid temperature outside this range will result in either an under or over-filled transmission. Fluid temperature higher than 35Â°C will result in an under-filled condition. Fluid temperature lower than 15Â°C will result in an over-filled condition. An under-filled transmission will cause premature component damage. An over-filled transmission will cause fluid to discharge out the vent tube, fluid foaming, or pump cavitation.**

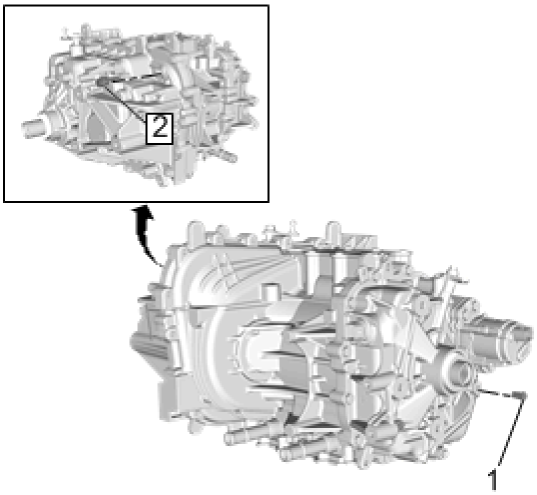

Fig. 11: Transmission Fluid Level Plug And Fill Plug
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The transmission fluid pump must not be running when the transmission fluid level plug is removed or excessive fluid loss will occur, resulting in an under-filled condition.**

NOTE: **Continue to monitor the Transmission Fluid Temperature. If the Transmission Fluid Temperature is not within the specified values,**

reinstall the transmission fluid level plug and repeat the previous steps.

1. Drive vehicle until transmission fluid temperature is 15 - 35Â°C (59 - 95Â°F).
2. Vehicle Off with the transmission in Park (P).
3. Raise the vehicle.
4. Remove Front Wheelhouse Liner. Refer to **Front Wheelhouse Liner Replacement**
5. Remove Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
6. Remove the transmission fluid level plug (1).
7. Verify fluid slowly drips from the transmission fluid level check hole.
   - If the fluid is flowing as a steady stream, wait until the fluid begins to drip. Go to step 9 procedure.
   - If no fluid comes out, remove the transmission fill plug (2) and add 0.5 L (0.52 qts) of fluid using a commercially available hand pump through the case fill hole until fluid drips out. Go to step 8 procedure.

CAUTION: **Refer to Fastener Caution .**

8. Install the NEW transmission fill plug (2) and tighten to 13 N.m (115 lb in).
9. Install the NEW transmission fluid level plug (1) and tighten to 12 N.m (106 lb in).
10. Vehicle in service mode with the transmission in Park (P).
11. Using the scan tool, command the transmission fluid pump speed to on for 1 minute for lubrication.
12. Vehicle Off.
13. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
14. Install Front Wheelhouse Liner. Refer to **Front Wheelhouse Liner Replacement**

Fluid Condition Inspection

- If the fluid has a burnt odor, inspect the fluid for excessive metal particles or other debris which may indicate transmission wear or damage. Refer to **Road Test** to verify transmission operation. Change the transmission fluid if a burnt odor is the only condition found.
- Fluid that is cloudy or milky or appears to be contaminated with water indicates engine coolant or water contamination. Change the transmission fluid.

ROAD TEST

NOTE: **The Road Test Procedure should be performed only as part of the Symptom Diagnosis. Refer to Symptoms - Automatic Transmission.**

The following test provides a method of evaluating the condition of the automatic transmission. The test is structured so that most driving conditions would be achieved. The test is divided into the following parts:

- Electrical Function Check
- Torque Control
- Part Throttle Torque Control
- Coasting

NOTE: **Complete the test in the sequence given. Incomplete testing cannot guarantee an accurate evaluation.**

Before the road test, ensure the following:

- Transmission fluid level is correct. Refer to **Transmission Fluid Level and Condition Check**.

- Tire pressure is correct.

During the road test:

- Perform the test only when traffic conditions permit.
- Operate the vehicle in a controlled, safe manner.
- Observe all traffic regulations.
- View the scan tool data while conducting this test.

  Take along qualified help in order to operate the vehicle safely.

- Observe any unusual sounds or smells.

After the road test, check the following:

- Inspect for proper transmission fluid level. Refer to **Transmission Fluid Level and Condition Check**.
- Inspect for any diagnostic trouble codes (DTCs) that may have set during the testing. Refer to the applicable DTC.
- Monitor the scan tool data for any abnormal readings or data.
- Inspect for fluid leaks. Refer to **Fluid Leak Diagnosis**.

Electrical Function Check

Perform this procedure first in order to ensure the electronic transmission components are functioning properly. If these components are not checked, a simple electrical condition could be misdiagnosed.

1. Connect the scan tool.
2. Ensure the gear selector is in PARK and set the parking brake.
3. Verify that the following scan tool data can be obtained and is functioning properly.

   Refer to **K20 Engine Control Module: Scan Tool Information** for typical data values. Data that is questionable may indicate a concern.

   - Driver Requested Axle Torque
   - Vehicle Speed
   - Output Shaft Direction
   - Brake Switch
   - IMS A/B/C/P
   - IMS
   - Trans. Fluid Temp.
4. Check the garage shifts.
   1. Apply the brake pedal and ensure the parking brake is set.
   2. Move the gear selector through the following ranges:
      1. PARK to REVERSE
      2. REVERSE to NEUTRAL
      3. NEUTRAL to DRIVE
   3. Pause 2 to 3 seconds in each gear position.

      NOTE: **These shifts can-not be felt when trans is functioning properly.**

   4. Verify the gear engagements are immediate and not harsh.
5. Monitor transmission range on the scan tool, trans data list.
   1. Apply the brake pedal and ensure the parking brake is set.
   2. Move the gear selector through all ranges.
   3. Pause 2 to 3 seconds in each range.

    4. Return gear selector to PARK.
    5. Verify that all selector positions match the scan tool display.
6. Check throttle position input.
    1. Apply the brake pedal and ensure the parking brake is set.
    2. Ensure the gear selector is in PARK.

If any of the above checks do not perform properly, record the result for reference after completion of the road test.

Manual Gear Range Selection

This range is used to slow the vehicle more when the driver's foot is lifted from the throttle.

Reverse

Perform the following test using a 10 - 15 percent throttle position.

1. With the vehicle stopped, move the gear selector to REVERSE.
2. Slowly accelerate the vehicle.
3. Verify that there is no noticeable slip, noise or vibration.

CASE POROSITY REPAIR

Some external leaks are caused by case porosity in non-pressurized areas. You can usually repair these leaks with the transmission in the vehicle.

1. Thoroughly clean the area to be repaired with a cleaning solvent. Air dry the area.

WARNING: **Epoxy adhesive may cause skin irritations and eye damage. Read and follow all information on the container label as provided by the manufacturer.**

2. Using instructions from the manufacturer, mix a sufficient amount of an epoxy to make the repair.
3. While the transmission case is still hot, apply the epoxy. You can use a clean, dry soldering acid brush to clean the area and also to apply the epoxy cement. Make certain that the area to be repaired is fully covered.
4. Allow the epoxy cement to cure for three hours before operating the vehicle.
5. Repeat the fluid leak diagnosis procedures.

AUTOMATIC TRANSMISSION FLUID LEAKS

Checks	Causes
Case Assembly	• Inspect for porosity or damage on the sealing surfaces • Inspect for damaged manual shift shaft seal • Inspect for damaged or worn axle seal or axle seal Slinger on the axle shafts • Inspect for loose fluid level plug
Case Cover assembly	• Inspect for porosity or damage on the sealing surface • Inspect for damaged case cover gasket • Inspect for loose case cover assembly bolts • Inspect for loose, damaged or leaking case cover assembly bore plugs

FLUID LEAK DIAGNOSIS

General Method

1. Verify that the leak is transmission fluid.

CAUTION: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushings.

2. Thoroughly clean the suspected leak area using a rag.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Park the vehicle over clean paper or cardboard.
5. Shut OFF the vehicle.
6. Look for fluid spots on the paper.
7. Make the necessary repairs.

Powder Method

CAUTION: Do not clean using brake cleaner or other reactive solvents as these solvents can damage rubber gaskets, seals and bushings.

1. Thoroughly clean the suspected leak area using a rag.
2. Apply an aerosol type leak tracing powder to the suspected leak area.
3. Operate the vehicle for 24 km (15 mi), or until normal operating temperatures are reached.
4. Shut OFF the vehicle.
5. Inspect the suspected leak area.
6. Trace the leak path through the powder in order to find the source of the leak.
7. Make the necessary repairs.

Dye and Black Light Method

A fluid dye and black light kit is available from various tool manufacturers.

1. Follow the manufacturer's instructions in order to determine the amount of dye to use.
2. Operate the vehicle for 24 km (15 mi) or until normal operating temperatures are reached.
3. Detect the leak with the black light.
4. Make the necessary repairs.

Find the Cause of the Leak

Pinpoint the leak and trace the leak back to the source. You must determine the cause of the leak in order to repair the leak properly. For example, if you replace a gasket, but the sealing flange is bent, the new gasket will not repair the leak. You must also repair the bent flange. Before you attempt to repair a leak, check for the following conditions, and make repairs as necessary:

Gaskets

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Improperly tightened fasteners
- Dirty or damaged threads
- Warped flanges or sealing surface
- Scratches, burrs, or other damage to the sealing surface
- Damaged or worn gasket
- Cracking or porosity of the component
- Improper sealant used, where applicable
- Incorrect gasket

Seals

- Fluid level/pressure is too high
- Plugged vent or drain-back holes
- Damaged seal bore
- Damaged or worn seal
- Improper installation
- Cracks in component
- Manual shaft or output shaft surface is scratched, nicked, or damaged
- Loose or worn bearing causing excess seal wear

Possible Points of Fluid Leaks

Transmission Case Side Cover

- Incorrectly tightened bolts
- Improperly installed or damaged gasket/seal
- Damaged mounting face
- Incorrect gasket seal

Case Leak

- Damaged manual shaft seal
- Worn or damaged axle shaft oil seal
- Loose line pressure pipe plug or fluid level pipe plug
- Porous casting

Leak at the Vent

- Overfilled system
- Water or coolant in the fluid; The fluid will appear milky
- Transmission case porous
- Plugged vent

DRIVE MOTOR POWER INVERTER MODULE 3 PHASE CABLE INSPECTION

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure will perform the following tasks:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Failure to follow the procedures exactly as written may result in serious injury or death.

NOTE: **This procedure is for inspection and repair of the 3 phase high voltage cable outer sheathing only.**

Visual/Physical Inspection

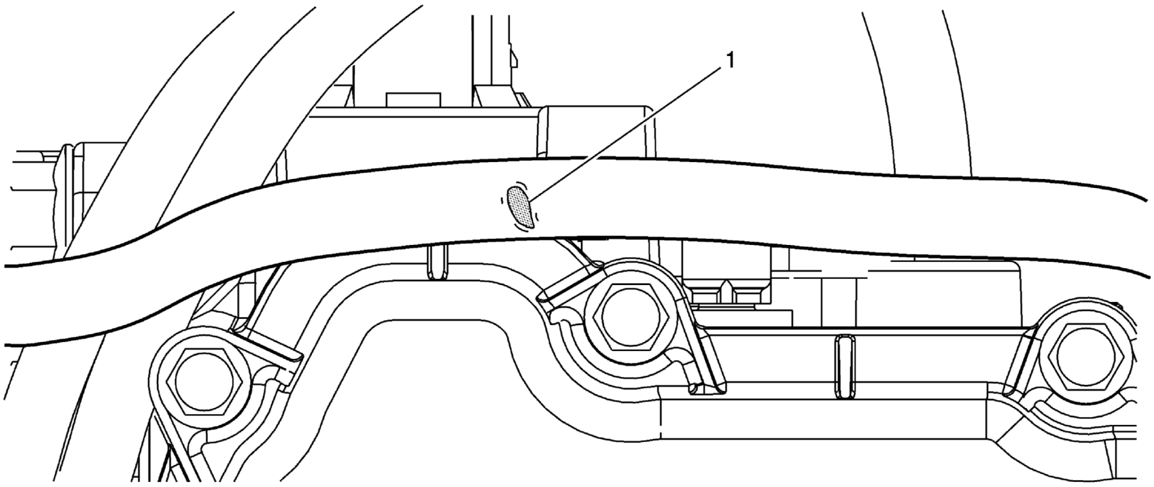

Fig. 12: Inspecting Outer Cable Jacket Or Sheathing
Courtesy of GENERAL MOTORS COMPANY

Cable Construction

- Outer Abrasion Sleeve
- Outer Jacket or Sheathing
- Braided Shield
- Insulated Conductor
- 3 Individual Cables per Cable Assembly, all of the same construction

1. Disconnect or remove the drive motor generator power inverter module cover to gain better visibility of 3 phase cables.
2. Disconnect the 3 phase cable P-clip from the APM shield bracket.
3. Disconnect and drop the cradle assembly with drive unit. If the cable needs to be replaced then this is required anyway, since you cannot remove the 3 phase cable from the Drive unit without first removing the rear drive unit mount.
4. Inspect all three lengths of cable.
5. Determine if the exposure is limited to the braided shield or has penetrated to the insulated conductor.
6. If the conductor wire is exposed, the cable assembly must be replaced.

NOTE: **If the 3 phase cable drive motor generator power inverter module connector is removed two new seals must be used.**

7. Examine the cables for abrasion or damage.
8. If any damage is present then the cable must be replaced.
9. If connector/s to SPIM were removed, install with new seal and torque nuts to 9 N.m +/ - 1.5 N.m (80 lb in +/ - 1 1/2 lb in). The two nuts clamp both the connector and cover, trapping both seals.

VIBRATION

Checks	Causes
Counter Shaft Assembly	Inspect for wear or damage.
Front Differential Assembly	Inspect for damaged gears and bearings.

NOISE AND VIBRATION ANALYSIS

A noise or vibration that is noticeable when the vehicle is in motion MAY NOT be the result of the transmission.

- Inspect the tires for the following conditions:
  - Uneven wear

  - Imbalance
  - Mixed sizes
  - Mixed radial and bias ply
- Inspect the suspension components for the following conditions:
  - Alignment wear or damage
  - Loose fasteners
  - Driveline damage or wear
- Inspect the transmission mounts for damage and loose bolts.
- Inspect the transmission case mounting holes for the following conditions:
  - Missing bolts, nuts, and studs
  - Stripped threads
  - Cracks

WHINE/GROWL NOISE THAT CHANGES WITH VEHICLE SPEED

Checks	Causes
Front Differential Assembly	Inspect for damaged gears and bearings.

NOISE IN DRIVE OR REVERSE GEAR

Checks	Causes
Front Differential Assembly	Inspect for damaged gears and bearings.
Drive Motor Assembly	Inspect for damaged bearings.

NO PARK OR DRIVE

Checks	Causes
Counter Shaft Assembly	Inspect for wear or damage.
Front Differential Assembly	Inspect for damaged gears and bearings.

NO DRIVE IN ALL RANGES

Checks	Causes
Front Differential Assembly	• Inspect for damaged front differential assembly. • Inspect for damaged front differential bearings.
Drive Motor with Generator	**Motor Failure** • Inspect 3 phase cables • Inspect connections at motor • Inspect 1st gear • Inspect motor end bearings
Counter Shaft Assembly	• Inspect for damaged counter shaft assembly. • Inspect for damaged counter shaft bearings.
Fluid Filter Assembly	• Inspect for damaged or restricted fluid filter assembly. • Inspect for damaged fluid filter seal assembly or improper sealing interface, leaks, and fluid aeration.

Checks	Causes
Fluid Pump Assembly	• Inspect for worn or damaged seal. • Inspect the fluid pump motor.

NO REVERSE

Checks	Causes
Drive Motor with Generator	**Motor Failure** • Inspect 3 phase cables. • Inspect connections at motor. • Inspect motor end bearings.
Output Shaft Assembly	Inspect for damaged internal gears.
Front Differential Assembly	Inspect for damaged gears and bearings.
Counter Shaft Assembly	Inspect for spline wear or damage.
Fluid Filter Assembly	• Inspect for damaged or restricted fluid filter assembly. • Inspect for damaged fluid filter seal assembly or improper sealing interface, leaks, and fluid aeration.
Fluid Pump Seal	Inspect for worn or damaged seal.

REPAIR INSTRUCTIONS - ON VEHICLE

TRANSMISSION ELECTRONIC CONTROL REPLACEMENT

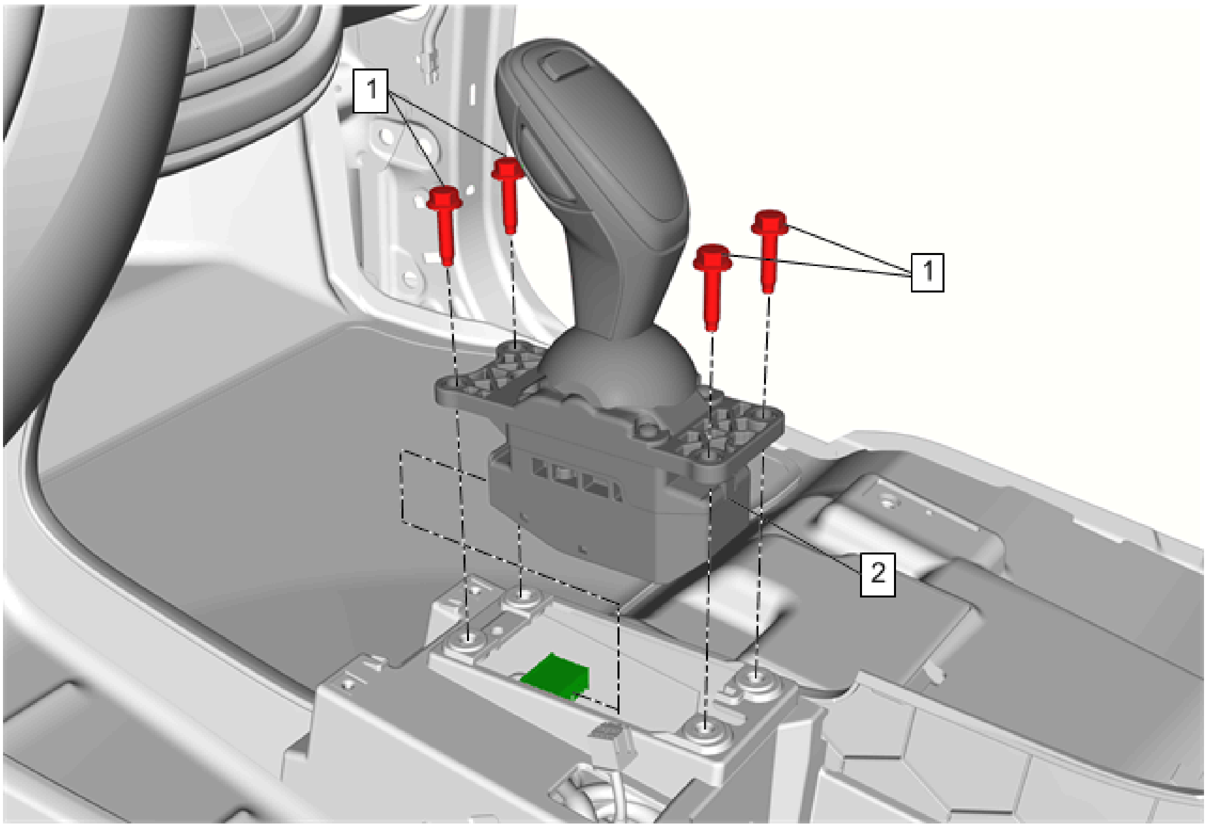

Fig. 13: Transmission Electronic Control
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
Preliminary Procedures 1. Disconnect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection 2. Remove Front Floor Console Cup Holder. Refer to Front Floor Console Cup Holder Replacement	
1	Automatic Transmission Electronic Control Bolt (Qty: 4) **CAUTION:** **Refer to Fastener Caution** **Tighten** 9 N.m (80 lb in)
2	Automatic Transmission Electronic Control **Procedure** 1. Disconnect the electrical connector. 2. Connect the negative battery cable. Refer to Battery Negative Cable Disconnection and Connection

TRANSMISSION CONTROL LEVER KNOB REPLACEMENT

Removal Procedure

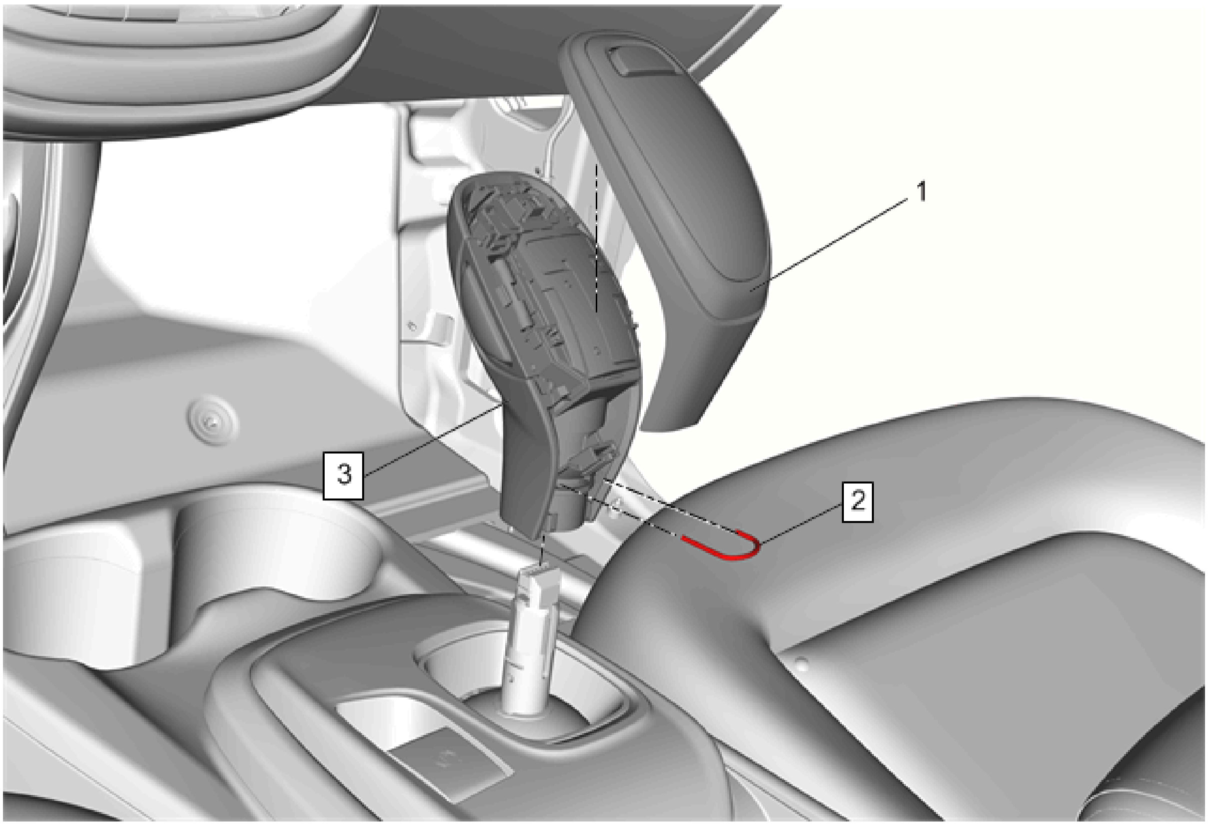

Fig. 14: Transmission Control Lever Knob, Cover And Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

1. Using a flat-bladed trim tool, remove the knob cover (1) from transmission control lever knob.
2. Remove Retaining Clip (2)
3. Remove Transmission Control Lever Knob (3) @ Transmission Control Assembly

Installation Procedure

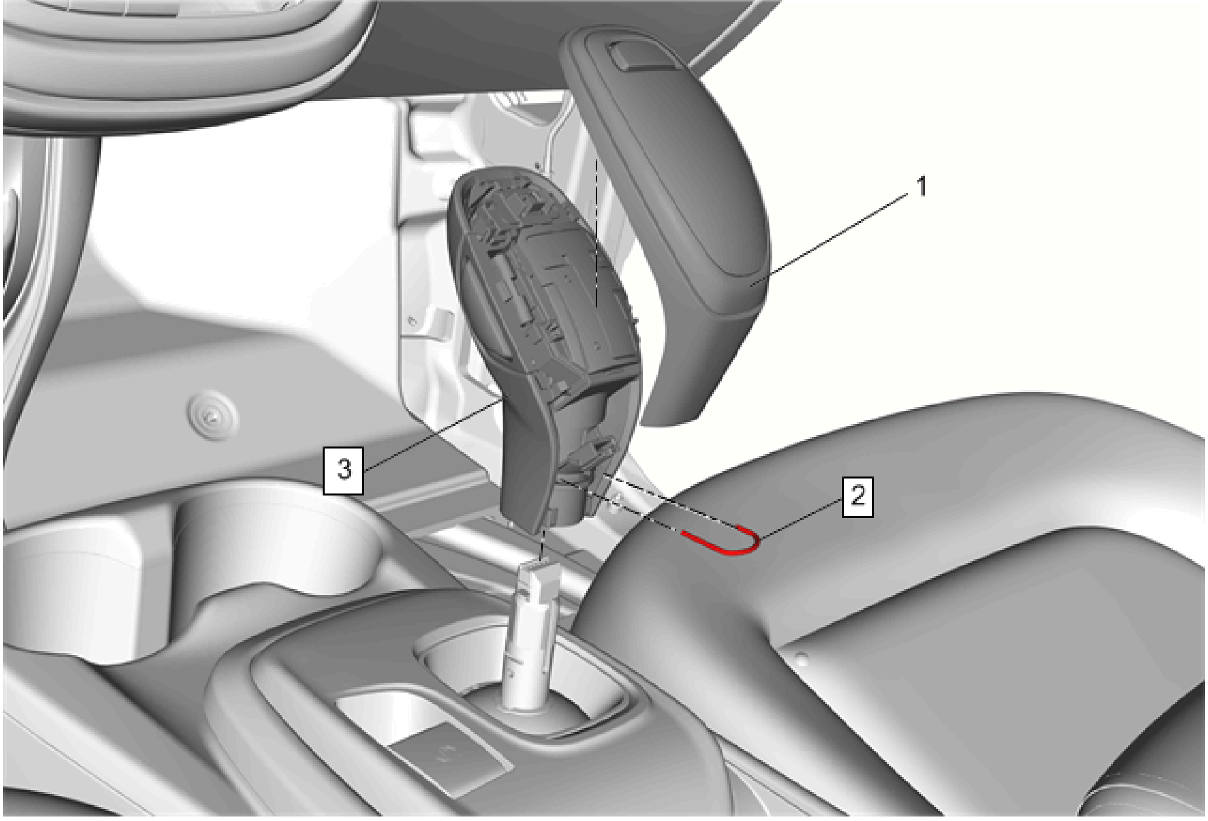

Fig. 15: Transmission Control Lever Knob, Cover And Retaining Clip
Courtesy of GENERAL MOTORS COMPANY

NOTE: **One side is longer. Install the retaining clip correctly.**

1. Insert the retaining clip (2) into the transmission control lever knob (3).
2. Ensure the manual shift button is properly assembled.
3. Install Knob Cover (1) @ Transmission Control Lever Knob (3)
4. Install the transmission control lever knob (3) to the transmission control assembly. Ensure the knob is locked in place.

AUTOMATIC TRANSMISSION RANGE SELECTOR ACTUATOR HARDWARE MODULE REPLACEMENT

Removal Procedure

1. Set the parking brake and chock the wheels.

NOTE: **If re-installing the original automatic transmission range selector actuator hardware module back into the vehicle, the Backup Park Lock Actuator must be activated prior to removal.**

NOTE: **If the automatic transmission range selector actuator hardware module is being replaced due to a malfunction, the original module does not need to be activated prior to removal. Proceed to Step 3.**

NOTE: **Perform this procedure before disconnecting the battery and removal of the actuator.**

2. Perform the Backup Park Lock Actuator Disarming procedure. Refer to **Backup Park Lock Actuator Disarming**
3. Before performing this procedure, review the high voltage safety information. Refer to **High Voltage Safety**
4. Disable the high voltage system. Refer to **High Voltage Disabling**
5. Remove Drive Motor Battery Charger. Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)**

6. Remove the left front wheelhouse liner. Refer to **Front Wheelhouse Liner Replacement**

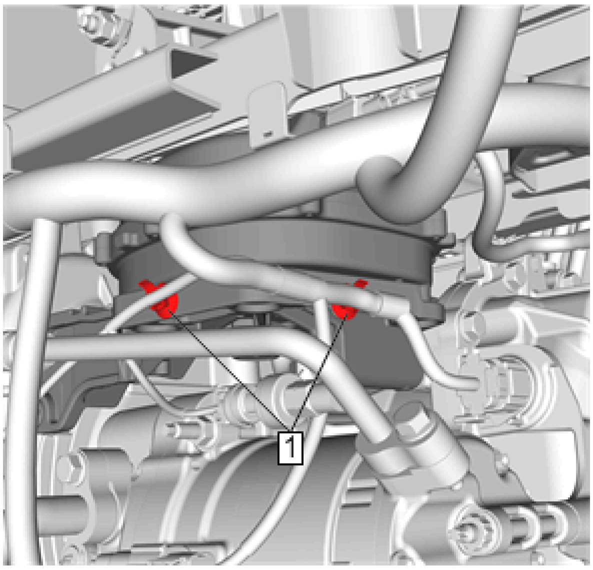

Fig. 16: Retainers
Courtesy of GENERAL MOTORS COMPANY

7. Remove Retainers (1) (Qty: 2)

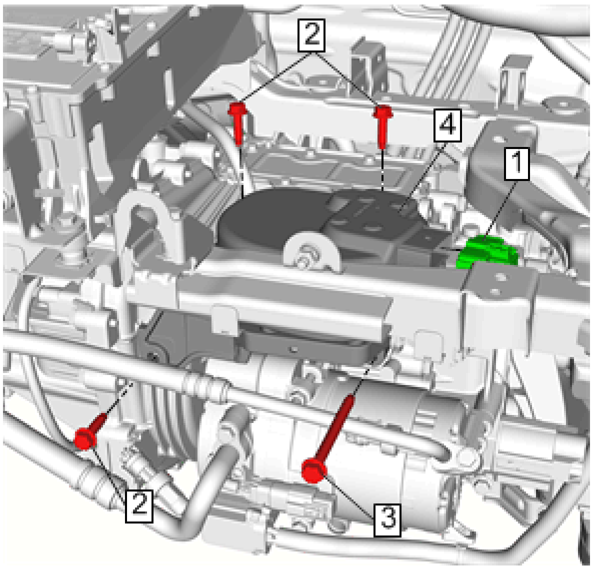

Fig. 17: Range Selector Actuator Hardware Module, Bolts And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

8. Disconnect Electrical Connector (1) @ Range Selector Actuator Hardware Module (4)
9. Remove Range Selector Actuator Hardware Module Bolts (2, 3) (Qty: 4)

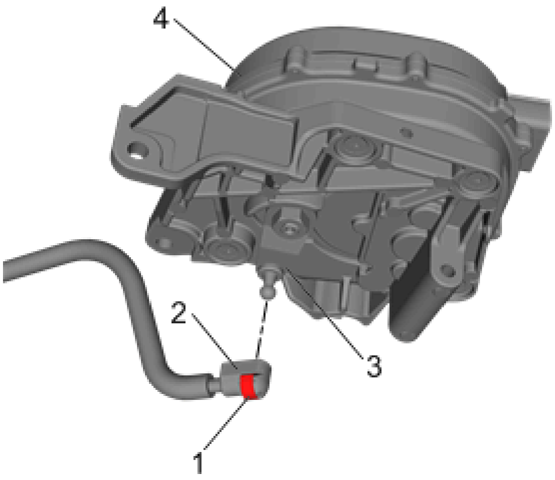

Fig. 18: Transmission Range Selector Lever Link, Retainer And Range Selector Actuator Hardware Module
Courtesy of GENERAL MOTORS COMPANY

10. Using a suitable tool, remove the transmission range selector lever link (2) while pulling the range selector lever link retainer (1).
11. Remove Range Selector Actuator Hardware Module (4)

Installation Procedure

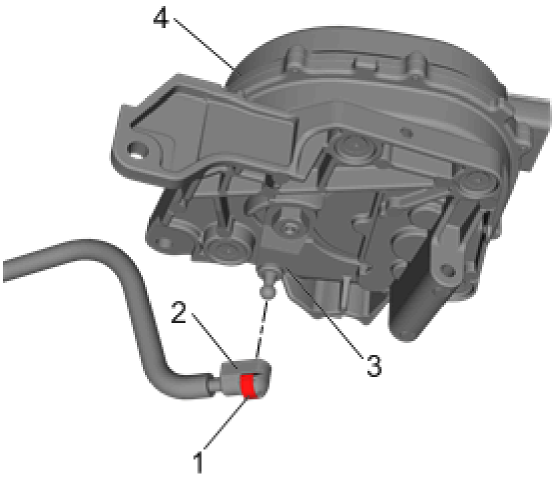

Fig. 19: Transmission Range Selector Lever Link, Retainer And Range Selector Actuator Hardware Module
Courtesy of GENERAL MOTORS COMPANY

1. Verify the transmission range selector actuator hardware module lever is in the park position.
2. Install the transmission range selector lever link (2) to the range selector actuator hardware module lever (3).

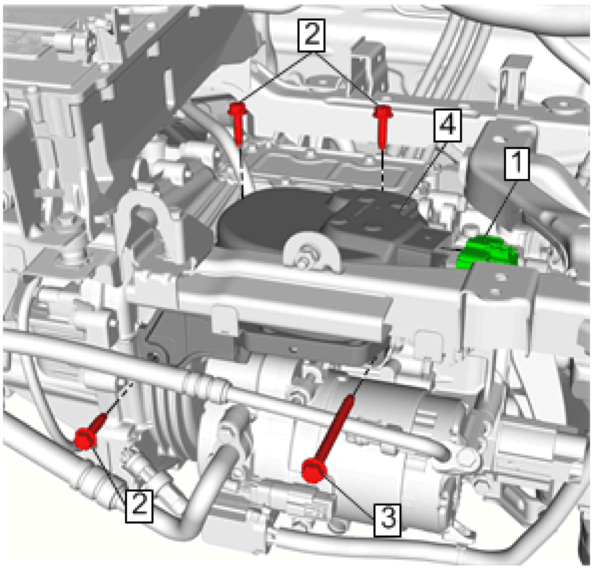

Fig. 20: Range Selector Actuator Hardware Module, Bolts And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

3. Install Range Selector Actuator Hardware Module (4) @ Transmission

CAUTION: **Refer to Fastener Caution .**

4. Install and tighten Range Selector Actuator Hardware Module Bolts (2, 3) (Qty: 4) to 22 N.m (16 lb ft)
5. Connect Electrical Connector (1) @ Range Selector Actuator Hardware Module (4)

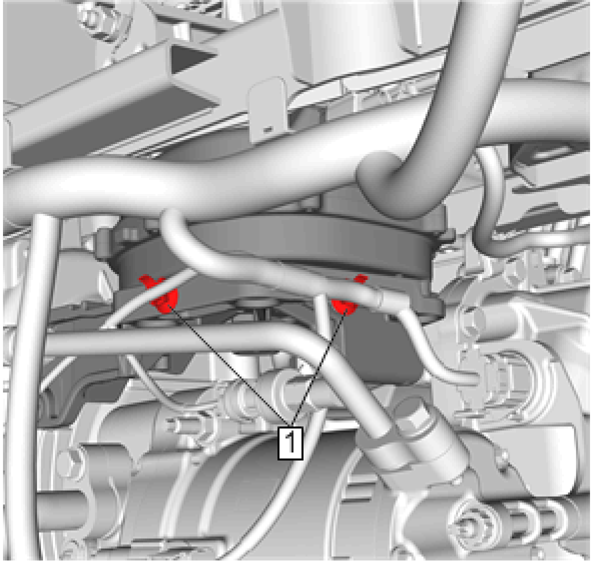

Fig. 21: Retainers
Courtesy of GENERAL MOTORS COMPANY

6. Install Retainers (1) (Qty: 2)
7. Check the range selector lever link adjustment. Refer to **Range Selector Lever Link Adjustment**
8. Install the left front wheelhouse liner. Refer to **Front Wheelhouse Liner Replacement**
9. Install Drive Motor Battery Charger. Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)**
10. Enable the high voltage system. Refer to **High Voltage Disabling**
11. Program the transmission range control module. Refer to **Control Module References**

AUTOMATIC TRANSMISSION RANGE SELECTOR LEVER REPLACEMENT

Removal Procedure

1. Set the parking brake and chock the wheels.
2. Before performing this procedure, review the high voltage safety information. Refer to **High Voltage Safety**
3. Disable the high voltage system. Refer to **High Voltage Disabling**
4. Remove Drive Motor Power Inverter Module. Refer to **Drive Motor Power Inverter Module Replacement**
5. Ensure that the transmission range selector lever is in the park (P) position.

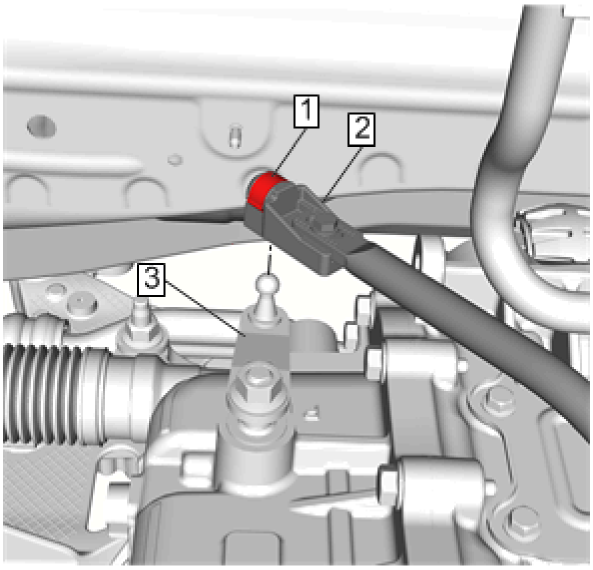

Fig. 22: Transmission Range Selector Lever Link And Retainer
Courtesy of GENERAL MOTORS COMPANY

6. Using a suitable tool, remove the transmission range selector lever link (2) while pulling the range selector lever link retainer (1).

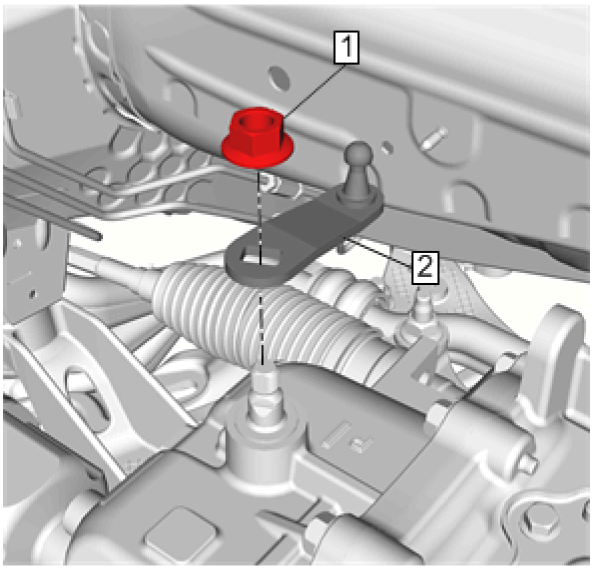

Fig. 23: Transmission Range Selector Lever And Nut
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Hold the transmission range selector lever while removing or installing the lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to roll when placed in the park position.**

7. Remove Transmission Range Selector Lever Nut (1)
8. Remove Transmission Range Selector Lever (2)

Installation Procedure

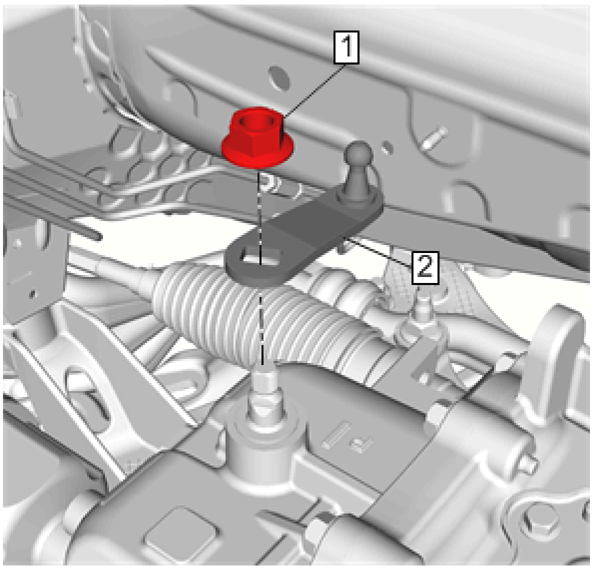

Fig. 24: Transmission Range Selector Lever And Nut
Courtesy of GENERAL MOTORS COMPANY

1. Install Transmission Range Selector Lever (2)

WARNING: **Hold the transmission range selector lever while removing or installing the lever retaining nut. Failure to hold the lever can cause damage to the transmission internal park system components which could allow the vehicle to roll when placed in the park position.**

CAUTION: **Refer to Fastener Caution .**

2. Install and tighten Transmission Range Selector Lever Nut (1) to 30 N.m (22 lb ft)

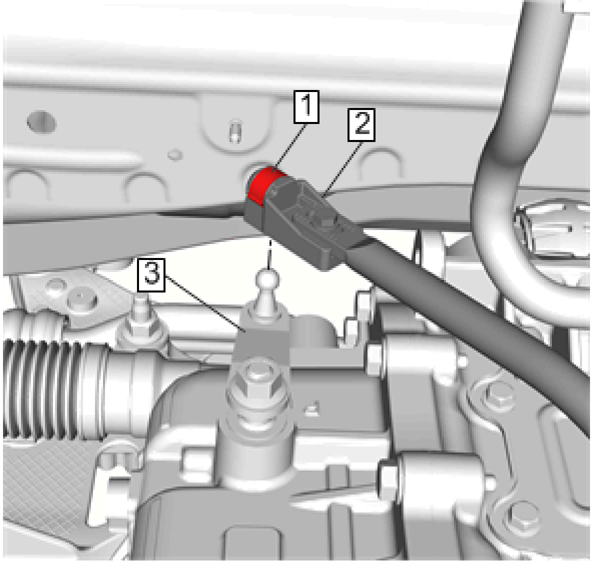

Fig. 25: Transmission Range Selector Lever Link And Retainer
Courtesy of GENERAL MOTORS COMPANY

3. Install Automatic Transmission Range Selector Lever Link (2) @ Transmission Range Selector Lever (3)
4. Check the range selector lever link adjustment. Refer to **Range Selector Lever Link Adjustment**
5. Install Drive Motor Power Inverter Module. Refer to **Drive Motor Power Inverter Module Replacement**
6. Enable the high voltage system. Refer to **High Voltage Enabling**
7. Perform the transmission range control module range motor position learn. Refer to **Transmission Range Control Module Range Motor Position Learn**

RANGE SELECTOR LEVER LINK REPLACEMENT

Removal Procedure

1. Set the parking brake and chock the wheels.
2. Before performing this procedure, review the high voltage safety information. Refer to **High Voltage Safety**
3. Disable the high voltage systems. Refer to **High Voltage Disabling**
4. Remove Drive Motor Battery Charger. Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)**
5. Remove Drive Motor Power Inverter Module. Refer to **Drive Motor Power Inverter Module Replacement**
6. Remove the left front wheelhouse liner. Refer to **Front Wheelhouse Liner Replacement**

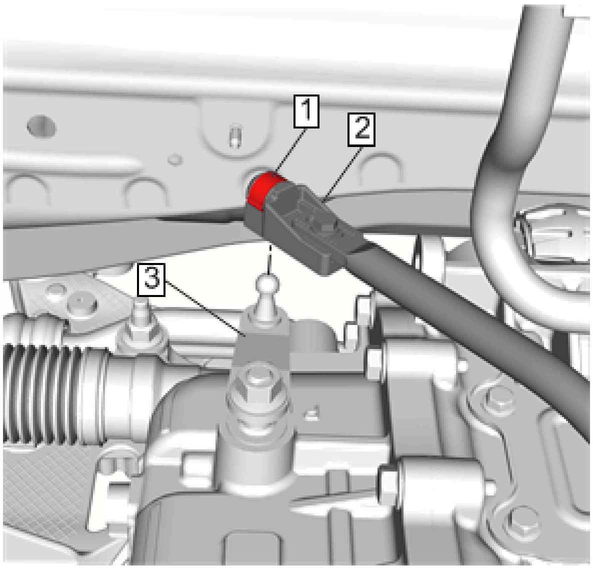

Fig. 26: Transmission Range Selector Lever Link And Retainer

Courtesy of GENERAL MOTORS COMPANY

7. Using a suitable tool, remove the transmission range selector lever link (2) while pulling the range selector lever link retainer (1).

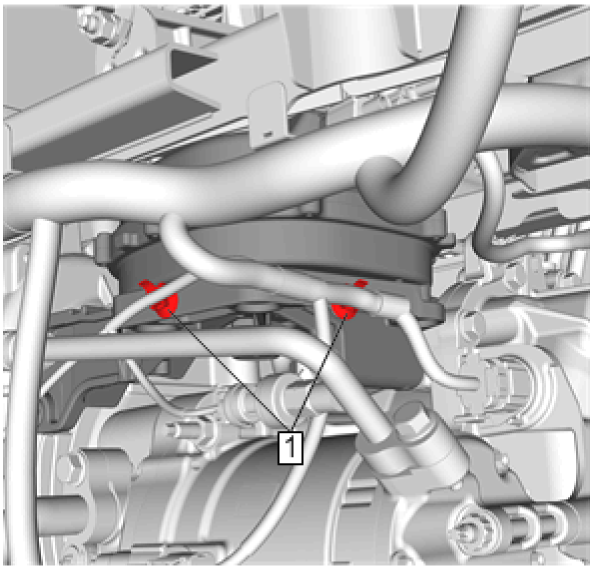

Fig. 27: Retainers

Courtesy of GENERAL MOTORS COMPANY

8. Remove Retainers (1) (Qty: 2)

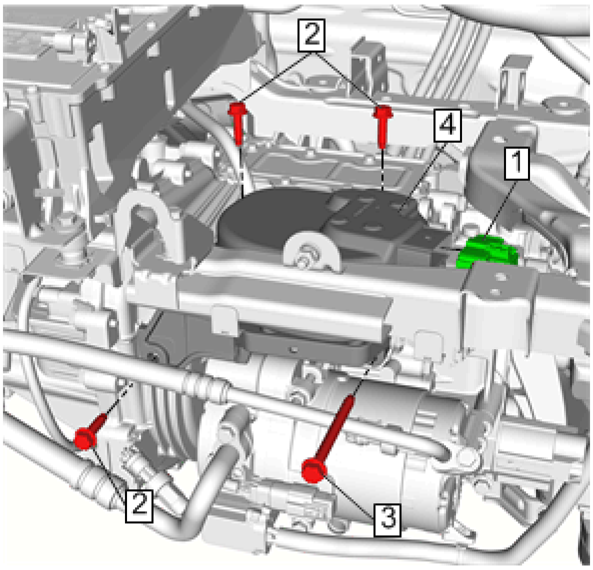

Fig. 28: Range Selector Actuator Hardware Module, Bolts And Electrical Connector

Courtesy of GENERAL MOTORS COMPANY

9. Disconnect Electrical Connector (1) @ Range Selector Actuator Hardware Module (4)
10. Remove Range Selector Actuator Hardware Module Bolts (2, 3) (Qty: 4)

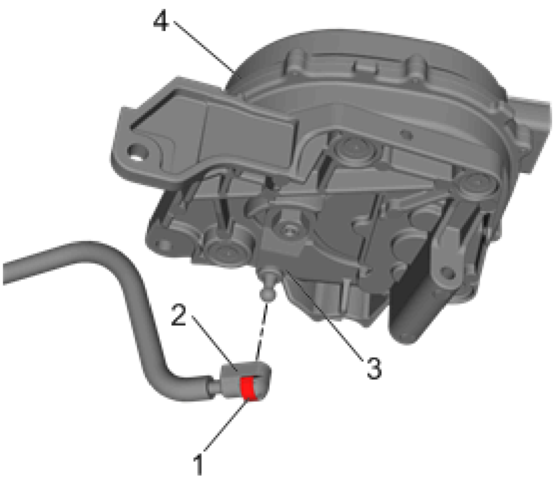

Fig. 29: Transmission Range Selector Lever Link, Retainer And Range Selector Actuator Hardware Module
Courtesy of GENERAL MOTORS COMPANY

11. Remove the transmission range selector lever link (2) and range selector actuator hardware module (4) from the vehicle.
12. Using a suitable tool, remove the transmission range selector lever link (2) while pulling the range selector lever link retainer (1).

Installation Procedure

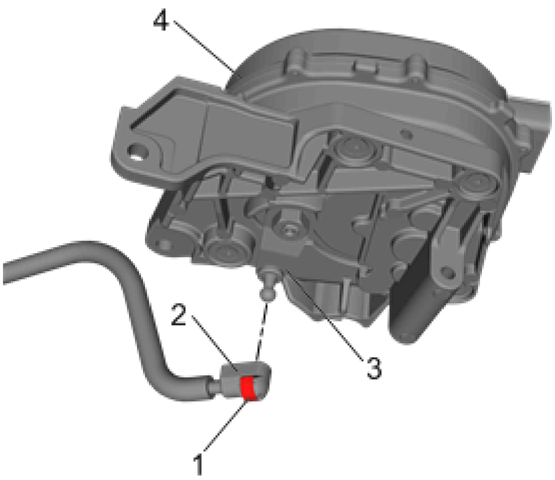

Fig. 30: Transmission Range Selector Lever Link, Retainer And Range Selector Actuator Hardware Module
Courtesy of GENERAL MOTORS COMPANY

1. Verify the transmission range selector actuator hardware module lever is in the park position.
2. Install the range selector lever link (2) to the range selector actuator hardware module lever (3).

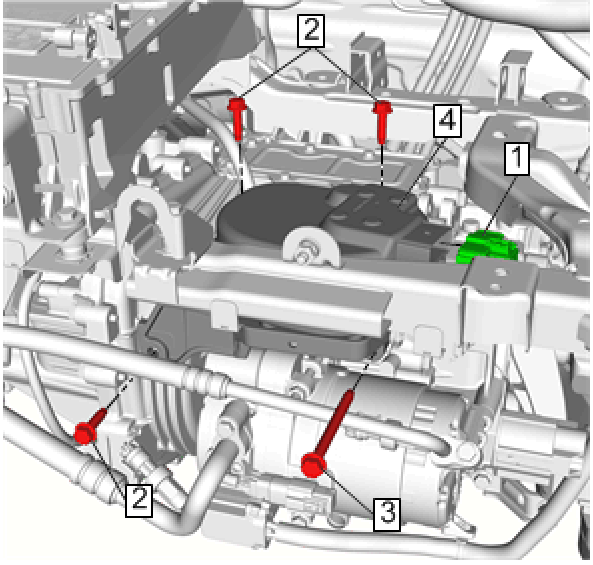

Fig. 31: Range Selector Actuator Hardware Module, Bolts And Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

3. Install Range Selector Actuator Hardware Module (4) @ Transmission

CAUTION: **Refer to Fastener Caution .**

4. Install and tighten Range Selector Actuator Hardware Module Bolts (2, 3) (Qty: 2) to 22 N.m (16 lb ft)
5. Connect Electrical Connector (1) @ Range Selector Actuator Hardware Module (4)

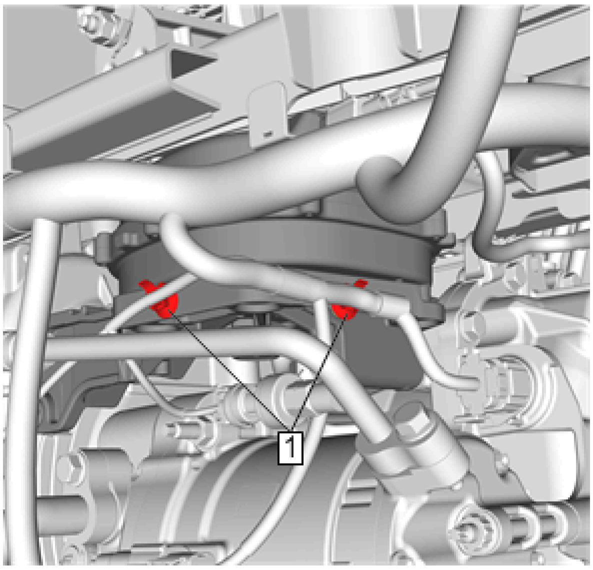

Fig. 32: Retainers
Courtesy of GENERAL MOTORS COMPANY

6. Install Retainers (1) (Qty: 2)

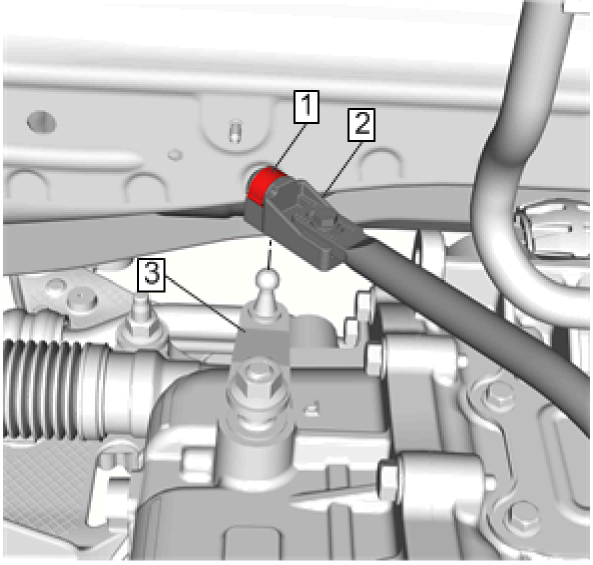

Fig. 33: Transmission Range Selector Lever Link And Retainer
Courtesy of GENERAL MOTORS COMPANY

7. Verify the transmission range selector lever is in the park position.
8. Install Automatic Transmission Range Selector Lever Link (2) @ Transmission Range Selector Lever (3)
9. Check the range selector lever link adjustment. Refer to **Range Selector Lever Link Adjustment**
10. Install the left front wheelhouse liner. Refer to **Front Wheelhouse Liner Replacement**
11. Install Drive Motor Power Inverter Module. Refer to **Drive Motor Power Inverter Module Replacement**
12. Install Drive Motor Battery Charger. Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)**
13. Enable the high voltage system. Refer to **High Voltage Enabling**
14. Perform the transmission range control module range motor position learn. Refer to **Transmission Range Control Module Range Motor Position Learn**

RANGE SELECTOR LEVER LINK ADJUSTMENT

1. Set the parking brake and chock the wheels.
2. Remove Range Selector Lever Link. Refer to **Range Selector Lever Link Replacement**

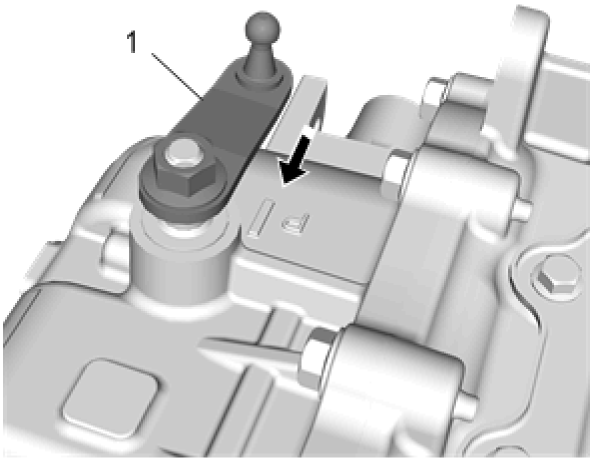

Fig. 34: Transmission Range Selector Lever
Courtesy of GENERAL MOTORS COMPANY

3. Verify the transmission range selector lever (1) is in the park position (arrow).

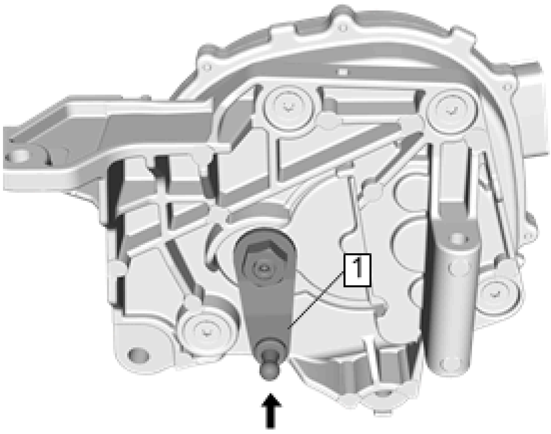

Fig. 35: Transmission Range Selector Actuator Hardware Module Lever
Courtesy of GENERAL MOTORS COMPANY

NOTE: **If the transmission range selector actuator hardware module lever is not in the park position, Set the park position by maximum turning the lever (1) clockwise.**

4. Verify the transmission range selector actuator hardware module lever (1) is in the park position (arrow).
5. Loosen the adjustment bolt on the range selector lever link.
6. Install the range selector lever link with the adjustment bolt loose.
7. Install Range Selector Lever Link. Refer to Range Selector Lever Link Replacement

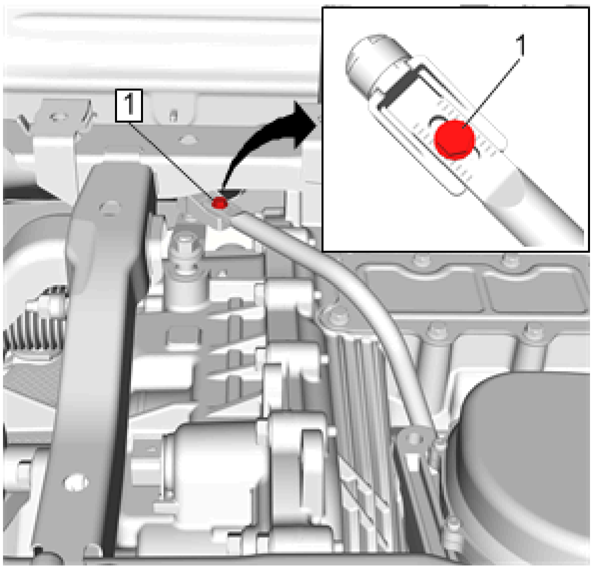

Fig. 36: Range Selector Lever Link Adjustment Bolt
Courtesy of GENERAL MOTORS COMPANY

8. With the link completely installed, and the park location verified on the actuator and transmission.
9. Install and tighten Range Selector Lever Link Adjustment Bolt (1) to 5 N.m (44 lb in)
10. Check the transmission range selector lever in all gear selections for proper operation.

VENT HOSE REPLACEMENT

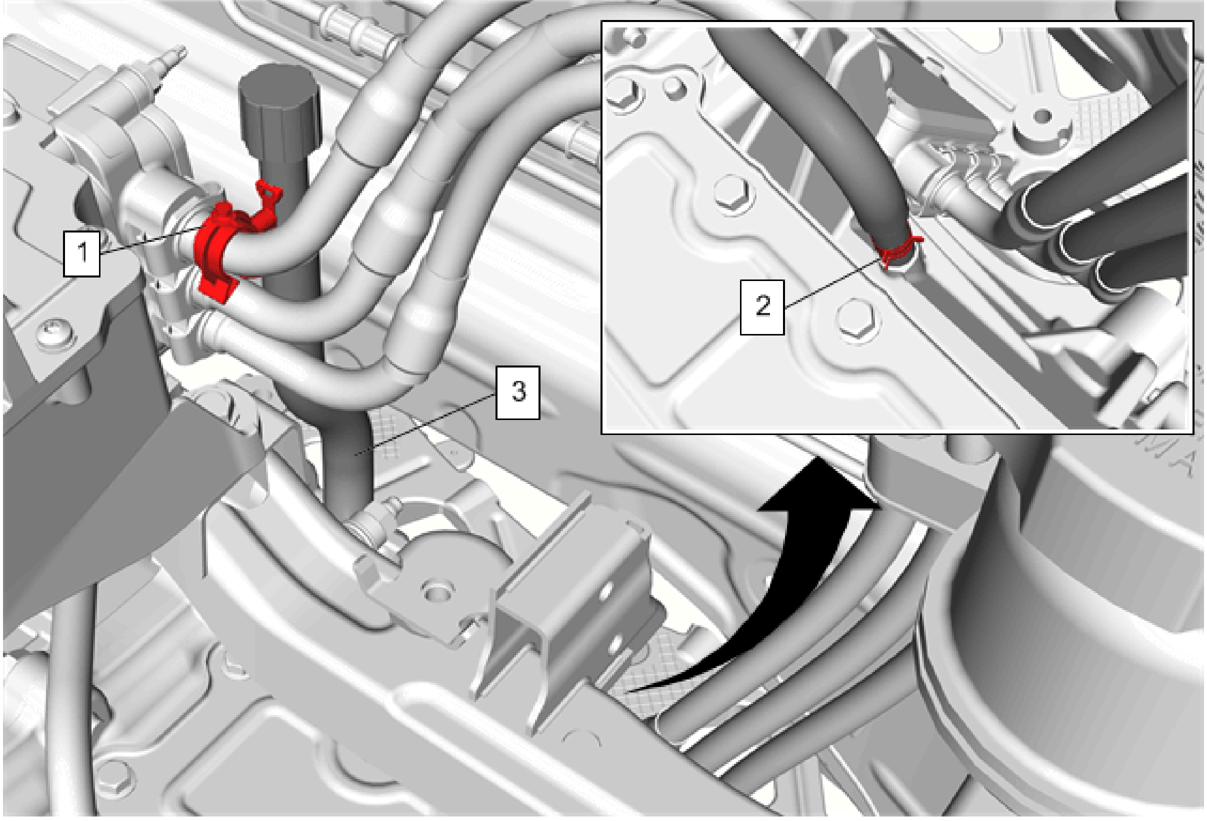

Fig. 37: Vent Hose
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Before performing this procedure, review the high voltage safety information. Refer to **High Voltage Safety** 2. Disable the high voltage systems. Refer to **High Voltage Disabling** 3. Remove Drive Motor Battery Charger. Refer to **Drive Motor Battery Charger Replacement (Except Dubai)** **Drive Motor Battery Charger Replacement (Dubai)**	
1	Transmission Vent Pipe Clip **Procedure** Unclip the transmission vent pipe clip from the 3 Phase Cable.
2	Transmission Vent Hose Clamp **Procedure** Loosen the transmission vent hose clamp using hose clamp pliers.
3	Transmission Vent Hose Assembly **Procedure** Enable the high voltage systems. Refer to **High Voltage Enabling**

TRANSMISSION FLUID PUMP REPLACEMENT

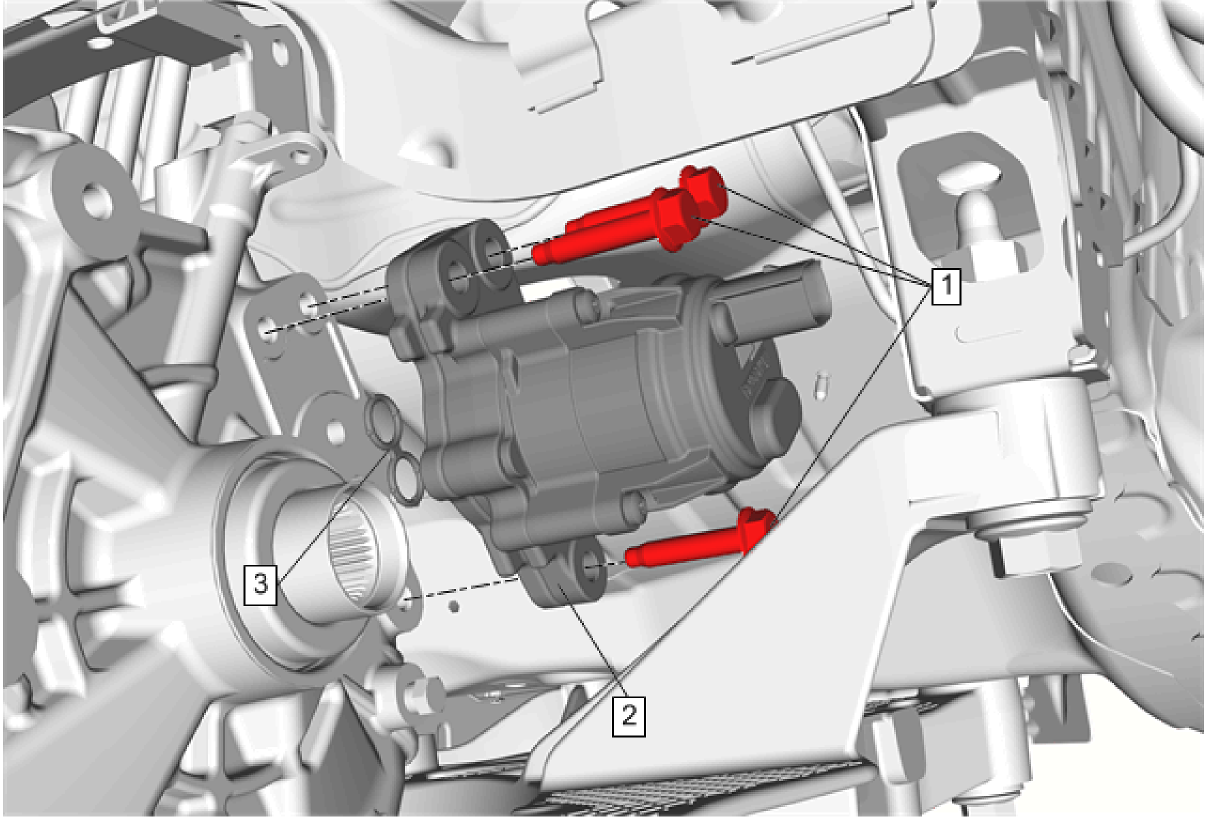

Fig. 38: Transmission Fluid Pump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** 2. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 3. Remove the left front wheelhouse liner. Refer to **Front Wheelhouse Liner Replacement** 4. Turn the steering wheel to full left.	
1	Automatic Transmission Fluid Pump Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution** **Tighten** 22 N.m (16 lb ft)
2	Automatic Transmission Fluid Pump Assembly **Procedure** 1. Disconnect the transmission fluid pump electrical connector. 2. Connect the battery negative cable. Refer to **Battery Negative Cable Disconnection and Connection** 3. Check the transmission fluid level. Refer to **Transmission Fluid Level and Condition Check**
3	Automatic Transmission Fluid Pump Seal **NOTE:** **Install a NEW fluid pump seal.**

DRIVE MOTOR MOUNT REPLACEMENT (LEFT SIDE)

Removal Procedure

1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
3. Remove Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
4. Remove Front Wheelhouse Liner. Refer to **Front Wheelhouse Liner Replacement**
5. Support the drive motor unit with a suitable jack stand.

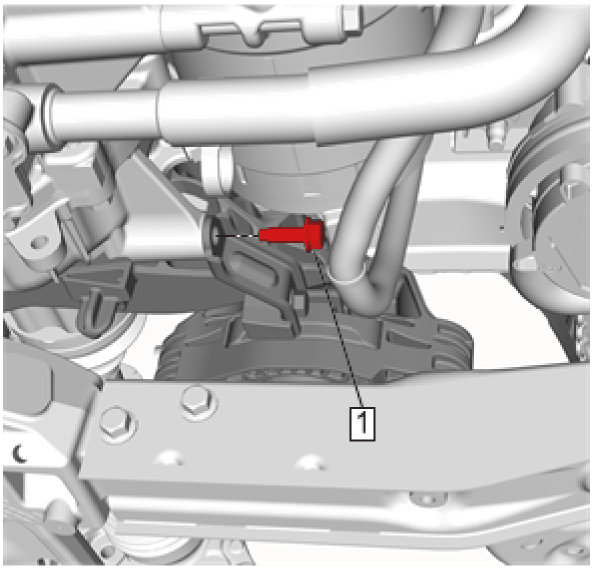

Fig. 39: Drive Motor Mount Drive Motor Side Bolt
Courtesy of GENERAL MOTORS COMPANY

6. Remove Drive Motor Mount Drive Motor Side Bolt (1)

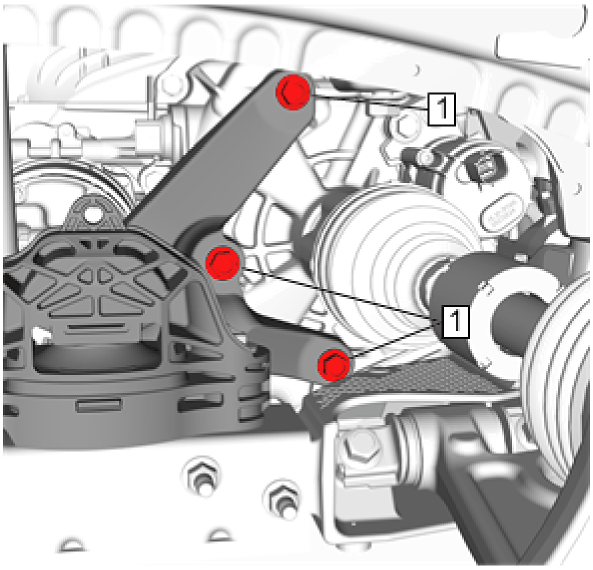

Fig. 40: Drive Motor Mount Motor Side Bolts
Courtesy of GENERAL MOTORS COMPANY

7. Remove and DISCARD Drive Motor Mount Motor Side Bolts (1) (Qty: 3)

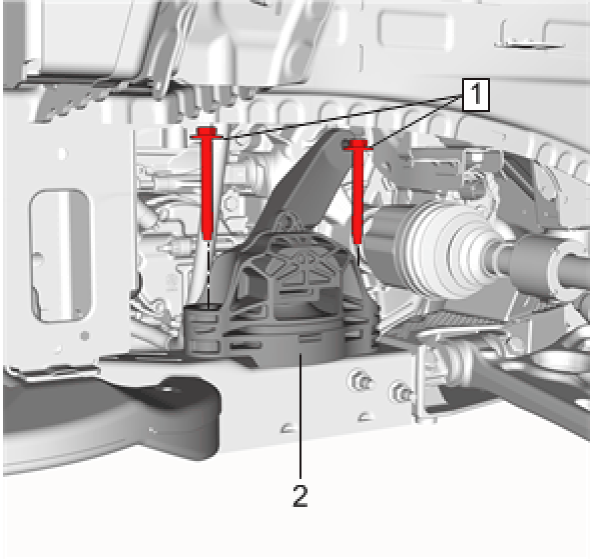

Fig. 41: Drive Motor Mount-Left Side And Bolts
Courtesy of GENERAL MOTORS COMPANY

8. Prior to removing the mount, mark the mount location on the frame using a paint pen or marker for correct positioning during installation.
9. Remove and DISCARD Drive Motor Mount Body Side Bolts (1) (Qty: 2)
10. Remove Drive Motor Mount-Left Side (2)

Installation Procedure

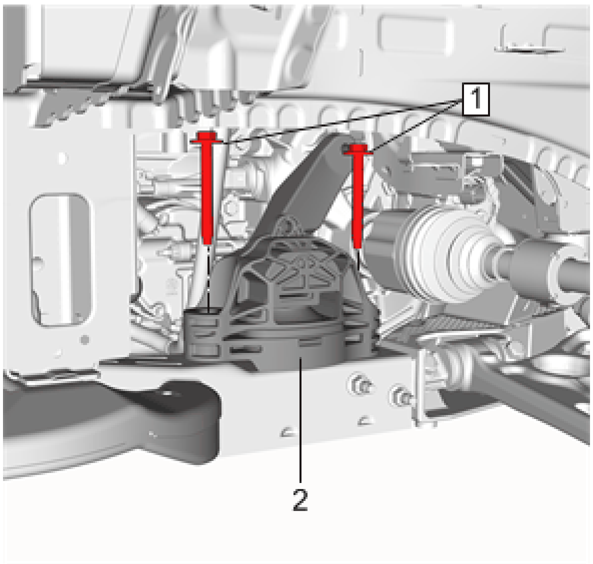

Fig. 42: Drive Motor Mount-Left Side And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Mount-Left Side (2)

CAUTION: **Refer to Fastener Caution**

CAUTION: **Refer to Torque-to-Yield Fastener Caution .**

2. Install NEW Drive Motor Mount Body Side Bolts (1) (Qty: 2)
3. Align the drive motor mount to the previously made marks on the frame.
4. Tighten Drive Motor Mount Body Side Bolt (1) (Qty: 2)
    1. First Pass: 58 N.m (43 lb ft)
    2. Final Pass: 60 - 75 Degrees

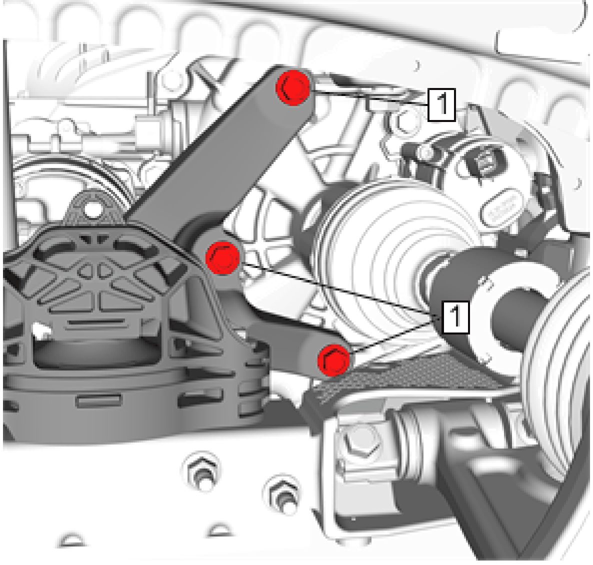

Fig. 43: Drive Motor Mount Motor Side Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install NEW Drive Motor Mount Motor Side Bolts (1) (Qty: 3)
    1. First Pass: 58 N.m (43 lb ft)
    2. Final Pass: 60 - 75 Degrees

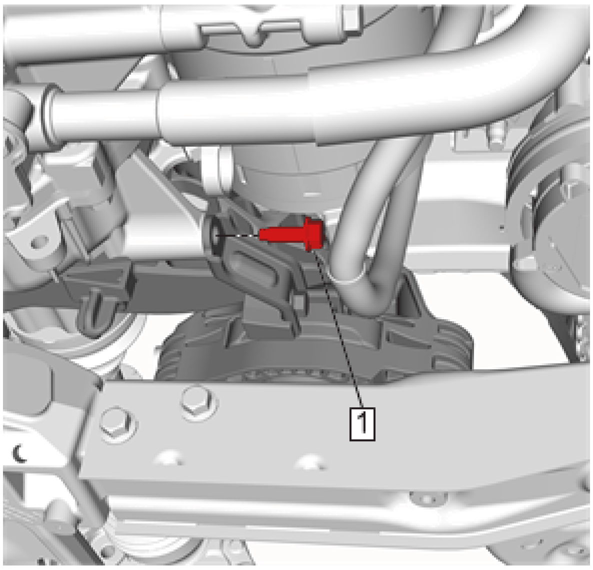

Fig. 44: Drive Motor Mount Drive Motor Side Bolt
Courtesy of GENERAL MOTORS COMPANY

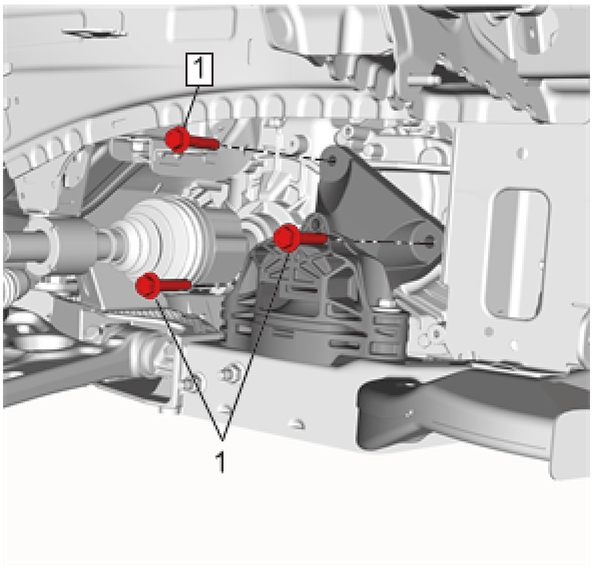
6. Install and tighten Drive Motor Mount Drive Motor Side Bolt (1) to 22 N.m (16 lb ft)
7. Remove the jack stand.
8. Install Front Wheelhouse Liner. Refer to **Front Wheelhouse Liner Replacement**
9. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
10. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
11. Lower the vehicle.

DRIVE MOTOR MOUNT REPLACEMENT (RIGHT SIDE)

Removal Procedure

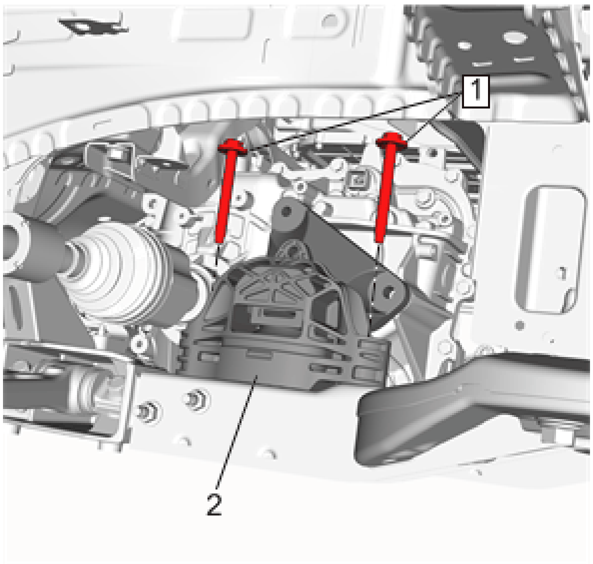
1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle**
2. Remove the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**
3. Remove Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
4. Remove Front Wheelhouse Liner. Refer to **Front Wheelhouse Liner Replacement**

5. Support the drive motor unit with a suitable jack stand.



[Fig. 45: Drive Motor Mount Motor Side Bolts]
Courtesy of GENERAL MOTORS COMPANY

6. Remove and DISCARD Drive Motor Mount Motor Side Bolts (1) (Qty: 3)



[Fig. 46: Drive Motor Mount-Right Side And Bolts]
Courtesy of GENERAL MOTORS COMPANY

7. Prior to removing the mount, mark the mount location on the frame using a paint pen or marker for correct positioning during installation.
8. Remove and DISCARD Drive Motor Mount Body Side Bolts (1) (Qty: 2)
9. Remove Drive Motor Mount-Right Side (2)

Installation Procedure

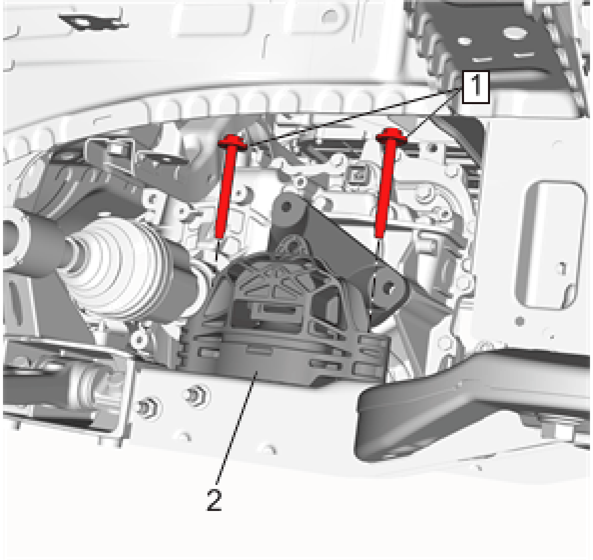


Fig. 47: Drive Motor Mount-Right Side And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Mount-Right Side (2)

CAUTION: **Refer to Fastener Caution**

CAUTION: **Refer to Torque-to-Yield Fastener Caution .**

2. Install NEW Drive Motor Mount Body Side Bolts (1) (Qty: 3)
3. Align the drive motor mount to the previously made marks on the frame.
4. Tighten Drive Motor Mount Body Side Bolts (1) (Qty: 2)
    1. First Pass: 58 N.m (43 lb ft)
    2. Final Pass: 60 - 75 Degrees

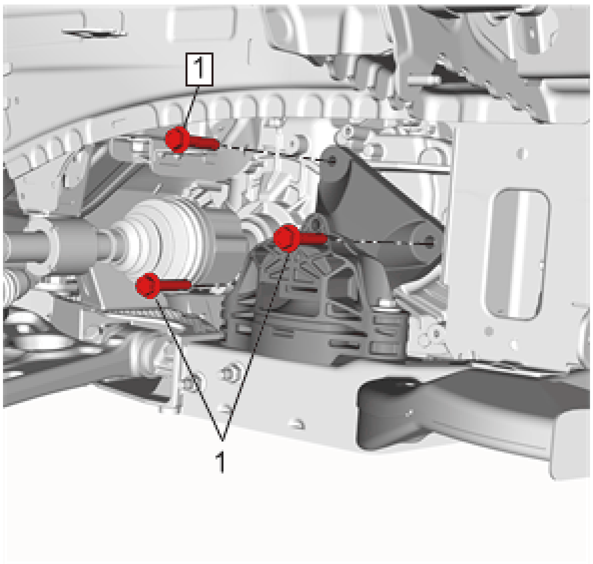

Fig. 48: Drive Motor Mount Motor Side Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Install NEW Drive Motor Mount Motor Side Bolts (1) (Qty: 3)
    1. First Pass: 58 N.m (43 lb ft)
    2. Final Pass: 60 - 75 Degrees
6. Remove the jack stand.
7. Install Front Wheelhouse Liner. Refer to **Front Wheelhouse Liner Replacement**
8. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
9. Install the front tire and wheel assembly. Refer to **Tire and Wheel Removal and Installation**

10. Lower the vehicle.

DRIVE MOTOR REAR MOUNT REPLACEMENT

Removal Procedure

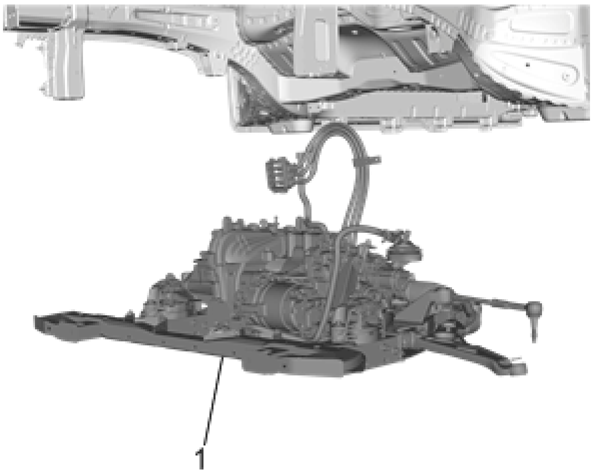

Fig. 49: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove Automatic Transmission and Drivetrain and Front Suspension Frame Assembly (1). Refer to **Drivetrain and Front Suspension Frame Removal and Installation**
2. Using an appropriate lift hook and engine hoist, raise the transmission slightly to remove weight from the rear mount.

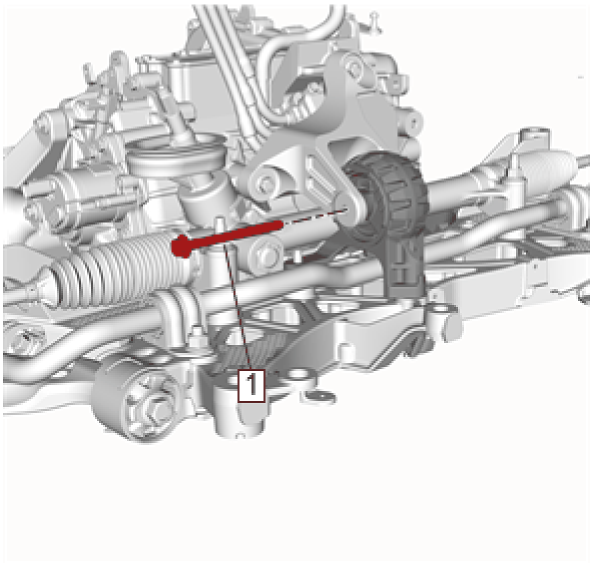

Fig. 50: Drive Motor Rear Mount Drive Motor Side Bolt
Courtesy of GENERAL MOTORS COMPANY

3. Remove and DISCARD Drive Motor Rear Mount Drive Motor Side Bolt (1)

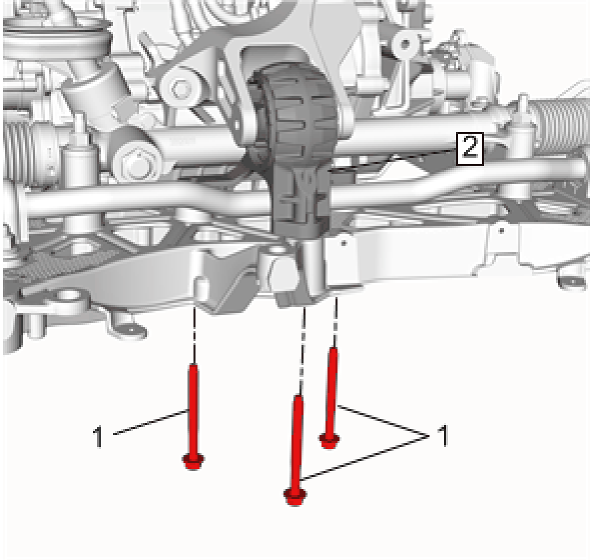

Fig. 51: Drive Motor Rear Mount And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove and DISCARD Drive Motor Rear Mount Drive Motor Side Bolts (1) (Qty: 3)
5. Remove Drive Motor Rear Mount (2)

Installation Procedure

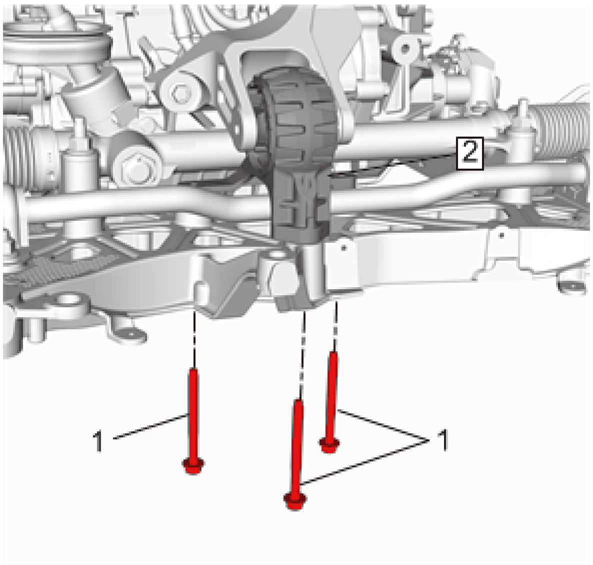

Fig. 52: Drive Motor Rear Mount And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Rear Mount (2)

CAUTION: **Refer to Fastener Caution**

CAUTION: **Refer to Torque-to-Yield Fastener Caution .**

2. Install NEW Drive Motor Rear Mount Frame Side Bolts (1) (Qty: 3)
    1. First Pass: 58 N.m (43 lb ft)
    2. Final Pass: 60 - 75 Degrees
3. Lower the transmission down until the mount and bracket holes are aligned.

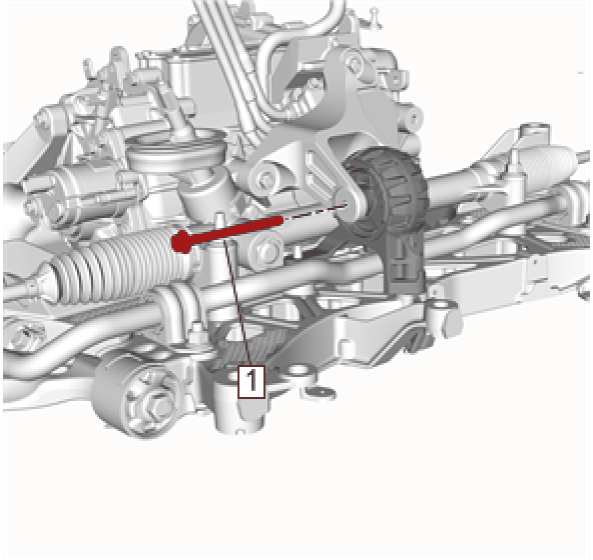

Fig. 53: Drive Motor Rear Mount Drive Motor Side Bolt
Courtesy of GENERAL MOTORS COMPANY

4. Install NEW Drive Motor Rear Mount Drive Motor Side Bolt (1)
    1. First Pass: 58 N.m (43 lb ft)
    2. Final Pass: 60 - 75 Degrees
5. Remove the engine hoist and lift hook.

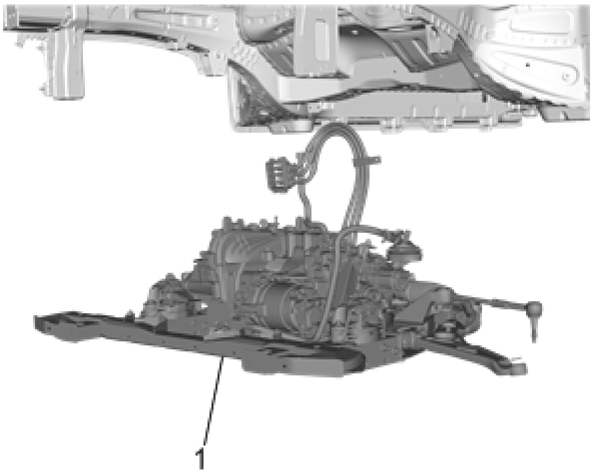

Fig. 54: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

6. Install Automatic Transmission and Drivetrain and Front Suspension Frame Assembly (1). Refer to **Drivetrain and Front Suspension Frame Removal and Installation**

DRIVE MOTOR REAR MOUNT BRACKET REPLACEMENT

Removal Procedure

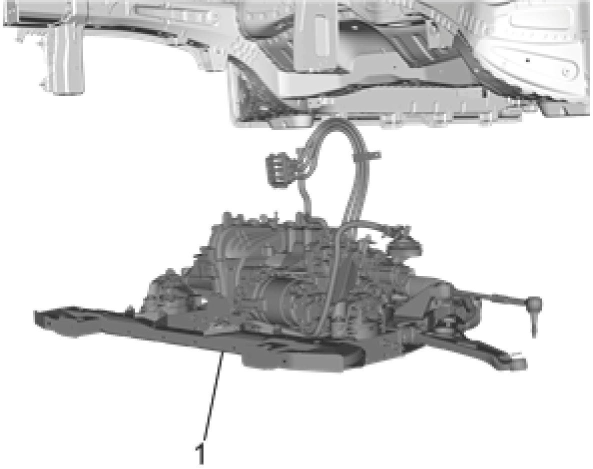

Fig. 55: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove Automatic Transmission and Drivetrain and Front Suspension Frame Assembly (1). Refer to **Drivetrain and Front Suspension Frame Removal and Installation**

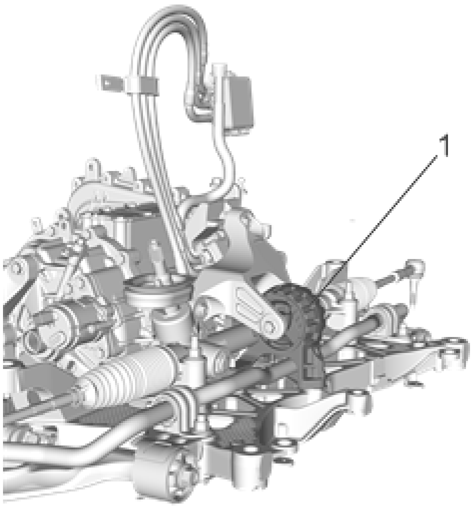

Fig. 56: Drive Motor Rear Mount
Courtesy of GENERAL MOTORS COMPANY

2. Remove Drive Motor Rear Mount (1). Refer to **Drive Motor Rear Mount Replacement**

NOTE: **The lift and hook is already attached as part of the rear mount markup.**

3. Raise the transmission with the engine lift, lift it high enough to gain access to the fasteners.

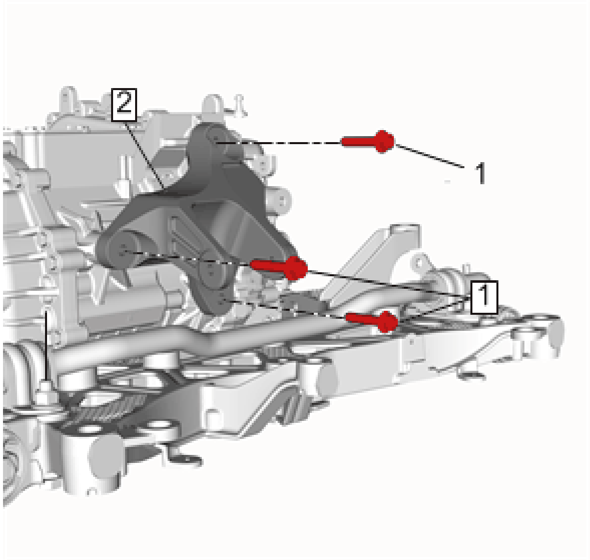

Fig. 57: Drive Motor Rear Mount Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

4. Remove and DISCARD Drive Motor Rear Mount Bracket Drive Motor Side Bolts (1) (Qty: 3)
5. Remove Drive Motor Rear Mount Bracket (2)

Installation Procedure

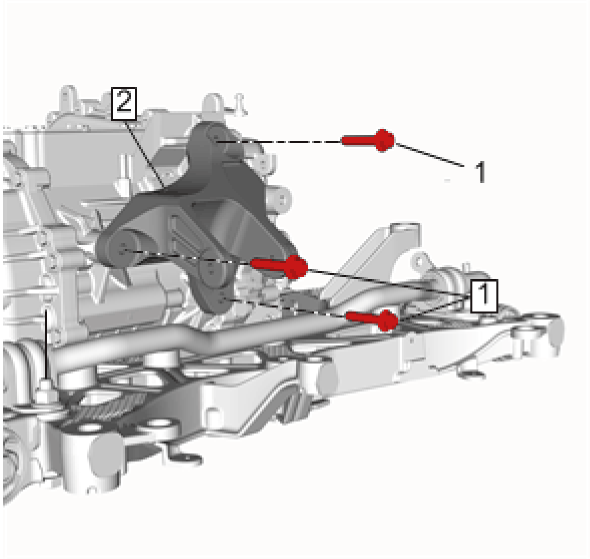

Fig. 58: Drive Motor Rear Mount Bracket And Bolts
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Rear Mount Bracket (2)

CAUTION: **Refer to Fastener Caution**

CAUTION: **Refer to Torque-to-Yield Fastener Caution .**

2. Install NEW Drive Motor Rear Mount Bracket Drive Motor Side Bolts (1) (Qty: 3)
    1. First Pass: 58 N.m (43 lb ft)
    2. Final Pass: 60 - 75 Degrees

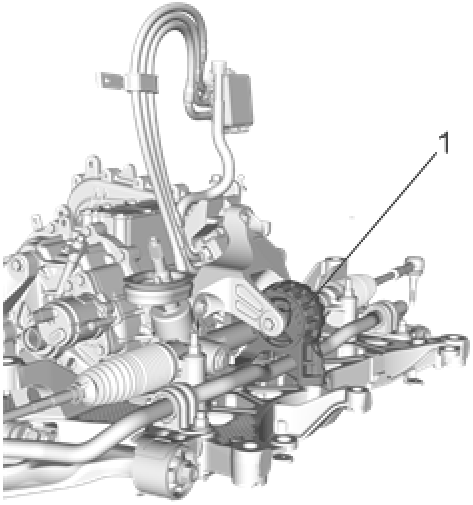

Fig. 59: Drive Motor Rear Mount
Courtesy of GENERAL MOTORS COMPANY

3. Install Drive Motor Rear Mount (1). Refer to **Drive Motor Rear Mount Replacement**

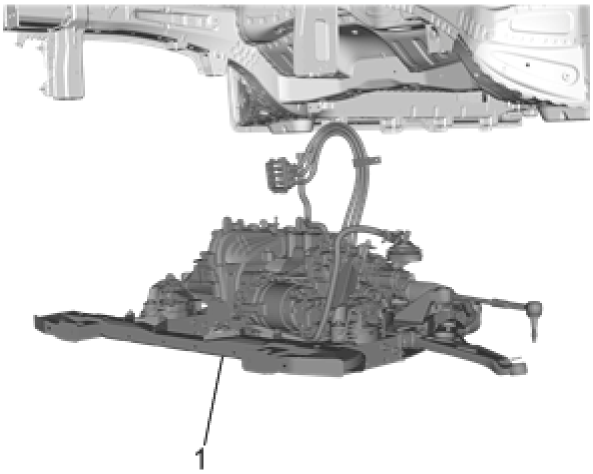

Fig. 60: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

4. Install Automatic Transmission and Drivetrain and Front Suspension Frame Assembly (1). Refer to **Drivetrain and Front Suspension Frame Removal and Installation**

SHIFT SHAFT COVER REPLACEMENT (COOLANT SUMP)

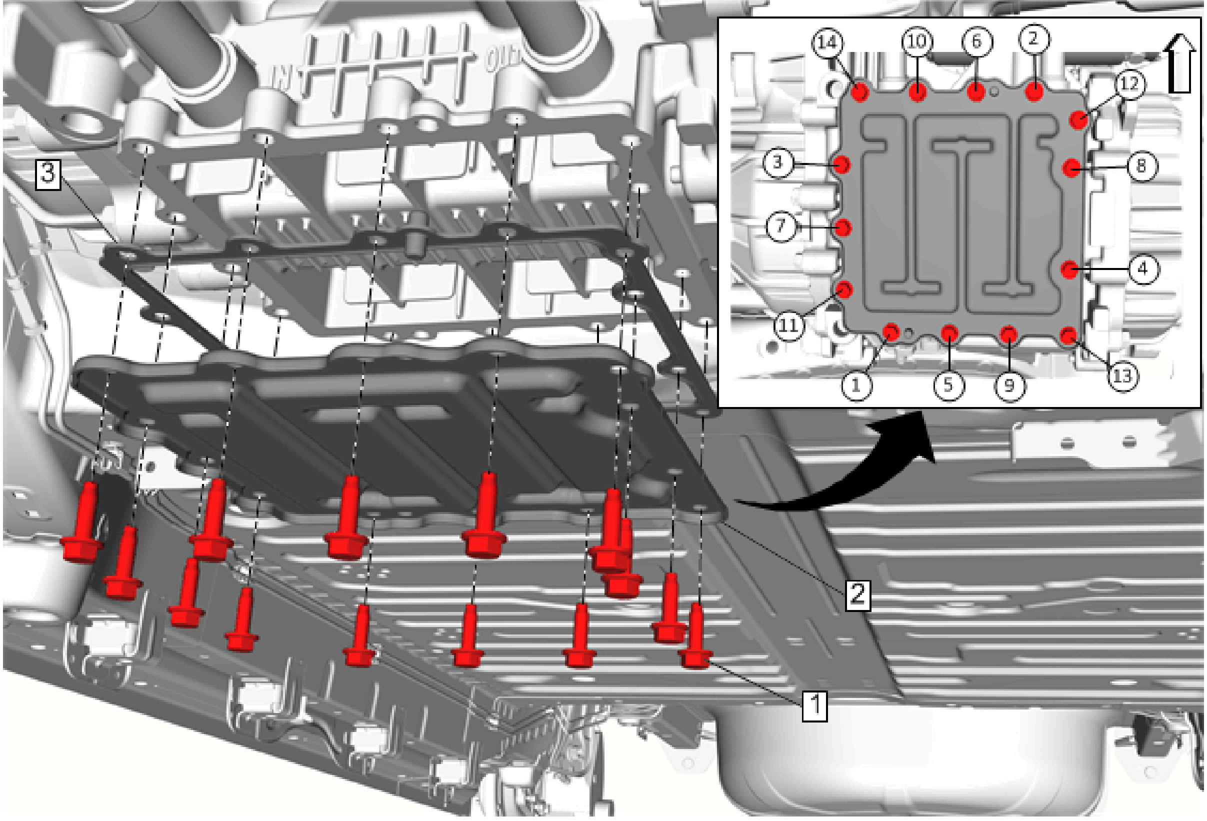

Fig. 61: Shift Shaft Cover With Bolt Tightening Sequence (Coolant Sump)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Remove Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement** 3. Drain the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling** 4. Place a drain pan beneath the transmission.	
1	Shift Shaft Cover Bolt (Qty: 14) **CAUTION:** **Refer to Fastener Caution .** **NOTE:** **Install all shift shaft cover bolts by hand then tighten all bolts in specified sequence** **Tighten** 9 N.m (80 lb in)
2	Shift Shaft Cover **Procedure** Fill the drive motor generator power inverter module cooling system. Refer to **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
3	Shift Shaft Cover Gasket **NOTE:** **Install a NEW gasket.**

SHIFT SHAFT COVER REPLACEMENT (OIL SUMP)

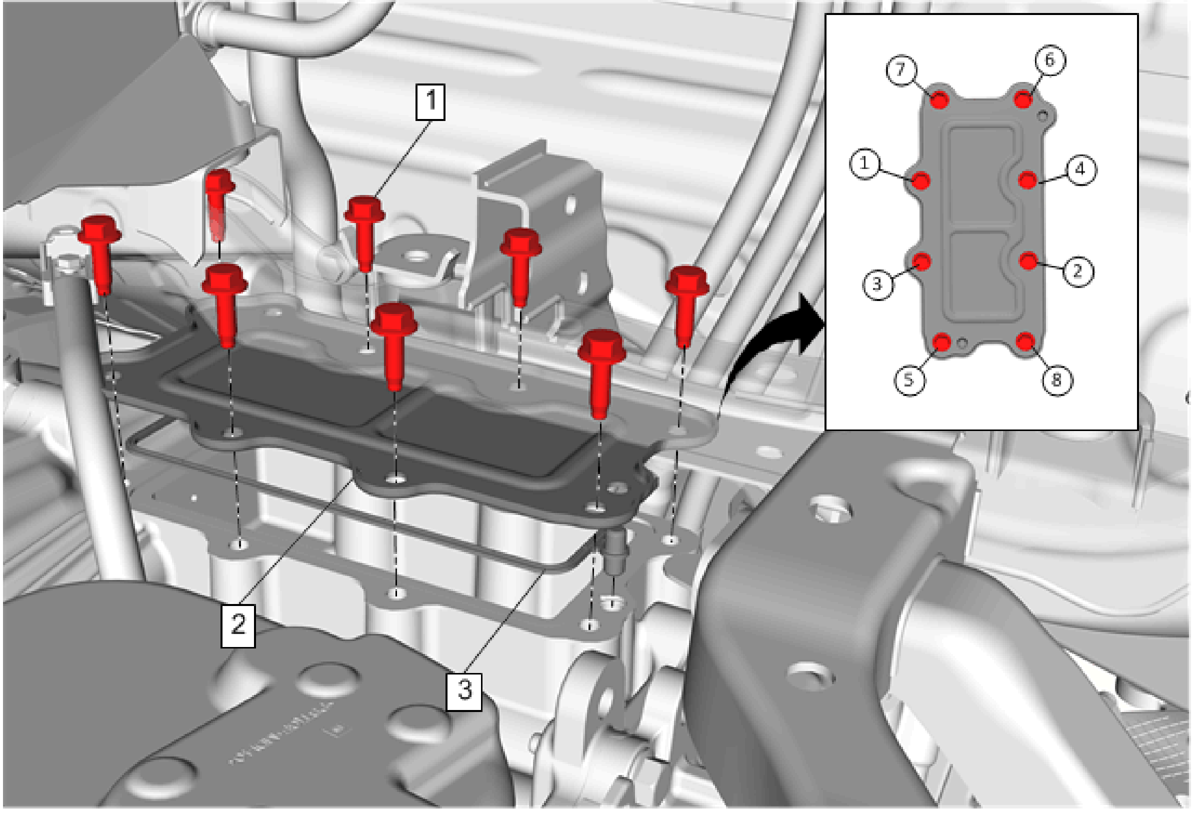

Fig. 62: Shift Shaft Cover With Bolt Tightening Sequence (Oil Sump)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Before performing this procedure, review the high voltage safety information. Refer to High Voltage Safety 2. Disable the high voltage system. Refer to High Voltage Disabling 3. Remove Drive Motor Battery Charger. Refer to Drive Motor Battery Charger Replacement (Except Dubai) Drive Motor Battery Charger Replacement (Dubai)	
1	Shift Shaft Cover Bolt (Qty: 8) **CAUTION:** **Refer to Fastener Caution .** **NOTE:** **Install all shift shaft cover bolts by hand then tighten all bolts in specified sequence** **Tighten** 9 N.m (80 lb in)
2	Shift Shaft Cover **Procedure** Enable the high voltage system. Refer to High Voltage Enabling
3	Shift Shaft Cover Gasket **NOTE:** **Install a NEW gasket.**

TRANSMISSION FLUID DRAIN AND FILL

1. Drive the vehicle until the normal fluid temperature 15 - 35Â°C (59 - 95Â°F) are reached.

2. Remove Front Wheelhouse Liner. Refer to Front Wheelhouse Liner Replacement
3. Remove Front Compartment Air Deflector. Refer to Front Compartment Air Deflector Replacement

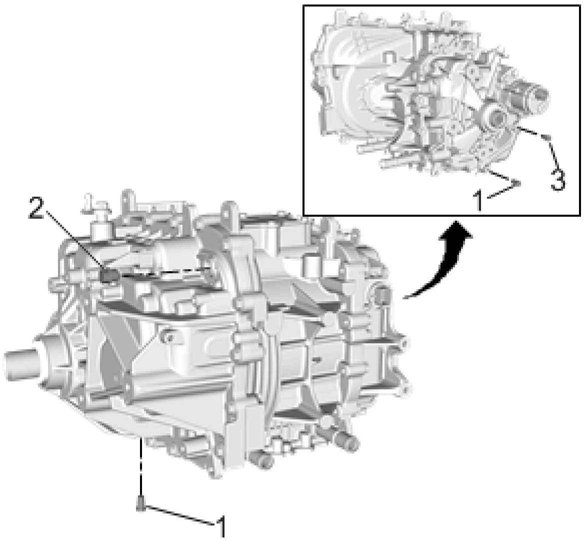

Fig. 63: Transmission Fluid Drain Plugs, Fill Plug And Fluid Level Check Plug
Courtesy of GENERAL MOTORS COMPANY

4. Remove and DISCARD Transmission Fluid Drain Plugs (1, 3) (Qty: 2)
5. Drain the transmission fluid into a suitable container.

CAUTION: **Refer to Fastener Caution .**

6. Install the 2 NEW transmission fluid drain plugs (1) and tighten to 12 N.m (106 lb in).
7. Remove the transmission fill plug (2).
8. Using a commercially available hand pump, add transmission fluid through the fill hole. Refer to Adhesives, Fluids, Lubricants, and Sealers, and Approximate Fluid Capacities for fluid specifications and fluid capacity.
9. Install the NEW transmission fill plug (2) and tighten to 13 N.m (115 lb in).
10. Wait for 5 minutes until oil reaches to the bottom of transmission.
11. Vehicle in service mode with the transmission in Park (P).
12. Using the scan tool, command the transmission fluid pump speed to ON for 1 minute for circulation.
13. Install Front Compartment Air Deflector. Refer to Front Compartment Air Deflector Replacement
14. Install Front Wheelhouse Liner. Refer to Front Wheelhouse Liner Replacement

NOTE: **Continue to monitor the transmission fluid temperature, if the fluid temperature falls below the specified range. Operate the vehicle again, until the transmission fluid temperature is reached.**

15. Drive the vehicle until the normal fluid temperature 35Â°C (95Â°F) are reached.
16. Wait for 5 minutes until oil reaches to the bottom of transmission.
17. Remove Front Wheelhouse Liner. Refer to Front Wheelhouse Liner Replacement
18. Remove Front Compartment Air Deflector. Refer to Front Compartment Air Deflector Replacement
19. Remove the transmission oil level check plug (3) and verify a light drip of fluid comes out.

NOTE: **Do not overfill the transmission. An overfilled transmission may result in foaming or fluid to be expelled out the vent tube when the vehicle is operated.**

20. Check the transmission fluid level. Refer to **Transmission Fluid Level and Condition Check**
21. Install the NEW transmission oil level check plug (3) and tighten to 12 N.m (106 lb in).
22. Install Front Compartment Air Deflector. Refer to **Front Compartment Air Deflector Replacement**
23. Install Front Wheelhouse Liner. Refer to **Front Wheelhouse Liner Replacement**
24. Perform the **Diagnostic Repair Verification** after completing the repair.

OUTPUT SHAFT REPLACEMENT - LEFT SIDE

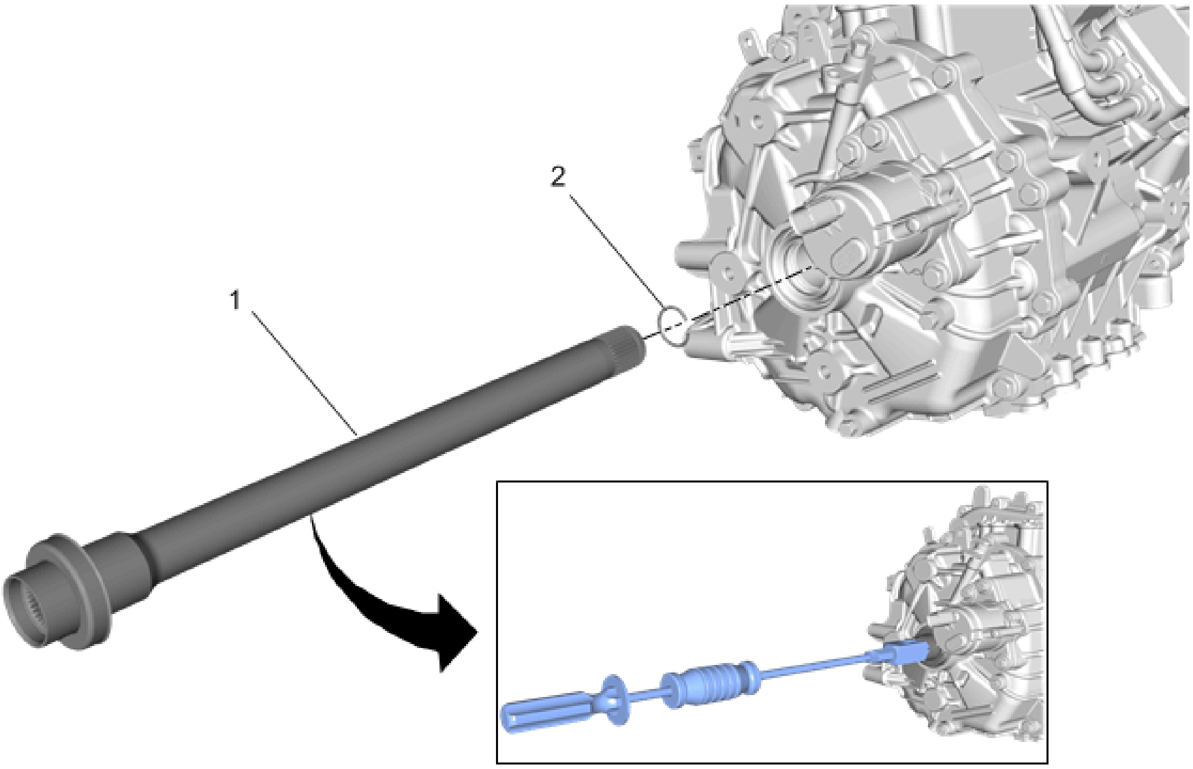

Fig. 64: Output Shaft - Left Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Remove Left Front Wheel Drive Shaft @ Transmission. Refer to **Front Wheel Drive Shaft Replacement**	
1	Output Shaft **Special Tools** - **DT-6125-1B** Slide Hammer - **DT-23907** Bearing Adapter Equivalent regional tools: **Special Tools**
2	Output Shaft Retaining Ring **NOTE:** **Install NEW output shaft retaining ring.**

OUTPUT SHAFT REPLACEMENT - RIGHT SIDE

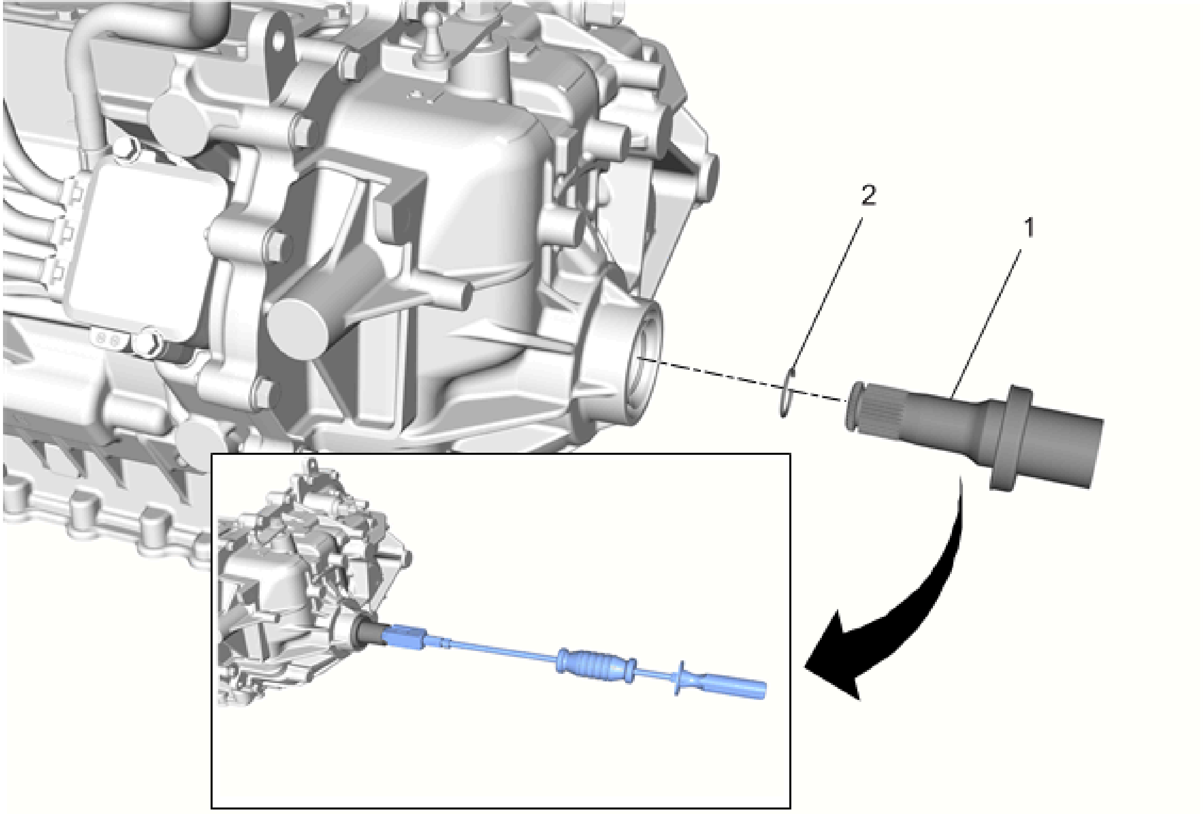

Fig. 65: Output Shaft - Right Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to Lifting and Jacking the Vehicle 2. Remove Right Front Wheel Drive Shaft @ Transmission. Refer to Front Wheel Drive Shaft Replacement	
1	Output Shaft **Special Tools** - **DT-6125-1B** Slide Hammer - **DT-23907** Bearing Adapter Equivalent regional tools: Special Tools
2	Output Shaft Retaining Ring **NOTE:** **Install NEW output shaft retaining ring.**

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - LEFT SIDE

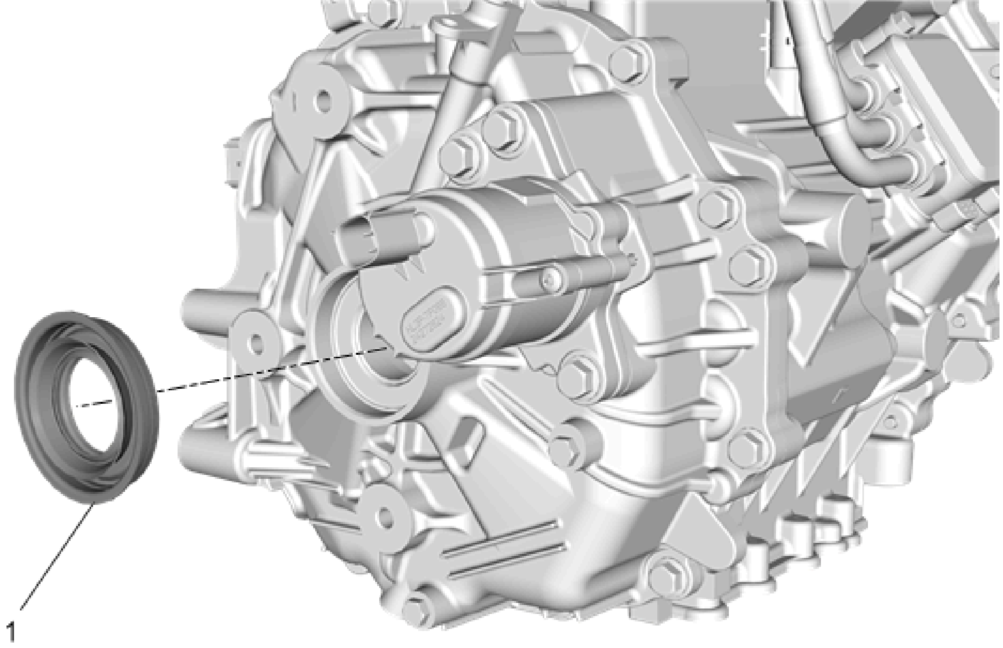

Fig. 66: Front Wheel Drive Shaft Seal - Left Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Remove Left Front Wheel Drive Shaft @ Transmission. Refer to **Front Wheel Drive Shaft Replacement** 3. Remove Output Shaft - Left Side. Refer to **Output Shaft Replacement - Left Side**	
1	Left Front Wheel Drive Shaft Oil Seal **Procedure** 1. For seal removal use **DT-6125-1B** slide hammer with **DT-23129** Universal Seal Remover. 2. For seal installation use **DT-44809** seal installer. **NOTE:** **Use NEW oil seal.** **Special Tools** - **DT-23129** Universal Seal Remover - **DT-6125-1B** Slide Hammer - **DT-44809** Seal Installer Equivalent regional tools: **Special Tools**

FRONT WHEEL DRIVE SHAFT SEAL REPLACEMENT - RIGHT SIDE

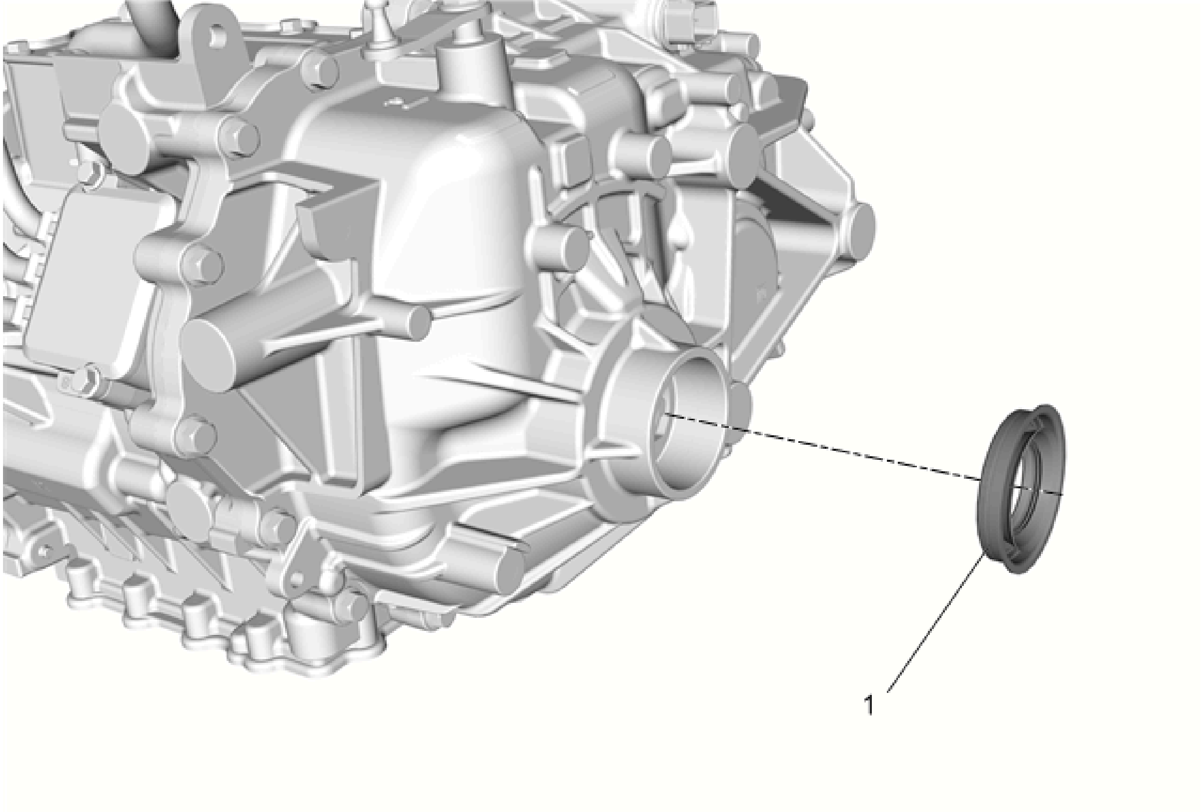

Fig. 67: Front Wheel Drive Shaft Seal - Right Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Raise and support the vehicle. Refer to **Lifting and Jacking the Vehicle** 2. Remove Right Front Wheel Drive Shaft @ Transmission. Refer to **Front Wheel Drive Shaft Replacement** 3. Remove Output Shaft - Right Side. Refer to **Output Shaft Replacement - Right Side**	
1	Right Front Wheel Drive Shaft Oil Seal **Procedure** 1. For seal removal use **DT-6125-1B** slide hammer with **DT-23129** Universal Seal Remover. 2. For seal installation use **DT-44809** seal installer. **NOTE:** **Use NEW oil seal.** **Special Tools** - **DT-23129** Universal Seal Remover - **DT-6125-1B** Slide Hammer - **DT-44809** Seal Installer Equivalent regional tools: **Special Tools**

TRANSMISSION REPLACEMENT

Special Tools

EN-36857 Engine Lift Bracket

Equivalent regional tools: Special Tools

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. Refer to High Voltage Disabling
2. Drain the transmission fluid. Refer to Transmission Fluid Drain and Fill

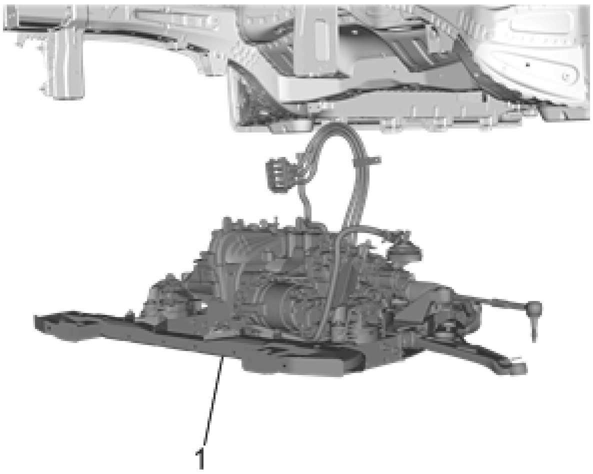

Fig. 68: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

3. Remove the drivetrain and front suspension frame with the automatic transmission from the vehicle. Refer to Drivetrain and Front Suspension Frame Removal and Installation
4. Remove Air Conditioning and Drive Motor Battery Cooling Compressor @ Transmission. Refer to Air Conditioning and Drive Motor Battery Cooling Compressor Replacement

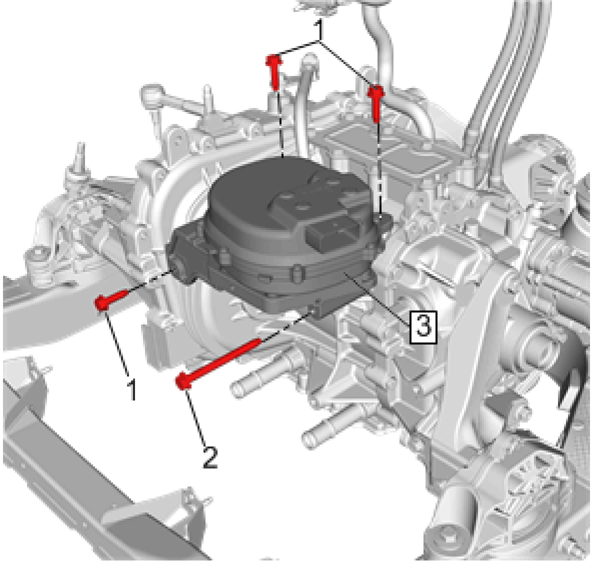

Fig. 69: Range Selector Actuator Hardware Module Assembly Bolts
Courtesy of GENERAL MOTORS COMPANY

5. Remove Range Selector Actuator Hardware Module Assembly Bolts (1, 2) (Qty: 4)

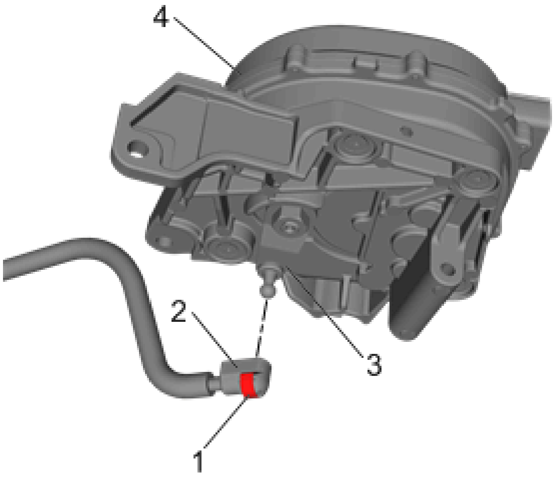

Fig. 70: Transmission Range Selector Lever Link, Retainer And Range Selector Actuator Hardware Module
Courtesy of GENERAL MOTORS COMPANY

6. Using a suitable tool, remove the transmission range selector lever link (2) while pulling the range selector lever link retainer (1).
7. Remove Range Selector Actuator Hardware Module Assembly (4)

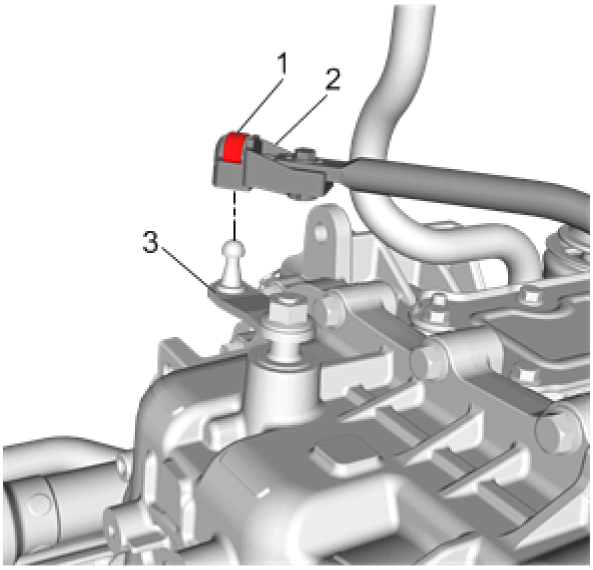

Fig. 71: Transmission Range Selector Lever Link And Lever Link Retainer
Courtesy of GENERAL MOTORS COMPANY

8. Using a suitable tool, remove the transmission range selector lever link (2) while pulling the range selector lever link retainer (1).
9. Position wood blocks under the transmission in order to support the transmission.
10. Remove the left and right drive motor mount. Refer to **Drive Motor Mount Replacement (Left Side)Drive Motor Mount Replacement (Right Side)**
11. Remove the drive motor rear mount bracket. Refer to **Drive Motor Rear Mount Bracket Replacement**

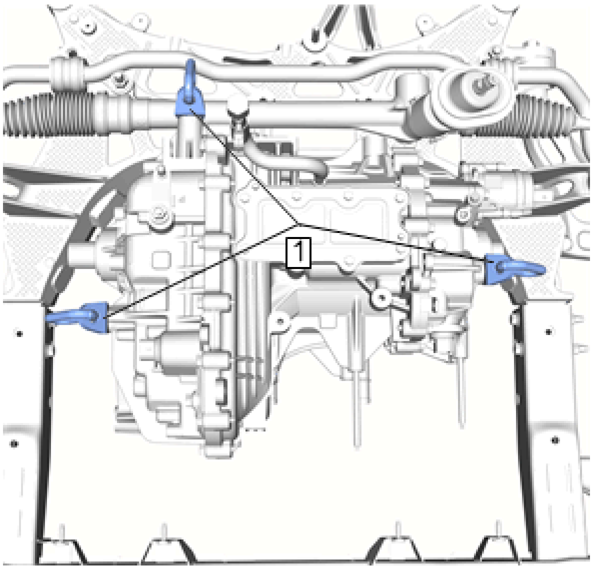

Fig. 72: Engine Lift Brackets And Lift Hooks
Courtesy of GENERAL MOTORS COMPANY

12. Separate the transmission from the drivetrain and front suspension frame.
    1. Install the *EN-36857* engine lift brackets (1) and lift hooks to the bosses on the transmission and use the engine hoist to remove the transmission from the frame.

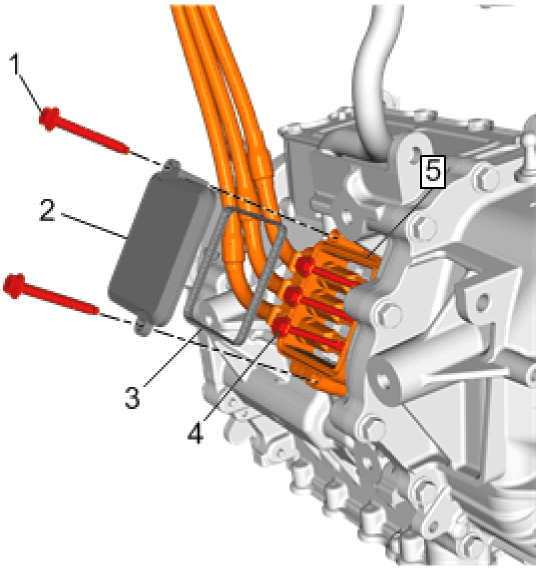

Fig. 73: Drive Motor Power Inverter Module 3 Phase Cable Connector, Cover, Bolts And Seal
Courtesy of GENERAL MOTORS COMPANY

13. Remove Drive Motor Power Inverter Module 3 Phase Cable Cover Bolts (1) (Qty: 2)
14. Remove Drive Motor Power Inverter Module 3 Phase Cable Cover (2)
15. Remove and DISCARD Drive Motor Power Inverter Module 3 Phase Cable Connector Seal (3)
16. Remove Drive Motor Power Inverter Module 3 Phase Cable Connector Bolts (4) (Qty: 3)
17. Remove Drive Motor Power Inverter Module 3 Phase Cable Connector (5) @ Transmission

Installation Procedure

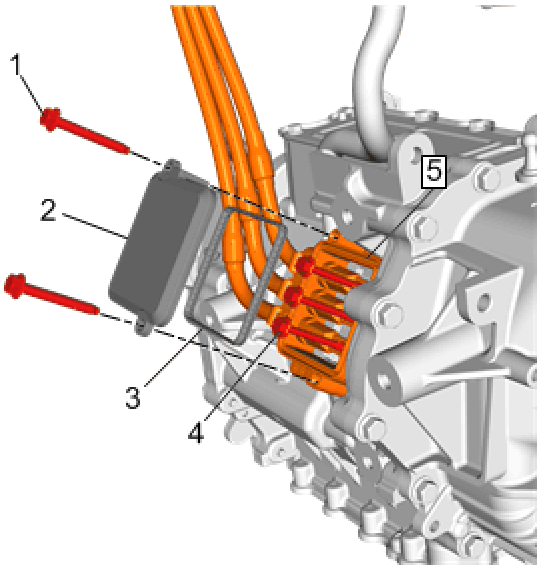

Fig. 74: Drive Motor Power Inverter Module 3 Phase Cable Connector, Cover, Bolts And Seal
Courtesy of GENERAL MOTORS COMPANY

1. Install Drive Motor Power Inverter Module 3 Phase Cable Connector (5) @ Transmission

CAUTION: **Refer to Fastener Caution .**

2. Install and tighten Drive Motor Power Inverter Module 3 Phase Cable Connector Bolts (4) (Qty: 3) to 9 N.m (80 lb in)
3. Install a NEW Drive Motor Power Inverter Module 3 Phase Cable Connector Seal (3).
4. Install Drive Motor Power Inverter Module 3 Phase Cable Cover (2)
5. Install and tighten Drive Motor Power Inverter Module 3 Phase Cable Cover Bolts (1) (Qty: 2) to 9 N.m (80 lb in)

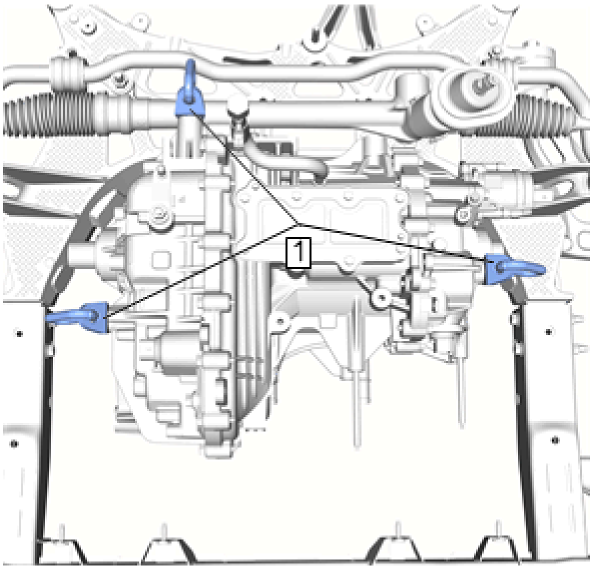

Fig. 75: Engine Lift Brackets And Lift Hooks
Courtesy of GENERAL MOTORS COMPANY

6. Position the transmission to the drivetrain and front suspension frame.
    1. Use the engine hoist to install the transmission to the frame.
    2. Position wood blocks under the transmission in order to support the transmission.
    3. Remove the *EN-36857* engine lift brackets (1) and lift hooks from the transmission.
7. Install the drive motor rear mount bracket. Refer to Drive Motor Rear Mount Bracket Replacement

8. Install the left and right drive motor mount. Refer to **Drive Motor Mount Replacement (Left Side)Drive Motor Mount Replacement (Right Side)**

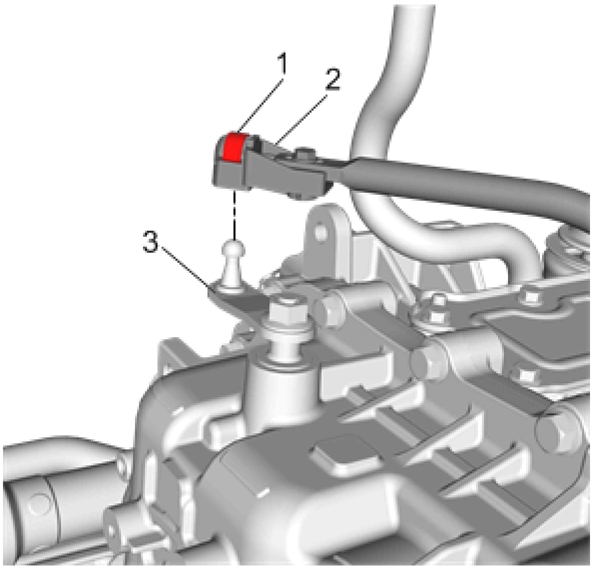

Fig. 76: Transmission Range Selector Lever Link And Lever Link Retainer
Courtesy of GENERAL MOTORS COMPANY

9. Verify the transmission range selector lever is in the park position.
10. Install Automatic Transmission Range Selector Lever Link (2) @ Transmission Range Selector Lever (3)

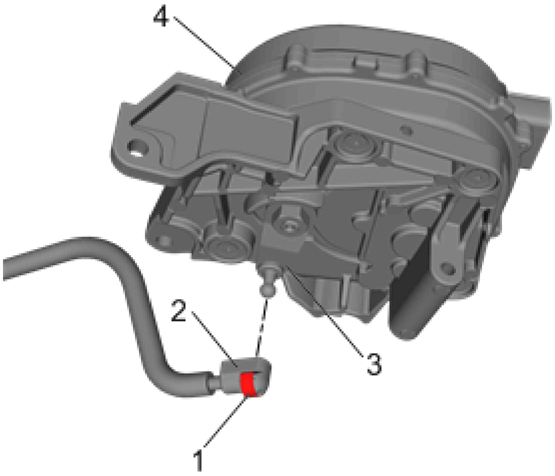

Fig. 77: Transmission Range Selector Lever Link, Retainer And Range Selector Actuator Hardware Module
Courtesy of GENERAL MOTORS COMPANY

11. Verify the transmission range selector actuator hardware module lever is in the park position.
12. Install the transmission range selector lever link (2) to the range selector actuator hardware module lever (3).

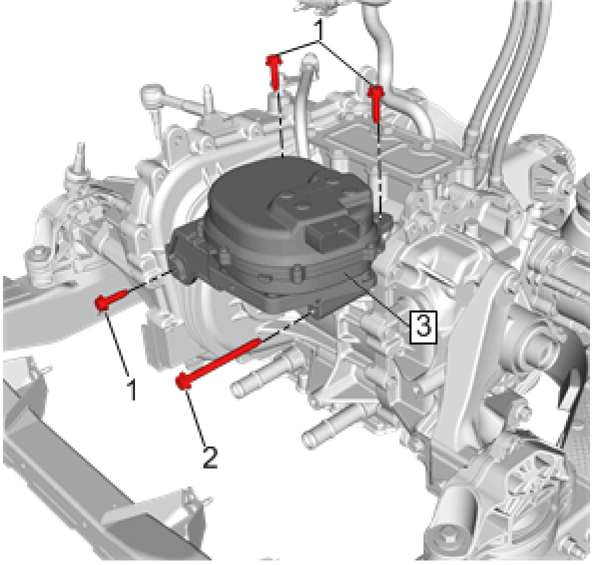

Fig. 78: Range Selector Actuator Hardware Module Assembly Bolts
Courtesy of GENERAL MOTORS COMPANY

13. Install Range Selector Actuator Hardware Module Assembly (3) @ Transmission
14. Install and tighten Range Selector Actuator Hardware Module Assembly Bolts (1, 2) (Qty: 4) to 22 N.m (16 lb ft)
15. Check the range selector lever link adjustment. Refer to **Range Selector Lever Link Adjustment**
16. Install Air Conditioning and Drive Motor Battery Cooling Compressor @ Transmission. Refer to **Air Conditioning and Drive Motor Battery Cooling Compressor Replacement**

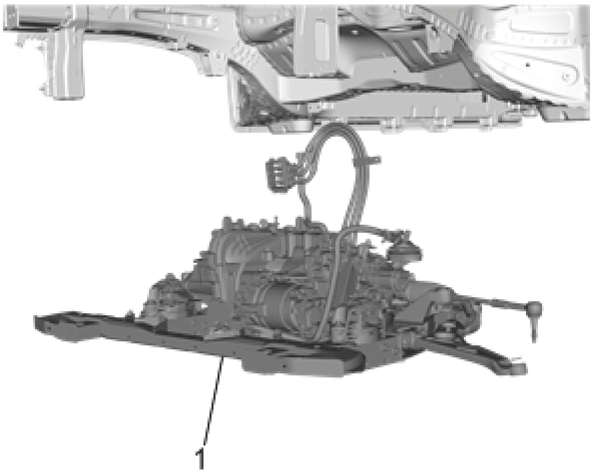

Fig. 79: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

17. Install the drivetrain and front suspension frame with the automatic transmission to the vehicle. Refer to **Drivetrain and Front Suspension Frame Removal and Installation**
18. Enable the high voltage system. Refer to **High Voltage Enabling**
19. Fill the transmission with transmission fluid. Refer to **Transmission Fluid Drain and Fill**
20. Perform the transmission range control module range motor position learn. Refer to **Transmission Range Control Module Range Motor Position Learn**
21. Verify proper operation of the transmission.

REPAIR INSTRUCTIONS - OFF VEHICLE

HOLDING FIXTURE INSTALLATION

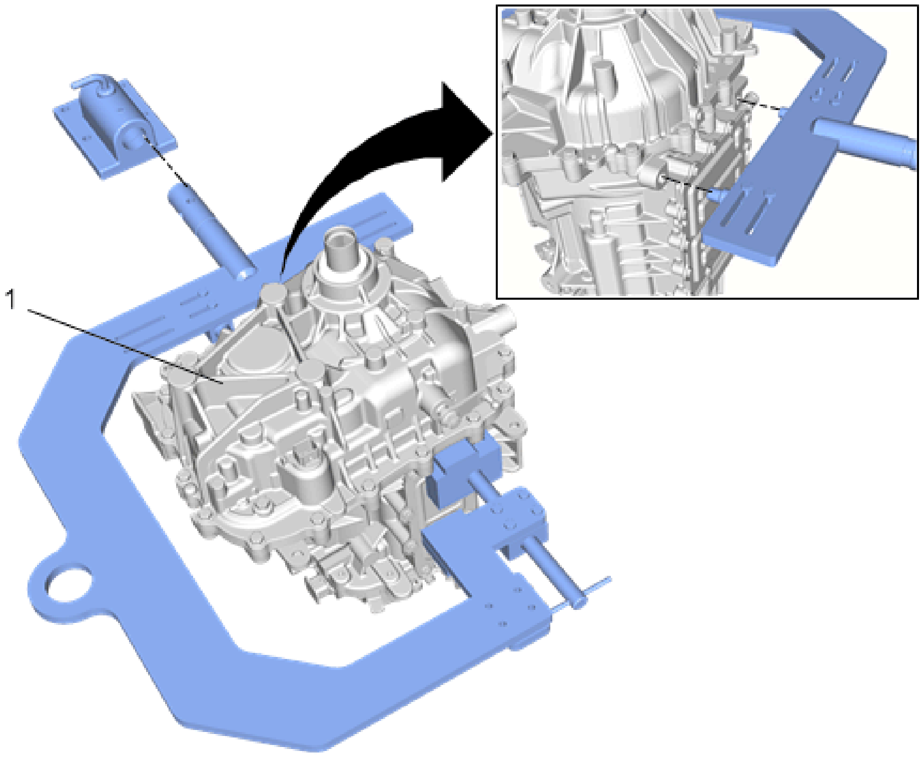

Fig. 80: Holding Fixture
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission **WARNING:** **Handle with care, the transmission assembly weighs over 83 Kg (183 lbs). Bodily injury could occur if not handled properly.** **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Use the supplied template to relocate holes on the fixture for mounting blocks. 2. Adjust mounting blocks on holding fixture to match bosses on case and tighten. **Tighten** 13 N.m (115 lb in) **Special Tools** - **DT-3289-20** Holding Fixture Base Assembly - **DT-46625** Holding Fixture - **DT-52009** Holding Fixture Adapter - **DT-46625-10** Holding Fixture Adapter Equivalent regional tools: Special Tools.

TRANSMISSION VENT PIPE REMOVAL

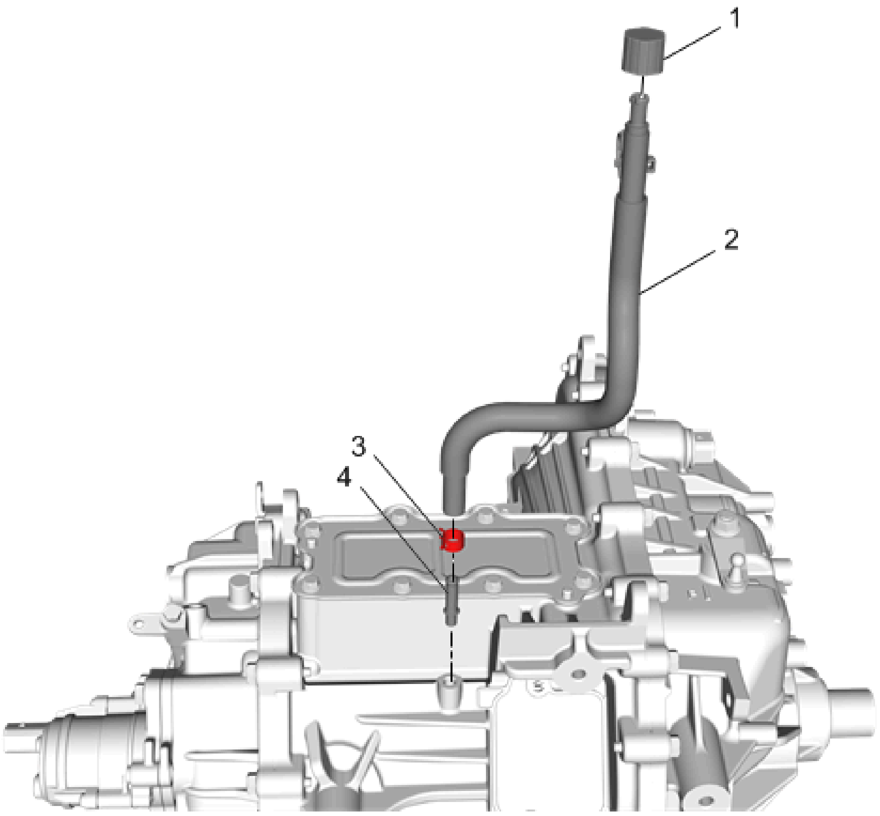

Fig. 81: Transmission Vent Pipe

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Transmission Vent Cap
2	Transmission Vent Hose
3	Transmission Vent Hose Clamp
4	Transmission Vent Pipe **NOTE:** **DISCARD the vent pipe.**

TRANSMISSION FLUID PUMP REMOVAL

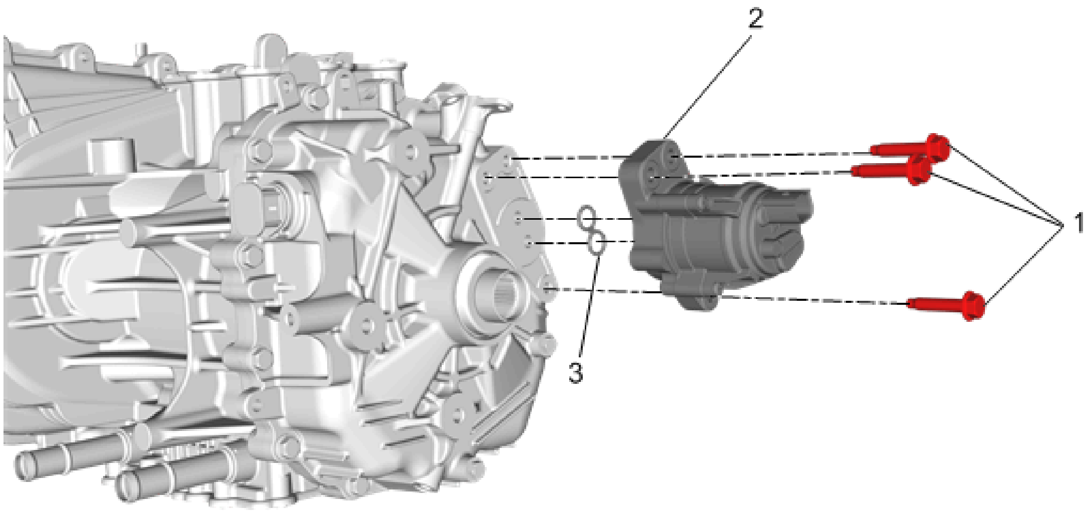

Fig. 82: Transmission Fluid Pump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Pump Bolt (Qty: 3)
2	Automatic Transmission Fluid Pump
3	Automatic Transmission Fluid Pump Seal **NOTE:** **DISCARD the automatic transmission fluid pump seal.**

OUTPUT SHAFT REMOVAL

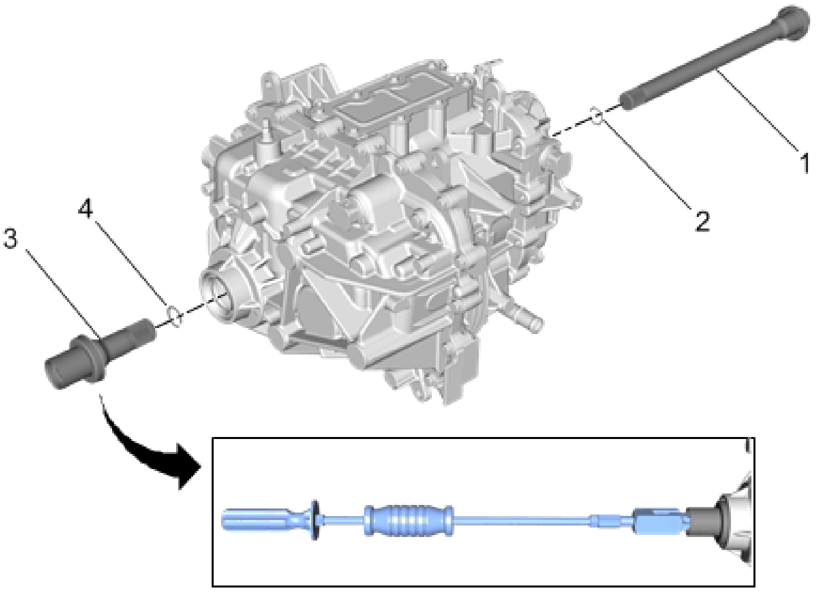

Fig. 83: Output Shaft
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Output Shaft (LHS) **NOTE:** **The output shaft is retained by an internal retaining ring.** **Special Tools** • **DT-6125-1B** Slide Hammer • **DT-23907** Bearing Adapter Equivalent regional tools: Special Tools.

Callout	Component Name
2	Output Shaft Retaining Ring **NOTE:** **DISCARD the output shaft retaining ring.**
3	Output Shaft (RHS) **NOTE:** **The output shaft is retained by an internal retaining ring.** **Special Tools** - **DT-6125-1B** Slide Hammer - **DT-23907** Bearing Adapter Equivalent regional tools: Special Tools.
4	Output Shaft Retaining Ring **NOTE:** **DISCARD the output shaft retaining ring.**

AUTOMATIC TRANSMISSION CASE REMOVAL

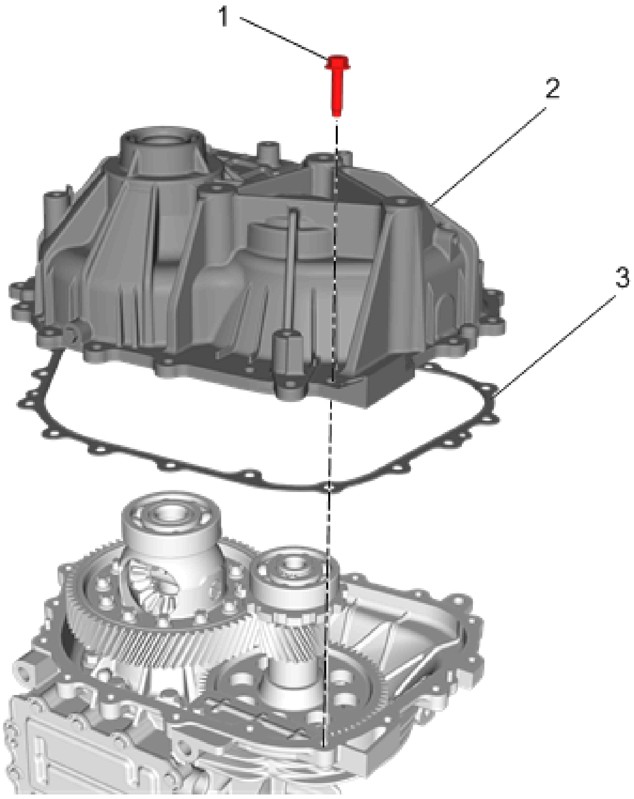

Fig. 84: Automatic Transmission Case
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Case Bolt (Qty: 18)
2	Automatic Transmission Case

Callout	Component Name
3	Automatic Transmission Case Gasket **NOTE:** **DISCARD the automatic transmission case gasket.**

AUTOMATIC TRANSMISSION CONTROL WIRING HARNESS REMOVAL - TRANSMISSION CASE

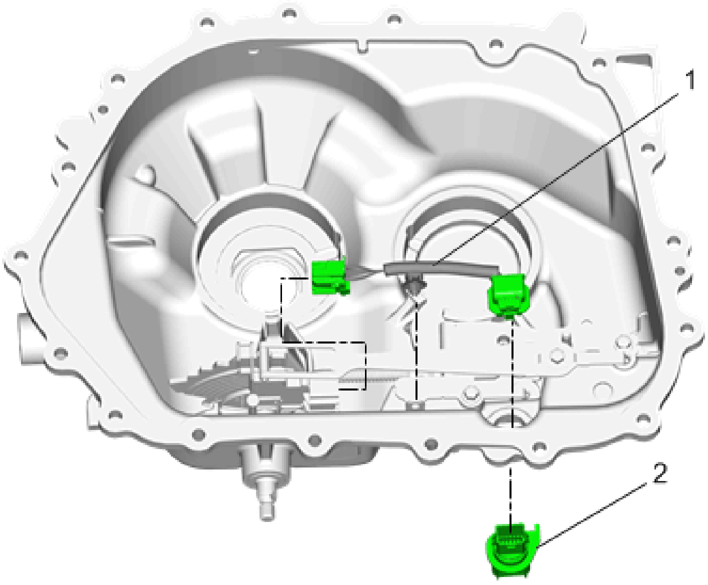

Fig. 85: Automatic Transmission Control Wiring Harness - Transmission Case
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Control Wiring Harness
2	Wiring Harness Electrical Connector **NOTE:** **DISCARD the wiring harness electrical connector.**

PARK PAWL AND MANUAL SHIFT SHAFT REMOVAL

Manual Shift Detent Lever Spring and Bracket Removal

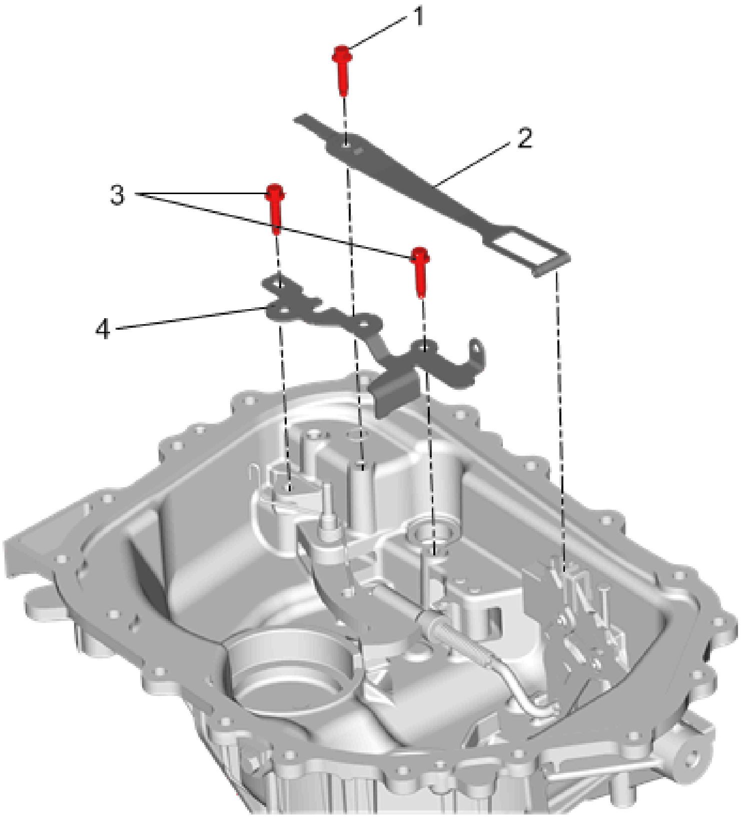

Fig. 86: Manual Shift Detent Lever Spring and Bracket
Courtesy of GENERAL MOTORS COMPANY

Manual Shift Detent Lever Spring and Bracket Removal

Callout	Component Name
1	Manual Shift Detent Lever Spring Bolt **NOTE:** **DISCARD the manual shift detent lever spring bolt**
2	Manual Shift Detent Lever Spring
3	Park Pawl Actuator Bracket Bolt (Qty: 2)
4	Park Pawl Actuator Bracket

Park Pawl, Shaft and Bracket Removal

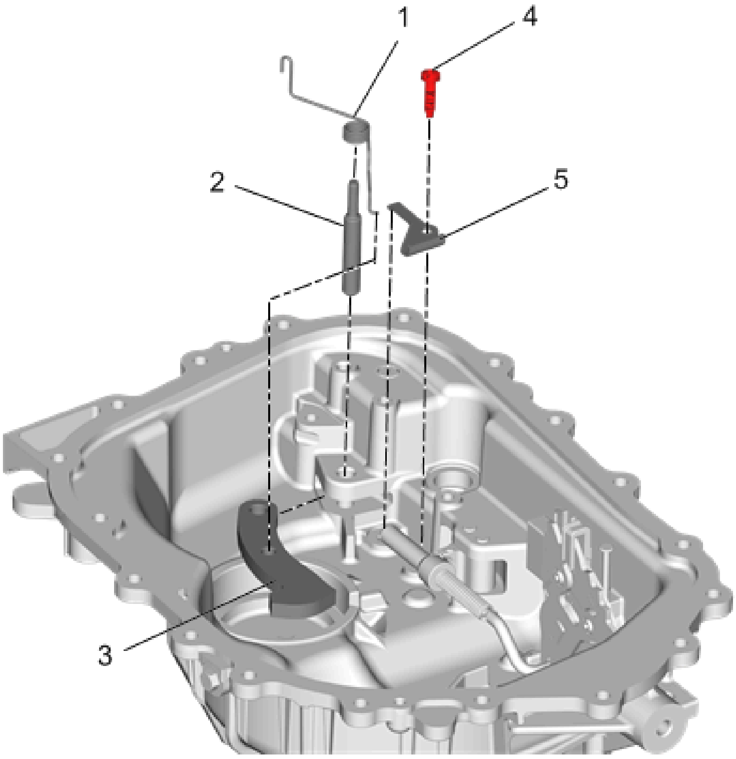

Fig. 87: Park Pawl, Shaft and Bracket
Courtesy of GENERAL MOTORS COMPANY

Park Pawl, Shaft and Bracket Removal

Callout	Component Name
1	Park Pawl Spring
2	Park Pawl Shaft
3	Park Pawl
4	Park Pawl Actuator Bracket Bolt
5	Park Pawl Actuator Bracket

Park Pawl Actuator Guide Removal

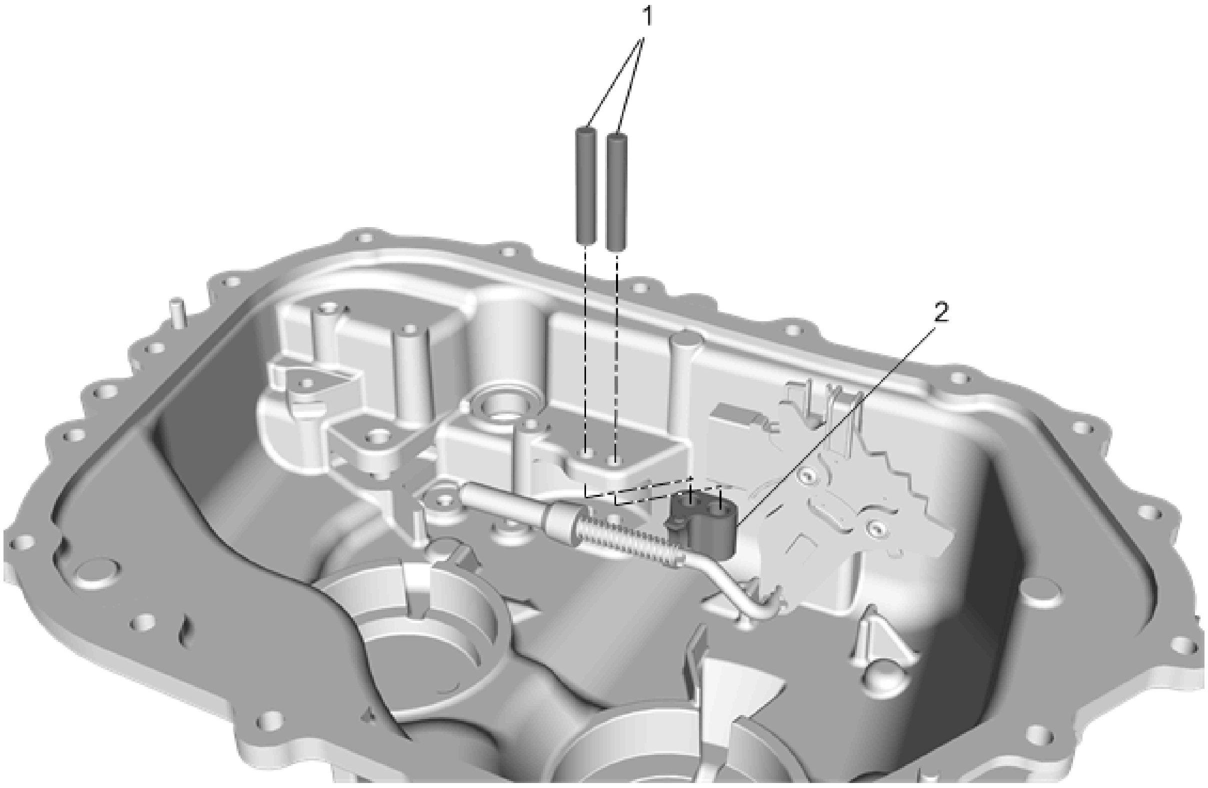

Fig. 88: Park Pawl Actuator Guide
Courtesy of GENERAL MOTORS COMPANY

Park Pawl Actuator Guide Removal

Callout	Component Name
1	Park Pawl Actuator Guide Pin (Qty: 2)
2	Park Pawl Actuator Guide

MANUAL SHIFT SHAFT POSITION SWITCH REMOVAL

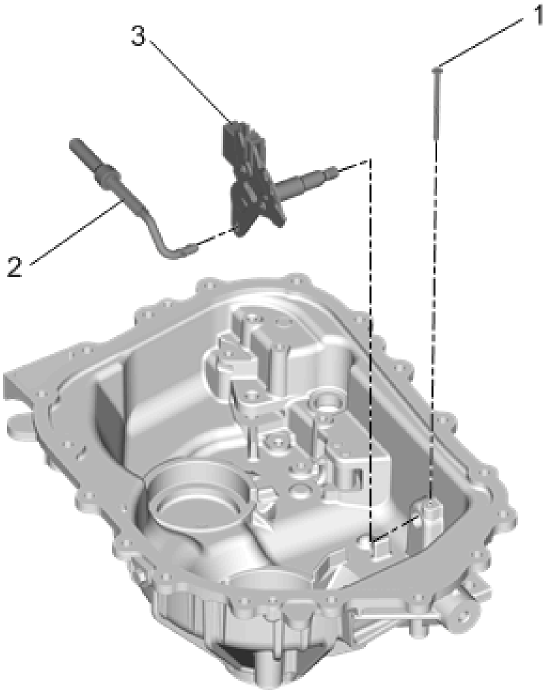

Fig. 89: Manual Shift Shaft Position Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Pin **NOTE:** **DISCARD the manual shift shaft pin.**
2	Park Pawl Actuator
3	Manual Shift Shaft Position Switch

MANUAL SHIFT SHAFT SEAL REMOVAL

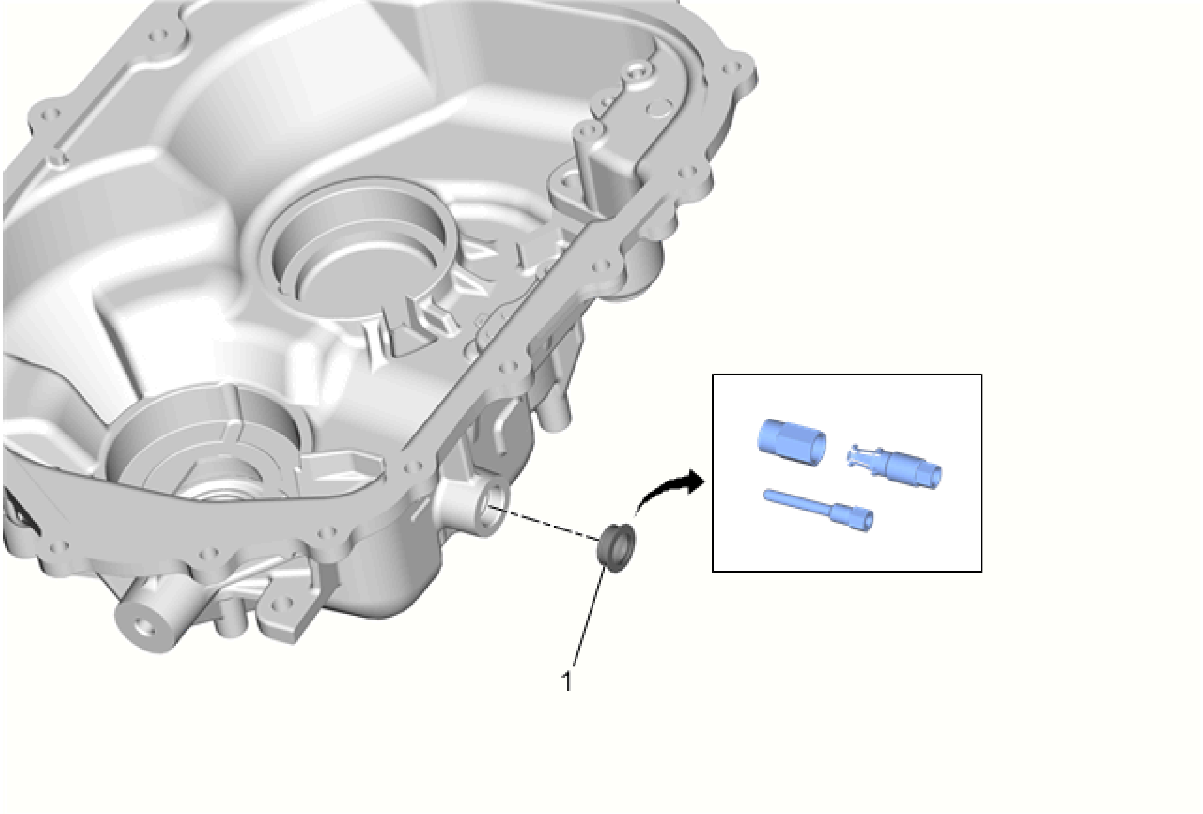

Fig. 90: Manual Shift Shaft Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Seal **NOTE:** **DISCARD the manual shift shaft seal.** **Special Tools** • **DT-45201** Shift Shaft Seal Remover Equivalent regional tools: Special Tools

FRONT WHEEL DRIVE SHAFT OIL SEAL REMOVAL - RIGHT SIDE

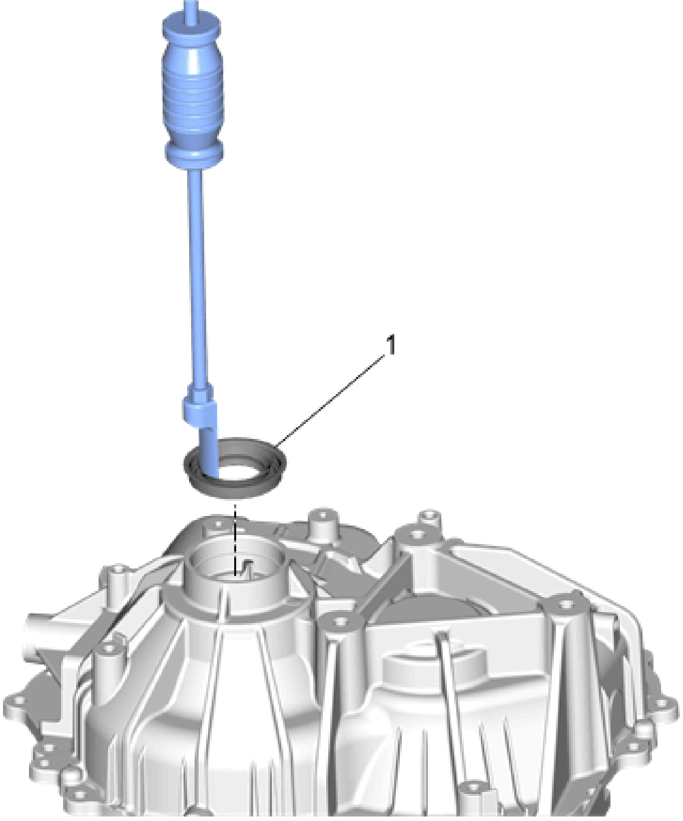

Fig. 91: Front Wheel Drive Shaft Oil Seal - Right Side
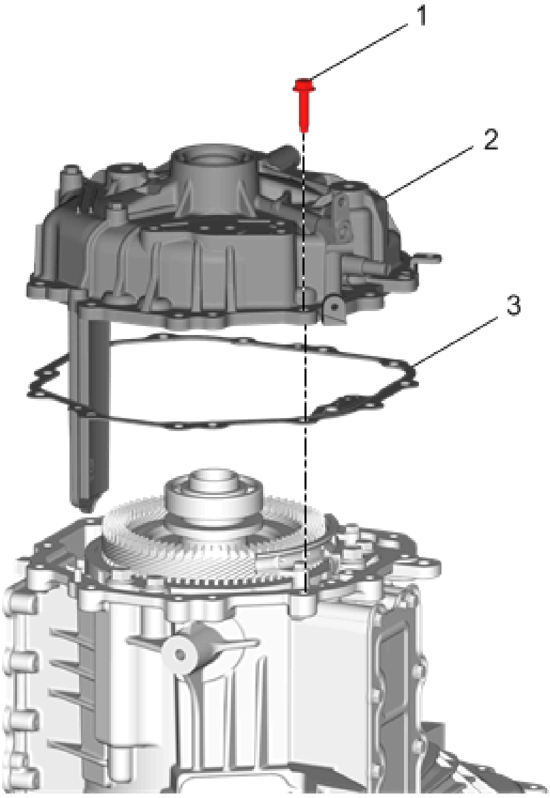
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal (RHS) **NOTE:** **DISCARD the front wheel drive shaft oil seal.** **Special Tools** • **DT-23129** Universal Seal Remover • **DT-6125-1B** Slide Hammer Equivalent regional tools: Special Tools

AUTOMATIC TRANSMISSION CASE COVER REMOVAL



[Fig. 92: Automatic Transmission Case Cover](#)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Case Cover Bolt (Qty: 13)
2	Automatic Transmission Case Cover
3	Automatic Transmission Case Cover Gasket **NOTE:** **DISCARD the automatic transmission case cover gasket.**

AUTOMATIC TRANSMISSION CONTROL WIRING HARNESS REMOVAL - TRANSMISSION CASE COVER

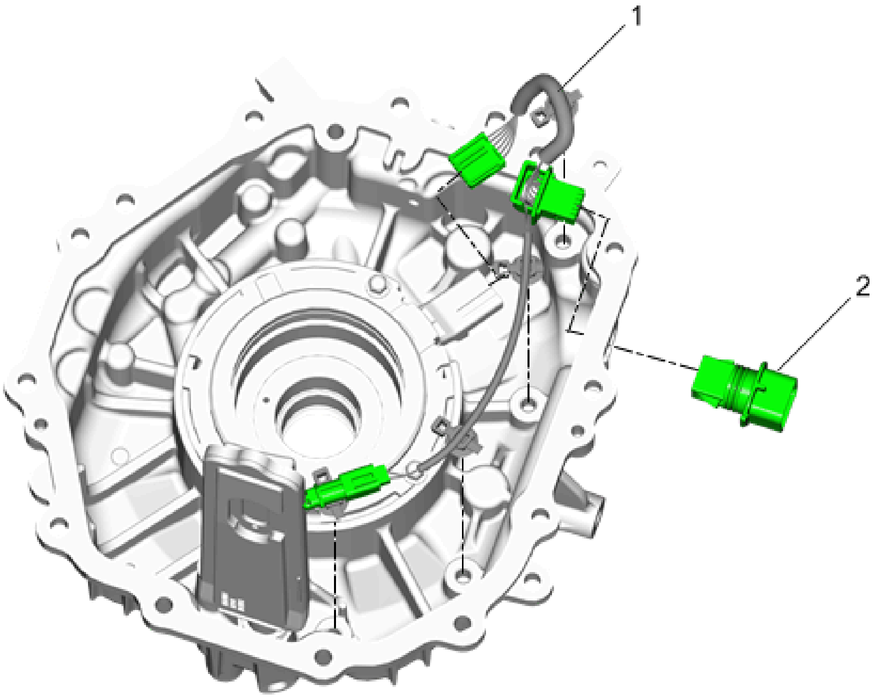


Fig. 93: Automatic Transmission Control Wiring Harness - Transmission Case Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Control Wiring Harness
2	Wiring Harness Electrical Connector **NOTE:** **DISCARD the wiring harness electrical connector.**

AUTOMATIC TRANSMISSION FLUID FILTER REMOVAL

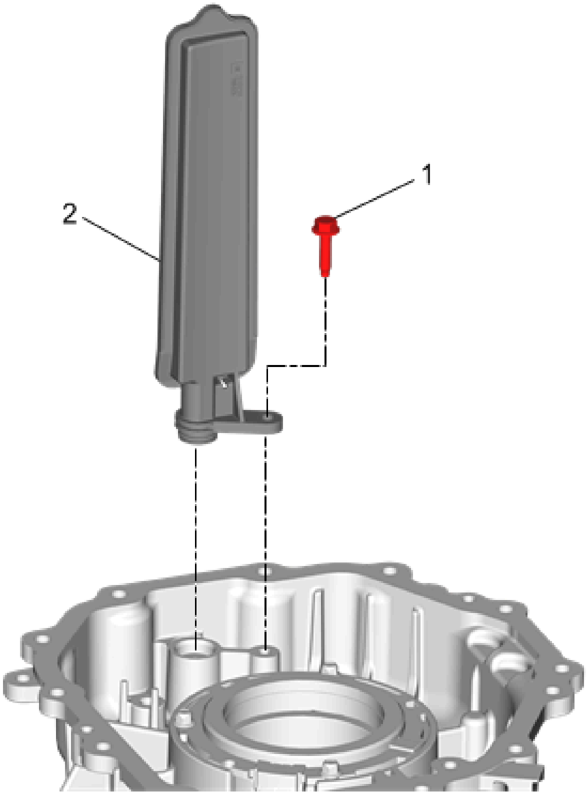

Fig. 94: Automatic Transmission Fluid Filter
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Filter Bolt
2	Automatic Transmission Fluid Filter **NOTE:** **Discard the fluid filter. The fluid filter O-ring is not serviceable separately.**

DRIVE MOTOR POSITION SENSOR STATOR REMOVAL

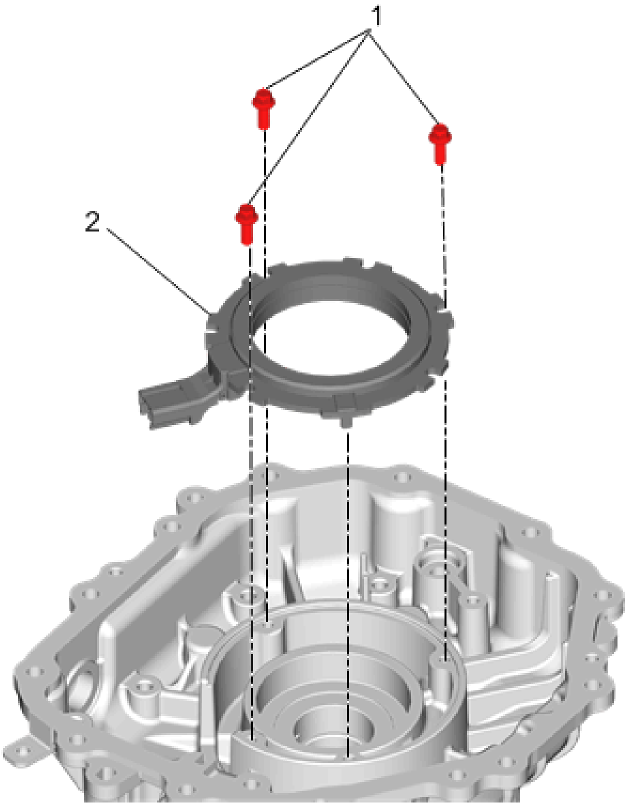

Fig. 95: Drive Motor Position Sensor Stator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Position Sensor Stator Bolt (Qty: 3) **NOTE:** **DISCARD the drive motor position sensor stator bolts.**
2	Drive Motor Position Sensor Stator

FRONT WHEEL DRIVE SHAFT OIL SEAL REMOVAL - LEFT SIDE

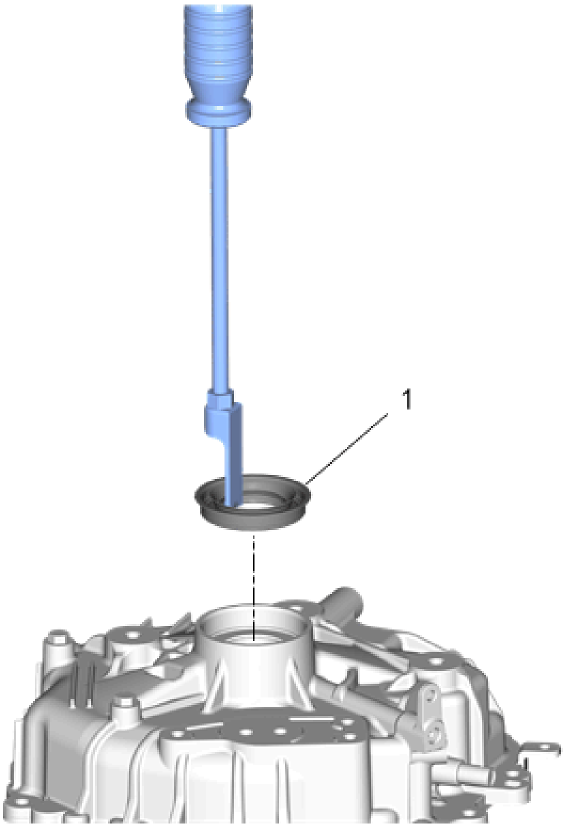

Fig. 96: Front Wheel Drive Shaft Oil Seal - Left Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal (LHS) **NOTE:** **DISCARD the front wheel drive shaft oil seal.** **Special Tools** • **DT-23129** Universal Seal Remover • **DT-6125-1B** Slide Hammer Equivalent regional tools: Special Tools

AUTOMATIC TRANSMISSION FLUID PAN MAGNET REMOVAL

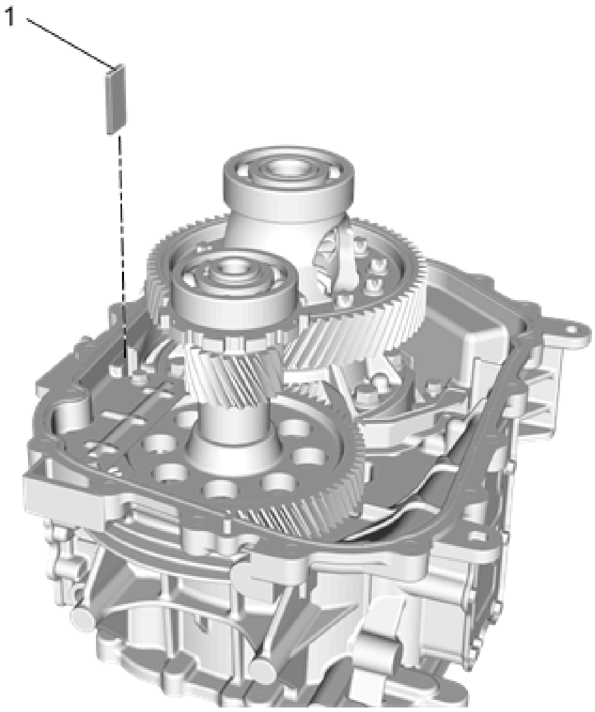

Fig. 97: Automatic Transmission Fluid Pan Magnet
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Pan Magnet

OIL PAN BAFFLE REMOVAL

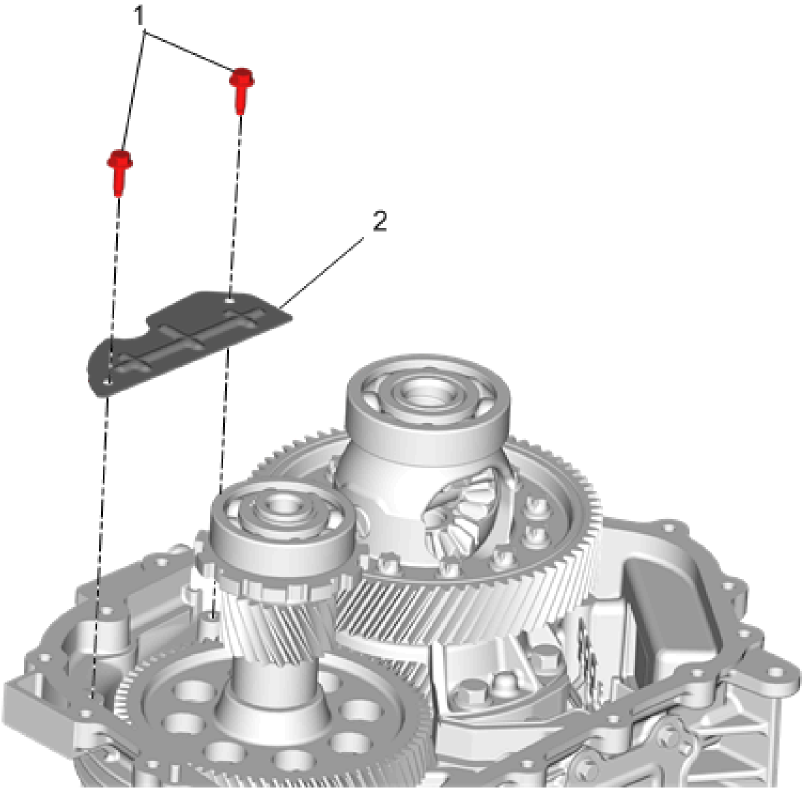

Fig. 98: Oil Pan Baffle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Oil Pan Baffle Bolt (Qty: 2)
2	Oil Pan Baffle

MANUAL TRANSMISSION OIL TROUGH REMOVAL

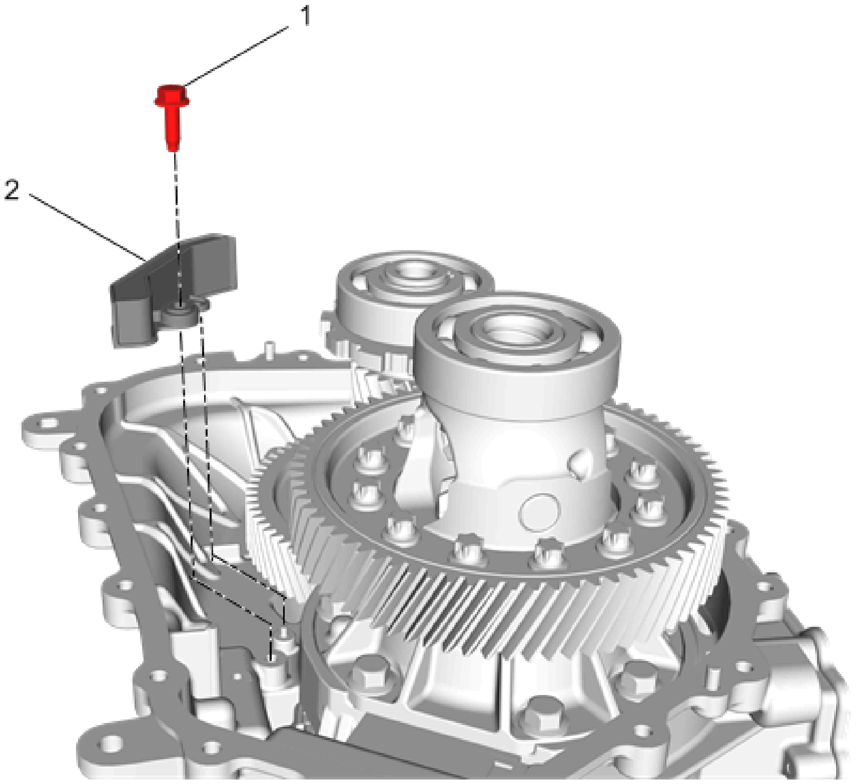

Fig. 99: Manual Transmission Oil Trough
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Transmission Oil Trough Bolt

Callout	Component Name
2	Manual Transmission Oil Trough

DRIVE MOTOR POWER INVERTER MODULE CABLE TERMINAL INSULATOR BLOCK REMOVAL

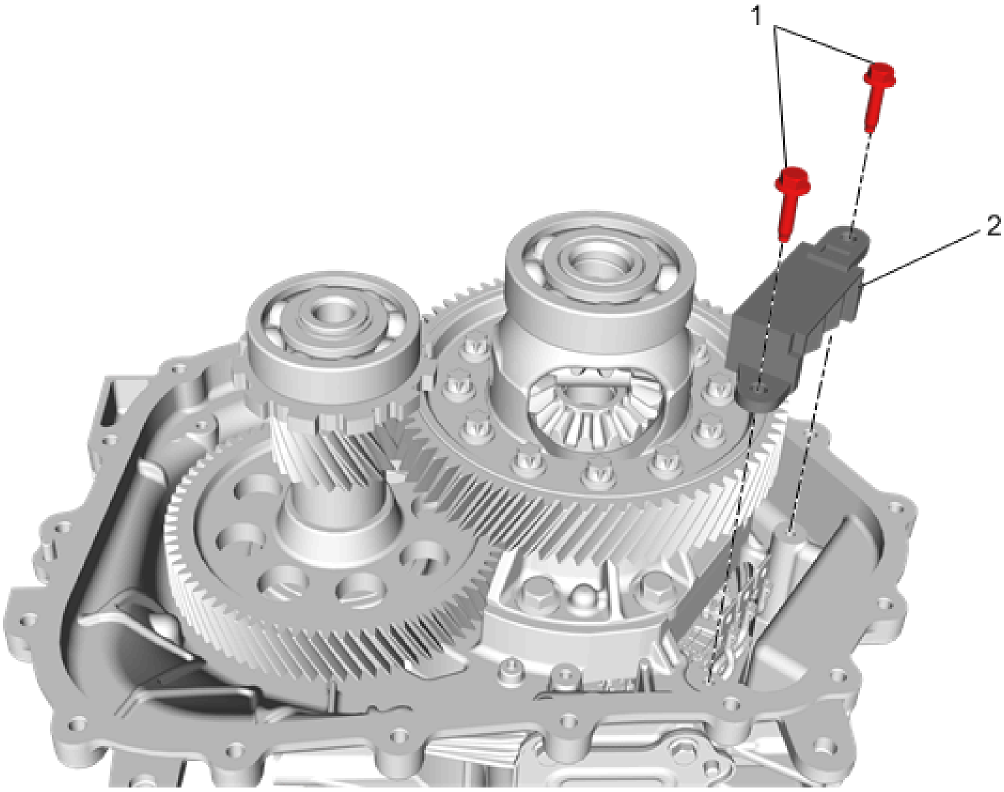

Fig. 100: Drive Motor Power Inverter Module Cable Terminal Insulator Block
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Power Inverter Module Cable Terminal Insulator Block Bolt (Qty: 2)
2	Drive Motor Power Inverter Module Cable Terminal Insulator Block

FRONT DIFFERENTIAL ASSEMBLY REMOVAL

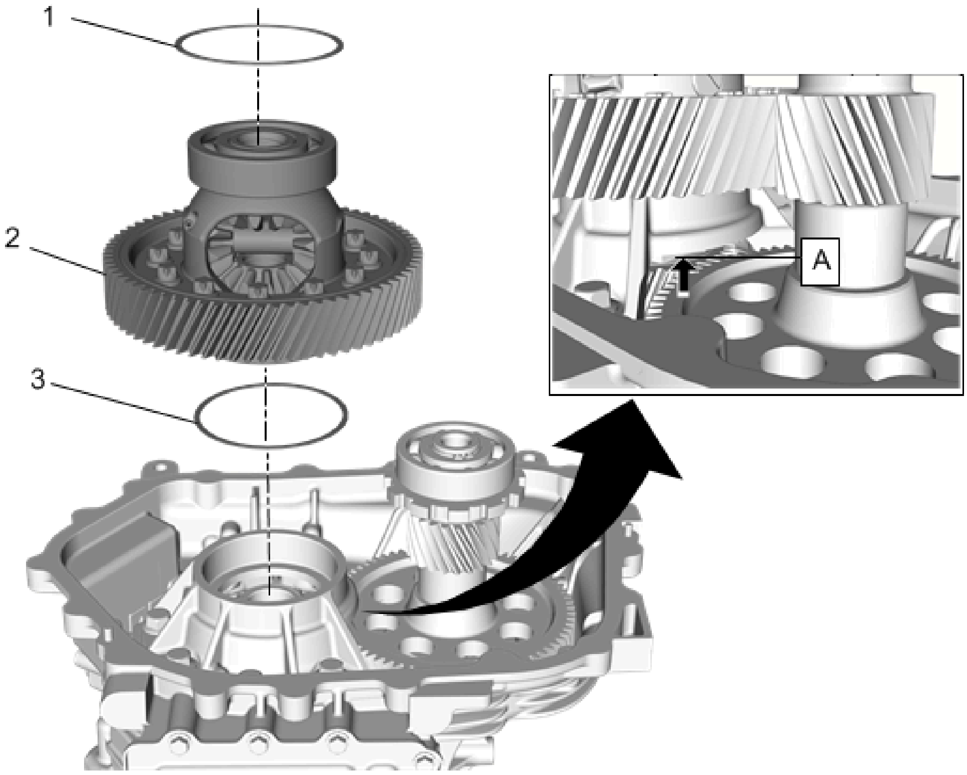

Fig. 101: Front Differential Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Bearing Shim (RHS) **NOTE:** **DISCARD the shim.**
2	Front Differential **NOTE:** **Raise the main shaft assembly until the A position in order to remove the front differential assembly.**
3	Front Differential Bearing Shim (LHS) **NOTE:** **DISCARD the shim.**

CENTER SUPPORT REMOVAL

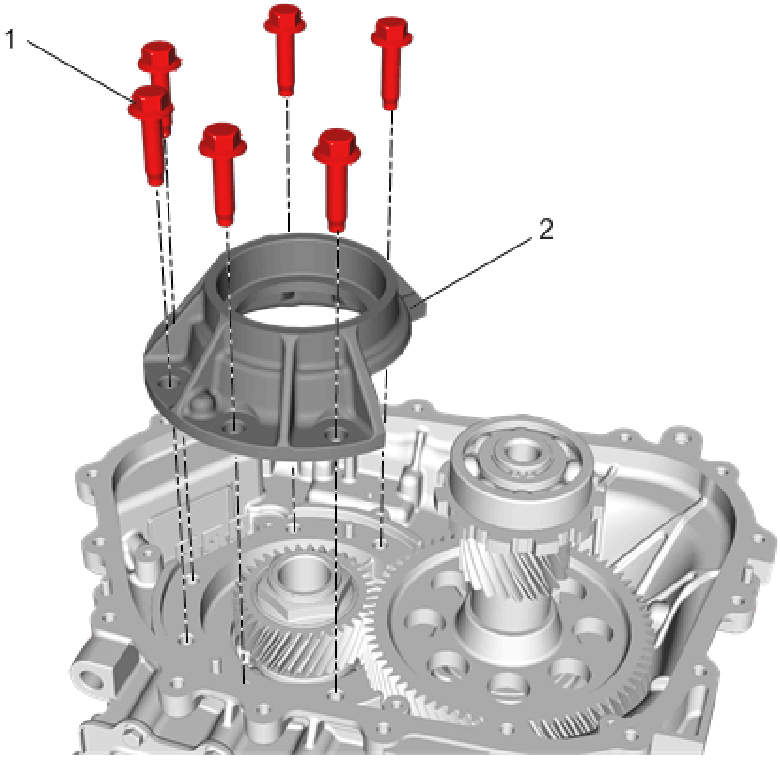

Fig. 102: Center Support
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Center Support Bolt (Qty: 6) **NOTE:** **DISCARD the center support bolts.**
2	Center Support

MAIN SHAFT ASSEMBLY REMOVAL

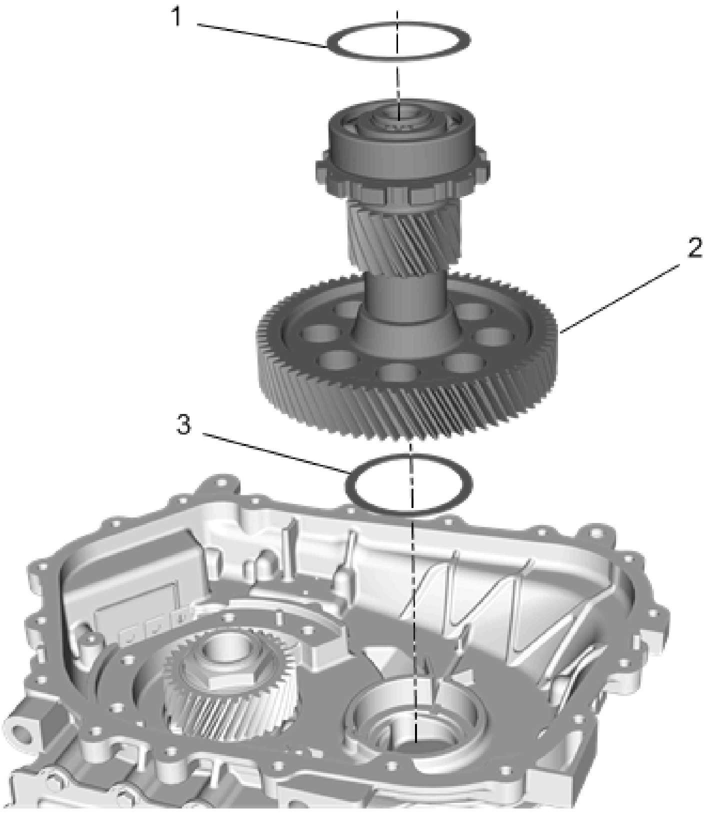

Fig. 103: Main Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Main Shaft Bearing Shim (RHS) **NOTE:** **DISCARD the shim.**
2	Main Shaft
3	Main Shaft Bearing Shim (LHS) **NOTE:** **DISCARD the shim.**

DRIVE MOTOR STATOR COOLANT DISTRIBUTOR CHANNEL REMOVAL

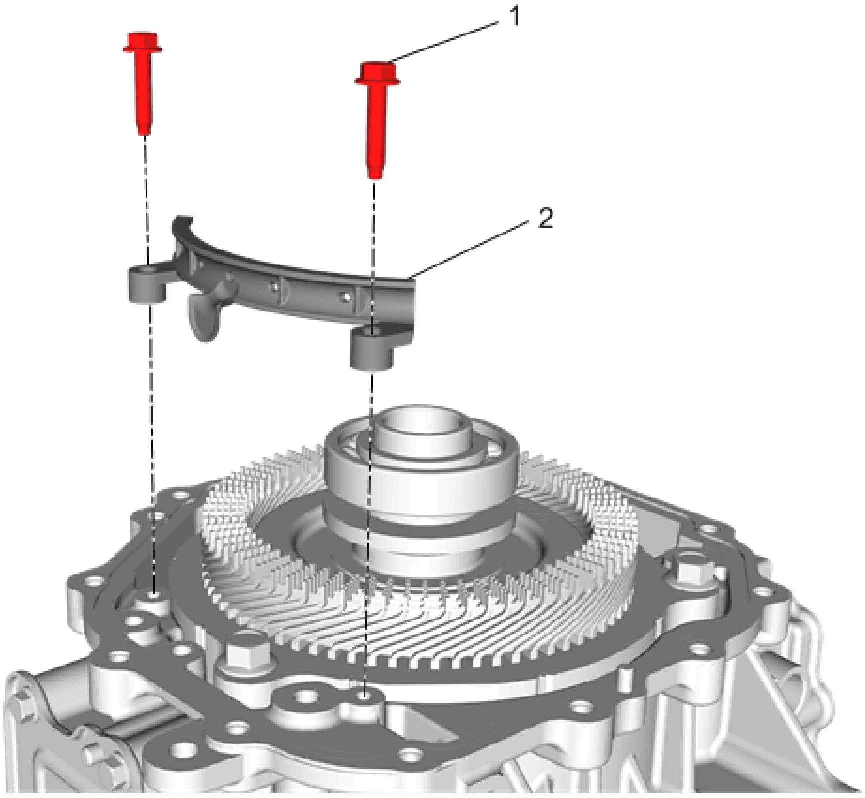

Fig. 104: Drive Motor Stator Coolant Distributor Channel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Stator Cooling Distributor Channel Bolt (Qty: 2)
2	Drive Motor Stator Cooling Distributor Channel

DRIVE MOTOR ROTOR REMOVAL

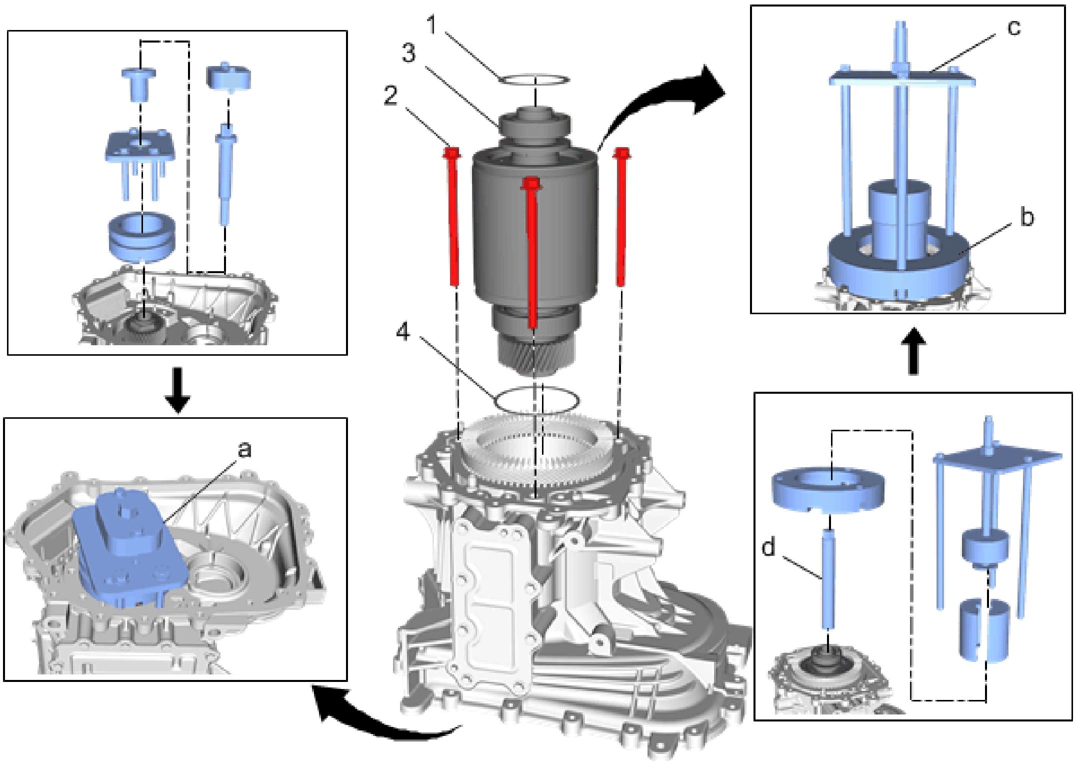

Fig. 105: Drive Motor Rotor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Drive Motor Rotor Bearing Shim (LHS) **NOTE:** **Remove the shim to transmission case cover if there is no shim on drive motor rotor bearing.** **NOTE:** **DISCARD the shim.**
2	Drive Motor Stator Bolt (Qty: 3) **NOTE:** **DISCARD the drive motor stator bolts.**
3	Drive Motor Rotor **Procedure** 1. Install the *DT-52011 - 1* rotor fixing (a), *DT-52011 - 3* hair pin cover (b) and *DT-52011 - 2* rotor remover/installer (c). 2. Remove the drive motor rotor by turning the nut on the *DT-52011 - 2* rotor remover/installer (c) clockwise. **NOTE:** **The drive motor rotor is strongly magnetic. DO NOT place within 6 inches of ferrous metallic components.** **NOTE:** **Place the drive motor rotor on a lint free cloth to prevent metallic debris from adhering to the outer diameter. Metallic debris can be removed from the motor outer diameter by blotting with adhesive tape.** **Special Tools** **DT-52011** Rotor Remover/Installer Kit Equivalent regional tools: Special Tools
4	Drive Motor Rotor Bearing Shim (RHS) **NOTE:** **DISCARD the shim.**

DRIVE MOTOR STATOR REMOVAL

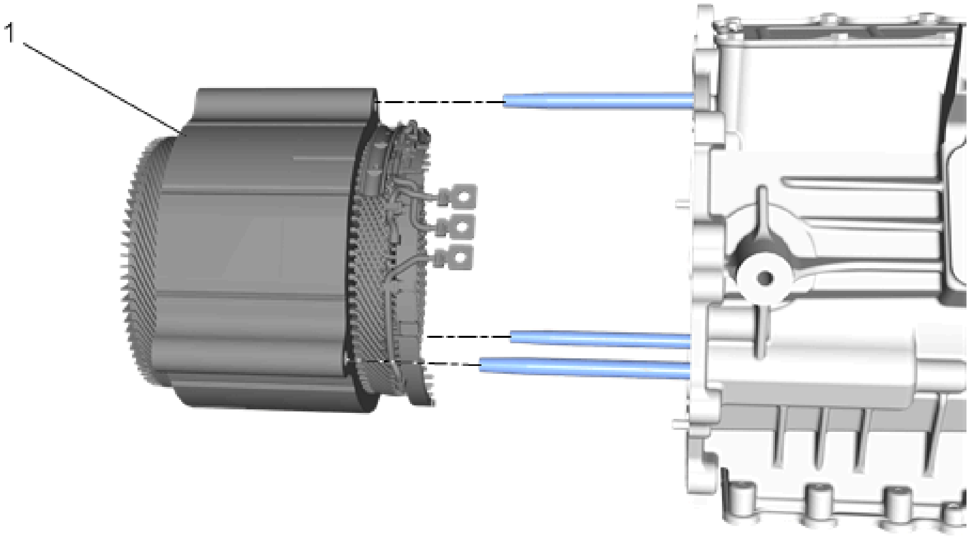

Fig. 106: Drive Motor Stator
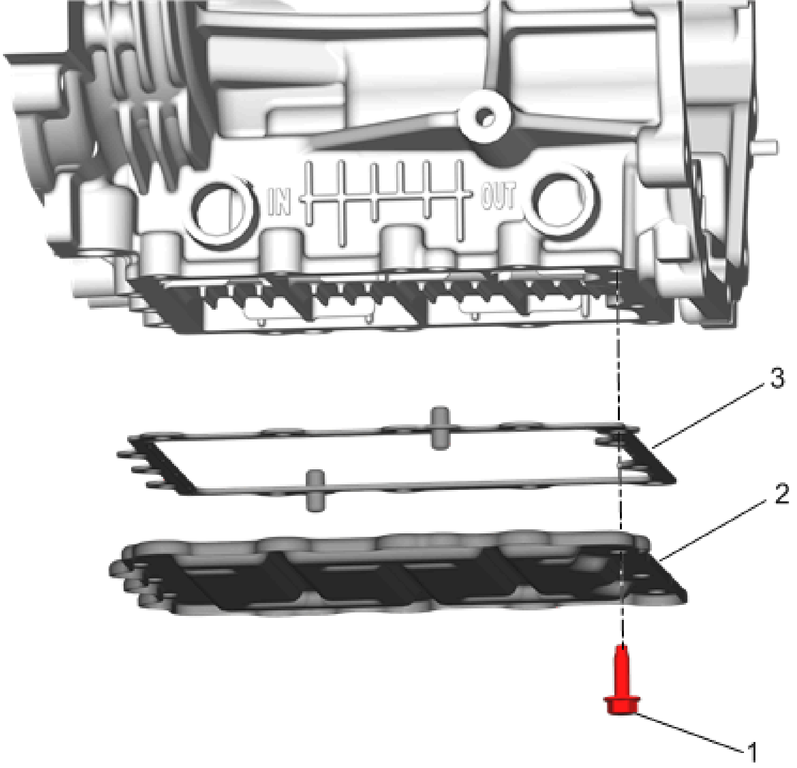
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Stator **CAUTION:** **DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage.** **NOTE:** **Place the drive motor stator on a lint free cloth over a piece of cardboard.** **Special Tools** **DT-52012** Stator Remover/Installer Equivalent regional tools: **Special Tools**

SHIFT SHAFT COVER REMOVAL - COOLANT SUMP



[Fig. 107: Shift Shaft Cover - Coolant Sump](#)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Shift Shaft Cover Bolt (Qty: 14)
2	Shift Shaft Cover
3	Shift Shaft Cover Gasket **NOTE:** **DISCARD the gasket.**

SHIFT SHAFT COVER REMOVAL - OIL SUMP

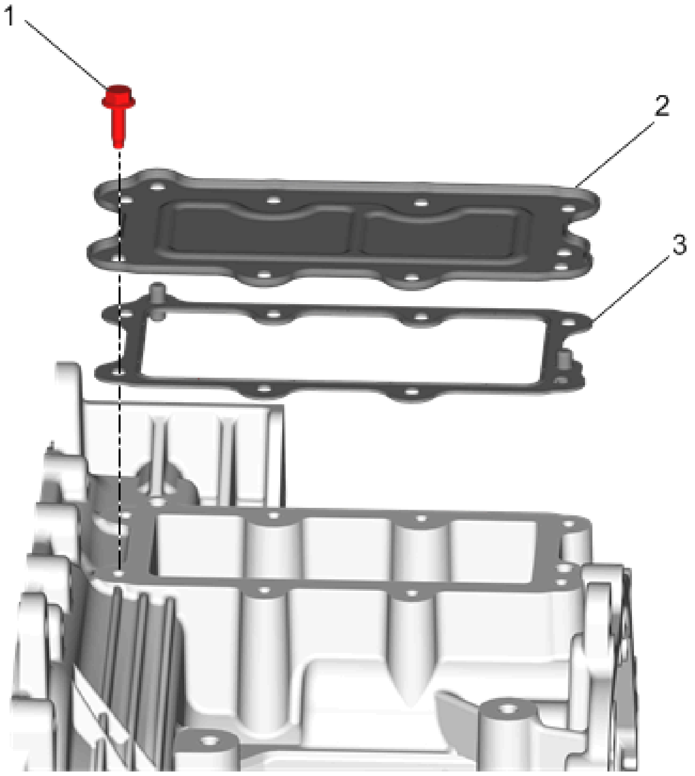


Fig. 108: Shift Shaft Cover - Oil Sump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Shift Shaft Cover Bolt (Qty: 8)
2	Shift Shaft Cover
3	Shift Shaft Cover Gasket **NOTE:** **DISCARD the gasket.**

SHIMMING PROCEDURES

Special Tools

DT-48008 Pinion Bearing Installer

Equivalent regional tools: Special Tools

Shimming Procedures

NOTE: **The correct shim has to be selected using the following procedure.**

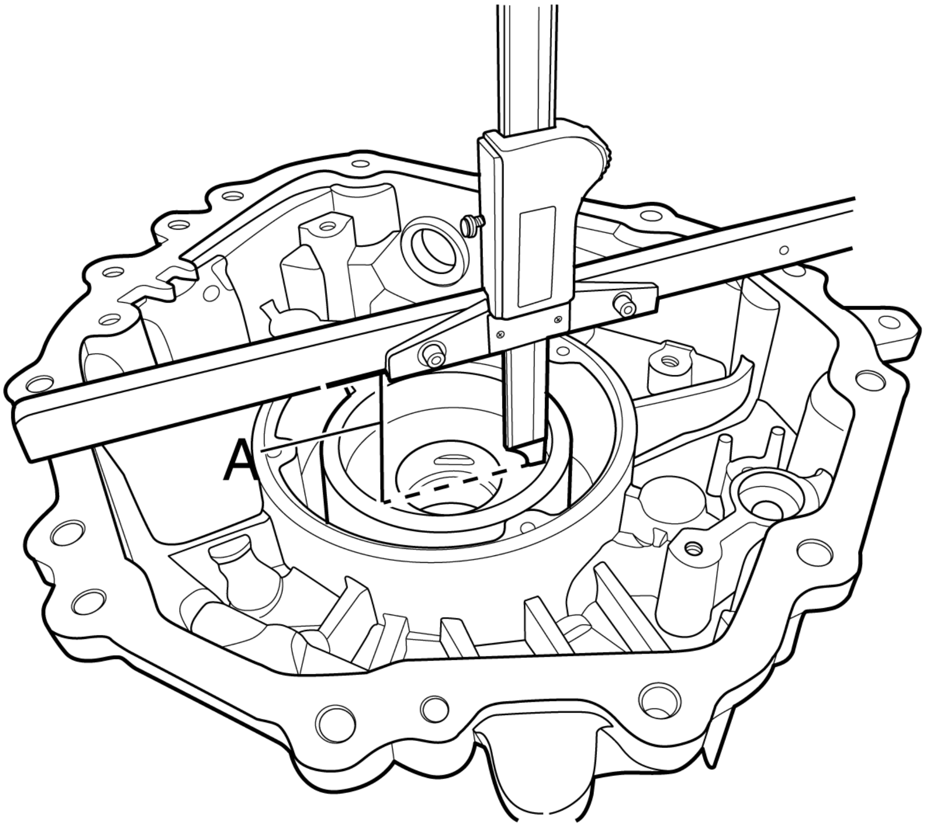

Fig. 109: Measuring Distance Between Transmission Case Cover Gasket Face And Drive Motor Rotor Bearing Pocket
Courtesy of GENERAL MOTORS COMPANY

1. Clean the transmission case cover from debris, oil and grease.
2. Measure the distance between the transmission case cover gasket face and the drive motor rotor bearing pocket using the depth gauge (A).
    1. Measure on 3 points and use the average value.

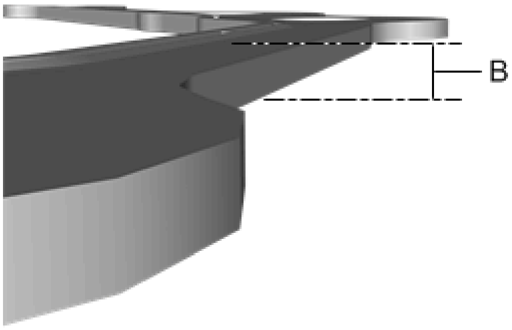

Fig. 110: Measure Transmission Case Cover Gasket Thickness
Courtesy of GENERAL MOTORS COMPANY

3. Measure the transmission case cover gasket thickness (B).
    1. Measure on 3 points and use the average value.

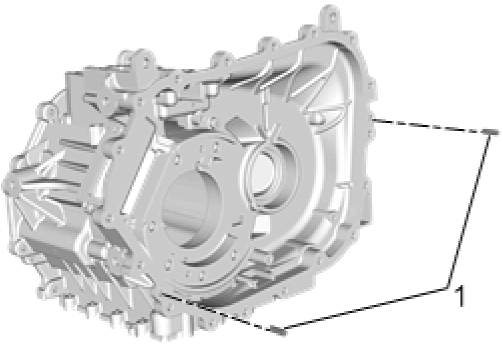

Fig. 111: Dowel Pins
Courtesy of GENERAL MOTORS COMPANY

4. Remove and DISCARD the dowel pins (1) (Qty: 2) from the motor housing using pin punch and hammer.

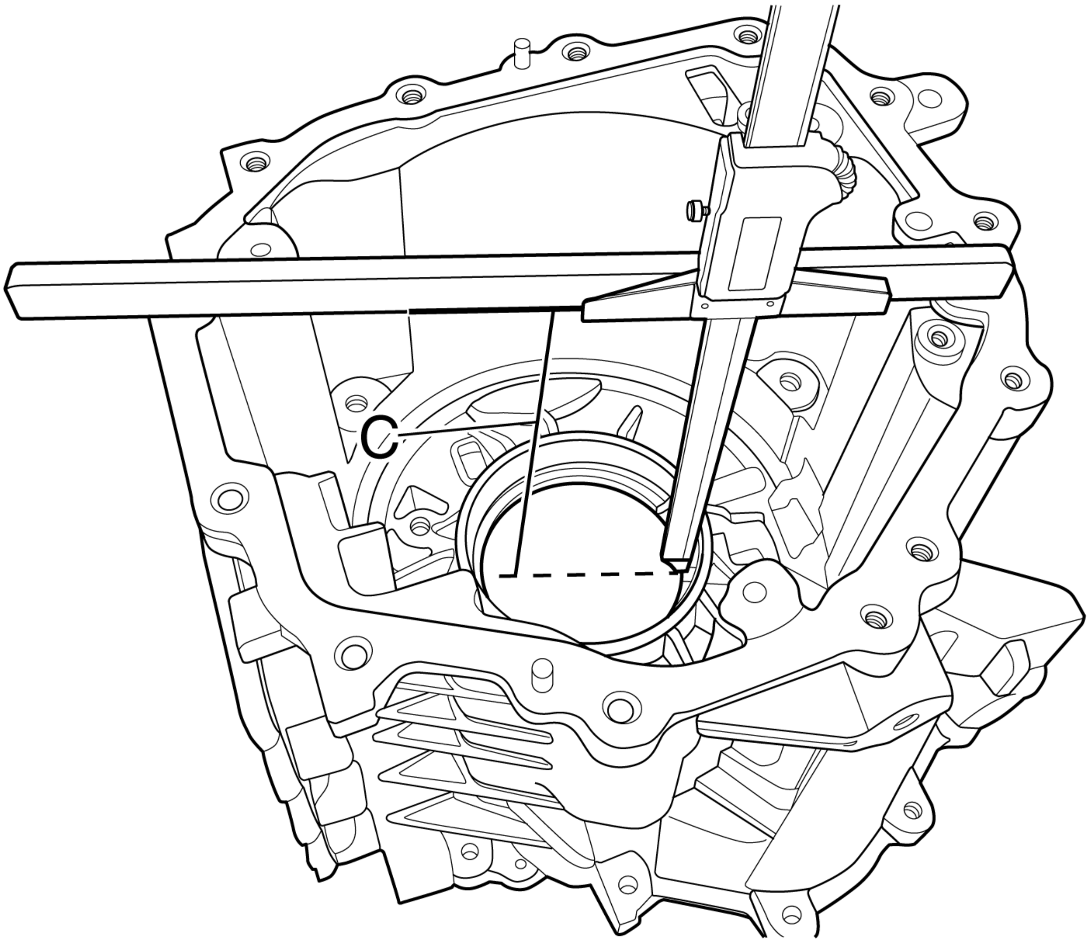

Fig. 112: Measuring Distance Between Drive Motor Housing Gasket Face And Drive Motor Rotor Bearing Pocket
Courtesy of GENERAL MOTORS COMPANY

5. Clean the motor housing from debris, oil and grease.
6. Measure the distance between the drive motor housing gasket face and the drive motor rotor bearing pocket using the depth gauge (C).
    1. Measure on 3 points and use the average value.

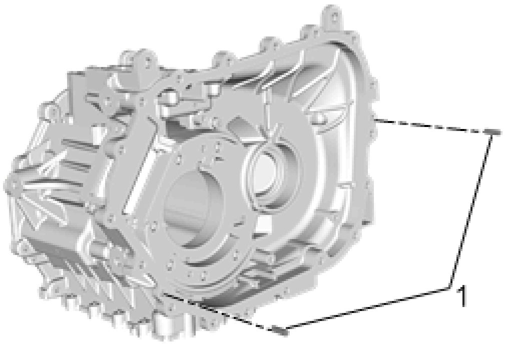

Fig. 113: Dowel Pins
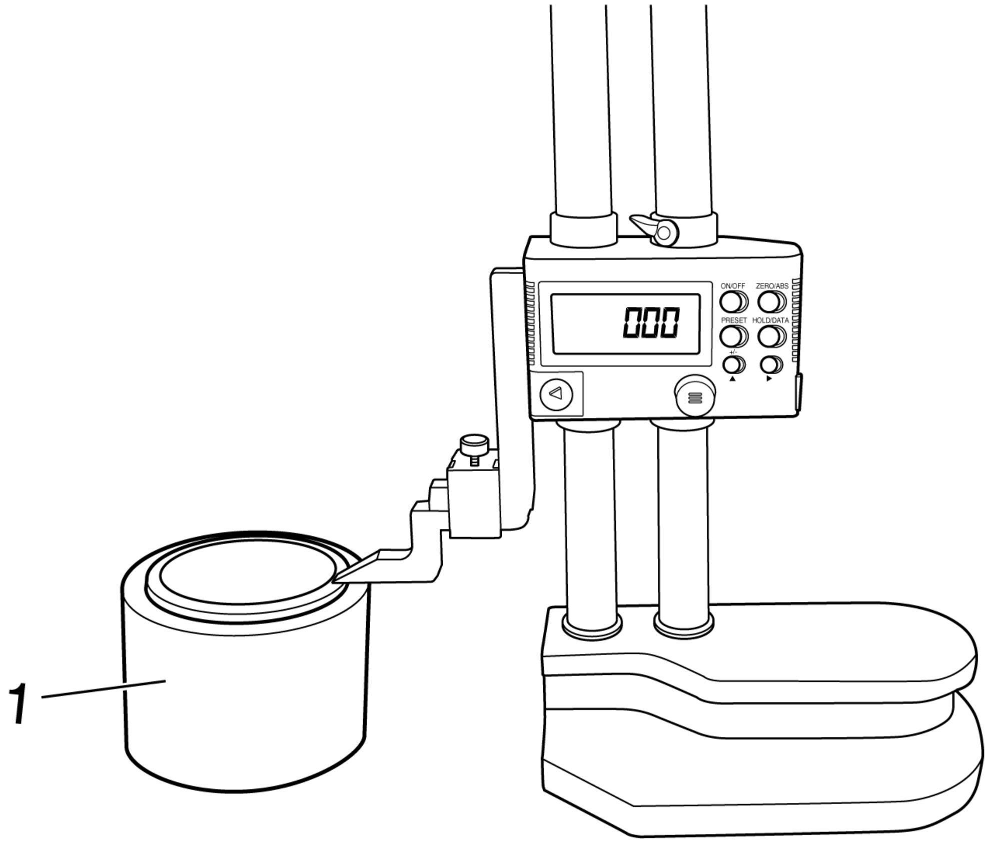
Courtesy of GENERAL MOTORS COMPANY

7. Install 2 NEW dowel pins (1) (Qty: 2) to the motor housing.



000
ON/OFF
ZERO/ABS
PRESET
HOLD/DATA
+/-
1

Fig. 114: Adjust Zero Point Setting On Pinion Bearing Installer Using Height Gauge
Courtesy of GENERAL MOTORS COMPANY

8. Adjust the zero point setting on the *DT-48008* pinion bearing installer (1) using the height gauge.

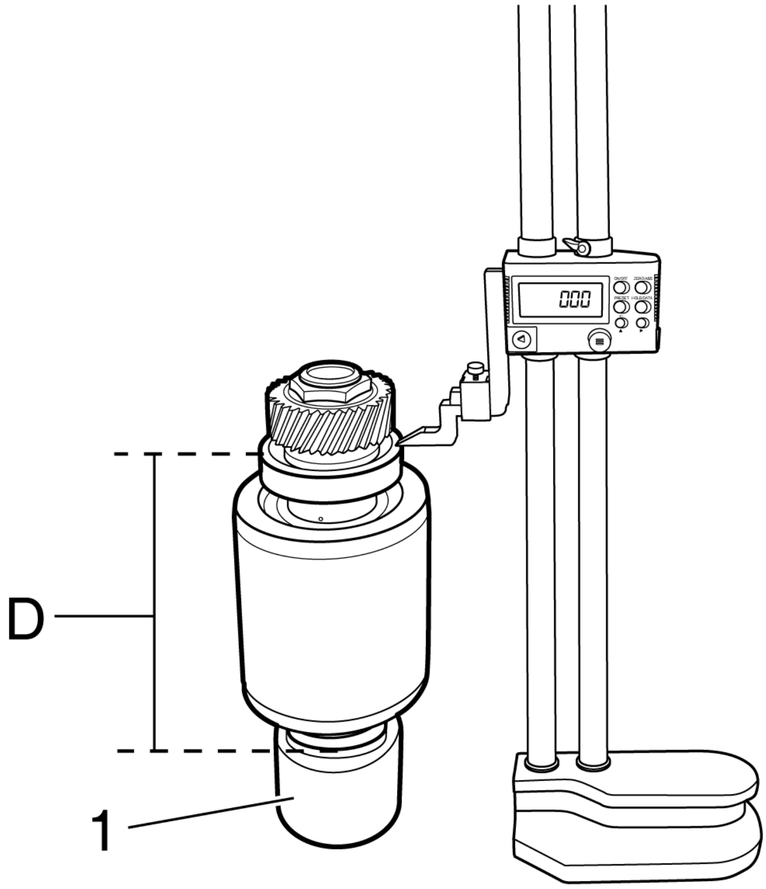


Fig. 115: Measure Distance Between Left Rotor Bearing And Right Rotor Bearing With Drive Motor Rotor Assembly On Pinion Bearing Installer
Courtesy of GENERAL MOTORS COMPANY

9. Place the drive motor rotor assembly on the *DT-48008* pinion bearing installer (1).
10. Measure the distance between the left rotor bearing and the right rotor bearing using the height gauge (D).
    1. Measure on 3 points and use the average value.

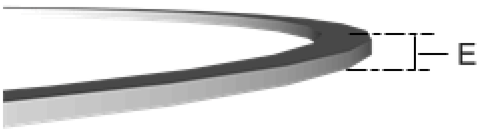

Fig. 116: Measure Shim Thickness Of Left Rotor Bearing Side
Courtesy of GENERAL MOTORS COMPANY

11. Measure the shim thickness of left rotor bearing side (E).
    1. Measure on 3 points and use the average value.
12. Measured clearance F ; F = A + B + C - D - E

13. Select the 1st gear rotor bearing side shim to meet the measured clearance. Refer to Shim Size Specifications

SHIFT SHAFT COVER INSTALLATION - OIL SUMP

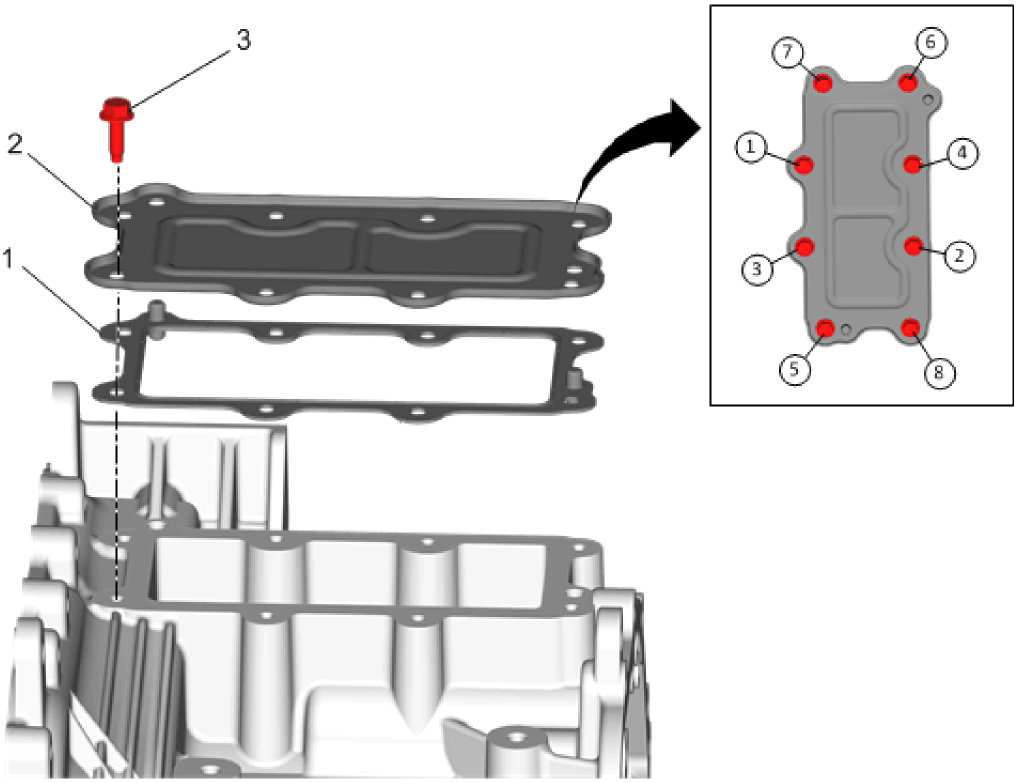

Fig. 117: Shift Shaft Cover With Bolt Tightening Sequence - Oil Sump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Shift Shaft Cover Gasket **NOTE:** **Install NEW gasket. It is not reusable.**
2	Shift Shaft Cover
3	Shift Shaft Cover Bolt (Qty: 8) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

SHIFT SHAFT COVER INSTALLATION - COOLANT SUMP

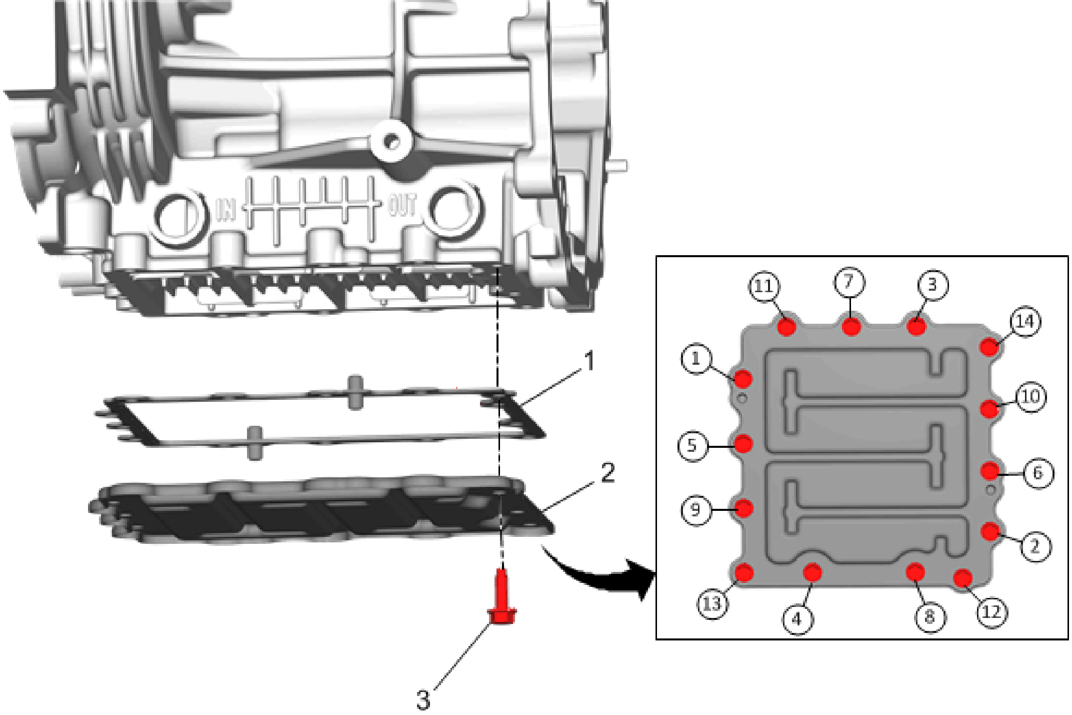

Fig. 118: Shift Shaft Cover With Bolt Tightening Sequence - Coolant Sump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Shift Shaft Cover Gasket **NOTE:** **Install NEW gasket. It is not reusable.**
2	Shift Shaft Cover
3	Shift Shaft Cover Bolt (Qty: 14) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

DRIVE MOTOR STATOR INSTALLATION

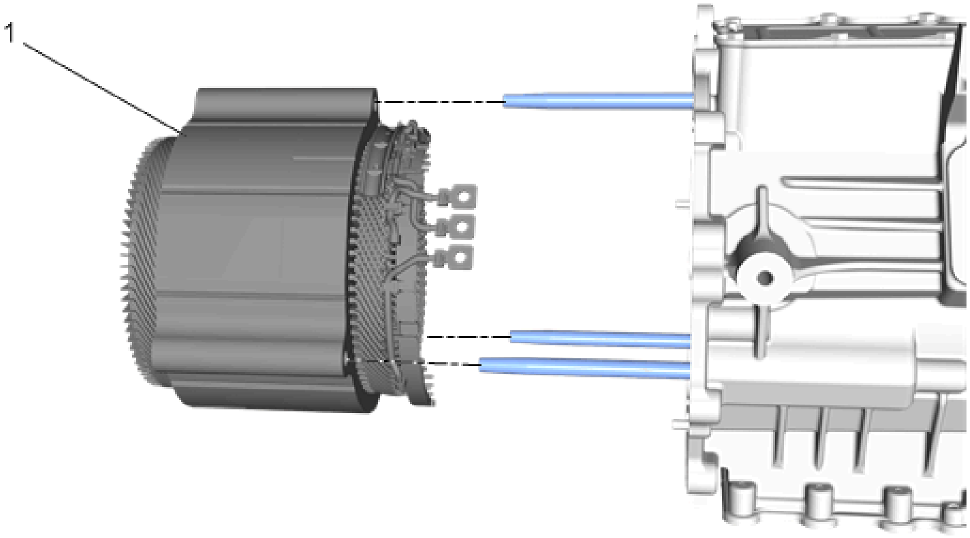

Fig. 119: Drive Motor Stator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Stator **CAUTION:** **DO NOT contact or rest the drive motor stator on the copper end coils. Damage to the copper end coils may cause a high voltage short during vehicle operation, resulting in component damage.** **Special Tools** **DT-52012** Stator Remover/Installer Equivalent regional tools: Special Tools

DRIVE MOTOR ROTOR INSTALLATION

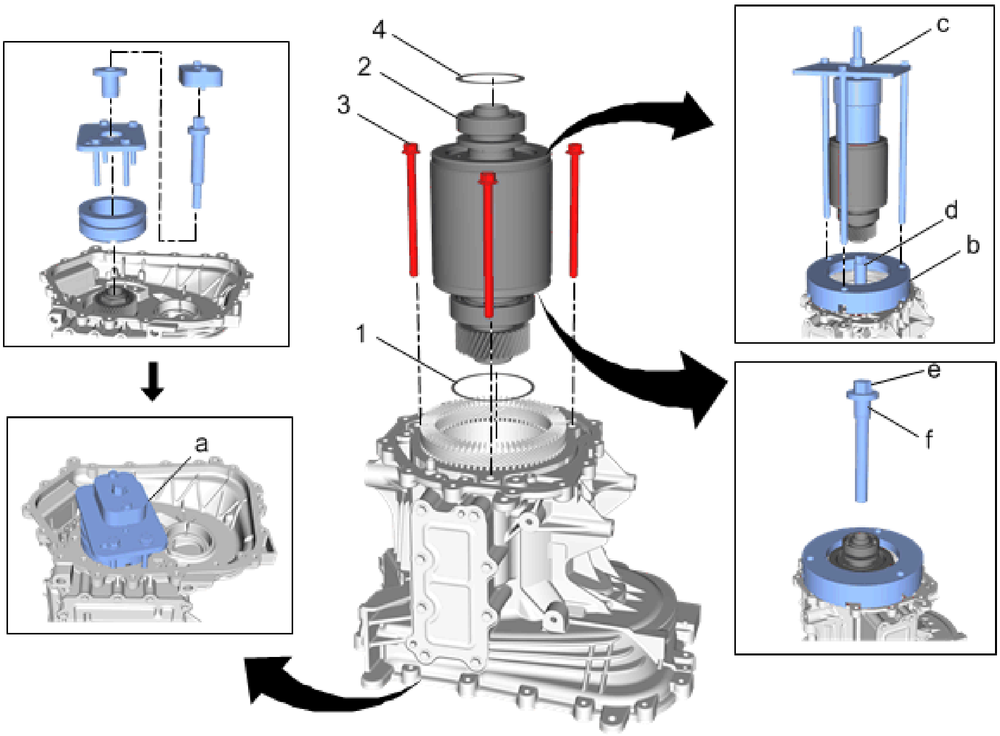

Fig. 120: Drive Motor Rotor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Rotor Bearing Shim (RHS) **Procedure** Measure the drive motor rotor bearing shim before the drive motor stator installation. Refer to **Shimming Procedures** **NOTE:** **Install NEW shim. It is not reusable.**
2	Drive Motor Rotor **Procedure** 1. Install the *DT-52011 - 1* rotor fixing (a) and *DT-52011 - 3* hair pin cover (b). 2. Apply transmission fluid to the drive motor rotor. 3. Install the drive motor rotor by turning the nut on the *DT-52011 - 2* rotor remover/installer (c) counterclockwise. 4. Remove the *DT-52011 - 2* rotor remover/installer (c) and *DT-52011 - 1 - 7* remover guide (d) when the drive motor rotor assembly stops moving. 5. Install the *DT-52011 - 1 - 1* installer guide (e) and *DT-52011 - 1 - 3* adapter (f). 6. Install the drive motor rotor by turning the shaft on the *DT-52011 - 1 - 1* installer guide (e) completely. **NOTE:** **The drive motor rotor is strongly magnetic. DO NOT place within 6 inches of ferrous metallic components. Metallic debris can be removed from the motor outer diameter by blotting with adhesive tape.** **Special Tools** **DT-52011** Rotor Remover/Installer Kit Equivalent regional tools: **Special Tools**

Callout	Component Name
3	Drive Motor Stator Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **NOTE:** **Install NEW drive motor stator bolts** **Tighten** 58 N.m (43 lb ft)
4	Drive Motor Rotor Bearing Shim (LHS) **NOTE:** **Install NEW shim. It is not reusable.**

DRIVE MOTOR STATOR COOLANT DISTRIBUTOR CHANNEL INSTALLATION

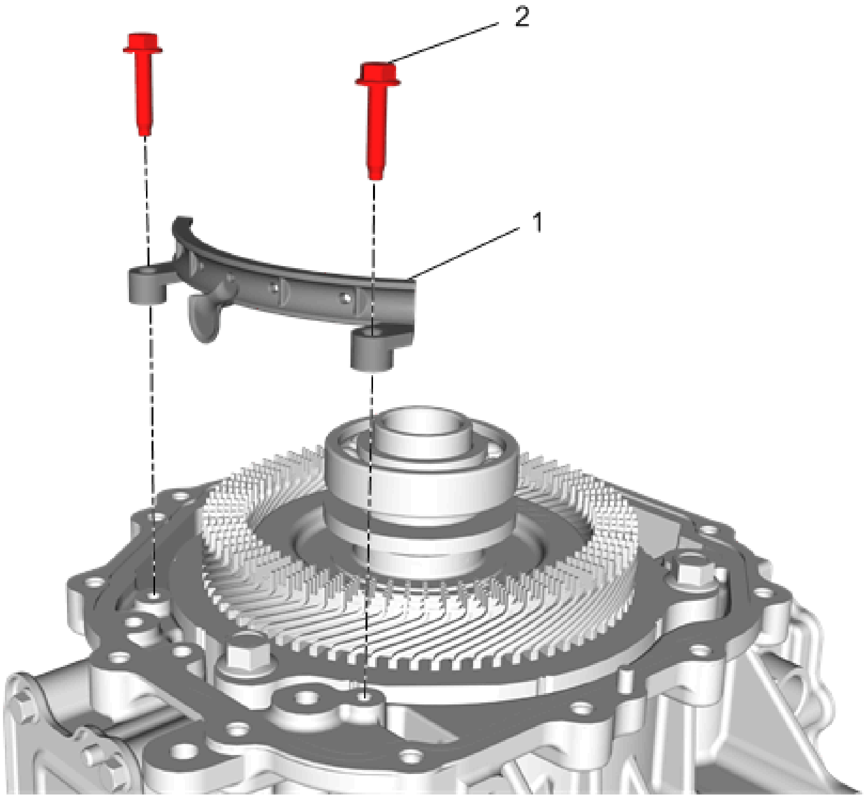

Fig. 121: Drive Motor Stator Coolant Distributor Channel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Stator Cooling Distributor Channel
2	Drive Motor Stator Cooling Distributor Channel Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

MAIN SHAFT ASSEMBLY INSTALLATION

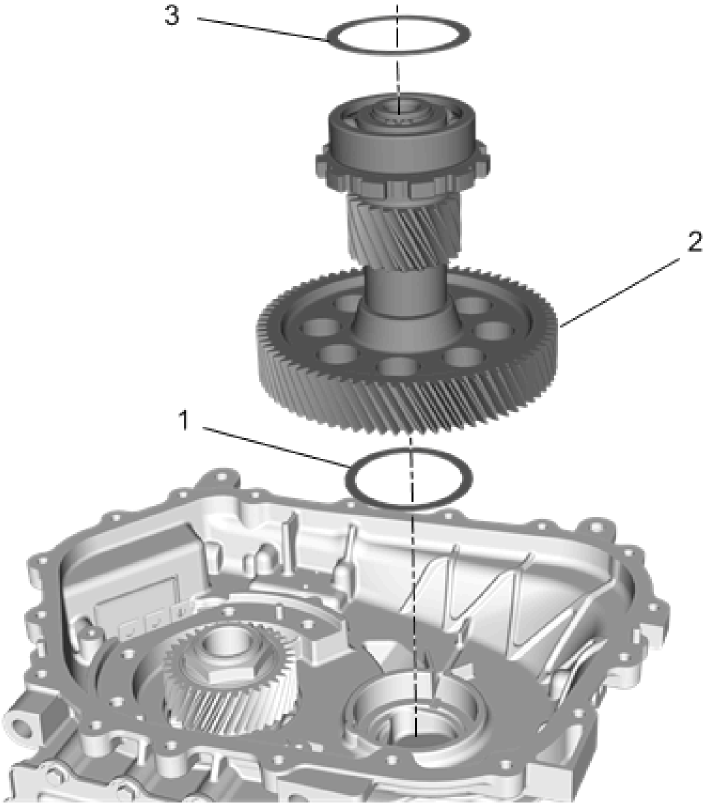

Fig. 122: Main Shaft Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Main Shaft Bearing Shim (LHS) **NOTE:** **Install NEW shim. It is not reusable.**
2	Main Shaft **NOTE:** **Apply transmission fluid to the main shaft bearing.**
3	Main Shaft Bearing Shim (RHS) **NOTE:** **Install NEW shim. It is not reusable.**

CENTER SUPPORT INSTALLATION

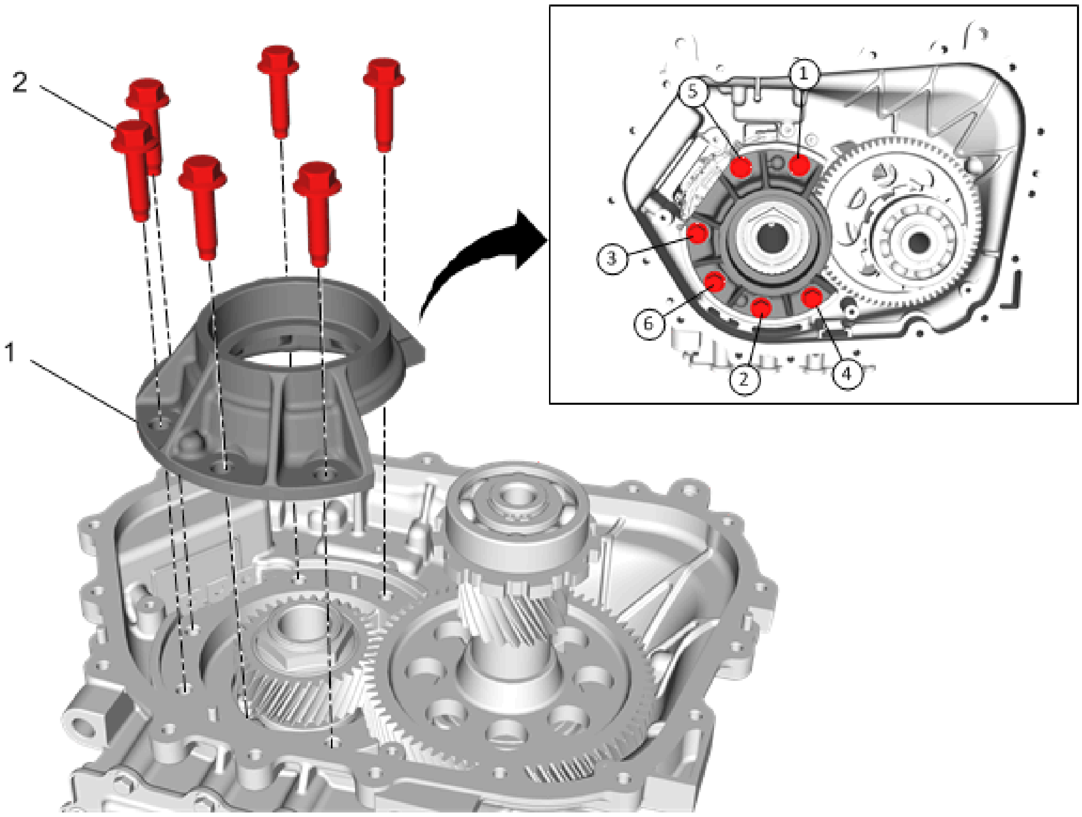

Fig. 123: Center Support
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Center Support
2	Center Support Bolt (Qty: 6) **CAUTION:** **Refer to Fastener Caution .** **CAUTION:** **Refer to Torque-to-Yield Fastener Caution .** **NOTE:** **Install NEW center support bolts.** **Tighten** 1. First pass: 58 N.m (43 lb ft) 2. Final pass: 30 degrees

FRONT DIFFERENTIAL ASSEMBLY INSTALLATION

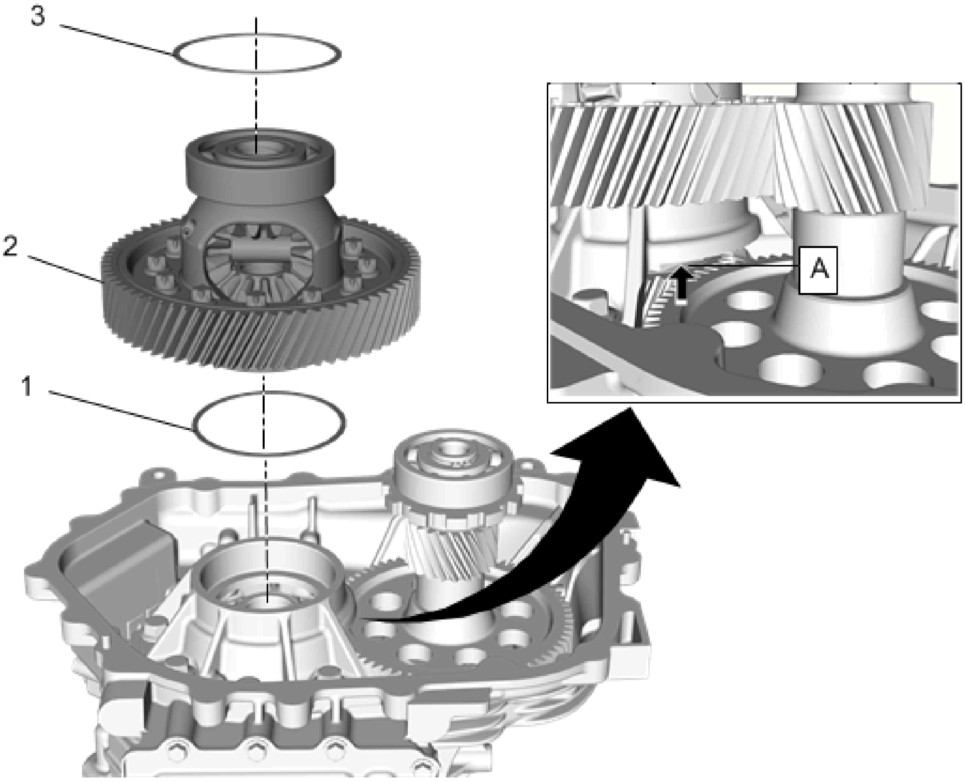

Fig. 124: Front Differential Assembly
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Differential Bearing Shim (LHS) **NOTE:** **Install NEW shim. It is not reusable.**
2	Front Differential **NOTE:** **Apply transmission fluid to the front differential bearing.** **NOTE:** **Raise the main shaft assembly until the A position in order to install the front differential assembly.**
3	Front Differential Bearing Shim (RHS) **NOTE:** **Install NEW shim. It is not reusable.**

DRIVE MOTOR POWER INVERTER MODULE CABLE TERMINAL INSULATOR BLOCK INSTALLATION

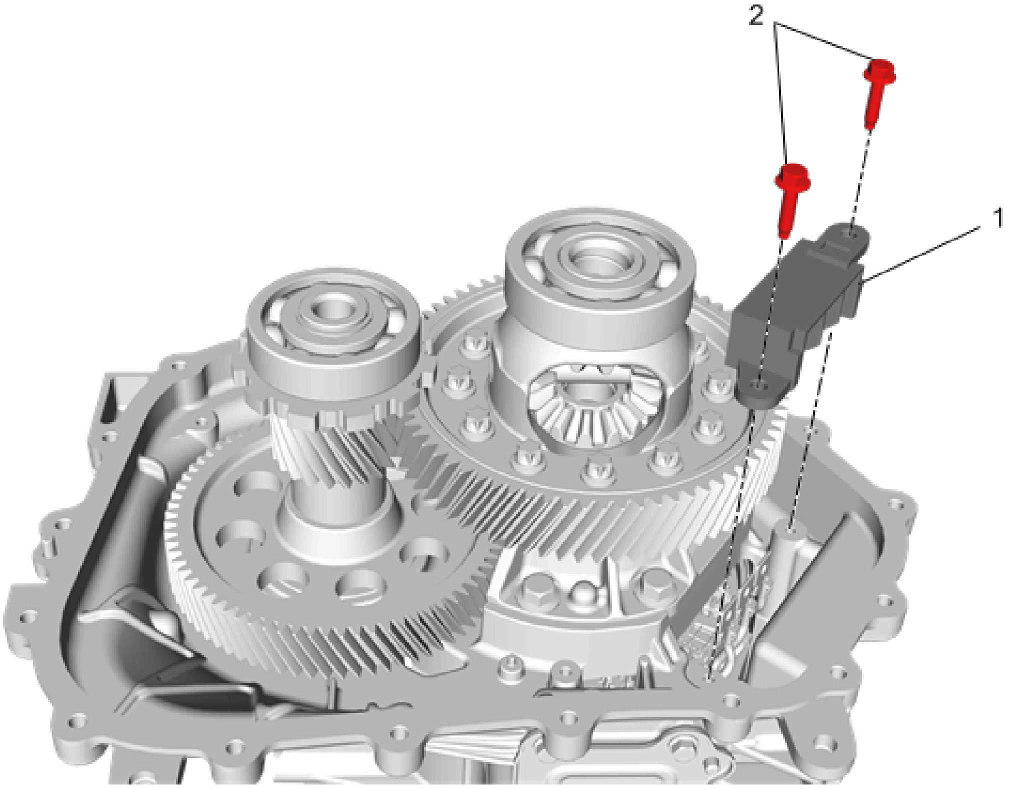

Fig. 125: Drive Motor Power Inverter Module Cable Terminal Insulator Block
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Power Inverter Module Cable Terminal Insulator Block
2	Drive Motor Power Inverter Module Cable Terminal Insulator Block Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

MANUAL TRANSMISSION OIL TROUGH INSTALLATION

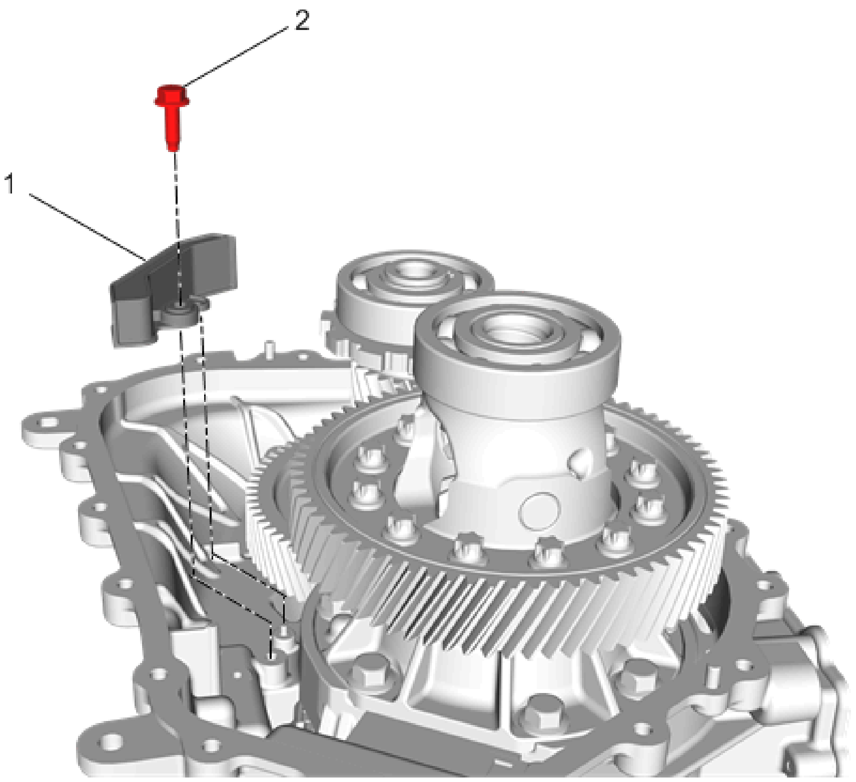

Fig. 126: Manual Transmission Oil Trough
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Transmission Oil Trough
2	Manual Transmission Oil Trough Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

OIL PAN BAFFLE INSTALLATION

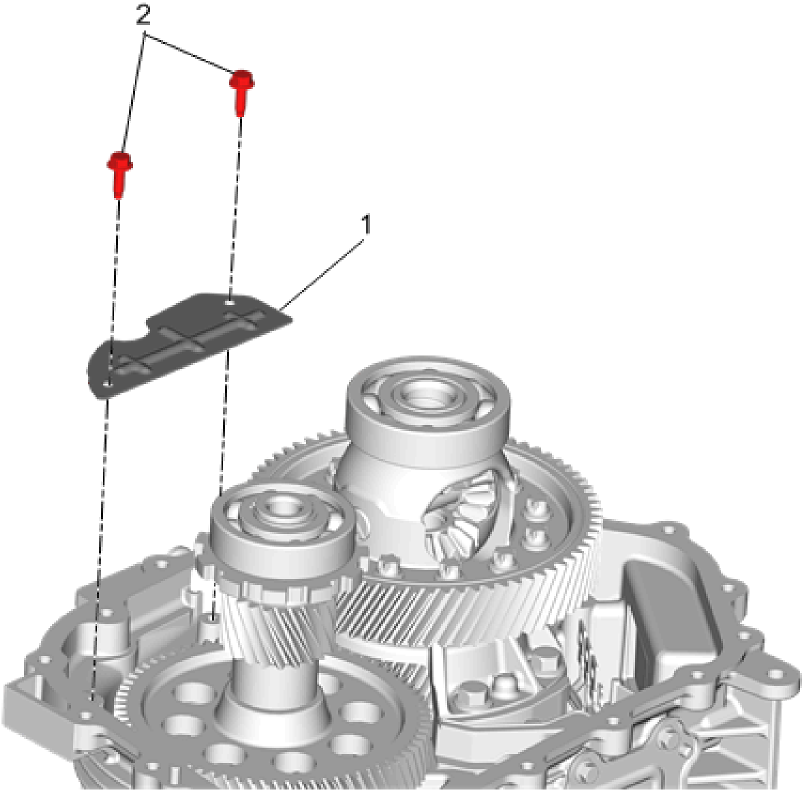

Fig. 127: Oil Pan Baffle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Oil Pan Baffle
2	Oil Pan Baffle Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

AUTOMATIC TRANSMISSION FLUID PAN MAGNET INSTALLATION

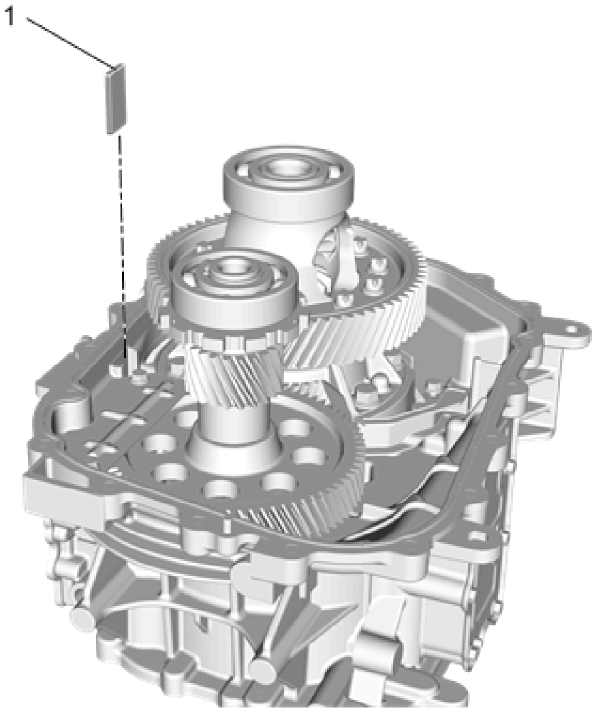

Fig. 128: Automatic Transmission Fluid Pan Magnet
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Pan Magnet

FRONT WHEEL DRIVE SHAFT OIL SEAL INSTALLATION - LEFT SIDE

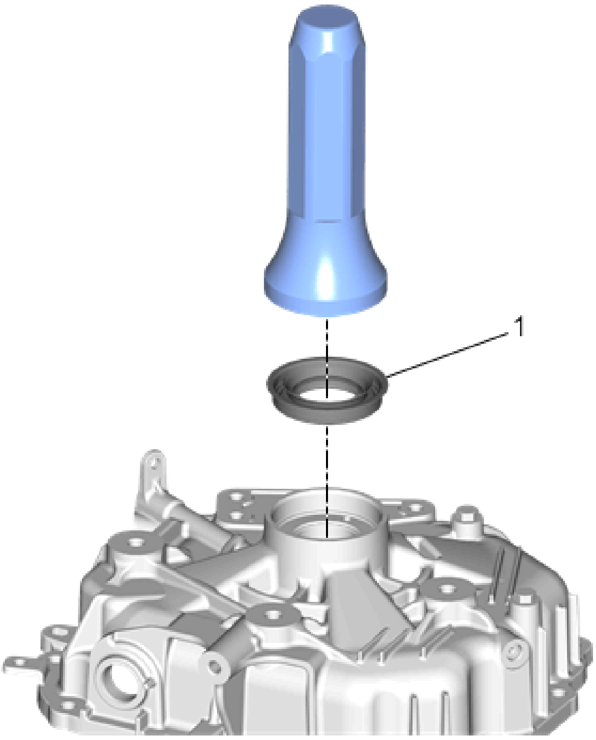

Fig. 129: Front Wheel Drive Shaft Oil Seal - Left Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal (LHS) **NOTE:** **Install NEW seal. It is not reusable.** **Special Tools** **DT-44809** Seal Installer Equivalent regional tools: Special Tools

DRIVE MOTOR POSITION SENSOR STATOR INSTALLATION

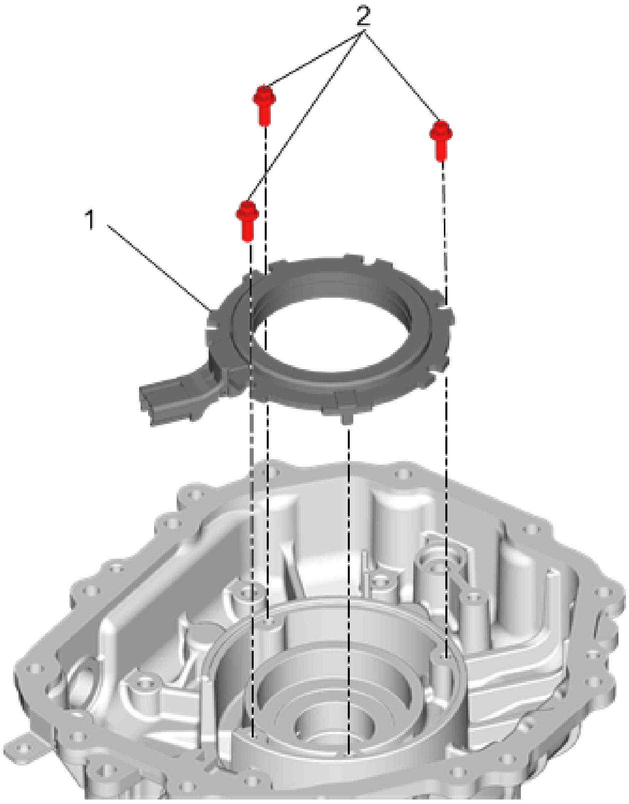

Fig. 130: Drive Motor Position Sensor Stator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Position Sensor Stator
2	Drive Motor Position Sensor Stator Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **NOTE:** **Install NEW drive motor position sensor stator bolts.** **Tighten** 9 N.m (80 lb in)

AUTOMATIC TRANSMISSION FLUID FILTER INSTALLATION

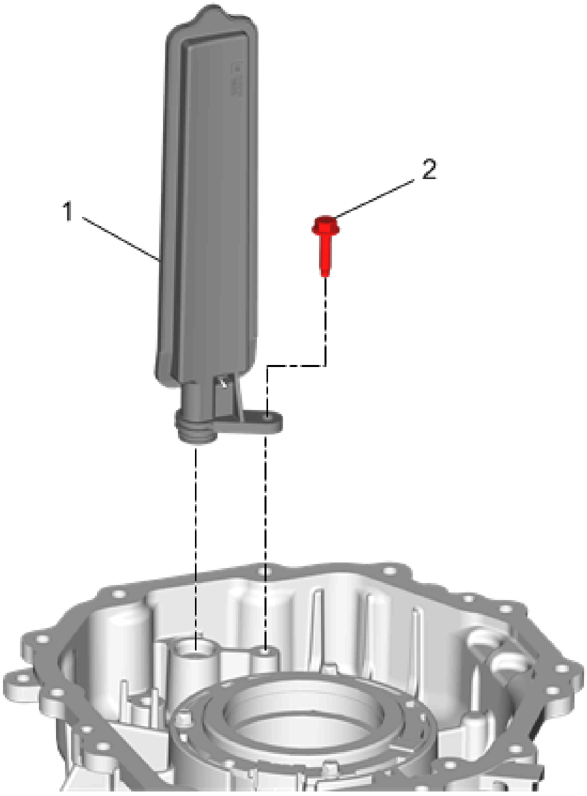

Fig. 131: Automatic Transmission Fluid Filter
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Filter **NOTE:** **Install NEW fluid filter. The fluid filter O-ring is not serviceable separately.**
2	Automatic Transmission Fluid Filter Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

AUTOMATIC TRANSMISSION CONTROL WIRING HARNESS INSTALLATION - TRANSMISSION CASE COVER

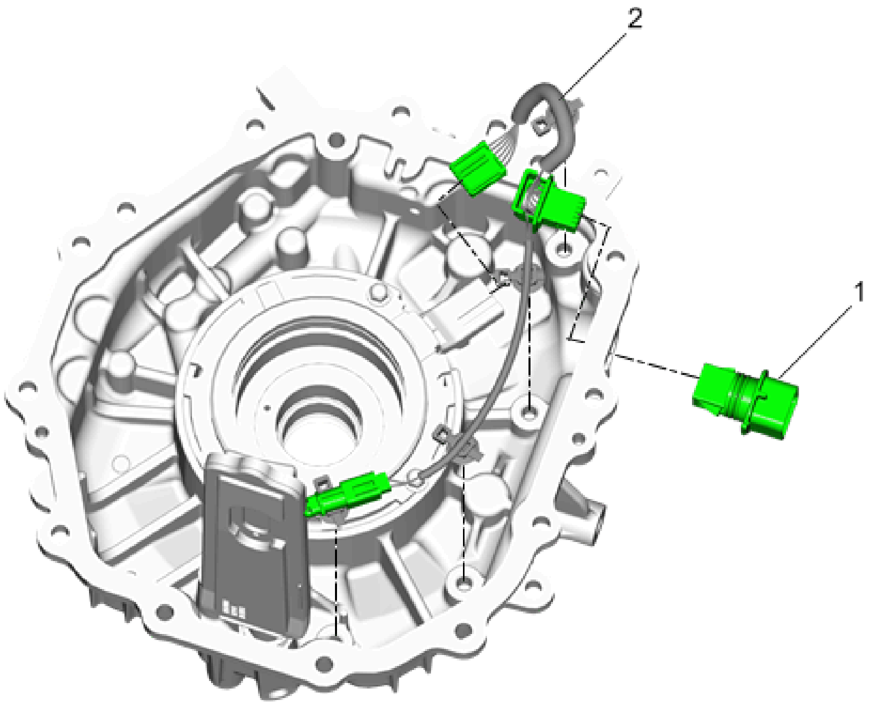

Fig. 132: Automatic Transmission Control Wiring Harness - Transmission Case Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Wiring Harness Electrical Connector **NOTE:** **Install NEW wiring harness electrical connector. It is not reusable.**
2	Automatic Transmission Control Wiring Harness

AUTOMATIC TRANSMISSION CASE COVER INSTALLATION

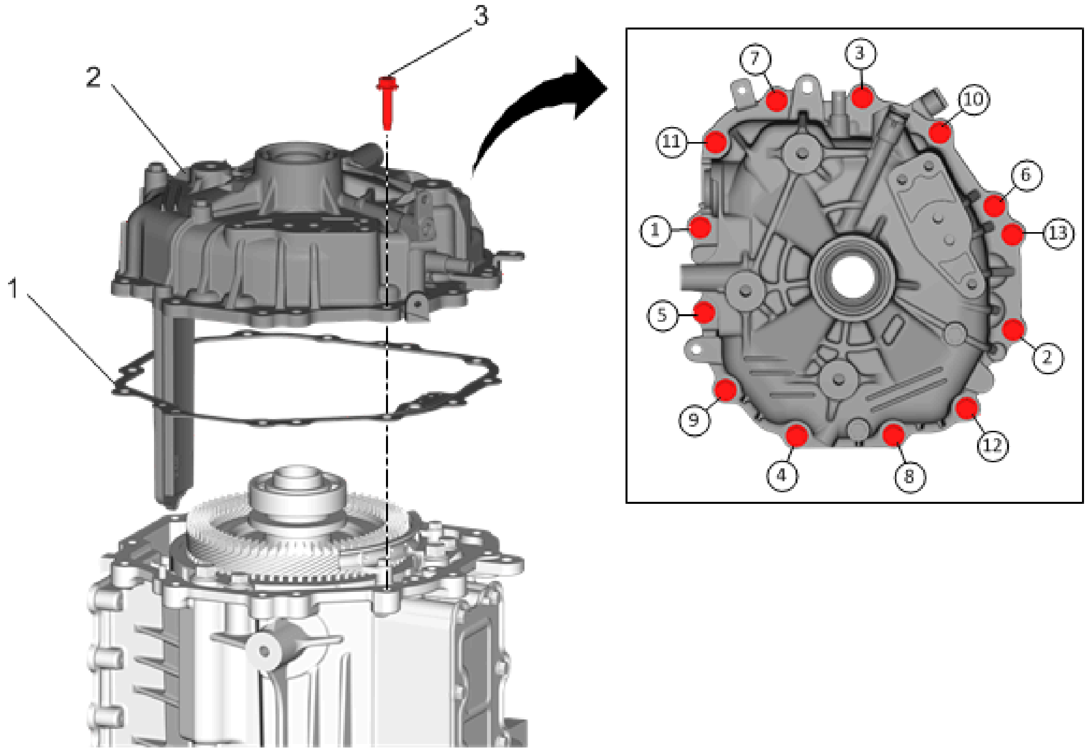

Fig. 133: Automatic Transmission Case Cover With Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Case Cover Gasket **NOTE:** **Install NEW gasket. It is not reusable.**
2	Automatic Transmission Case Cover
3	Automatic Transmission Case Cover Bolt (Qty: 13) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 22 N.m (16 lb ft)

FRONT WHEEL DRIVE SHAFT OIL SEAL INSTALLATION - RIGHT SIDE

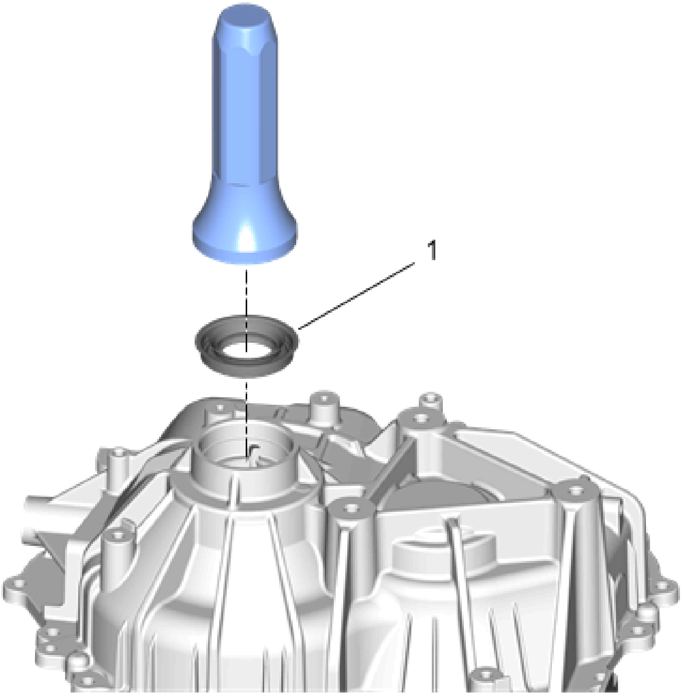

Fig. 134: Front Wheel Drive Shaft Oil Seal - Right Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Wheel Drive Shaft Oil Seal (RHS) **NOTE:** **Install NEW seal. It is not reusable.** **Special Tools** **DT-44809** Seal Installer Equivalent regional tools: Special Tools

MANUAL SHIFT SHAFT SEAL INSTALLATION

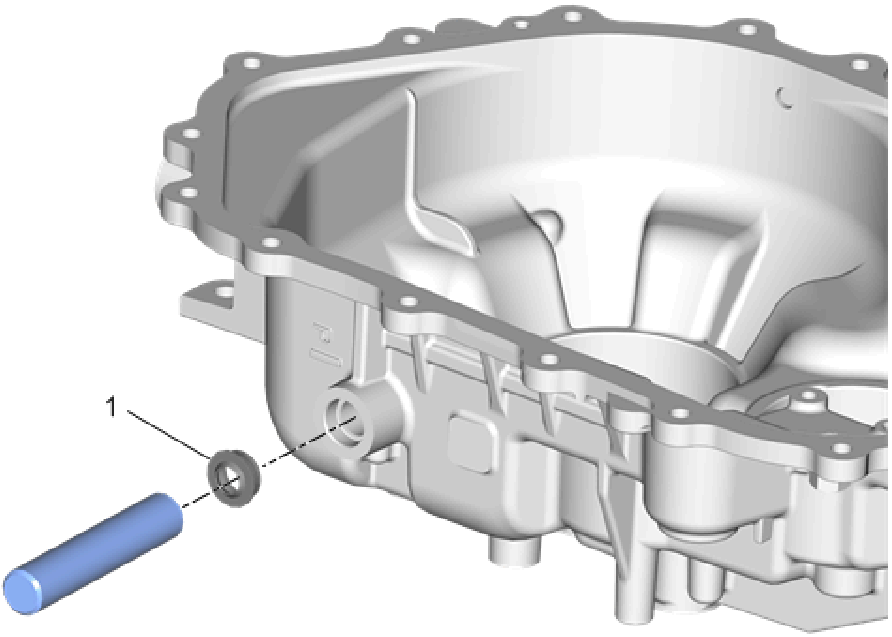

Fig. 135: Manual Shift Shaft Seal
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Seal **NOTE:** **Install NEW seal. It is not reusable.** **Special Tools** **DT-49101** Shift Shaft Seal Installer Equivalent regional tools: **Special Tools**

MANUAL SHIFT SHAFT POSITION SWITCH INSTALLATION

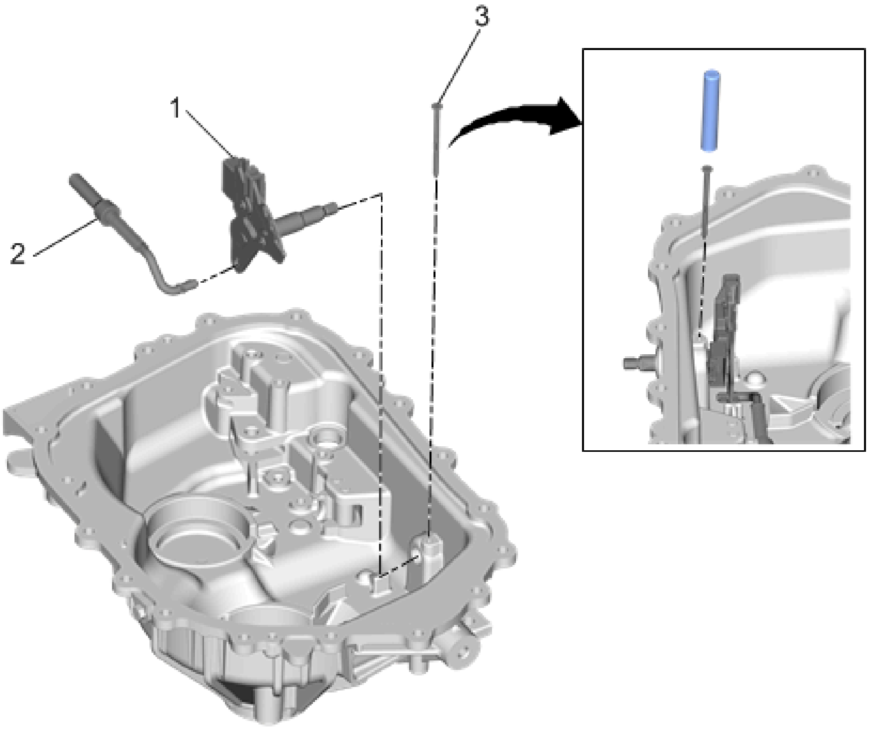

Fig. 136: Manual Shift Shaft Position Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Position Switch
2	Park Pawl Actuator
3	Manual Shift Shaft Pin **NOTE:** **Install NEW pin. It is not reusable.** **Special Tools** **DT-51436** Manual Shaft Pin Installer Equivalent regional tools: Special Tools

PARK PAWL AND MANUAL SHIFT SHAFT INSTALLATION

Park Pawl Actuator Guide Installation

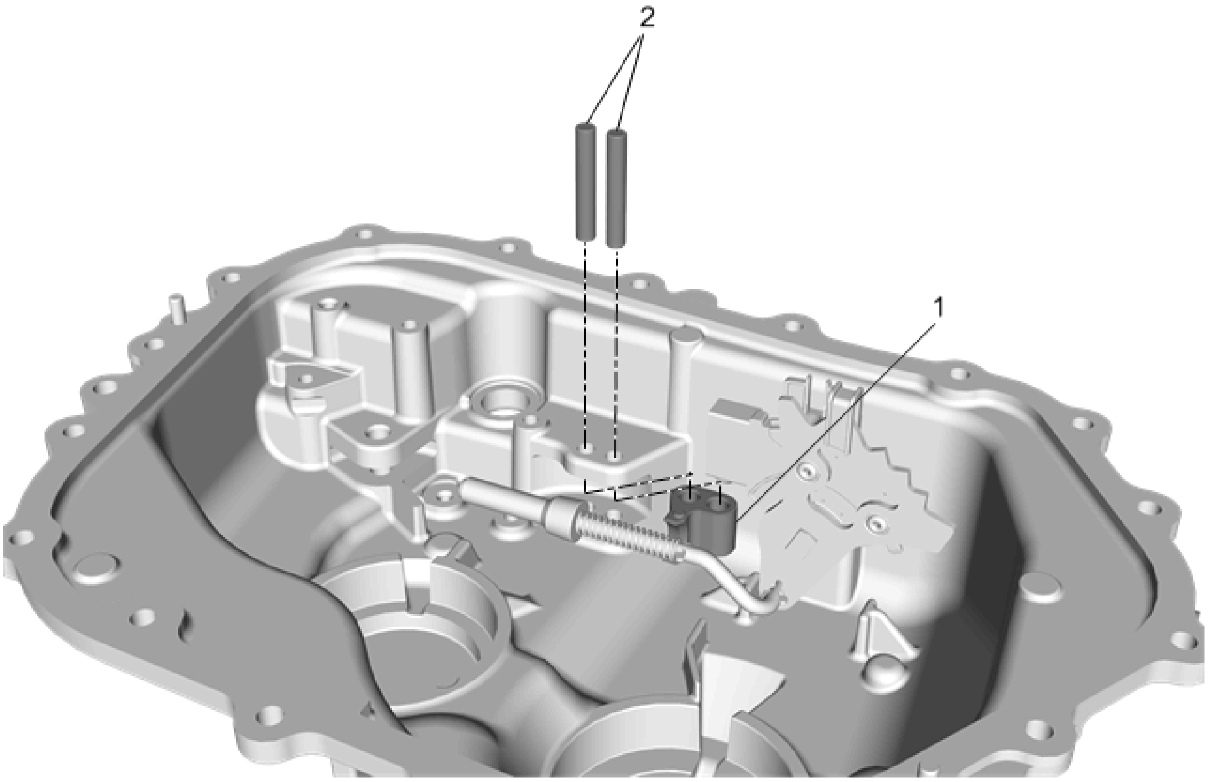

Fig. 137: Park Pawl Actuator Guide
Courtesy of GENERAL MOTORS COMPANY

Park Pawl Actuator Guide Installation

Callout	Component Name
1	Park Pawl Actuator Guide
2	Park Pawl Actuator Guide Pin (Qty: 2)

Park Pawl, Shaft and Bracket Installation

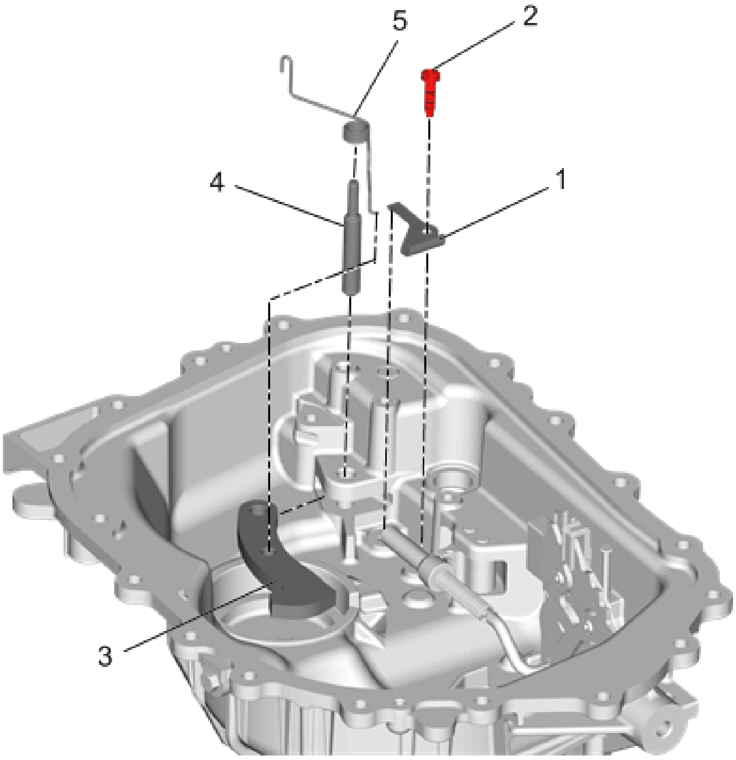

Fig. 138: Park Pawl, Shaft and Bracket
Courtesy of GENERAL MOTORS COMPANY

Park Pawl, Shaft and Bracket Installation

Callout	Component Name
1	Park Pawl Actuator Bracket
2	Park Pawl Actuator Bracket Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
3	Park Pawl
4	Park Pawl Shaft
5	Park Pawl Spring

Manual Shift Detent Lever Spring and Bracket Installation

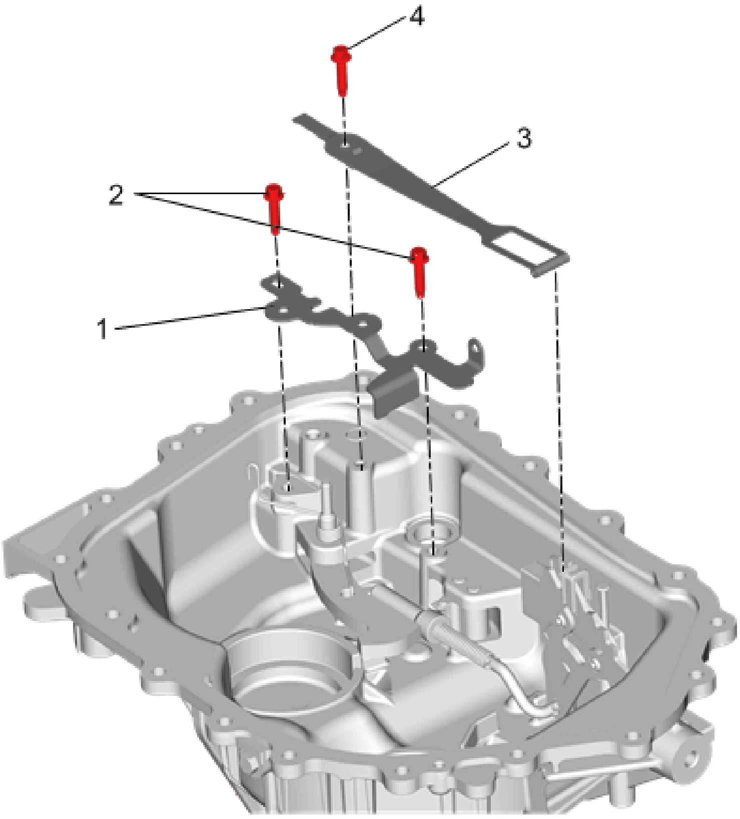

Fig. 139: Manual Shift Detent Lever Spring and Bracket
Courtesy of GENERAL MOTORS COMPANY

Manual Shift Detent Lever Spring and Bracket Installation

Callout	Component Name
1	Park Pawl Actuator Bracket
2	Park Pawl Actuator Bracket Bolt (Qty: 2) **Tighten** 9 N.m (80 lb in)
3	Manual Shift Detent Lever Spring
4	Manual Shift Detent Lever Spring Bolt **NOTE:** **Install NEW manual shift detent lever spring bolt** **Tighten** 9 N.m (80 lb in)

AUTOMATIC TRANSMISSION CONTROL WIRING HARNESS INSTALLATION - TRANSMISSION CASE

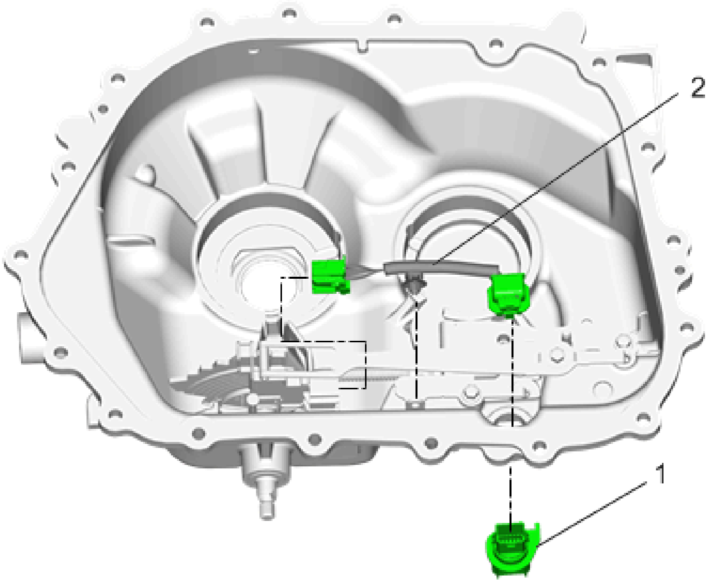

Fig. 140: Automatic Transmission Control Wiring Harness - Transmission Case
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Wiring Harness Electrical Connector **NOTE:** **Install NEW wiring harness electrical connector. It is not reusable.**
2	Automatic Transmission Control Wiring Harness

AUTOMATIC TRANSMISSION CASE INSTALLATION

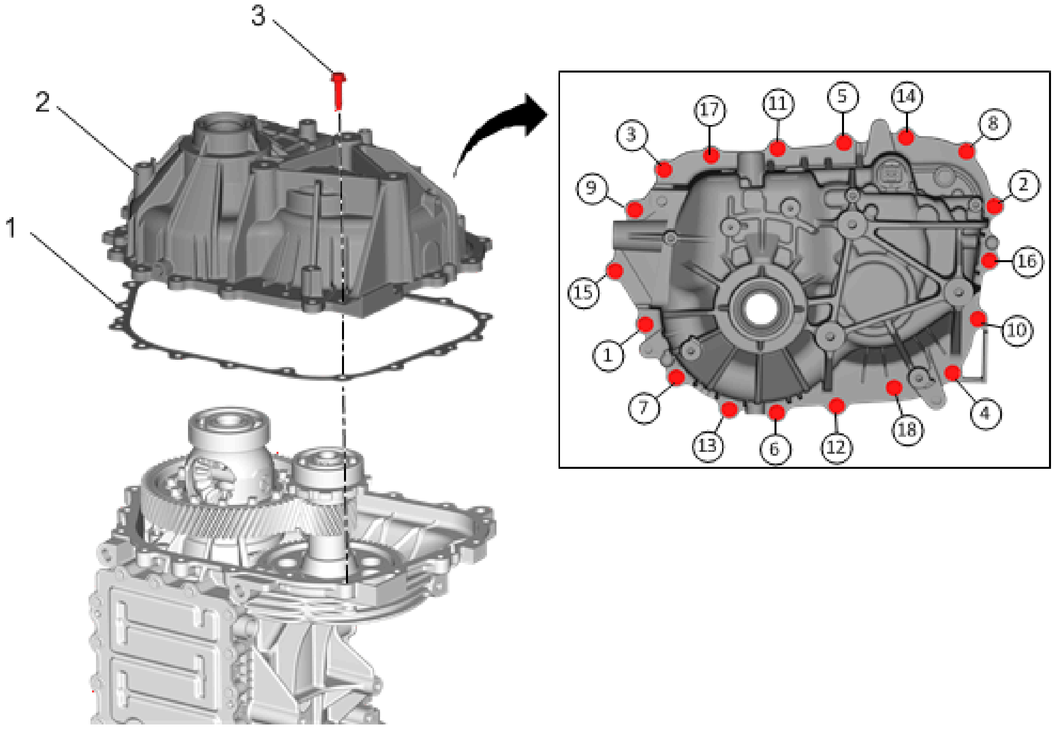

Fig. 141: Automatic Transmission Case With Bolt Tightening Sequence
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Case Gasket **NOTE:** **Install NEW gasket. It is not reusable.**
2	Automatic Transmission Case
3	Automatic Transmission Case Bolt (Qty: 18) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 22 N.m (16 lb ft)

OUTPUT SHAFT INSTALLATION

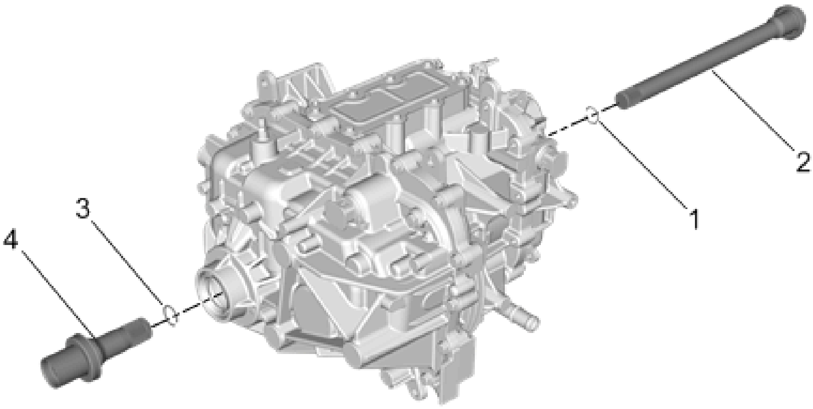

Fig. 142: Output Shaft
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Output Shaft Retaining Ring **NOTE:** **Install a NEW output shaft retaining ring.**
2	Output Shaft (LHS)
3	Output Shaft Retaining Ring **NOTE:** **Install a NEW output shaft retaining ring.**
4	Output Shaft (RHS)

AUTOMATIC TRANSMISSION FLUID PUMP INSTALLATION

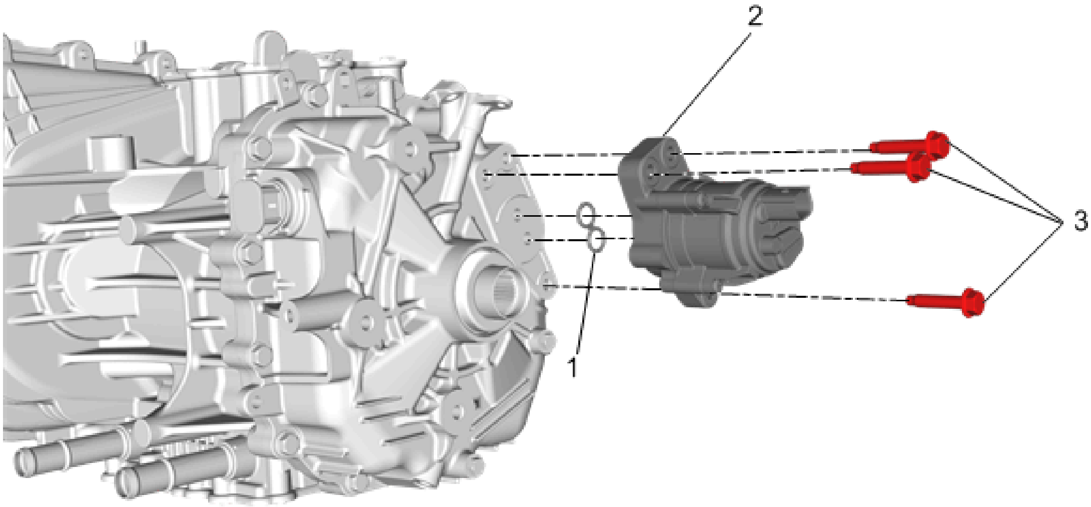

Fig. 143: Automatic Transmission Fluid Pump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Pump Seal **NOTE:** **Install NEW seal. It is not reusable.**
2	Automatic Transmission Fluid Pump
3	Automatic Transmission Fluid Pump Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 22 N.m (16 lb ft)

TRANSMISSION VENT PIPE INSTALLATION

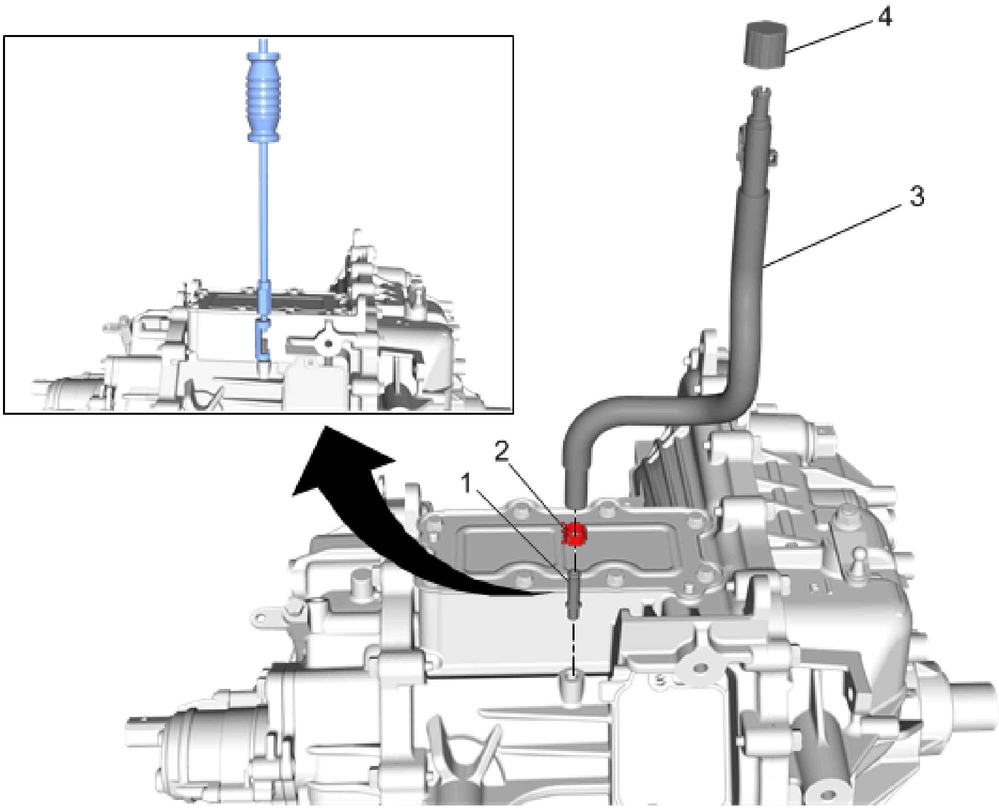

Fig. 144: Transmission Vent Pipe
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Transmission Vent Pipe **NOTE:** **Install NEW vent pipe. It is not reusable.** **Special Tools** - **DT-6125-1B** Slide Hammer - **DT-52017** Vent Hose Pipe Installer Equivalent regional tools: Special Tools.
2	Transmission Vent Hose Clamp
3	Transmission Vent Hose
4	Transmission Vent Cap

HOLDING FIXTURE REMOVAL

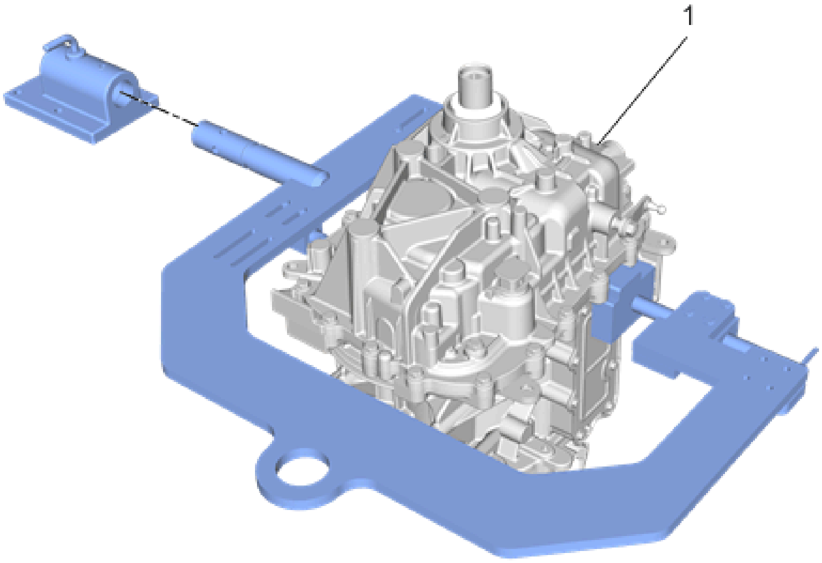

Fig. 145: Holding Fixture
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission **WARNING:** **Handle with care, the transmission assembly weighs over 83 Kg (183 lbs). Bodily injury could occur if not handled properly.** **Special Tools** - **DT-3289-20** Holding Fixture Base Assembly - **DT-46625** Holding Fixture - **DT-52009** Holding Fixture Adapter - **DT-46625-10** Holding Fixture Adapter Equivalent regional tools: Special Tools.

DESCRIPTION AND OPERATION

DEFINITIONS AND ABBREVIATIONS

Propulsion Condition Definitions

Chuggle/Cogging

A bucking or jerking condition.

Shudder

A repeating jerking condition similar to Chuggle/Cogging but more severe and rapid. This condition may be most noticeable during certain ranges of vehicle speed.

Surge

A repeating condition of acceleration and deceleration that is less intense than Chuggle/Cogging.

Noise Conditions

Propulsion System Noise

A whine or growl that increases or fades with vehicle speed, and is most noticeable under a light acceleration. It may also be noticeable in PARK or NEUTRAL operating ranges with the vehicle stationary.

Final Drive Noise

A hum related to vehicle speed which is most noticeable under a light acceleration.

Pump Noise

A high pitched whine or growl that is noticeable only when the auxiliary transmission fluid pump is ON. This condition may also be noticeable in all operating ranges with the vehicle moving.

TRANSMISSION GENERAL DESCRIPTION

The Chevrolet Bolt EV is a fully electric vehicle. The propulsion of the vehicle is achieved by an electric drive Transmission. The Transmission is a fully automatic, front wheel drive transaxle, variable-speed, electronic-controlled transmission. It consists primarily of an 150kW drive motor, 1 differential/Offset gear set, high voltage electric auxiliary transmission fluid pump and housing, and 2 axles.

The Differential/Offset gear set provides the fixed forward and reverse ratio. Changing speed and torque is fully automatic and is accomplished through the use of a drive motor generator power inverter control module located under hood. The drive motor generator power inverter control module receives and monitors various electronic sensor inputs and uses this information to vary the torque output to the drive axles based on throttle position.

The Lubrication system uses an electric auxiliary fluid pump motor assembly located outside of the transmission for lubrication of rotating components. This is a gerotor-type pump, electric 12V DC

Voltage motor, electric harness, and control module. The control module is located inside of the drive motor generator power inverter module under the hood. The transmission fluid pump operates under low pressure and will only run when out of park or neutral and vehicle speed is detected.

The transmission fluid temperature sensor is internal to the transmission and is located near the transmission fluid oil filter. The transmission fluid temperature sensor is connected to the ECM. The ECM sends the fluid temperature data to the drive motor power inverter module for drive motor torque.

Power delivery is controlled by first Electronic Precision Shift system. This shift and Park-by-wire system sends electronic signals to the Bolt EV's drive unit to manage precise feel and delivery of power and torque, based on drive mode selection and accelerator inputs. A by-wire shifter requires less packaging space than a traditional mechanical shifter, resulting in more interior space and improved interior layout.

The transmission may be operated in any of the following gear ranges:

PARK (P)

This position locks the wheels and prevents the vehicle from rolling either forward or backward. PARK is the best position to use when starting the propulsion system for the vehicle. Because the transmission utilizes a shift lock control system, it is necessary to fully depress the brake pedal before shifting out of PARK. For safety reasons, use the parking brake in addition to the PARK position.

REVERSE (R)

This position allows the vehicle to be operated in a rearward direction by reversing the rotation of the electric drive motor.

NEUTRAL (N)

This position allows the vehicle to be moved without the park pawl engaged.

DRIVE (D)

Drive range should be used for all normal driving conditions for maximum efficiency and range economy. Drive range allows the drive unit to operate in a forward direction by electrically varying the output torque and speed of the electric drive motor.

Low (L)

This position is used for the "feel" of engine braking and can be used for the slowing of the vehicle once the throttle is lifted. While in the position the vehicle will slow quicker and use the motor to more aggressively collect energy during a regenerative braking event.

TRANSMISSION COMPONENT AND SYSTEM DESCRIPTION

The mechanical components of the Bolt EV MMF 1ET25 are as follows:

- Gerotor type fluid pump
- Drive motor housing
- Drive motor 150 kW
- Transmission case
- Front differential carrier
- Counter shaft
- Center support
- Output shaft (LHS)
- Output shaft (RHS)
- Park pawl

The electrical components of the Bolt EV MMF 1ET25 are as follows:

- Drive Motor, 150 kW
- Manual Shift Shaft Position Sensor is also referred to as the Transmission Internal Mode Switch.
- Electric Auxiliary Fluid Pump Motor
- Transmission Fluid Temperature Sensor
- Drive Motor Position Sensor
- Transmission Control Wiring Harness

TRANSMISSION INDICATORS AND MESSAGES

No transmission-related indicators or messages are displayed on the instrument panel cluster (IPC). For a complete listing and description of all vehicle indicators and messages, refer to **Indicator/Warning Message Description and Operation** .

ELECTRONIC COMPONENT DESCRIPTION

Drive Motor

Drive Motor Housing Assembly (2 of 2)

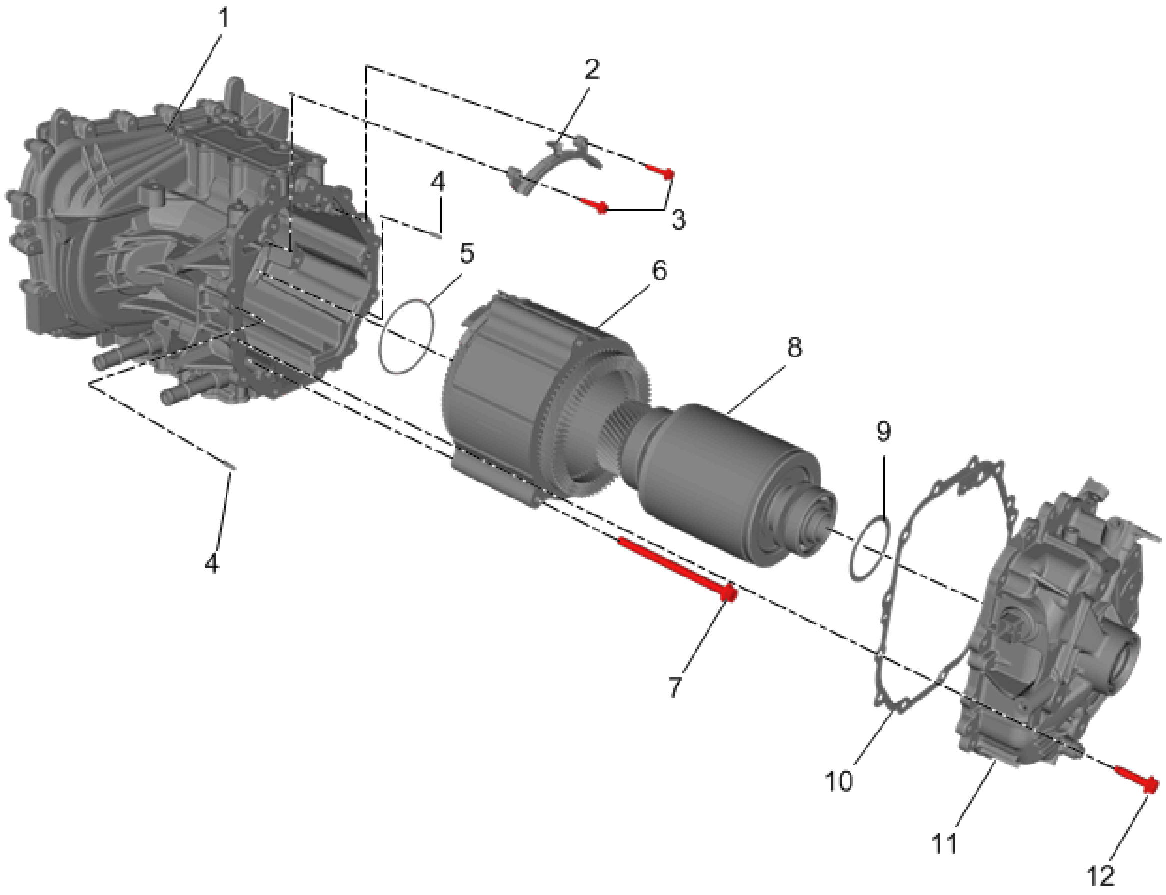

Fig. 147: Drive Motor Housing Assembly (2 of 2)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Drive Motor Housing
2	Drive Motor Stator Coolant Distributor Channel
3	Drive Motor Stator Coolant Distributor Channel Bolt (Qty: 2)
4	Pin (Qty: 2)
5	Drive Motor Rotor Bearing Shim (Right Side)
6	Drive Motor Stator

Callout	Component Name
7	Drive Motor Stator Bolt (Qty: 3)
8	Drive Motor Rotor
9	Drive Motor Rotor Bearing Shim (Left Side)
10	Automatic Transmission Case Cover Gasket
11	Automatic Transmission Case Cover
12	Automatic Transmission Case Cover Bolt (Qty: 13)

The drive motor (1) is a permanent magnet 150 Kw peak power electric machine and is controlled by the power inverter module, often referred to as the drive motor generator power inverter module, in order to provide torque for vehicle propulsion and regenerative braking. Drive motor speed is controlled and monitored by a resolver-type position sensor. The drive motor position sensor is monitored by the drive motor generator power inverter module. The drive motor generator power inverter module monitors the angular position, speed and direction of the drive motor based upon the signals the position sensor outputs to the drive motor generator power inverter module. The drive motor position sensor, or resolver, contains a drive coil, 2 driven coils and an irregular shaped metallic rotor. The metallic rotor is mechanically attached to the shaft of the drive motor generator. When the vehicle is ON, the drive motor generator power inverter module outputs an AC excitation signal to the drive coil. The drive coil excitation signal creates a magnetic field surrounding the 2 driven coils and the irregular shaped rotor. The drive motor generator power inverter module then monitors the 2 driven coil circuits for a return signal. The position of the irregular shaped metallic rotor causes the magnetically-induced return signals of the driven coils to vary in size and shape. A comparison of the 2 driven coils signals allows the motor control module to determine the exact angle, speed and direction of the drive motor. For more information, refer to **Drive Motor Power Inverter Module Description and Operation** .

Electric Auxiliary Transmission Fluid Pump Motor

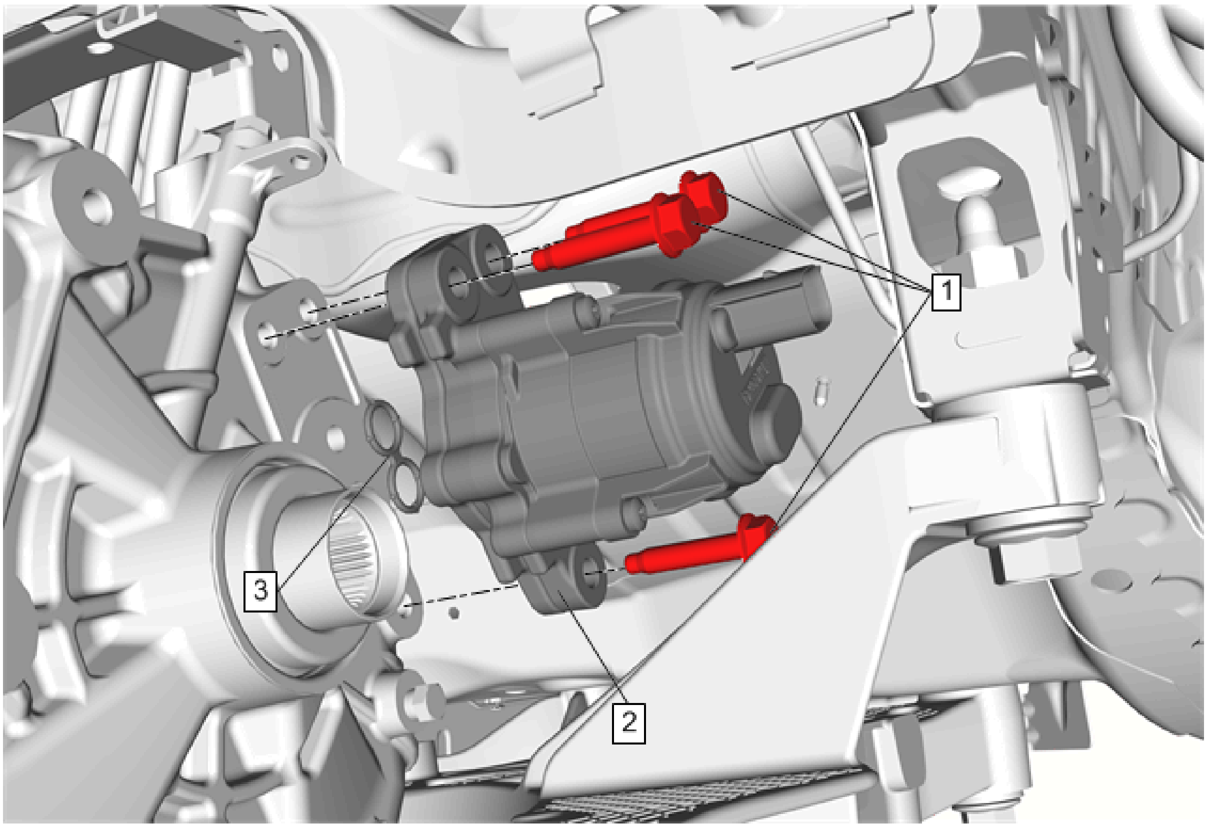

Fig. 148: Transmission Fluid Pump
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Fluid Pump Bolt (Qty: 3)
2	Automatic Transmission Fluid Pump Assembly
3	Automatic Transmission Fluid Pump Seal

The electric auxiliary transmission fluid pump motor assembly is driven by 12V pulse width modulated (PWM) direct current which is controlled by the power inverter module. The purpose of the electric auxiliary transmission fluid pump motor assembly is to supply oil to the transmission for lubrication and cooling during vehicle operation.

Transmission Internal Mode Switch

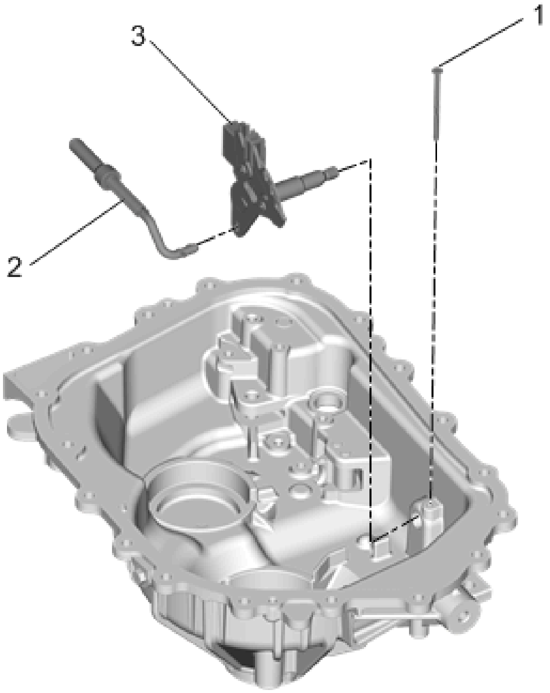

Fig. 149: Transmission Internal Mode
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Manual Shift Shaft Pin
2	Park Pawl Actuator
3	Manual Shift Shaft Position Switch Assembly

The 5 electronic switches are called the transmission range switches and are used to indicate the gear position the vehicle operator has selected. The 5 outputs (A, B, C, P, S) are range selection inputs to the hybrid/EV powertrain control module 1, through the Automatic Transmission Wiring Harness - Shift Shaft Position Switch. The manual shift detent lever assembly is mounted on the interior front of the transmission case above the control valve body assembly. The internal mode switch indicates to the hybrid/EV powertrain control module 1 which gear position the vehicle operator has selected. The Internal Mode Switch consists of 5 separate hall effect switches. Each hall effect switch is supplied a 9 V reference circuit, and a signal circuit from the hybrid/EV powertrain control module 1. Each signal circuit for each gear selector position will have either a voltage reading of 0.70 - 0.96 V indicating ON or 1.68 - 2.38 V indicating OFF. The voltage values on each Internal Mode Switch circuit will change and are dependent on the position of the gear selector. The state of each Internal Mode Switch A/B/C/P/S circuit is displayed on the scan tool.

Transmission Fluid Temperature Sensor

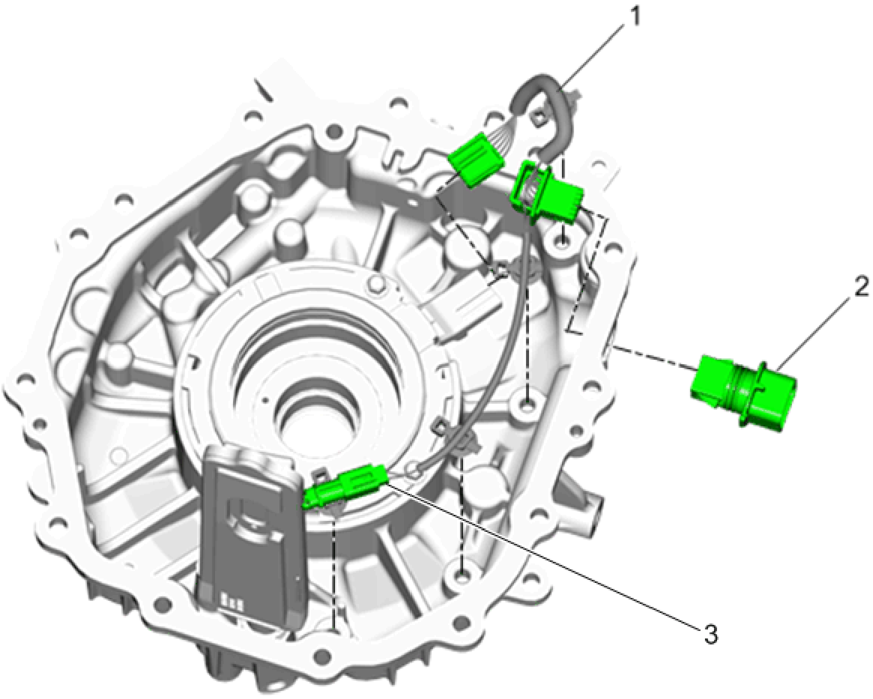

Fig. 150: Transmission Fluid Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Automatic Transmission Control Wiring Harness
2	Wiring Harness Electrical Connector
3	Transmission Fluid Temperature Sensor

The transmission fluid temperature sensor is part of the A/Trans Control Wiring Harness Assembly and can be serviced separately. The transmission fluid temperature sensor is connected to the ECM. The ECM sends the fluid temperature data to the power inverter module for drive motor torque.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B2A00: DOOR OPEN SWITCH SIGNAL - DOOR AJAR SWITCH SIGNAL NOT PLAUSIBLE/DRIVER DOOR OPEN SWITCH CIRCUIT NOT PLAUSIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2A00 00

Door Open Switch Signal - Door Ajar Switch Signal Not Plausible

DTC B297B 5A

Driver Door Open Switch Circuit Not Plausible

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B2A00 00, B297B 5A	B2A00 00, B297B 5A	B2A00 00, B297B 5A	-
Ground	-	1	-	-
1. Ajar Indicator Inoperative				

Circuit/System Description

The keyless entry control module provides a 12 V signal to the driver door open switch signal circuit. The driver window motor or the driver window switch provides a 12 V signal to the driver door ajar switch signal circuit. The door open switch and the door ajar switch are integral to the driver door latch assembly.

The door open switch and the door ajar switch contacts will be open with the door is fully closed, the door switches within the door latch are designed so that the when the door is ajar, the contact in the door ajar switch closes, the voltage is pulled low and the driver window motor or the driver window switch will then send a serial data message to the body control module indicating that the door is ajar. When the driver door is opened further, the contact in the door open switch will then close providing a ground for the door open signal circuit, the keyless entry control module will then detect that the door is open.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V.

Conditions for Setting the DTC

B2A00 00

- The chassis control module detects the driver door open switch is Active while receiving a serial data message from the body control module that the driver door ajar switch is Inactive.
- The condition must be present for greater than 30 seconds

B297B 5A

- The keyless entry control module detects the driver door open switch is Active while receiving a serial data message from the body control module that the driver door ajar switch is Inactive.
- The condition must be present for greater than 30 seconds

Action Taken When the DTC Sets

B2A00 00, B297B 5A

The driver information center will display the Service Driver Door Switch message

Conditions for Clearing the DTC

- The DTC will be current for as long as the fault is present.
- When the keyless entry control module receives a serial data message from the BCM that the door is ajar before the keyless entry control module detects the door open switch is active, then the DTC will be a history DTC.
- A history DTC will clear after 50 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Body Control Module Driver Door Ajar Switch parameter changes between Inactive and Active when opening and closing the driver door.
   - **If the parameter does not change**

     Refer to **Door Ajar Indicator Malfunction**

   - **If the parameter changes**
3. Verify the scan tool Keyless Entry Control Module Driver Door Ajar Switch parameter changes between Inactive and Active when opening and closing the driver door.
   - **If the parameter does not change**

     Refer to Circuit/System Testing

   - **If the parameter changes**
4. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON.
4. Test for greater than 10 V between the signal circuit terminal listed below and ground:
   - Signal circuit terminal 2 (LHD)
   - Signal circuit terminal 4 (RHD)
   - **If 10 V or less**
   1. Ignition OFF, disconnect the harness connector at the K84 Keyless Entry Control Module
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance on the circuit.
      - If less than 2 Ω, replace the K84 Keyless Entry Control Module
   - **If greater than 10 V**
5. Test or replace the A23D Door Latch Assembly-Driver.

Component Testing

1. Ignition OFF, disconnect the harness connector at the A23D Door Latch Assembly-Driver.

2. Test for infinite resistance between the signal terminal and ground terminal listed below with the switch in the open position.
   - Signal terminal 2 and ground terminal 3 (LHD)
   - Signal terminal 4 and ground terminal 3 (RHD)
   - **If less than infinite resistance**

     Replace the A23D Door Latch Assembly-Driver.

   - **If infinite resistance**
3. Test for less than 5 Ω between the signal terminal and ground terminal listed below with the switch in the closed position.
   - Signal terminal 2 and ground terminal 3 (LHD)
   - Signal terminal 4 and ground terminal 3 (RHD)
   - **If 5 Ω or greater**

     Replace the A23D Door Latch Assembly-Driver.

   - **If less than 5 Ω**
4. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Front Side Door Latch Replacement**
- Refer to **Control Module References** for keyless entry control module replacement, programming and setup

DTC C1280: ELECTRIC PARK BRAKE AVAILABILITY STATUS MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC C1280

Electric Park Brake Availability Status Message Counter Incorrect

Circuit/System Description

The internal fault detection is handled inside the device. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.
- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.
- Resolve any current DTC's that are present relating to the Electronic Transmission Range Selector system prior to replacement of components or programming/setup of module. Faults in any component or module that work together in this system may cause the programming/setup failure.
- Replacement or inspection of K173 Transmission Range Control Module requires rod linkage (if equipped) to be adjusted. If rod linkage is not properly adjusted, programming and setup procedure may fail and DTCs may set. Check K173 Transmission Range Control Module rod linkage adjustment prior to replacing the K173 Transmission Range Control Module. Something as simple as loosening the K173 Transmission Range Control Module mounting bolts can cause the module to be out of adjustment.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Check for updated software in K17 Electronic Brake Control Module.
    - **If software is not current**

      Perform the **programming** procedure for the K17 Electronic Brake Control Module.

    - **If software is up to date**
3. Replace the K17 Electronic Brake Control Module.
4. Verify DTC C1280 is not set.
    - **If DTC C1280 is set**

      Replace the K38 Chassis Control Module

    - **If DTC C1280 is not set**

5. All OK.

Repair Instructions

- Perform the **Diagnostic Repair Verification** after completing the repair.
- Refer to **Control Module References** for module replacement, programming and setup

DTC P073D, P073E, P07E4, P07E5, P1769, OR P1789: UNABLE TO ENGAGE R-D-N-P/TRANSMISSION RANGE SENSOR TRCM CORRELATION/CURRENT TRANSMISSION RANGE UNKNOWN

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P073E

Unable to Engage Reverse

DTC P07E5

Unable to Engage Drive

DTC P073D

Unable to Engage Neutral

DTC P07E4

Unable to Engage Park

DTC P1769

Transmission Range Sensor TRCM Correlation

DTC P1789

Current Transmission Range Unknown

Circuit/System Description

The Transmission Shift Lever will provide electrical signals based on customer input to the Chassis Control Module, where the customer shift request will be determined. When the Chassis Control Module receives the gear request signal from the Transmission Shift Lever it sends the message for the Transmission Range Control Module to engage the selected gear.

Conditions for Running the DTC

Ignition ON/Vehicle in Service Mode.

Conditions for Setting the DTC

P073E

The actual transmission range does not equal Reverse within 1 s of commanding Reverse.

P07E5

The actual transmission range does not equal Drive within 1 s of commanding Drive.

P073D

The actual transmission range does not equal Neutral within 1 s of commanding Neutral.

P07E4

The actual transmission range does not equal Park within 1 s of commanding Park.

NOTE: **DTC P07E4 could set on conditions when battery voltage is low or battery voltage is high. This may not indicate an issue in the Electronic Transmission Range Selector system but may be a result of a low battery condition. Battery voltage DTCs should be resolved prior to resolving DTC P07E4.**

P1769

The actual transmission range from the internal mode switch does not match the actual transmission range from the rotary shaft position sensor in the TRCM.

P1789

The actual transmission range is not valid for 1 s. This DTC will put the vehicle in Latent Fault Mode. Refer to **Latent Fault Mode Description**.

Action Taken When the DTC Sets

DTC P073E, P07E5, P073D, P07E4, P1769, or P1789 is a Type B DTC. The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify no other DTCs are set.
   - **If other DTCs are set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle and resolve all other DTCs

- **If no other DTCs are set**

3. Verify K173 Transmission Range Control Module is mounted securely and if it has a linkage ensure the linkage from K173 Transmission Range Control Module to Transmission is adjusted properly with no excessive play.
   - **If play is found in the mounting of the K173 Transmission Range Control Module or linkage**

     Resolve issue and perform K173 Transmission Range Control Module learn procedure. Refer to Transmission Range Control Module Range Motor Position Learn.

   - **If no play is found in the mounting of the K173 Transmission Range Control Module or linkage**
4. Check for updated software in K173 Transmission Range Control Module.
   - **If software is not current**

     Perform the **programming** procedure for the K173 Transmission Range Control Module.

   - **If software is up to date**
5. Replace the K173 Transmission Range Control Module
6. Verify DTC P073E, P07E5, P073D, P07E4, P1769, or P1789 did not set.
   - **If any of the DTCs are set**

     Replace the K38 Chassis Control Module

   - **If none of the DTCs are set**
7. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for module replacement, programming and setup.

DTC P07B3-P07B5: TRANSMISSION PARK POSITION SWITCH 1 CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC P07B3

Transmission Park Position Switch 1 Circuit Low

DTC P07B4

Transmission Park Position Switch 1 Circuit High

DTC P07B5

Transmission Park Position Switch 1 Circuit Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P07B3	P07B4	P07B4	P07B5

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Reference	-	P07B4	-	-

Circuit/System Description

The Park Button Switch is located in the S156 Transmission Shift Lever Knob which is mounted on the S3 Transmission Shift Lever. The Park Button Switch has two internal sensors which are monitored by the K38 Chassis Control Module. When the Park switch is pressed the K38 Chassis Control Module will process the Park request and send a command signal to the K173 Transmission Range Control Module via serial data. These DTCs will put the vehicle in Latent Fault Mode. Refer to **Latent Fault Mode Description**.

Conditions for Running the DTC

P07B3 or P07B4

The K38 Chassis Control Module monitors this DTC at all times.

P07B5

P07B3 or P07B4 is not set.

Conditions for Setting the DTC

P07B3

The K38 Chassis Control Module detects a low voltage condition, in the Park Button Switch 1 circuit for 1 s. Low voltage is considered 0.2 - 0 V. Fault must be present for 7 out of 9 samples.

P07B4

The K38 Chassis Control Module detects a high voltage condition, in the Park Button Switch 1 circuit for 1 s. High voltage is considered anything greater than 4.8 V. Fault must be present for 7 out of 9 samples.

P07B5

The K38 Chassis Control Module detects a circuit performance condition, in the Park Button Switch 1 circuit for 1 s. Voltage performance fault is considered 3.1 - 3.5 V. Fault must be present for 7 out of 9 samples.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present. Type B DTC.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the scan tool Transmission Park Position Switch 1 parameter is 35% - 45% when the Park Button Switch is pressed on the Transmission Shift Lever assembly.
    - **If parameter is not 35% - 45%**

      Refer to Circuit/System Testing.

    - **If parameter is 35% - 45%**
3. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Verify the scan tool Transmission Park Position Switch 1 parameter is greater than 95%.
    - **If less than 95%**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the signal circuit terminal 9 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K38 Chassis Control Module.
    - **If greater than 95%**
5. Install a 3 A fused jumper wire between the signal circuit terminal 9 and the low reference circuit terminal 10.
6. Verify the scan tool Transmission Park Position Switch 1 is less than 5%.
    - **If greater than 5%**
    1. Ignition OFF/Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.

        - If less than 1 V
    3. Ignition OFF/Vehicle OFF
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 5%**
7. Replace the S3 Transmission Shift Lever.
8. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If the DTC sets**

      Replace the S156 Transmission Shift Lever Knob.

    - **If the DTC does not set**
9. All OK.

Component Testing

NOTE: **When performing Component Testing on the S3 Transmission Shift Lever, the S156 Transmission Shift Lever Knob should remain attached.**

1. Ignition OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever.
2. Verify circuit is 3 - 3.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch not pressed.
    - **If circuit is not between 3 - 3.5K Ω**

      Replace the S3 Transmission Shift Lever and repeat step 2. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

    - **If circuit is between 3 - 3.5 K Ω**
3. Verify circuit is 1 - 1.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch pressed.
    - **If circuit is not between 1 - 1.5K Ω**

      Replace the S3 Transmission Shift Lever and repeat step 3. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

    - **If circuit is between 1 - 1.5K Ω**
4. All OK

Repair Instructions

- Perform the Diagnostic Repair Verification after completing the repair.
- Refer to Electronic Transmission Range Selector Component Replacement Reference
- Refer to Control Module References for module replacement, programming, and setup.

DTC P07B9-P07BB: TRANSMISSION PARK POSITION SWITCH 2 CIRCUIT

DTC P07BA

Transmission Park Position Switch 2 Circuit High

DTC P07BB

Transmission Park Position Switch 2 Circuit Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P07B9	P07BA	P07BA	P07BB
Low Reference	-	P07BA	-	-

Circuit/System Description

The Park Button Switch is located in the S156 Transmission Shift Lever Knob which is mounted on the S3 Transmission Shift Lever. The Park Button Switch has two internal sensors which are monitored by the K38 Chassis Control Module. When the Park switch is pressed the K38 Chassis Control Module will process the Park request and send a command signal to the K173 Transmission Range Control Module via serial data. These DTCs will put the vehicle in Latent Fault Mode. Refer to **Latent Fault Mode Description**.

Conditions for Running the DTC

P07B9 or P07BA

The K38 Chassis Control Module monitors this DTC at all times.

P07BB

P07B9 or P07BA is not set.

Conditions for Setting the DTC

P07B9

The K38 Chassis Control Module detects a low voltage condition, in the Park Button Switch 2 circuit for 1 s. Low voltage is considered 0.2 - 0 volts. Fault must be present for 7 out of 9 samples.

P07BA

The K38 Chassis Control Module detects a high voltage condition, in the Park Button Switch 2 circuit for 1 s. High voltage is considered anything greater than 4.8 volts. Fault must be present for 7 out of 9 samples.

P07BB

The K38 Chassis Control Module detects a circuit performance condition, in the Park Button Switch 2 circuit for 1 s. Voltage performance fault is considered 3.1 - 3.5 volts. Fault must be present for 7 out of 9 samples.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present. Type B DTC.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

2. Verify the scan tool Transmission Park Position Switch 2 parameter is 35% - 45% when the Park Button Switch is pressed on the Transmission Shift Lever assembly.
    - **If parameter is not 35% - 45%**

      Refer to Circuit/System Testing.

    - **If parameter is 35% - 45%**
3. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 12 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Verify the scan tool Transmission Park Position Switch 2 parameter is greater than 95%.
    - **If less than 95%**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the signal circuit terminal 11 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K38 Chassis Control Module.
    - **If greater than 95%**

5. Install a 3 A fused jumper wire between the signal circuit terminal 12 and the low reference circuit terminal 11.
6. Verify the scan tool Transmission Park Position Switch 2 is less than 5%.
    - **If greater than 5%**
    1. Ignition OFF/Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF/Vehicle OFF
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 5%**
7. Replace the S3 Transmission Shift Lever.
8. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If the DTC sets**

      Replace the S156 Transmission Shift Lever Knob.

    - **If the DTC does not set**
9. All OK.

Component Testing

NOTE: **When performing Component Testing on the S3 Transmission Shift Lever, the S156 Transmission Shift Lever Knob should remain attached.**

1. Ignition OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever.
2. Verify circuit is 3 - 3.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch not pressed.
    - **If circuit is not between 3 - 3.5K Ω**

      Replace the S3 Transmission Shift Lever and repeat step 2. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

    - **If circuit is between 3 - 3.5K Ω**
3. Verify circuit is 1 - 1.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch pressed.
    - **If circuit is not between 1 - 1.5K Ω**

      Replace the S3 Transmission Shift Lever and repeat step 3. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

    - **If circuit is between 1 - 1.5K Ω**
4. All OK

Repair Instructions

- Perform the Diagnostic Repair Verification after completing the repair.
- Refer to Electronic Transmission Range Selector Component Replacement Reference
- Refer to Control Module References for module replacement, programming, and setup.

DTC P07BE OR P17F3: TRANSMISSION PARK POSITION SWITCH 1-2 NOT PLAUSIBLE/TRANSMISSION PARK POSITION SWITCH CIRCUIT 1 OR 2 STUCK ON

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P07BE

Transmission Park Position Switch 1-2 Not Plausible

DTC P17F3

Transmission Park Position Switch Circuit 1 or 2 Stuck On

Circuit/System Description

The Park Button Switch is located in the S156 Transmission Shift Lever Knob which is mounted on the S3 Transmission Shift Lever. The Park Button Switch has two internal sensors which are monitored by the K38 Chassis Control Module. When the Park switch is pressed the K38 Chassis Control Module will process the Park request and send a command signal to the K173 Transmission Range Control Module via serial data. These DTCs will put the vehicle in Latent Fault Mode. Refer to **Latent Fault Mode Description**.

Conditions for Running the DTC

The K38 Chassis Control Module monitors this DTC at all times.

Conditions for Setting the DTC

P07BE

Park Button Switch 1 and Park Button Switch 2 are both in valid positions (Pressed or Released) but positions to do not match. Fault must be present for 7 out of 9 samples.

P17F3

Park Button Switch 1 and Park Button Switch 2 are both in valid positions (Pressed or Released) but positions to do not match. Fault must be present for 7 out of 9 samples.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present. Type B DTC.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

Diagnostic Aids

If the Park Button is not firmly pressed in the center, there is a chance that 1 of the 2 contacts within the button will not make contact. This could cause DTC P07BE or DTC P17F3 to set without any fault present. If this is the case, the customer should be educated to press the Park Button firmly and in the center.

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Reference	-	P082B, P082E	-	-

Circuit/System Description

The S3 Transmission Shift Lever will provide electrical signals based on customer input to the K38 Chassis Control Module, where the customer shift request will be determined. The shift lever position is determined by 2 internal sensors that each transmit an X and Y coordinate signal. All 4 signal circuits are inputs to the K38 Chassis Control Module and are diagnosable for a high duty cycle condition, low duty cycle condition, and a signal performance condition. These DTCs will put the vehicle in Latent Fault Mode. Refer to **Latent Fault Mode Description**.

Conditions for Running the DTC

The K38 Chassis Control Module monitors this DTC at all times.

Conditions for Setting the DTC

P082B

The chassis control module detects a low duty cycle percentage, in the Transmission Range Selector X Position Sensor 1 Circuit for 1 s. Low duty cycle is considered less than 5%. Fault must be present for 7 out of 9 samples.

P082C

The chassis control module detects a high duty cycle percentage, in the Transmission Range Selector X Position Sensor 1 Circuit for 1 s. High duty cycle is considered greater than 95%. Fault must be present for 7 out of 9 samples.

P082A

The chassis control module detects a circuit performance condition, in the Transmission Range Selector X Position Sensor 1 Circuit for 1 s. Fault must be present for 7 out of 9 samples. DTC P082B or P082C is not set.

P082E

The chassis control module detects a low duty cycle percentage, in the Transmission Range Selector Y Position Sensor 1 Circuit for 1 s. Low duty cycle is considered less than 5%. Fault must be present for 7 out of 9 samples.

P082F

The chassis control module detects a high duty cycle percentage, in the Transmission Range Selector Y Position Sensor 1 Circuit for 1 s. High duty cycle is considered greater than 95%. Fault must be present for 7 out of 9 samples.

P082D

The chassis control module detects a circuit performance condition, in the Transmission Range Selector Y Position Sensor 1 Circuit for 1 s. Fault must be present for 7 out of 9 samples. DTC P082E or P082F is not set.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present. Type B DTC.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.

- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the scan tool Transmission Gear Lever X Position 1 Duty Cycle and Transmission Gear Lever Y Position 1 Duty Cycle parameters are between 5% and 95% and duty cycle changes when gear lever is moved to different positions.
   - **If Transmission Gear Lever X Position 1 Duty Cycle is less than 5% or greater than 95% or does not change**

     Refer to Circuit/System Testing for Transmission Range Selector X Position Sensor 1.

   - **If Transmission Gear Lever Y Position 1 Duty Cycle is less than 5% or greater than 95% or does not change**

     Refer to Circuit/System Testing for Transmission Range Selector Y Position Sensor 1.

   - **If both parameters are between 5% and 95% and change but the DTC is still present**

     Refer to Circuit/System Testing for the appropriate sensor.

   - **If both parameters are between 5% and 95% and change with no DTC present**
3. All OK.

Circuit/System Testing

Transmission Range Selector X Position Sensor 1

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 15 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 13 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If between 4.8 - 5.2 V**
5. Test for 4.8 - 5.2 V between the signal circuit terminal 14 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If between 4.8 - 5.2 V**
6. Replace the S3 Transmission Shift Lever.

Transmission Range Selector Y Position Sensor 1

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 15 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.

- **If less than 10 Ω**

3. Ignition ON/Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 13 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the 5 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 5 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the 5 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If between 4.8 - 5.2 V**
5. Test for 4.8 - 5.2 V between the signal circuit terminal 16 and ground.
    - **If less than 4.8 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If between 4.8 - 5.2 V**
6. Replace the S3 Transmission Shift Lever.

Circuit/System Description

The S3 Transmission Shift Lever will provide electrical signals based on customer input to the K38 Chassis Control Module, where the customer shift request will be determined. The shift lever position is determined by 2 internal sensors that each transmit an X and Y coordinate signal. All 4 signal circuits are inputs to the K38 Chassis Control Module and are diagnosable for a high duty cycle condition, low duty cycle condition, and a signal performance condition. These DTCs will put the vehicle in Latent Fault Mode. Refer to **Latent Fault Mode Description**.

Conditions for Running the DTC

The K38 Chassis Control Module monitors this DTC at all times.

Conditions for Setting the DTC

P089C

The chassis control module detects a low duty cycle percentage, in the Transmission Range Selector X Position Sensor 2 Circuit for 1 s. Low duty cycle is considered less than 5%. Fault must be present for 7 out of 9 samples.

P089D

The chassis control module detects a high duty cycle percentage, in the Transmission Range Selector X Position Sensor 2 Circuit for 1 s. High duty cycle is considered greater than 95%. Fault must be present for 7 out of 9 samples.

P089B

The chassis control module detects a circuit performance condition, in the Transmission Range Selector X Position Sensor 2 Circuit for 1 s. Fault must be present for 7 out of 9 samples.

P08A1

The chassis control module detects a low duty cycle percentage, in the Transmission Range Selector Y Position Sensor 2 Circuit for 1 s. Low duty cycle is considered less than 5%. Fault must be present for 7 out of 9 samples.

P08A2

The chassis control module detects a high duty cycle percentage, in the Transmission Range Selector Y Position Sensor 2 Circuit for 1 s. High duty cycle is considered greater than 95%. Fault must be present for 7 out of 9 samples.

P08A0

The chassis control module detects a circuit performance condition, in the Transmission Range Selector Y Position Sensor 2 Circuit for 1 s. Fault must be present for 7 out of 9 samples.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present. Type B DTC.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the scan tool Transmission Gear Lever X Position 2 Duty Cycle and Transmission Gear Lever Y Position 2 Duty Cycle parameters are between 5% and 95% and duty cycle changes when gear lever is moved to different positions.

- **If Transmission Gear Lever X Position 2 Duty Cycle is less than 5% or greater than 95% or does not change**

  Refer to Circuit/System Testing for Transmission Range Selector X Position Sensor 2.

- **If Transmission Gear Lever Y Position 2 Duty Cycle is less than 5% or greater than 95% or does not change**

  Refer to Circuit/System Testing for Transmission Range Selector Y Position Sensor 2.

- **If both parameters are between 5% and 95% and change but the DTC is still present**

  Refer to Circuit/System Testing for the appropriate sensor.

- **If both parameters are between 5% and 95% and change with no DTC present**

3. All OK.

Circuit/System Testing

Transmission Range Selector X Position Sensor 2

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K38 Chassis Control Module.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 4 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for infinite resistance between the 5 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K38 Chassis Control Module.
   - **If greater than 5.2 V**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
   2. Test for less than 1 V between the 5 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K38 Chassis Control Module.
   - **If between 4.8 - 5.2 V**
5. With the X1 harness connector at the S3 Transmission Shift Lever still disconnected, test for 4.8 - 5.2 V between the signal circuit terminal 1 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for infinite resistance between the signal circuit and ground.

      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K38 Chassis Control Module.
   - **If greater than 5.2 V**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K38 Chassis Control Module.
   - **If between 4.8 - 5.2 V**
6. Replace the S3 Transmission Shift Lever.

Transmission Range Selector Y Position Sensor 2

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K38 Chassis Control Module.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 4 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for infinite resistance between the 5 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K38 Chassis Control Module.
   - **If greater than 5.2 V**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
   2. Test for less than 1 V between the 5 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K38 Chassis Control Module.
   - **If between 4.8 - 5.2 V**
5. With the X1 harness connector at the S3 Transmission Shift Lever still disconnected, test for 4.8 - 5.2 V between the signal circuit terminal 3 and ground.
   - **If less than 4.8 V**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If greater than 5.2 V**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K38 Chassis Control Module.
    - **If between 4.8 - 5.2 V**

6. Replace the S3 Transmission Shift Lever.

Repair Instructions

- Perform the **Diagnostic Repair Verification** after completing the repair.
- Refer to **Electronic Transmission Range Selector Component Replacement Reference**
- Refer to **Control Module References** for module replacement, programming, and setup.

DTC P17D5

Transmission Range Control Slow Response

Circuit/System Description

The internal fault detection is handled inside the device. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.
- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.
- Resolve any current DTC's that are present relating to the Electronic Transmission Range Selector system prior to replacement of components or programming/setup of module. Faults in any component or module that work together in this system may cause the programming/setup failure.
- Replacement or inspection of K173 Transmission Range Control Module requires rod linkage (if equipped) to be adjusted. If rod linkage is not properly adjusted, programming and setup procedure may fail and DTCs may set. Check K173 Transmission Range Control Module rod linkage adjustment prior to replacing the K173 Transmission Range Control Module. Something as simple as loosening the K173 Transmission Range Control Module mounting bolts can cause the module to be out of adjustment.

DTC P174C: TRANSMISSION RANGE CONTROL MODULE WHEEL SPEED SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P174C

Transmission Range Control Module Wheel Speed Signal Message Counter Incorrect

Circuit/System Description

The wheel speeds are detected by active wheel speed sensors. Each wheel speed sensor receives a 12 V reference voltage from the electronic brake control module (EBCM) and provides an alternating current square wave signal to the EBCM. As the wheel spins, the EBCM uses the frequency of the square wave signal to calculate the wheel speed. The EBCM sends the wheel speed information as a high speed controller area network (CAN) serial data message.

Conditions for Running the DTC

Ignition ON/Vehicle in Service Mode.

Conditions for Setting the DTC

A supervised periodic message that includes the wheel speed serial data has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function or operate in degraded mode.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Scan Tool Reference

Control Module References for scan tool information

Diagnostic Aids

- This DTC can be set due to an incorrect part wheel speed sensor installed.
- Inspect the wheel encoder ring for rust or corrosion.
- If the customer comments that the ABS indicator is ON only during moist environmental conditions (rain, snow, vehicle wash, etc.), inspect the wheel speed sensor wiring for signs of water intrusion.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify that DTC C0035, C0040, C0045, or C0050 is not set in the K17 Electronic Brake Control Module.
    - **If any listed DTC is set**

Refer to Diagnostic Trouble Code (DTC) List - Vehicle to diagnose DTC prior to this diagnostic.

- **If any listed DTC is not set**

3. Replace the K17 Electronic Brake Control Module.
4. Verify the DTC does not set while operating the vehicle under the Conditions for Running the DTC.
   - **If the DTC sets**

     Replace the module that set the DTC.

   - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for control module replacement, programming and setup

DTC P174D OR P17AB: TRANSMISSION RANGE CONTROL MODULE RANGE NOT LEARNED/NOT PROGRAMMED

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC P174D

Transmission Range Control Module Range Not Learned

DTC P17AB

Transmission Range Control Module Not Programmed

Circuit/System Description

Some devices must be configured with specific software, serial numbers, vehicle options, or other information. If a device was not properly configured after installation that module may set DTC P174D or DTC P17AB. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- MIL will be illuminated on first trip with fault present. Type A DTC.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

DTC P1787

Unexpected Range Change Detected

DTC P17C8

Transmission Range Control Module Range Motor Command Performance - Protection Mode Active

Circuit/System Description

The S3 Transmission Shift Lever will provide electrical signals based on customer input to the K38 Chassis Control Module, where the customer shift request will be determined. When the K38 Chassis Control Module receives the gear request signal from the S3 Transmission Shift Lever it sends the message for the K173 Transmission Range Control Module to engage the selected gear.

Conditions for Running the DTC

The Ignition is ON.

Conditions for Setting the DTC

P1787

The actual transmission range does not equal the requested transmission range, without the driver requesting a range change.

P17C8

The device has detected an internal malfunction.

Action Taken When the DTC Sets

DTC P1787 or P17C8 is a Type B DTC. The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify no other DTCs are set.
    - **If other DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** and resolve all other DTCs

    - **If no other DTCs are set**
3. Verify K173 Transmission Range Control Module is mounted securely and if it has a linkage ensure the linkage from K173 Transmission Range Control Module to Transmission is adjusted properly with no excessive play.
    - **If play is found in the mounting of the K173 Transmission Range Control Module or linkage**

      Resolve issue and perform K173 Transmission Range Control Module learn procedure. Refer to **Transmission Range Control Module Range Motor Position Learn**.

    - **If no play is found in the mounting of the K173 Transmission Range Control Module or linkage**
4. Verify K173 Transmission Range Control Module has the most up to date software.
    - **If software is not current**

      Perform the **programming** procedure for the K173 Transmission Range Control Module.

    - **If software is up to date**
5. Perform the Backup Park Lock Actuator Arming procedure. Refer to **Backup Park Lock Actuator Arming**.
6. Verify DTC P1787 or P17C8 is not set.
    - **If DTC P1787 or P17C8 is set**

      Replace the K173 Transmission Range Control Module

      1. Verify DTC P1787 or P17C8 is not set.
          - If DTC P1787 or P17C8 is set

            Replace the K38 Chassis Control Module.

          - If DTC P1787 or P17C8 is not set

            All OK.

    - **If DTC P1787 or P17C8 is not set**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for module replacement, programming and setup.

DTC P17A3-P17A5: TRANSMISSION SHIFT INTERLOCK 1 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P17A3

Transmission Shift Interlock 1 Circuit Low

DTC P17A4

Transmission Shift Interlock 1 Circuit High

DTC P17A5

Transmission Shift Interlock 1 Circuit Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P17A3	P17A4	P17A4	P17A5
Low Reference	-	P17A4	-	-

Circuit/System Description

The Shift Interlock Button Switch is located in the S156 Transmission Shift Lever Knob which is mounted on the S3 Transmission Shift Lever. The Shift Interlock Button Switch has two internal sensors which are monitored by the K38 Chassis Control Module. When the Shift Interlock switch is pressed the K38 Chassis Control Module will process the request and send a command signal to the K173 Transmission Range Control Module via serial data.

Conditions for Running the DTC

P17A3 or P17A4

The K38 Chassis Control Module monitors this DTC at all times.

P17A5

P17A3 or P17A4 is not set.

Conditions for Setting the DTC

P17A3

The chassis control module detects a low voltage condition, in the Shift Interlock 1 circuit for 1 s. Low voltage is considered 0.2 - 0 volts. Fault must be present for 7 out of 9 samples.

P17A4

The chassis control module detects a high voltage condition, in the Shift Interlock 1 circuit for 1 s. High voltage is considered anything greater than 4.8 volts. Fault must be present for 7 out of 9 samples.

P17A5

The chassis control module detects a circuit performance condition, in the Shift Interlock 1 circuit for 1 s. Voltage performance fault is considered 3.1 - 3.5 volts. Fault must be present for 7 out of 9 samples.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.

- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

Description and Operation

Electronic Transmission Range Selector Description

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the scan tool Transmission Shift Interlock Switch 1 parameter is 50% - 60% when the Shift Interlock Button is pressed on the Transmission Shift Lever assembly.
    - **If parameter is not 50% - 60%**

      Refer to Circuit/System Testing.

    - **If parameter is 50% - 60%**
3. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 18 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Verify the scan tool Transmission Shift Interlock Switch 1 parameter is greater than 95%.
    - **If less than 95%**
    1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
    2. Test for infinite resistance between the signal circuit terminal 19 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance, replace the K38 Chassis Control Module.
    - **If greater than 95%**
5. Install a 3 A fused jumper wire between the signal circuit terminal 19 and the low reference circuit terminal 18.
6. Verify the scan tool Transmission Shift Interlock Switch 1 is less than 5%.
    - **If greater than 5%**
    1. Ignition OFF/Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF/Vehicle OFF
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K38 Chassis Control Module.
    - **If less than 5%**
7. Replace the S3 Transmission Shift Lever.
8. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
    - **If the DTC sets**

      Replace the S156 Transmission Shift Lever Knob.

    - **If the DTC does not set**
9. All OK.

Component Testing

NOTE: **When performing Component Testing on the S3 Transmission Shift Lever, the S156 Transmission Shift Lever Knob should remain attached.**

1. Ignition OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever.
2. Verify circuit is 3 - 3.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch not pressed.
    - **If circuit is not between 3 - 3.5K Ω**

      Replace the S3 Transmission Shift Lever and repeat step 2. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

    - **If circuit is between 3 - 3.5K Ω**
3. Verify circuit is 1 - 1.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch pressed.
    - **If circuit is not between 1 - 1.5K Ω**

      Replace the S3 Transmission Shift Lever and repeat step 3. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

    - **If circuit is between 1 - 1.5K Ω**
4. All OK

Repair Instructions

- Perform the Diagnostic Repair Verification after completing the repair.
- Refer to Electronic Transmission Range Selector Component Replacement Reference
- Refer to Control Module References for module replacement, programming, and setup.

DTC P17A6 OR P17F4: TRANSMISSION SHIFT INTERLOCK SWITCH 1-2 NOT PLAUSIBLE/TRANSMISSION SHIFT INTERLOCK SWITCH CIRCUIT 1 OR 2 STUCK ON

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P17A6

Transmission Shift Interlock Switch 1-2 Not Plausible

DTC P17F4

Transmission Shift Interlock Switch Circuit 1 or 2 Stuck On

Circuit/System Description

The Shift Interlock Button Switch is located in the S156 Transmission Shift Lever Knob which is mounted on the S3 Transmission Shift Lever. The Shift Interlock Button Switch has two internal sensors which are monitored by the K38 Chassis Control Module. When the Shift Interlock switch is pressed the K38 Chassis Control Module will process the request and send a command signal to the K173 Transmission Range Control Module via serial data.

Conditions for Running the DTC

The K38 Chassis Control Module monitors this DTC at all times.

Conditions for Setting the DTC

P17A6

Shift Interlock Switch 1 and Shift Interlock Switch 2 are both in valid positions (Pressed or Released) but positions to do not match. Fault must be present for 7 out of 9 samples.

P17F4

Shift Interlock Switch 1 and Shift Interlock Switch 2 are both in valid positions (Pressed or Released) but positions to do not match. Fault must be present for 7 out of 9 samples.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

Diagnostic Aids

If the Shift Interlock Button is not firmly pressed in the center, there is a chance that 1 of the 2 contacts within the button will not make contact. This could cause DTC P17A6 or DTC P17F4 to set without any fault present. If this is the case, the customer should be educated to press the Shift Interlock Button firmly and in the center.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the scan tool Shift Interlock Switch 1 and Shift Interlock Switch 2 is between 67% - 85% when the Park Button Switch is not being pressed on the Transmission Shift Lever assembly.
    - **If parameter is not between 67% - 85%**
    1. Replace the S156 Transmission Shift Lever Knob.
    2. Verify the DTC does not set while operating the vehicle with the Conditions for Running the DTC.
        - If the DTC sets, replace the S3 Transmission Shift Lever.
        - If the DTC does not set
    3. All OK.
    - **If parameter is between 67% - 85%**
3. Verify the scan tool Shift Interlock Switch 1 and Shift Interlock Switch 2 is between 50% - 60% when the Shift Interlock Button is pressed on the Transmission Shift Lever assembly.
    - **If parameter is not between 50% - 60%**
    1. Replace the S156 Transmission Shift Lever Knob.
    2. Verify the DTC does not set while operating the vehicle with the Conditions for Running the DTC.
        - If the DTC sets, replace the S3 Transmission Shift Lever.
        - If the DTC does not set
    3. All OK.
    - **If parameter is between 50% - 60%**
4. All OK.

Component Testing

NOTE: **When performing Component Testing on the S3 Transmission Shift Lever, the S156 Transmission Shift Lever Knob should remain attached.**

1. Ignition OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever.
2. Verify circuit is 3 - 3.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch not pressed.
    - **If circuit is not between 3 - 3.5K Ω**

Replace the S3 Transmission Shift Lever and repeat step 2. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

  - **If circuit is between 3 - 3.5K Ω**

3. Verify circuit is 1 - 1.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch pressed.
   - **If circuit is not between 1 - 1.5K Ω**

     Replace the S3 Transmission Shift Lever and repeat step 3. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

   - **If circuit is between 1 - 1.5K Ω**
4. All OK

Repair Instructions

- Perform the **Diagnostic Repair Verification** after completing the repair.
- Refer to **Electronic Transmission Range Selector Component Replacement Reference**
- Refer to **Control Module References** for module replacement, programming, and setup.

DTC P17A7-P17A9: TRANSMISSION SHIFT INTERLOCK 2 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P17A7

Transmission Shift Interlock 2 Circuit Low

DTC P17A8

Transmission Shift Interlock 2 Circuit High

DTC P17A9

Transmission Shift Interlock 2 Circuit Performance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P17A7	P17A8	P17A8	P17A9
Low Reference	-	P17A8	-	-

Circuit/System Description

The Shift Interlock Button Switch is located in the S156 Transmission Shift Lever Knob which is mounted on the S3 Transmission Shift Lever. The Shift Interlock Button Switch has two internal sensors which are monitored by the K38 Chassis Control Module. When the Shift Interlock switch is pressed the K38 Chassis Control Module will process the request and send a command signal to the K173 Transmission Range Control Module via serial data.

Conditions for Running the DTC

P17A7 or P17A8

The K38 Chassis Control Module monitors this DTC at all times.

P17A9

P17A7 or P17A8 is not set.

Conditions for Setting the DTC

P17A7

The chassis control module detects a low voltage condition, in the Shift Interlock 2 circuit for 1 s. Low voltage is considered 0.2 - 0 volts. Fault must be present for 7 out of 9 samples.

P17A8

The chassis control module detects a high voltage condition, in the Shift Interlock 2 circuit for 1 s. High voltage is considered anything greater than 4.8 volts. Fault must be present for 7 out of 9 samples.

P17A9

The chassis control module detects a circuit performance condition, in the Shift Interlock 2 circuit for 1 s. Voltage performance fault is considered 3.1 - 3.5 volts. Fault must be present for 7 out of 9 samples.

Action Taken When the DTC Sets

- MIL will be illuminated on second trip with fault present.
- Vehicle will not be allowed to shift out of park after 35 to 50 trips with fault present.

Conditions for Clearing the DTC

- A current DTC will clear when the malfunction is no longer present and the ignition switch is cycled.
- A history DTC will clear after 40 ignition cycles with no current DTC active during the 40 ignition cycles.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify the scan tool Transmission Shift Interlock Switch 2 parameter is 50% - 60% when the Shift Interlock Button is pressed on the Transmission Shift Lever assembly.

- **If parameter is not 50% - 60%**

  Refer to Circuit/System Testing.

- **If parameter is 50% - 60%**

3. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 20 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K38 Chassis Control Module.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. Verify the scan tool Transmission Shift Interlock Switch 2 parameter is greater than 95%.
   - **If not greater than 95%**
   1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the K38 Chassis Control Module.
   2. Test for infinite resistance between the signal circuit terminal 21 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K38 Chassis Control Module.
   - **If greater than 95%**
5. Install a 3 A fused jumper wire between the signal circuit terminal 21 and the low reference circuit terminal 20.
6. Verify the scan tool Transmission Shift Interlock Switch 2 is less than 5%.
   - **If greater than 5%**
   1. Ignition OFF/Vehicle OFF, remove the jumper wire, disconnect the harness connector at the K38 Chassis Control Module, Ignition ON/Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Ignition OFF/Vehicle OFF
   4. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K38 Chassis Control Module.
   - **If less than 5%**
7. Replace the S3 Transmission Shift Lever.
8. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
   - **If the DTC sets**

     Replace the S156 Transmission Shift Lever Knob.

   - **If the DTC does not set**
9. All OK.

Component Testing

NOTE: **When performing Component Testing on the S3 Transmission Shift Lever, the S156 Transmission Shift Lever Knob should remain attached.**

1. Ignition OFF, disconnect the X1 harness connector at the S3 Transmission Shift Lever.
2. Verify circuit is 3 - 3.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch not pressed.
   - **If circuit is not between 3 - 3.5K Ω**

     Replace the S3 Transmission Shift Lever and repeat step 2. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

   - **If circuit is between 3 - 3.5K Ω**
3. Verify circuit is 1 - 1.5K Ω between signal circuit terminal 9 and the low reference circuit terminal 10, with the Park Button Switch pressed.
   - **If circuit is not between 1 - 1.5K Ω**

     Replace the S3 Transmission Shift Lever and repeat step 3. If issue still occurs, replace the S156 Transmission Shift Lever Knob.

   - **If circuit is between 1 - 1.5K Ω**
4. All OK

Repair Instructions

- Perform the **Diagnostic Repair Verification** after completing the repair.
- Refer to **Electronic Transmission Range Selector Component Replacement Reference**
- Refer to **Control Module References** for module replacement, programming, and setup.

DTC P17CB: HYBRID CHARGING SYSTEM PARK REQUEST SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC P17CB

Hybrid Charging System Park Request Signal Message Counter Incorrect

Circuit/System Description

The internal fault detection is handled inside the device. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.
- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.
- Resolve any current DTC's that are present relating to the Electronic Transmission Range Selector system prior to replacement of components or programming/setup of module. Faults in any component or module that work together in this system may cause the programming/setup failure.
- Replacement or inspection of K173 Transmission Range Control Module requires rod linkage (if equipped) to be adjusted. If rod linkage is not properly adjusted, programming and setup procedure may fail and DTCs may set. Check K173 Transmission Range Control Module rod linkage adjustment prior to replacing the K173 Transmission Range Control Module. Something as simple as loosening the K173 Transmission Range Control Module mounting bolts can cause the module to be out of adjustment.

ELECTRONIC TRANSMISSION RANGE SELECTOR COMPONENT REPLACEMENT REFERENCE

Component	Transmission RPO	Repair Instruction
S3 Transmission Shift Lever	MKE	**Transmission Electronic Control Replacement**
K173 Transmission Range Control Module	MKE	**Automatic Transmission Range Selector Actuator Hardware Module Replacement**

BACKUP PARK LOCK ACTUATOR ARMING

Introduction

The Backup Park Lock function is electrically isolated from the Transmission Range Control Module, and forces the transmission manual shaft to the Park position under specified conditions. Under these conditions the vehicle is put in Latent Fault Mode, refer to **Latent Fault Mode Description**. The procedures below are designed to assist in the arming of the Backup Park Lock Actuator when the position of the actuator becomes unknown. Before you start, read these procedures carefully and completely. For further information regarding the Transmission Range Selector system refer to **Electronic Transmission Range Selector Description**.

Before Running the Arming Procedure

- Ensure Transmission Range Control Module and Chassis Control Module software packages are the most current software available.
- Resolve any current DTC's that are present relating to the Electronic Transmission Range Selector system prior to running learn procedure. Refer to **Electronic Transmission Range Selector Description**. Faults in any component or module that work together in this system may cause a learn procedure failure.
- Ensure the MDI tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during learn, learn failure or ECU damage may occur.
- Stable battery voltage is critical during learn procedure. Any fluctuation, spiking, over voltage or loss of voltage will interrupt learn procedure. Install the **EL-49642** SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack unplugged/disconnected from the AC voltage supply.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.

Starting the Arming Procedure

1. With your foot off the brake, press and hold the Start/Run Button for 10 seconds to set the ignition correctly.
2. Install a scan tool.
3. Verify that the transmission fluid temperature is 50Ã‚Â°F (10Ã‚Â°C) or greater before running the arming procedure.
4. In the scan tool under Transmission Range Control Module, Configuration/Reset Functions perform the Backup Park Lock Actuator Arming procedure. Follow all on-screen instructions.
5. If arming procedure failure occurs, refer to wiring diagnostics to resolve any electrical faults.
6. Attempt rerunning the arming procedure 2 additional times before replacing Transmission Range Control Module. If the test successfully completed, cycle the ignition OFF.
7. After the Backup Park Lock Actuator Arming procedure has completed successfully, perform the **Diagnostic Repair Verification** .

8. Clear DTCs after arming is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

BACKUP PARK LOCK ACTUATOR DISARMING

Introduction

The Backup Park Lock function is an electrically isolated smart actuator inside the Transmission Range Control Module that is activated when the transmission does not achieve Park. When the Backup Park Lock function is activated, the gear is "disarmed" which rotates the torsional spring forcing the transmission manual shaft to the Park position. The procedure below is designed to disarm the Backup Park Lock Actuator when the rod linkage is adjusted (if equipped) or if the Transmission Range Control Module is being removed then reinstalled. Before you start, read these procedures carefully and completely. For further information regarding the Transmission Range Selector system refer to **Electronic Transmission Range Selector Description**.

Before Running the Disarming Procedure

- Ensure Transmission Range Control Module and Chassis Control Module software packages are the most current software available.
- Resolve any current DTC's that are present relating to the Electronic Transmission Range Selector system prior to running the disarming procedure. Refer to **Electronic Transmission Range Selector Description**. Faults in any component or module that work together in this system may cause a disarming procedure failure.
- Ensure the MDI tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during disarming, disarming failure or ECU damage may occur.
- Stable battery voltage is critical during disarming procedure. Any fluctuation, spiking, over voltage or loss of voltage will interrupt disarming procedure. Install the **EL-49642** SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack unplugged/disconnected from the AC voltage supply.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.

Starting the Disarming Procedure

1. With your foot off the brake, press and hold the Start/Run Button for 10 seconds to set the ignition correctly.
2. Install a scan tool.
3. Verify that the transmission fluid temperature is 50Ã‚Â°F (10Ã‚Â°C) or greater before running the disarming procedure.
4. In the scan tool under Transmission Range Control Module, Configuration/Reset Functions perform the Backup Park Lock Actuator Disarming procedure. Follow all on-screen instructions.
5. If disarming procedure failure occurs, refer to wiring diagnostics to resolve any electrical faults.
6. Attempt rerunning the disarming procedure 2 additional times before replacing Transmission Range Control Module. If the test successfully completed, cycle the ignition OFF.

TRANSMISSION RANGE CONTROL MODULE RANGE MOTOR POSITION LEARN

Introduction

The Electronic Transmission Range Selector system needs to know exact position of the Transmission Range Control Module Range Motor and the Backup Park Lock Actuator on the Transmission manual shaft. The procedures below are designed to assist in the learning of the Transmission Range Control Module Range Motor and Backup Park Lock Actuator position. Before you start, read these procedures carefully and completely. For further information regarding the Transmission Range Selector system refer to **Electronic Transmission Range Selector Description**.

Before Running the Learn Procedure

- Ensure Transmission Range Control Module and Chassis Control Module software packages are the most current software available.
- Resolve any current DTC's that are present relating to the Electronic Transmission Range Selector system prior to running learn procedure. Refer to **Electronic Transmission Range Selector Description**. Faults in any component or module that work together in this system may cause a learn procedure failure.
- Ensure the MDI tool is equipped with the latest software and is securely connected to the data link connector. If there is an interruption during learn, learn failure or ECU damage may occur.
- Stable battery voltage is critical during learn procedure. Any fluctuation, spiking, over voltage or loss of voltage will interrupt learn procedure. Install the **EL-49642** SPS Programming Support Tool to maintain system voltage. If not available, connect a fully charged 12 V jumper or booster pack unplugged/disconnected from the AC voltage supply.
- Turn OFF or disable systems that may put a load on the vehicles battery such as; interior lights, exterior lights (including daytime running lights), HVAC, radio, etc.

NOTE: **Loosening of the fasteners or replacement of the Transmission Range Control Module will cause module to become out of adjustment. If module is not properly adjusted, learn procedure may fail. If learn procedure fails, check Transmission Range Control Module mounting bolts and rod linkage if applicable prior to replacing the Transmission Range Control Module and running the learn procedure.**

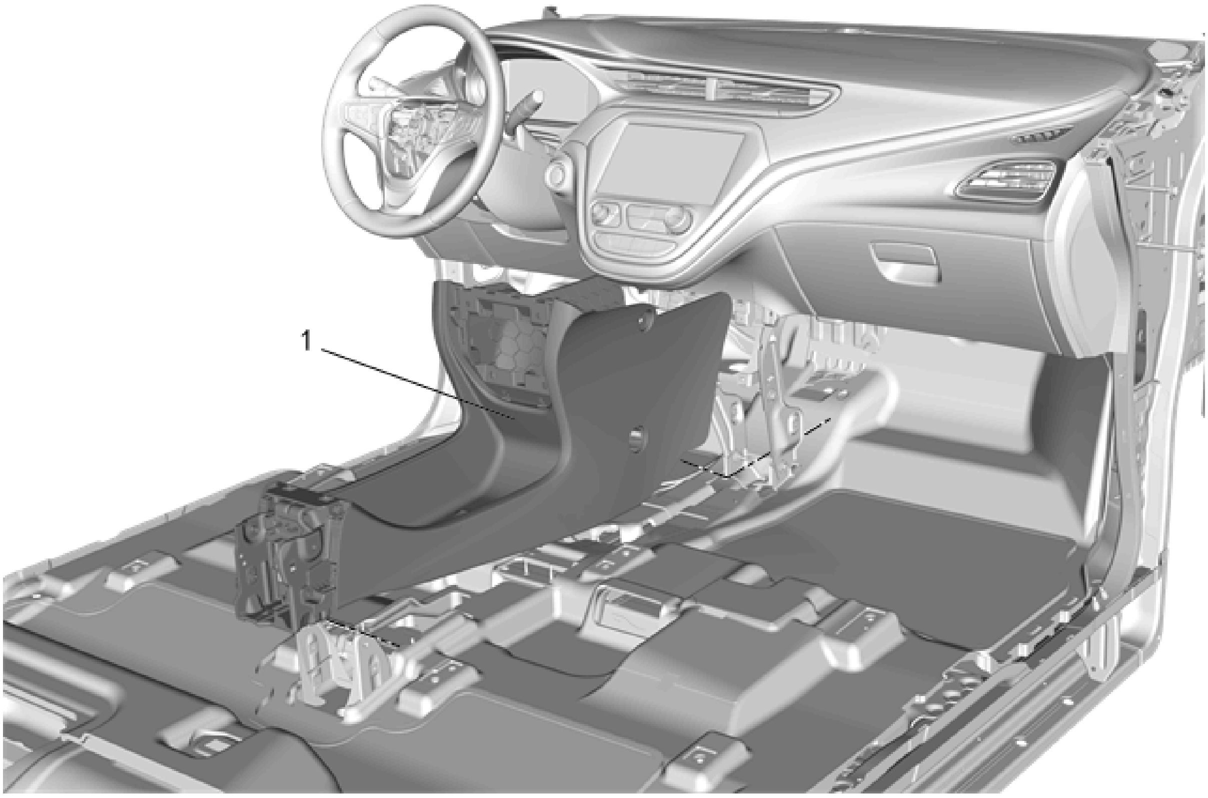
Starting the Learn Procedure

1. With your foot off the brake, press and hold the Start/Run Button for 10 seconds to set the ignition correctly.
2. Install a scan tool.
3. Verify that the transmission fluid temperature is between 50Ã‚Â°F (10Ã‚Â°C) to 104Ã‚Â°F (40Ã‚Â°C) before running a learn procedure.
4. In the scan tool under Transmission Range Control Module, Configuration/Reset Functions perform the Transmission Range Control Module Range Motor Position Learn procedure. Follow all on-screen instructions.
5. If learn procedure failure occurs, refer to wiring diagnostics to resolve any electrical faults and check Transmission Range Control Module mounting bolts, and rod linkage adjustment if applicable. Any looseness or movement in the Transmission Range Control Module will cause learn failure.
6. Attempt rerunning the learn procedure 2 additional times (adjusting rod linkage, if equipped, before each attempt) before replacing Transmission Range Control Module. If the test successfully completed, cycle the ignition OFF.
7. After the Transmission Range Control Module Range Motor Position Learn procedure has completed successfully, perform the **Diagnostic Repair Verification** .
8. Clear DTCs after learn is complete. Clearing powertrain DTCs will set the Inspection/Maintenance (I/M) system status indicators to NO.

REPAIR INSTRUCTIONS

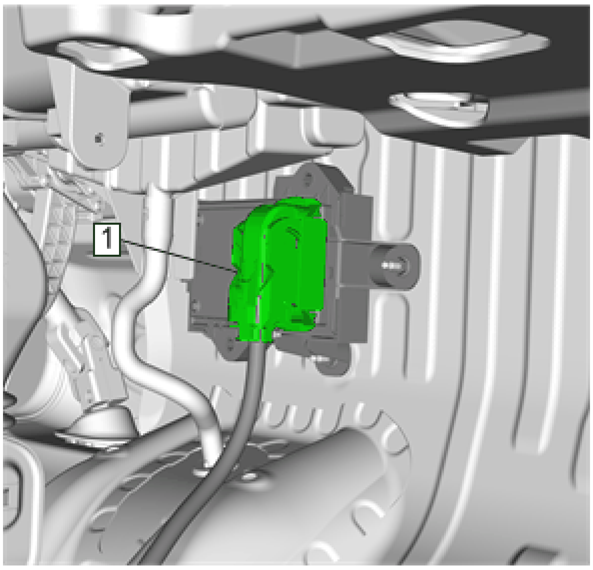
CHASSIS CONTROL MODULE REPLACEMENT

Removal Procedure



[Fig. 3: Front Floor Console](#)
Courtesy of GENERAL MOTORS COMPANY

1. Remove Front Floor Console (1) @ Vehicle. Refer to **Front Floor Console Replacement**



[Fig. 4: Electrical Connector](#)
Courtesy of GENERAL MOTORS COMPANY

2. Disconnect Electrical Connector (1) @ Chassis Control Module

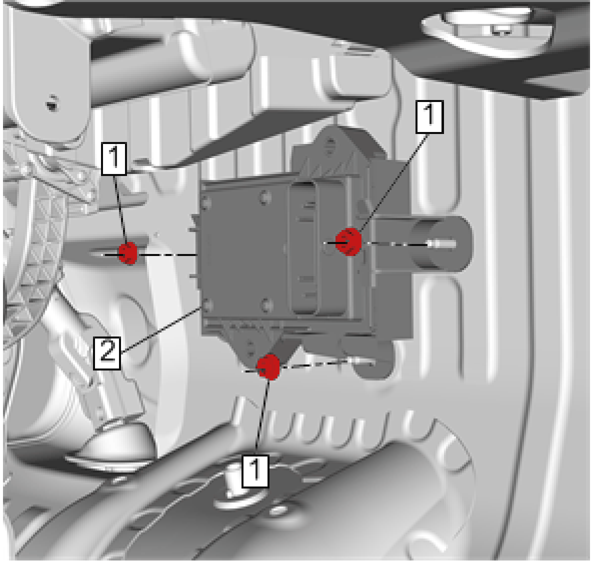


Fig. 5: Chassis Control Module/Bracket Assembly And Nuts
Courtesy of GENERAL MOTORS COMPANY

3. Remove Chassis Control Module Bracket Nuts (1) (Qty: 3)
4. Remove the chassis control module and bracket assembly (2) from the vehicle.

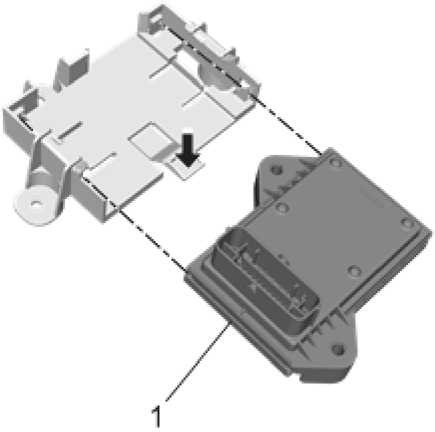

Fig. 6: Chassis Control Module And Chassis Control Module Bracket

5. Remove Chassis Control Module (1) @ Chassis Control Module Bracket

Installation Procedure

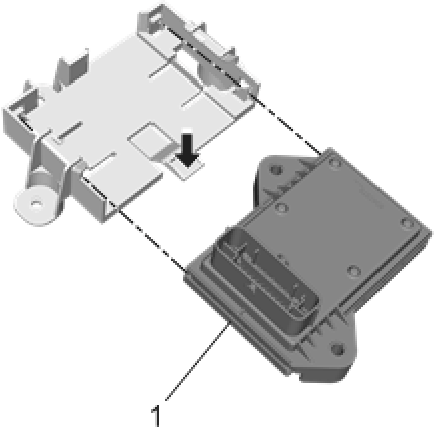

Fig. 7: Chassis Control Module And Chassis Control Module Bracket
Courtesy of GENERAL MOTORS COMPANY

1. Install Chassis Control Module (1) @ Chassis Control Module Bracket

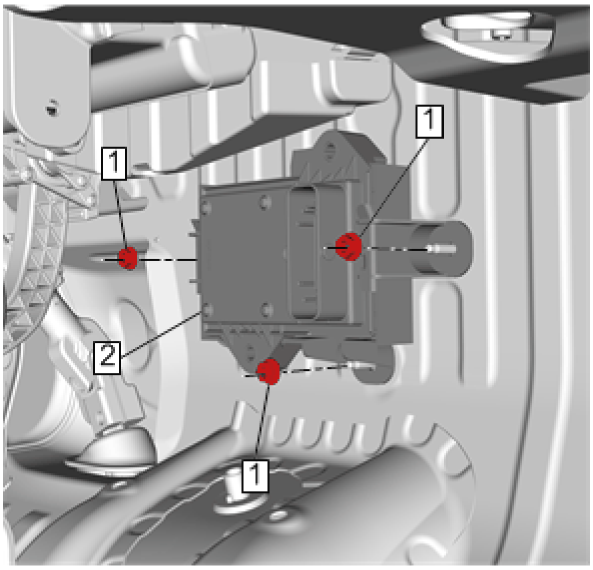

Fig. 8: Chassis Control Module/Bracket Assembly And Nuts
Courtesy of GENERAL MOTORS COMPANY

2. Install the chassis control module and bracket assembly (2) to the vehicle.

CAUTION: **Refer to Fastener Caution**

3. Install and tighten Chassis Control Module Bracket Nuts (1) (Qty: 3) to 9 N.m (80 lb in)

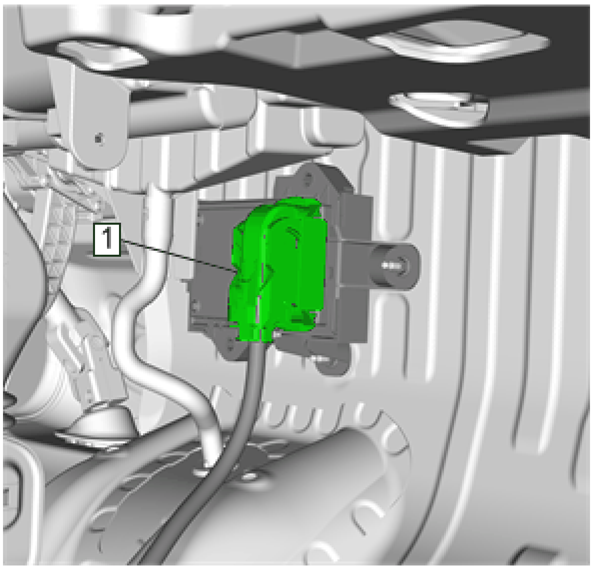

Fig. 9: Electrical Connector
Courtesy of GENERAL MOTORS COMPANY

4. Connect Electrical Connector (1) @ Chassis Control Module

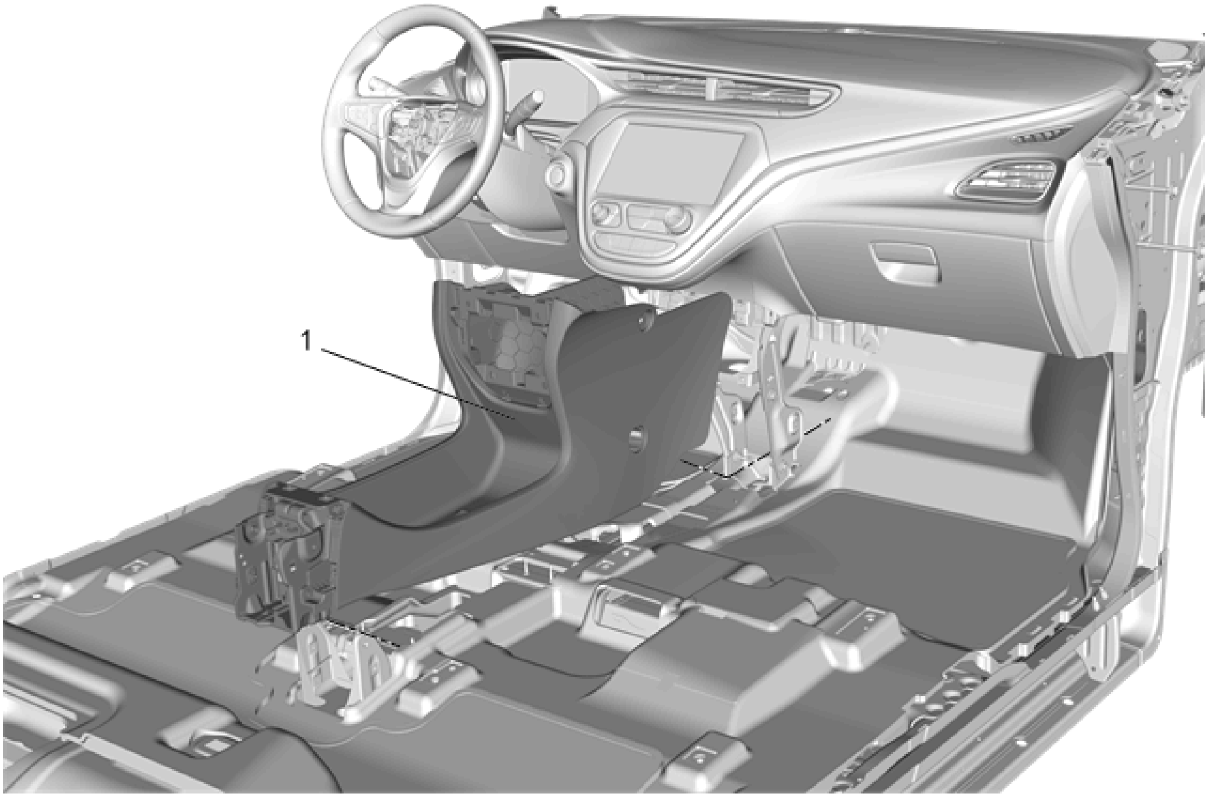

Fig. 10: Front Floor Console
Courtesy of GENERAL MOTORS COMPANY

5. Install Front Floor Console (1) @ Vehicle. Refer to **Front Floor Console Replacement**
6. Program the chassis control module. Refer to **Control Module References**

CRITICAL FAULT MODE MANEUVERING

Critical Fault Mode Maneuvering

The following procedure should be followed if vehicle is in Critical Fault Mode and needs to be moved:

- Verify charge of battery. If necessary, charge or jump start battery.
- Set the parking brake in service mode: **Rear Parking Brake Service Mode Selection**
- If accessible, remove linkage at the transmission: **Range Selector Lever Link Adjustment** . Manually shift the vehicle using transmission shift lever.
- If linkage is not accessible, wheel dollies should be used.

DESCRIPTION AND OPERATION

CRITICAL FAULT MODE DESCRIPTION

Critical Fault Mode

When a fault is detected in the Electronic Transmission Range Selector system and the Requested Gear Position or Actual Gear Position cannot be determined

- Vehicle will remain in current commanded gear position until the vehicle speed is below 3 kph
- In order to lower vehicle speed, the electronic brake control module will engage braking
- When vehicle speed is below 3 kph, the vehicle will engage electronic park brake and backup park lock (also know as Default to Park)
- Electronic park brake will not disengage until the issue is corrected and all related DTC's are History

ELECTRONIC TRANSMISSION RANGE SELECTOR DESCRIPTION

The Electronic Transmission Range Select (ETRS) subsystem selects the transmission range (Park, Reverse, Neutral, Drive, or Manual) by means of electronic control rather than by mechanical means.

The ETRS feature is controlled in the Chassis Control Module. All Electronic Transmission Range Selector and Transmission Range Control Module DTC's will set in the Chassis Control Module. The Chassis Control Module communicates via HS GMLAN, the Chassis Expansion Bus, and LIN.

When a gear is selected, the Transmission Range Control Module (TRCM) will move the transmission manual shaft into the range commanded by the ETRS. The TRCM will communicate on HS GMLAN and the Chassis Expansion Bus.

The Backup Park Lock function is electrically isolated from the TRCM, and forces the transmission manual shaft to the Park position under specified conditions. Under these conditions the vehicle is put in Latent Fault Mode, refer to Latent Fault Mode Description. The Backup Park Lock communicates with the Chassis Control Module via LIN.

The Shifter Assembly in the ETRS system has no mechanical linkage to the transmission. Instead, the shifter will provide electrical signals based on customer input to the Chassis Control Module, where the customer shift request will be determined.

ETRS Shift Lever Assembly includes:

- Shift Interlock Button - The Shift Interlock Button has two sensors which are both inputs to the Chassis Control Module.
- Park Button - The Park Button has two sensors which are both inputs to the Chassis Control Module.
- Two Dimensional Shift Lever - The shift lever is designed so any single fault at the shifter can be isolated and error corrected by the Chassis Control Module. The shift lever position is determined by 2 internal sensors that each transmit an X and Y coordinate signal. All 4 signal circuits are inputs to the Chassis Control Module.
- Transmission Shift Lever Position Indicator - LED display located on the face of the shifter. Indicates transmission actual gear position. Displays "R N P D M", which refer to Reverse, Neutral, Park, Drive, or Manual.

Transmission Range Control Module includes:

- Coupler to coupler, or lever to rod linkage interface with the transmission manual shaft.
- Backup Park Lock function (also know as Default to Park)

The vehicle is equipped with the following Electronic Transmission Range Selector Components:

- S3 Transmission Shift Lever
- K38 Chassis Control Module
- K173 Transmission Range Control Module
- Backup Park Lock is located within the K173 Transmission Range Control Module
- P2 Transmission Shift Lever Position Indicator is located within the S3 Transmission Shift Lever
- K71 Transmission Control Module

LATENT FAULT MODE DESCRIPTION

Latent Fault Mode

When a fault is detected in the Electronic Transmission Range Selector system, the data information center will display the message "Service Transmission Now, Unable to Shift Soon" along with a 10 second chime. The driver must acknowledge the message to show other data on the data information center. The frequency that the message and chime occur will increase until 50 trips are reached with the fault present. At that point, the transmission will not be allowed to shift out of park.

When "Service Shifter See Owner's Manual" message is shown on the data information center, the shift lever is requiring service. If the vehicle is automatically shifting into P (Park), check to see if the park button is stuck by running through the shifter electrical diagnostics. To operate the vehicle, hold the shift lever in the desired gear, R (Reverse) or D (Drive), until vehicle speed exceeds 15 km/h (10 mph), then release the shift lever.

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Brake Systems

BRAKE SYSTEMS

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to

honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	**Reasons to Suggest Repair or Replacement**
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

BRAKE SYSTEMS

NOTE: **Some states may have specifications that differ from OEM. Check your local/state regulations. Where state or local laws are stricter, they take precedence over these guidelines.**

ACCELEROMETERS

Condition	Code	Procedure
Condition	**Code**	**Procedure**
Broken	A	Require replacement
Connector loose	A	Require repair or replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement

Condition	Code	Procedure
Out of position	B	Require re-positioning to vehicle manufacturer's specifications
Output signal incorrect	B	Require replacement

ACCUMULATORS

Condition	Code	Procedure
Leaking	A	Require replacement
Missing	C	Require replacement
Pre-charge incorrect	B	Require replacement

ANCHOR PINS

Condition	Code	Procedure
Anchor pin bent	B	Require repair or replacement
Anchor pin broken	A	Require replacement
Anchor pin worn, affecting structural integrity	B	Require replacement

ANTI-LOCK BRAKE CONTROL ASSEMBLY(MODULE)

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specifications, or out of range.**		
Missing	C	Require replacement

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ANTI-LOCK BRAKE CONTROLLER

Condition	Code	Procedure
Application incorrect	A	Require replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required
NOTE: **Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).**		
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
Electro Magnetic Brake Inoperative	A	Require repair or replacement
Expansion Spring Brake Inoperative	A	Require repair or replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Pulse Width Modulation Valve Inoperative	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ANTI-LOCK BRAKE SYSTEMS

NOTE: **Anti-lock brakes are an integral part of the brake system. It is essential that the Anti-lock brakes function properly when brake service is performed. Anti-lock brake systems are commonly referred to as "" ABS"" and will be referred to as ABS throughout these guidelines. Some ABS components also function as part of a traction control system (TCS). When diagnosing and servicing high pressure components, observe safety procedures and equipment requirements established by the vehicle manufacturer to reduce the possibility of serious personal injury.**

NOTE: **Intermittent electrical conditions are often caused by a loss of ground, poor connection, or water intrusion into the wiring harness. Electro-magnetic interference (EMI) may be caused by incorrect installation of accessories or components. EMI can result in improper system operation.**

AXLE SEAL

Condition	Code	Procedure
Leaking	A	Require repair or replacement

BACKING PLATES

Condition	Code	Procedure
Anchor pin bent	B	Require repair or replacement
Anchor pin broken	A	Require replacement
Anchor pin worn, affecting structural integrity	B	Require replacement
Backing plate bent	B	Require repair or replacement
Backing plate broken	A	Require replacement
Backing plate cracked	B	Require repair or replacement
Corroded, affecting structural integrity	A	Require replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Shoe lands worn	A	Require repair or replacement

BLEEDER SCREW

Condition	Code	Procedure
Bent	A	Require replacement

Condition	Code	Procedure
Broken	A	Require replacement
Incorrect	B	Require replacement of stud
Loose	A	Require repair or replacement of affected component
Nut flats rounded	A	Require replacement of nut
seized	A	Require replacement of nut and/or stud
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped (threads missing)	A	Require replacement of component with stripped threads

BRAKE ABS ACTIVE LIGHT (BLUE)

Condition	Code	Procedure
Bulb burned out	A	Require replacement
Light does not come on during bulb check	Â	Further inspection required to determine cause
Light flashes	Â	Further inspection required to determine cause
Light stays on after initial bulb check	Â	Further inspection required to determine cause

BRAKE FLUID

NOTE: **Most manufacturers prohibit the use of DOT 5 brake fluid in a system equipped with ABS. DOT 3, DOT 4, and DOT 5.1 brake fluids are clear or light amber in color. DOT 5 brake fluid is violet in color. Correct fluid type is normally stamped on the master cylinder cover.**

NOTE: **Fluid Flush - a process using a sufficient volume of fluid to help remove contaminants and replacing the contaminated fluid with new fluid of the same type and specification. At times a chemical may be used to enhance removal.**

NOTE: **Fluid Exchange/Replace - draining (evacuating) old fluid and replacing it with new fluid of the correct type and specification.**

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
At or beyond OEM service interval	3	Suggest fluid exchange/replacement
Brake fluid type incorrect	B	Require flushing and refilling
NOTE: **For example, DOT fluid lower than specified for the vehicle or silicone brake fluid (DOT 5) in an ABS system**		
Contaminated, for example, fluid other than brake fluid present	A	Require service
NOTE: **If a fluid other than brake fluid is present in the brake system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct brake fluid.**		
Contaminated, for example, fluid other than brake fluid present	B	Require service

Condition	Code	Procedure
NOTE: **If a fluid other than brake fluid is present in the brake system which DOES NOT affect the rubber parts, the required service is to flush and fill with the correct brake fluid.**		
Corrosion inhibitors depleted	B	Require fluid exchange/replacement
NOTE: **A copper content of 200 ppm or greater indicates a depletion of corrosion inhibitors in the brake fluid.**		
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
Hydraulic component overhaul or replacement	3	Suggest flushing and refilling
Rubber master cylinder cover gasket distorted and gummy	A	Require replacement of gasket
NOTE: **This condition may indicate contaminated brake fluid. Further inspection required.**		

BRAKE FRICTION MATERIAL

NOTE: **Original Equipment Manufacturer (OEM) specifications designate replacement at different thicknesses. It is required that friction material be matched in axle sets for consistent braking characteristics.**

Condition	Code	Procedure
Contaminated, for example, fluid that leaked from caliper, wheel cylinder, or axle seal	A	Require replacement
NOTE: **Identify and repair cause of contamination prior to replacing friction material.**		
Cracked (Cracked through)	B	Require replacement
Cracked (Surface cracking)	Â	No service suggested or required. Further inspection may be necessary to determine cause
Flaking or chunking	B	Require replacement
Glazed (shiny)	Â	No service suggested or required
Grooves or ridges	Â	No service suggested or required
NOTE: **When reconditioning or replacing drums or rotors, replacement of friction material may be suggested depending on the severity of the grooves or ridges.**		
Permanently attached hardware bent	A	Require replacement
Permanently attached hardware broken	A	Require replacement
Permanently attached hardware loose	A	Require replacement
Permanently attached hardware missing	C	Require replacement
Permanently attached hardware seized	A	Require repair or replacement
Rivets loose	B	Require replacement
Separating from backing	B	Require replacement
Shoe table or web bent	B	Require replacement

Condition	Code	Procedure
Shoe table or web cracked	A	Require replacement
Shoe table or web worn, affecting performance	A	Require replacement
Tapered wear	Â	Further inspection required
NOTE: **Some vehicles use friction materials that are tapered by design. Refer to specific vehicle application. If not normal, require replacement of friction materials and correction of cause.**		
Thickness of one pad is greater than opposite pad in the same caliper (uneven wear)	Â	Replacement of friction material not suggested or required Further inspection required. See Calipers and Caliper Hardware.
NOTE: **Uneven pad thickness is normal on some vehicles. Refer to specific vehicle applications.**		
Wear indicator device (electronic) contacts rotor	B	Require replacement of appropriate parts
NOTE: **The pad-wear indicator light may come on due to other electrical problems.**		
Wear indicator device (mechanical) broken	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured. The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is Suggested.**		
Wear indicator device (mechanical) bent	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material, must be measured. The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is Suggested.**		
Wear indicator device (mechanical) contacts rotor	Â	Further inspection required
NOTE: **The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is suggested.**		
Wear indicator device (mechanical) contacts rotor	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured.**		
Worn close to minimum specifications	1	Suggest replacement
NOTE: **When the part appears to be close to the end of its useful life, replacement may be suggested.**		
Worn to, or below minimum specifications	B	Require replacement

BRAKE ON - OFF SWITCH

Condition	Code	Procedure
Bent, affecting performance	B	Require replacement
Broken	A	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Missing	C	Require replacement
Out of adjustment	B	Require adjustment or replacement
Output signal incorrect	B	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

BRAKE PADS

NOTE: **Original Equipment Manufacturer (OEM) specifications designate replacement at different thicknesses. It is required that friction material be matched in axle sets for consistent braking characteristics.**

Condition	Code	Procedure
Contaminated, for example, fluid that leaked from caliper, wheel cylinder, or axle seal	A	Require replacement
NOTE: **Identify and repair cause of contamination prior to replacing friction material.**		
Cracked (Cracked through)	B	Require replacement
Cracked (Surface cracking)	Â	No service suggested or required. Further inspection may be necessary to determine cause
Flaking or chunking	B	Require replacement
Glazed (shiny)	Â	No service suggested or required
Grooves or ridges	Â	No service suggested or required
NOTE: **When reconditioning or replacing drums or rotors, replacement of friction material may be suggested depending on the severity of the grooves or ridges.**		
Out of Adjustment	B	Require Adjustment or Repair
NOTE: **Determine cause and correct prior to adjustment or repair**

BRAKE WARNING LIGHT (AMBER)

Condition	Code	Procedure
Bulb burned out	A	Require replacement
Warning light does not come on during bulb check	Â	Further inspection required to determine cause
Warning light flashes	Â	Further inspection required to determine cause
Warning light stays on after initial bulb check	Â	Further inspection required to determine cause

BRAKE WARNING LIGHT (RED)

Condition	Code	Procedure
Bulb burned out	A	Require replacement
Warning light does not come on during bulb check	Â	Further inspection required to determine cause
Warning light flashes	Â	Further inspection required to determine cause
Warning light stays on after initial bulb check	Â	Further inspection required to determine cause

BULB SOCKETS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require repair or replacement
Bulb seized in socket	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of socket.**		
Burned, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of socket**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Leaking	B	Require repair or replacement
Melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**

Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

BULBS AND LEDS

NOTE: **Does not include soldered-in components.**

Condition	Code	Procedure
Application incorrect	B	Require replacement
NOTE: **Application incorrect includes wrong bulb coating or color.**		
Base burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base corroded, affecting performance	A	Require repair or replacement
Base corroded, not affecting performance	2	Suggest repair or replacement
Base loose, affecting performance	B	Require repair or replacement
Base loose, not affecting performance	1	Suggest repair or replacement
Burned out	A	Require replacement
Intermittent	A	Require replacement

Condition	Code	Procedure
Missing	C	Require replacement
Seized in socket	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

CALIPER HARDWARE

Condition	Code	Procedure
Bent	A	Require repair or replacement
Broken	A	Require repair or replacement
Corroded, affecting performance	A	Require repair or replacement
Dust boots on slider pin (bolt) missing	C	Require replacement of boots
Dust boots on slider pin (bolt) torn	A	Require replacement of boots
Missing	C	Require replacement
Shim (OE standard) missing	C	Require replacement
NOTE: **Aftermarket shims may be suggested to reduce noise.**		
Shim bent	A	Require removal or replacement
NOTE: **Removal is acceptable if shim is not OEM.**		
Shim out of position	B	Require removal or replacement
NOTE: **Removal is acceptable if shim is not OEM.**		
Shim worn	A	Require removal or replacement
NOTE: **Removal is acceptable if shim is not OEM.**		
Slider pin (bolt) bent	A	Require replacement of slider pin or bolt and lubricants
Slider pin (bolt) rust-pitted	A	Require replacement of slider pin or bolt and lubricants
Slider pin (bolt) worn	A	Require replacement of slider pin or bolt and lubricants
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require replacement

CALIPER MOUNTING PIN

Condition	Code	Procedure
Slider pin (bolt) bent	A	Require replacement of slider pin or bolt and lubricants
Slider pin (bolt) rust-pitted	A	Require replacement of slider pin or bolt and lubricants
Slider pin (bolt) worn	A	Require replacement of slider pin or bolt and lubricants

CALIPER PISTON

Condition	Code	Procedure
Broken	A	Require repair or replacement
Corroded, affecting performance	A	Require repair or replacement
Worn, affecting performance	A	Require replacement

CALIPER SHIM

Condition	Code	Procedure
Shim (OEM standard) missing	C	Require replacement
Shim bent	A	Require removal or replacement
Shim out of position	B	Require removal or replacement
Shim worn	A	Require removal or replacement

CALIPER SLIDER PIN (BOLT) DUST BOOT

Condition	Code	Procedure
Dust boots on slider pin (bolt) missing	C	Require replacement of boots
Dust boots on slider pin (bolt) torn	A	Require replacement of boots
Missing	C	Require replacement

CALIPER SLIDER PIN (BOLT)

Condition	Code	Procedure
Broken	A	Require repair or replacement
Missing	C	Require replacement
Slider pin (bolt) bent	A	Require replacement of slider pin or bolt and lubricants
Slider pin (bolt) rust-pitted	A	Require replacement of slider pin or bolt and lubricants
Slider pin (bolt) worn	A	Require replacement of slider pin or bolt and lubricants
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require replacement

CALIPERS

NOTE: **You are not required to replace or rebuild calipers in axle sets. However, when replacing or rebuilding a caliper due to the conditions that follow, you may suggest servicing, rebuilding, or replacement of the other caliper (on the same axle) for improved performance and preventive maintenance (for example, the part is close to the end of its useful life, replacing the caliper may extend pad life, or contribute to more balanced braking). When installing loaded calipers, it is required that friction material be matched in axle sets for consistent braking characteristics.**

Condition	Code	Procedure

Condition	Code	Procedure
Bleeder port damaged	A	Require repair or replacement of caliper
Bleeder screw broken off in caliper	A	Require repair or replacement of caliper
NOTE: **Only required if hydraulic system must be opened.**		
Bleeder screw plugged	A	Require repair or replacement of bleeder screw
NOTE: **Only required if hydraulic system must be opened.**		
Bleeder screw seized	A	Require replacement of caliper
NOTE: **Seized is defined as a bleeder screw that cannot be removed after a practical attempt at removing. Only required if the hydraulic system must be opened.**		
Casting corroded, affecting structural integrity	A	Require replacement
Casting damaged, affecting structural integrity	A	Require replacement
Dust boot around caliper piston torn	A	Require replacement of dust boot
Leaking	A	Require repair or replacement
Mounting pin threads damaged	A	Require repair or replacement of component with damaged threads
Mounting pin threads stripped (threads missing)	A	Require repair or replacement of component with stripped threads
Mounting pin threads stripped in caliper bracket (threads missing)	A	Require repair or replacement of caliper bracket
Mounting pin threads stripped in steering knuckle (threads missing)	A	Require repair or replacement of steering knuckle
Parking brake cable support, lever, or return spring bent	A	Require replacement of parts
Parking brake cable support, lever, or return spring broken	A	Require replacement of parts
Parking brake mechanism in caliper inoperative	A	Require repair or replacement
Piston corroded (pitted or peeling chrome plating)	B	Require replacement of piston and rebuilding or replacement of caliper
Piston damaged, affecting performance	B	Require replacement of piston and rebuilding or replacement of caliper
Piston damaged, not affecting performance	Â	No service suggested or required
Piston finish worn off	B	Require replacement of piston and rebuilding or replacement of caliper
Piston sticking	A	Require rebuilding or replacement of caliper
Slide mechanism sticking	A	Require repair or replacement of slide mechanism

COMBINATION VALVE

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement

Condition	Code	Procedure
Linkage bent (rear load valves)	A	Require repair or replacement of linkage
Linkage broken (rear load valves)	A	Require repair or replacement of linkage
Pressure out of specification	B	Require adjustment If not possible, require replacement
Seized	A	Require replacement
Sticking	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CONTROLLERS

Condition	Code	Procedure
Application incorrect	A	Require replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required
NOTE: **Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).**		
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
Electro Magnetic Brake Inoperative	A	Require repair or replacement
Expansion Spring Brake Inoperative	A	Require repair or replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		

Condition	Code	Procedure
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Pulse Width Modulation Valve Inoperative	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

DIGITAL RATIO AXLE CONTROLLERS AND BUFFERS (DRAB AND DRAM)

Condition	Code	Procedure
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Electro Magnetic Brake Inoperative	A	Require repair or replacement
Expansion Spring Brake Inoperative	A	Require repair or replacement
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Pulse Width Modulation Valve Inoperative	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

DISABLE SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware

Condition	Code	Procedure
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

DRUMS

NOTE: **Determine the need to recondition based upon individual drum conditions that follow. Friction material replacement does not require drum reconditioning unless other justifications exist. Do not recondition new drums unless they are being pressed or bolted onto an existing hub. It is not necessary to replace drums in axle sets. However, when replacing or reconditioning a drum due to the conditions that follow, you may suggest reconditioning of the other drum on the same axle to eliminate uneven braking behavior. Always wash drums after servicing or before installing.**

Condition	Code	Procedure
Balance weight missing Affecting performance	A	Require repair or replacement
Balance weight missing Not affecting performance	Â	No service suggested or required

Condition	Code	Procedure
Bell-mouthed, affecting performance	A	Require reconditioning or replacement
Cooling fin broken	Â	No service suggested or required
Cracked	B	Require replacement
Drum diameter is greater than OEM ""machine to"" specifications but less than ""discard at""	1	Suggest replacement
specifications, and the drum does not require reconditioning	Â	Â
NOTE: **Only applies to vehicles for which OEM ""machine to"" specifications exist. If OEM does not supply ""machine to"" specifications, the drum may be worn to discard specifications**		
Drum diameter will exceed OEM ""machine to"" specifications after required reconditioning	B	Require replacement
NOTE: **If OEM does not supply ""machine to"" specifications, you may machine to discard specifications.**		
Hard -spotted	2	Suggest reconditioning or replacement
Measured diameter is greater than OEM discard specifications	B	Require replacement
Out-of-round (runout), affecting performance	A	Require reconditioning or replacement
Out-of-round (runout), exceeding manufacturer's specifications	B	Require reconditioning or replacement
Scored	B	Require reconditioning or replacement
Surface threaded due to improper machining	B	Require reconditioning or replacement
Tapered, affecting performance	A	Require reconditioning or replacement

ELECTRICAL BRAKE PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**

Leaking internally	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement

Condition	Code	Procedure
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ELECTRO-MAGNETIC INTERFERENCE

NOTE: **An engineering term used to designate interference in a piece of electronic equipment caused by another piece of electronic or other equipment.**

ELECTRONIC BRAKE CONTROL MODULATOR

NOTE: **Many modulators can only be replaced as complete assemblies. Whenever possible, replace the failed component part. If replacement of the failed part is not possible, then replace the modulator assembly.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Disabled	A	Require repair or replacement
Electrical failure	A	Require repair or replacement
External leak	A	Require repair or replacement
Housing cracked	B	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Internal leak	A	Require repair or replacement
Missing	C	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Valve stuck	A	Require repair or replacement
Wire lead burned	A	Require repair or replacement

Condition	Code	Procedure
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ELECTRONIC BRAKE DISTRIBUTION

NOTE: **EBD adjusts braking pressure front-to-rear, based on the weight distribution of passengers and/or cargo. Weight distribution is typically determined via the relative difference in rotational speed of the front and rear wheels. Greater braking pressure, (and subsequently stopping power), is directed to the rear wheels when loads in the rear are heavier. This contributes to a more controlled stop, and minimizes ""brake dive"" during hard braking.**

ELECTRONIC BRAKE TRACTION CONTROL MODULE

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specifications, or out of range.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ELECTRONIC CONTROLLERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required
NOTE: **Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).**		
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
Electro Magnetic Brake Inoperative	A	Require repair or replacement
Expansion Spring Brake Inoperative	A	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Pulse Width Modulation Valve Inoperative	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ELECTRONIC TRACTION CONTROL

NOTE: **The further development of the electronic locking differential. It electronically reduces engine torque, preventing engine and wheel braking from working against each other. (Example: a driver continues to apply the accelerator while the electronic traction control is attempting to redistribute excess engine torque through braking). This system works in unison with some OEM's stability control systems.**

EXTERNAL BRAKE CABLE

Condition	Code	Procedure
Cable improperly adjusted	B	Require cable adjustment
Cable or individual wires in the cable are broken	A	Require replacement of cable assembly
Cable sticking	A	Require cable lubrication
Cable stuck inside conduit and cannot be lubricated so that parking brake functions properly	A	Require replacement of cable assembly

FLOW CONTROL VALVE

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement
Linkage bent (rear load valves)	A	Require repair or replacement of linkage
Linkage broken (rear load valves)	A	Require repair or replacement of linkage
Pressure out of specification	B	Require adjustment If not possible, require replacement
Seized	A	Require replacement
Sticking	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FLUID LEVEL SENSOR SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Float saturated	A	Require replacement
Leaking	A	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement

Condition	Code	Procedure
Worn	1	Suggest replacement

FLUID

NOTE: **Most manufacturers prohibit the use of DOT 5 brake fluid in a system equipped with ABS. DOT 3, DOT 4, and DOT 5.1 brake fluids are clear or light amber in color. DOT 5 brake fluid is violet in color. Correct fluid type is normally stamped on the master cylinder cover.**

NOTE: **Fluid Flush - a process using a sufficient volume of fluid to help remove contaminants and replacing the contaminated fluid with new fluid of the same type and specification. At times a chemical may be used to enhance removal.**

NOTE: **Fluid Exchange/Replace - draining (evacuating) old fluid and replacing it with new fluid of the correct type and specification.**

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
At or beyond OEM service interval	3	Suggest fluid exchange/replacement
Brake fluid type incorrect	B	Require flushing and refilling
NOTE: **For example, DOT fluid lower than specified for the vehicle or silicone brake fluid (DOT 5) in an ABS system.**		
Contaminated, for example, fluid other than brake fluid present	B	Require service
NOTE: **If a fluid other than brake fluid is present in the brake system which DOES NOT affect the rubber parts, the required service is to flush and fill with the correct brake fluid.**		
Contaminated, for example, fluid other than brake fluid present	A	Require service
NOTE: **If a fluid other than brake fluid is present in the brake system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct brake fluid.**		
Corrosion inhibitors depleted	B	Require fluid exchange/replacement
NOTE: **A copper content of 200 ppm or greater indicates a depletion of corrosion inhibitors in the brake fluid.**		
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
Hydraulic component overhaul or replacement	3	Suggest flushing and refilling with correct fluid
Rubber master cylinder cover gasket distorted and gummy	A	Require replacement of gasket

Condition	Code	Procedure
NOTE: **This condition may indicate contaminated brake fluid.**		

FOUR WHEEL DRIVE SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

FRICTION MATERIAL

NOTE: **Original Equipment Manufacturer (OEM) specifications designate replacement at different thicknesses. It is required that friction material be matched in axle sets for consistent braking characteristics.**

Condition	Code	Procedure
Contaminated, for example, fluid that leaked from caliper, wheel cylinder, or axle seal	A	Require replacement
NOTE: **Identity and repair cause of contamination prior to replacing friction material.**		
Cracked (Cracked through)	B	Require replacement
Cracked (Surface cracking)	Â	No service suggested or required. Further inspection may be necessary to determine cause
Flaking or chunking	B	Require replacement
Glazed (shiny)	Â	No service suggested or required
Grooves or ridges	Â	No service suggested or required
NOTE: **When reconditioning or replacing drums or rotors, replacement of friction material may be suggested depending on the severity of the grooves or ridges.**		
Out of Adjustment	B	Require Adjustment or Repair
Permanently attached hardware bent	A	Require replacement
Permanently attached hardware broken	A	Require replacement
Permanently attached hardware loose	A	Require replacement
Permanently attached hardware missing	C	Require replacement
Permanently attached hardware seized	A	Require repair or replacement
Rivets loose	B	Require replacement
Separating from backing	B	Require replacement
Shoe table or web bent	B	Require replacement
Shoe table or web cracked	A	Require replacement
Shoe table or web worn, affecting performance	A	Require replacement
Tapered wear	B	Suggest replacement
NOTE: **Some vehicles use pads that are tapered by design. Refer to specific vehicle application. If not normal, require correction of cause and replacement of pads.**		
Thickness of one pad is greater than opposite pad in the same caliper (uneven wear)	Â	Replacement of friction material not suggested or required. Further inspection required.
NOTE: **Uneven pad thickness is normal on some vehicles. Refer to specific vehicle applications.**		
Wear indicator device (electronic) contacts rotor	B	Require replacement of appropriate parts
NOTE: **The pad-wear indicator light may come on due to other electrical problems.**		
Wear indicator device (mechanical) bent	Â	Further inspection required

Condition	Code	Procedure
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured. The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is Suggested.**		
Wear indicator device (mechanical) broken	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured.**		
Wear indicator device (mechanical) broken	Â	Further inspection required
NOTE: **The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is suggested.**		
Wear indicator device (mechanical) contacts rotor	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured. The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is Suggested.**		
Worn close to minimum specifications	1	Suggest replacement
NOTE: **When the part appears to be close to the end of its useful life, replacement may be suggested.**		
Worn to, or below minimum specifications	B	Require replacement

G SENSORS

Condition	Code	Procedure
Broken	A	Require replacement
Connector loose	A	Require repair or replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Out of position	B	Require re-positioning to vehicle manufacturer's specifications
Output signal incorrect	B	Require replacement

GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

GRAVITATIONAL SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

GREASE SEAL

Condition	Code	Procedure
Leaking	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

HEIGHT SENSING PROPORTIONING VALVE

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement
Linkage bent (rear load valves)	A	Require repair or replacement of linkage
Linkage broken (rear load valves)	A	Require repair or replacement of linkage
Pressure out of specification	B	Require adjustment If not possible, require replacement
Seized	A	Require replacement
Sticking	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

HIGH PRESSURE ACCUMULATOR

Condition	Code	Procedure
Leaking	A	Require replacement
Missing	C	Require replacement
Pre-charge incorrect	B	Require replacement

HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Blistered	B	Require replacement

Condition	Code	Procedure
Expansion affecting performance	A	Require Replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Incorrectly secured	B	Require repair
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly	B	Require repair

HUB

Condition	Code	Procedure
Worn or damaged affecting performance	A	Require repair or replacement

HYDRAULIC CONTROL UNIT

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Disabled	A	Require repair or replacement
Electrical failure	A	Require repair or replacement
External leak	A	Require repair or replacement
Housing cracked	B	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Internal leak	A	Require repair or replacement
Missing	C	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

Condition	Code	Procedure
Valve stuck	A	Require repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

HYDRAULIC MODULATORS

NOTE: **Many modulators can only be replaced as complete assemblies. Whenever possible, replace the failed component part. If replacement of the failed part is not possible, then replace the modulator assembly.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Disabled	A	Require repair or replacement
Electrical failure	A	Require repair or replacement
External leak	A	Require repair or replacement
Housing cracked	B	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Internal leak	A	Require repair or replacement
Missing	C	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Valve stuck	A	Require repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

HYDRO-BOOSTERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Does not apply assist, or inadequate assist	A	Require repair or replacement
Leaking	B	Require repair or replacement
Leaks fluid at fitting	B	Require tightening or replacement
Leaks fluid at unit	B	Require repair or replacement
Leaks fluid from pressure hose(s)	B	Require replacement of hose(s)
Leaks fluid into passenger compartment	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

HYDRO-ELECTRIC BOOSTERS (POWERMASTER)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Does not apply assist, or inadequate assist	A	Require repair or replacement
Leaking	B	Require repair or replacement
Leaks fluid at fitting	B	Require tightening or replacement
Leaks fluid at unit	B	Require repair or replacement
Leaks fluid from pressure hose(s)	B	Require replacement of hose(s)
Leaks fluid into passenger compartment	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

IGNITION DISABLE SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement

Condition	Code	Procedure
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

LAMP DRIVER RELAY

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Housing broken	A	Require replacement
Housing cracked	2	Suggest replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

LATERAL ACCELERATION SWITCHES

Condition	Code	Procedure
Broken	A	Require replacement
Connector loose	A	Require repair or replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Out of position	B	Require re-positioning to vehicle manufacturer's specifications
Output signal Incorrect	B	Require replacement

LEDS

NOTE: **Does not include soldered-in components.**

Condition	Code	Procedure

Condition	Code	Procedure
Application incorrect	B	Require replacement
NOTE: **Application incorrect includes wrong bulb coating or color.**		
Base burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base corroded, affecting performance	A	Require repair or replacement
Base corroded, not affecting performance	2	Suggest repair or replacement
Base loose, affecting performance	B	Require repair or replacement
Base loose, not affecting performance	1	Suggest repair or replacement
Burned out	A	Require replacement
Intermittent	A	Require replacement
Missing	C	Require replacement
Seized in socket	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

LENSES

Condition	Code	Procedure
Application incorrect	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	Â	No service suggested or required
Cracked	B	Require replacement
Discolored	A	Require replacement
Leaking	B	Require repair or replacement
Melted, affecting performance	A	Require replacement
Melted, not affecting performance	2	Suggest replacement
Missing	C	Require replacement

LOW PRESSURE ACCUMULATOR

Condition	**Code**	**Procedure**
Leaking	A	Require replacement
Missing	C	Require replacement
Pre-charge incorrect	B	Require replacement

LUG NUT

Condition	**Code**	**Procedure**
Lug nut flats rounded	A	Require replacement of nut
Lug nut installed backward	B	Require repair
Lug nut mating surface dished	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut seized	A	Require replacement of nut and/or stud
Stud incorrect	B	Require replacement of stud
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped (threads missing)	A	Require replacement of component with stripped threads

MASTER CYLINDER COVER GASKET

Condition	**Code**	**Procedure**
Rubber master cylinder cover gasket distorted and gummy	A	Require replacement of the gasket
NOTE: **This condition may indicate contaminated brake fluid. See Brake Fluid.**		

MASTER CYLINDERS

Condition	**Code**	**Procedure**
Brake fluid leaking from rear of master cylinder bore	B	Require repair or replacement
Brake pedal drops intermittently	A	Require repair or replacement
NOTE: **This condition may be normal on some vehicles equipped with anti-lock brakes.**		
Fluid level low	Â	Further inspection required
NOTE: **Refer to OEM procedures for adjusting low fluid level. Inspect for brake hydraulic leaks and friction material wear.**		
Internal valve failure	A	Require repair or replacement
Master cylinder leaking brake fluid internally	A	Require repair or replacement
Piston does not return	A	Require repair or replacement
Ports plugged	A	Require repair or replacement
Pushrod out of adjustment	B	Require Repair or Replacement
Rubber master cylinder cover gasket distorted and gummy	A	Require replacement of the gasket
NOTE: **This condition may indicate contaminated brake fluid. See Brake Fluid.**		

MODULATORS

NOTE: **Many modulators can only be replaced as complete assemblies. Whenever possible, replace the failed component part. If replacement of the failed part is not**

Condition	Code	Procedure
possible, then replace the modulator assembly.	Â	Â
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Disabled	A	Require repair or replacement
Electrical failure	A	Require repair or replacement
External leak	A	Require repair or replacement
Housing cracked	A	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Internal leak	A	Require repair or replacement
Missing	C	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Valve stuck	A	Require repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

MOTOR PACK

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement

Condition	Code	Procedure
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, not affecting performance	2	Require repair or replacement
Terminal loose not affecting performance	1	Suggest repair or replacement
Terminal Loose, Affecting Performance	B	Require repair or replacement

MOTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require replacement
NOTE: **Determine source of contamination. Require repair or replacement.**		
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Leaking externally	A	Require repair or replacement
Leaking internally	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

PADS

NOTE: **Original Equipment Manufacturer (OEM) specifications designate replacement at different thicknesses. It is required that friction material be matched in axle sets for consistent braking characteristics.**

Condition	Code	Procedure
Contaminated, for example, fluid that leaked from caliper, wheel cylinder, or axle seal	A	Require replacement
NOTE: **Identify and repair cause of contamination prior to replacing friction material.**		
Cracked (Cracked through)	B	Require replacement
Cracked (Surface cracking)	Â	No service suggested or required. Further inspection may be necessary to determine cause
Flaking or chunking	B	Require replacement
Glazed (shiny)	Â	No service suggested or required
Grooves or ridges	Â	No service suggested or required
NOTE: **When reconditioning or replacing drums or rotors, replacement of friction material may be suggested depending on the severity of the grooves or ridges.**		
Out of Adjustment	A	Require Repair or Replacement
Permanently attached hardware bent	A	Require replacement
Permanently attached hardware broken	A	Require replacement
Permanently attached hardware loose	A	Require replacement
Permanently attached hardware missing	C	Require replacement
Permanently attached hardware seized	A	Require repair or replacement
Rivets loose	B	Require replacement

Condition	Code	Procedure
Separating from backing	B	Require replacement
Shoe table or web bent	B	Require replacement
Shoe table or web cracked	A	Require replacement
Shoe table or web worn, affecting performance	A	Require replacement
Tapered wear	Â	Further inspection required
NOTE: **Some vehicles use pads that are tapered by design. Refer to specific vehicle application. If not normal, require correction of cause and replacement of pads.**		
Thickness of one pad is greater than opposite pad in the same caliper (uneven wear)	Â	Replacement of friction material not suggested or required Further inspection required. See Calipers and Caliper Hardware.
NOTE: **Uneven pad thickness is normal on some vehicles. Refer to specific vehicle applications.**		
Wear indicator device (electronic) contacts rotor	B	Require replacement of appropriate parts
NOTE: **The pad-wear indicator light may come on due to other electrical problems.**		
Wear indicator device (mechanical) broken	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured. The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is suggested**		
Wear indicator device (mechanical) bent	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured. The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is suggested**		
Wear indicator device (mechanical) contacts rotor	Â	Further inspection required
NOTE: **Explain to the customer that the purpose of the wear indicator is to alert him or her to check for friction wear. Wear indicators may be bent or broken. Therefore, the friction material must be measured. The need for friction material replacement is determined based upon the conditions stated in this section. Periodic inspection is suggested**		
Worn close to minimum specifications	1	Suggest replacement
NOTE: **When the part appears to be close to the end of its useful life, replacement may be suggested.**		
Worn to, or below minimum specifications	B	Require replacement

PARKING BRAKE CABLE

Condition	Code	Procedure
Cable improperly adjusted	B	Require cable adjustment
Cable or individual wires in the cable are broken	A	Require replacement of cable assembly
Cable sticking	A	Require cable lubrication
Cable stuck inside conduit and cannot be lubricated so that parking brake functions properly	A	Require replacement of cable assembly

PARKING BRAKE MECHANISM

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require replacement of inoperative parts
Parking brake parts bent	B	Require repair or replacement of bent parts
Parking brake parts broken	A	Require replacement of broken parts
Parking brake parts missing	C	Require replacement of missing parts
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

PARKING BRAKE SHOES

Condition	Code	Procedure
Contaminated, for example, fluid that leaked from caliper, wheel cylinder, or axle seal	A	Require replacement
NOTE: **Identify and repair cause of contamination prior to replacing friction material.**		
Cracked (Cracked through)	B	Require replacement
Cracked (Surface cracking)	Â	No service suggested or required. Further inspection may be necessary to determine cause
Flaking or chunking	B	Require replacement
Glazed (shiny)	Â	No service suggested or required
Grooves or ridges	Â	No service suggested or required
NOTE: **When reconditioning or replacing drums or rotors, replacement of friction material may be suggested depending on the severity of the grooves or ridges.**		
Out of Adjustment	B	Require adjustment or repair
NOTE: **Determine cause and correct prior to adjustment or repair**		
Permanently attached hardware bent	A	Require replacement
Permanently attached hardware broken	A	Require replacement
Permanently attached hardware loose	A	Require replacement
Permanently attached hardware missing	C	Require replacement
Permanently attached hardware seized	A	Require repair or replacement
Rivets loose	B	Require replacement
Separating from backing	B	Require replacement

Condition	Code	Procedure
Shoe table or web bent	B	Require replacement
Shoe table or web cracked	A	Require replacement
Shoe table or web worn, affecting performance	A	Require replacement
Tapered wear	Â	Further inspection required
NOTE: **Some vehicles use shoes that are tapered by design. Refer to specific vehicle application. If not normal, require correction of cause and replacement of shoes.**		
Thickness of one shoe is greater than opposite shoe in the same drum (uneven wear)	Â	Replacement of friction material not suggested or required Further inspection required
Worn close to minimum specifications	1	Suggest replacement
NOTE: **When the part appears to be close to the end of its useful life, replacement may be suggested.**		
Worn to, or below minimum specifications	B	Require replacement

PARKING BRAKE SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement

Condition	Code	Procedure
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

PARKING BRAKE SYSTEMS

NOTE: **The parking brake is an integral part of the brake system. It is important that the parking brake function properly when brake service is performed.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cable improperly adjusted	B	Require cable adjustment
Cable or individual wires in the cable are broken	A	Require replacement of cable assembly
Cable sticking	A	Require cable lubrication
Cable stuck inside conduit and cannot be lubricated so that parking brake functions properly	A	Require replacement of cable assembly
Inoperative	A	Require replacement of inoperative parts
NOTE: **Inoperative Includes intermittent operation.**		
Parking brake parts bent	B	Require repair or replacement of bent parts
Parking brake parts broken	A	Require replacement of broken parts
Parking brake parts missing	C	Require replacement of missing parts
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

PEDAL TRAVEL SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement

Condition	Code	Procedure
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

PEDALS

Condition	Code	Procedure
Bent, affecting performance	A	Require repair or replacement
Broken	A	Require repair or replacement
Pedal pad missing	C	Require replacement of pedal pad
Pedal pad worn	1	Suggest replacement
Pivot bushings worn, affecting performance	A	Require replacement of pivot bushings

POWER DISTRIBUTION CENTER

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	Â	No service suggested or required
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Melted, affecting performance	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Melted, not affecting performance	2	Suggest replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

POWERMASTER

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Does not apply assist, or inadequate assist	A	Require repair or replacement
Leaking	B	Require repair or replacement
Leaks fluid at fitting	B	Require tightening or replacement
Leaks fluid at unit	B	Require repair or replacement
Leaks fluid from pressure hose(s)	B	Require replacement of hose(s)
Leaks fluid into passenger compartment	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

PRESSURE DIFFERENTIAL SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

PRESSURE SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

PRESSURE TRANSDUCERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Drive mechanism damaged, affecting performance	A	Require repair or replacement
NOTE: **Further inspection required to determine cause.**		
Drive mechanism damaged, not affecting performance	2	Suggest repair or replacement
NOTE: **Further inspection required to determine cause.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation or out of specification.**		
Leaking (vacuum/fluid/air)	A	Require replacement
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	Â	No service suggested or required
Linkage binding, affecting performance	A	Require repair or replacement of linkage

Condition	Code	Procedure
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Out of adjustment	B	Further inspection required
NOTE: **Follow OEM recommended adjustment procedures. Repair or replace if out of specification.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

PROPORTIONING VALVE

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement
Linkage bent (rear load valves)	A	Require repair or replacement of linkage
Linkage broken (rear load valves)	A	Require repair or replacement of linkage
Pressure out of specification	B	Require adjustment If not possible, require replacement
Seized	A	Require replacement
Sticking	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

Condition	Code	Procedure
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require replacement
NOTE: **Determine source of contamination. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking externally	A	Require repair or replacement
Leaking internally	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

RELAYS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Housing broken	A	Require replacement
Housing cracked	2	Suggest replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

RELUCTOR (SPEED) RING

NOTE: **If the toothed ring requires replacement and cannot be replaced as a separate component, replace the assembly of which the ring is a part**

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Bent	B	Require replacement
Contaminated, affecting performance	A	Require repair. Identify and correct cause
Cracked	A	Require replacement
Loose	A	Require replacement of worn parts
Missing	C	Require replacement
Number of teeth incorrect	B	Require replacement
Teeth broken	A	Require replacement
Teeth damaged, affecting performance	A	Require replacement

ROTORS

NOTE: **Determine the need to recondition based upon individual rotor conditions that follow. Friction material replacement does not require rotor reconditioning unless other justifications exist. Do not recondition new rotors unless it does not meet installed OEM specifications. It is not necessary to replace rotors in axle sets unless required by the vehicle manufacturer. However, when replacing or reconditioning a rotor due to the conditions that follow, you may suggest reconditioning of the other rotor on the same axle to eliminate uneven braking behavior. Determine the need to replace based upon the individual rotor conditions that follow. Reconditioning is defined as machining and block sanding, or block sanding only. Block sanding is defined as using 120-150 grit sandpaper with moderate to heavy force for 60 seconds per side. Always wash rotors after servicing or before installing.**

SELF-ADJUSTING SYSTEMS

Condition	Code	Procedure
Bent	A	Require repair or replacement of bent part
Broken	A	Require repair or replacement of broken part

Condition	Code	Procedure
Inoperative	A	Require repair or replacement of inoperative parts
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement of missing part
Star wheel does not turn freely	A	Require repair or replacement

SHOE HARDWARE

NOTE: **See also Self-Adjusting Systems.**

Condition	Code	Procedure
Broken	A	Require replacement
Distorted	A	Require replacement
Missing	C	Require replacement
Surfaces rust-pitted	1	Suggest replacement
Worn, affecting performance	A	Require replacement

SHOES

NOTE: **Original Equipment Manufacturer (OEM) specifications designate replacement at different thicknesses. It is required that friction material be matched in axle sets for consistent braking characteristics.**

Condition	Code	Procedure
Contaminated, for example, fluid that leaked from caliper, wheel cylinder, or axle seal	A	Require replacement
NOTE: **Identify and repair cause of contamination prior to replacing friction material.**		
Cracked (Cracked through)	B	Require replacement
Cracked (Surface cracking)	Â	No service suggested or required. Further inspection may be necessary to determine cause
Flaking or chunking	B	Require replacement
Glazed (shiny)	Â	No service suggested or required
Grooves or ridges	Â	No service suggested or required
NOTE: **When reconditioning or replacing drums or rotors, replacement of friction material may be suggested depending on the severity of the grooves or ridges.**		
Out of Adjustment	B	Require Adjustment or Repair
Permanently attached hardware bent	A	Require replacement
Permanently attached hardware broken	A	Require replacement
Permanently attached hardware loose	A	Require replacement
Permanently attached hardware missing	C	Require replacement
Permanently attached hardware seized	A	Require repair or replacement
Rivets loose	B	Require replacement
Separating from backing	B	Require replacement
Shoe table or web bent	B	Require replacement
Shoe table or web cracked	A	Require replacement
Shoe table or web worn, affecting performance	A	Require replacement
Tapered wear	B	Suggest replacement

Condition	Code	Procedure
NOTE: **Some vehicles use shoes that are tapered by design. Refer to specific vehicle application. If not normal, require correction of cause and replacement of shoes.**		
Thickness of one shoe is greater than opposite shoe in the same drum (uneven wear)	Â	Replacement of friction material not suggested or required. Further inspection required.
NOTE: **Uneven shoe thickness is normal on some vehicles. Refer to specific vehicle applications.**		
Worn close to minimum specifications	1	Suggest replacement
NOTE: **When the part appears to be close to the end of its useful life, replacement may be suggested.**		
Worn to, or below minimum specifications	B	Require replacement

SOCKETS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require repair or replacement
Bulb seized in socket	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Leaking	B	Require repair or replacement
Melted	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SPEED SENSOR (RELUCTOR) RING

NOTE: **If the toothed ring requires replacement and cannot be replaced as a separate component, replace the assembly of which the ring is a part.**

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Bent	B	Require replacement
Contaminated, affecting performance	A	Require repair. Identify and correct cause
Cracked	A	Require replacement
Loose	A	Require replacement of worn parts
Missing	C	Require replacement
Number of teeth incorrect	B	Require replacement
Teeth broken	A	Require replacement
Teeth damaged, affecting performance	A	Require replacement

SPEED SENSORS (ELECTRONIC WHEEL AND VEHICLE)

Condition	Code	Procedure
Air gap incorrect	B	Require adjustment or replacement
NOTE: **If a sensor is not adjustable, further inspection is required to identify and correct cause.**		
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as metal particles or water. Require repair or replacement**		
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Leaking	B	Require repair or replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Sensor housing cracked	2	Suggest replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead misrouted	B	Require re-routing according to vehicle manufacturer's specifications
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

STAR WHEEL

Condition	Code	Procedure
Bent	A	Require repair or replacement of bent part
Broken	A	Require repair or replacement of broken part
Inoperative	A	Require repair or replacement of inoperative parts
Missing	C	Require replacement of missing part
Star wheel does not turn freely	A	Require repair or replacement

STEEL BRAKE LINES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Corroded, affecting structural integrity	A	Require replacement
Fitting incorrect (for example, compression fitting)	B	Require replacement
Flare type incorrect	B	Require repair or replacement
Leaking	A	Require repair or replacement

Condition	Code	Procedure
Line material incorrect (copper, etc.)	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly	B	Require routing correction
Rust-pitted	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

STOPLIGHT SWITCHES

Condition	Code	Procedure
Bent, affecting performance	B	Require replacement
Broken	A	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require Repair or Replacement
Missing	C	Require replacement
Out of adjustment	B	Require adjustment or replacement
Output signal incorrect	B	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

STROKE SENSOR

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	A	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement

Condition	Code	Procedure
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

TIRES

NOTE: **Consult the vehicle owner's manual or vehicle placard for correct size, speed ratings, and inflation pressure of the original tires.**

Condition	Code	Procedure
Tire diameter incorrect, affecting ABS or TCS	A	Require replacement
Tire pressure incorrect, affecting ABS or TCS	A	Require repair or replacement
Tire size incorrect, affecting ABS or TCS	A	Require replacement

TONE RING

NOTE: **If the toothed ring requires replacement and cannot be replaced as a separate component, replace the assembly of which the ring is a part**

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Bent	B	Require replacement
Contaminated, affecting performance	A	Require repair. Identify and correct cause
Cracked	A	Require replacement
Loose	A	Require replacement of worn parts
Missing	C	Require replacement
Number of teeth incorrect	B	Require replacement
Teeth broken	A	Require replacement
Teeth damaged, affecting performance	A	Require replacement

TOOTHED RINGS (TONE WHEEL)

NOTE: **If the toothed ring requires replacement and cannot be replaced as a separate component, replace the assembly of which the ring is a part**

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Bent	B	Require replacement
Contaminated, affecting performance	A	Require repair. Identify and correct cause
Cracked	A	Require replacement
Loose	A	Require replacement of worn parts
Missing	C	Require replacement
Number of teeth incorrect	B	Require replacement
Teeth broken	A	Require replacement
Teeth damaged, affecting performance	A	Require replacement

TRACTION CONTROL SYSTEM (TCS)

NOTE: **The further development of the electronic locking differential. It electronically reduces engine torque, preventing engine and wheel braking from working against each other. (Example: a driver continues to apply the accelerator while the electronic traction control is attempting to redistribute excess engine torque through braking). This system works in unison with some OEM's stability control systems.**

TRANSFER TUBES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Corroded, affecting structural integrity	A	Require replacement
Fitting incorrect (for example, compression fitting)	B	Require replacement
Flare type incorrect	B	Require repair or replacement
Leaking	A	Require repair or replacement
Line material incorrect (copper, etc.)	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly	B	Require routing correction
Rust-pitted	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

VACUUM BOOSTERS

Condition	Code	Procedure
Applies too much assist (oversensitive)	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Auxiliary vacuum pump inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Check valve grommet deteriorated, affecting performance	A	Require replacement of grommet
Check valve grommet deteriorated, not affecting performance	1	Suggest replacement of grommet
Check valve inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Check valve leaking	A	Require replacement of check valve
Check valve missing	C	Require replacement of check valve
Check valve noisy	2	Suggest replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Leaking	A	Require replacement
Pushrod out of adjustment	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Vacuum hose filter leaking	A	Require replacement of filter
Vacuum hose filter restricted	A	Require replacement of filter
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

VACUUM HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Blistered	B	Require replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Incorrectly secured	B	Require repair

Condition	Code	Procedure
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly	B	Require repair

VALVES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement
Linkage bent (rear load valves)	A	Require repair or replacement of linkage
Linkage broken (rear load valves)	A	Require repair or replacement of linkage
Pressure out of specification	B	Require adjustment If not possible, require replacement
Seized	A	Require replacement
Sticking	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

WEAR INDICATOR

Condition	Code	Procedure
Wear indicator device (electronic) contacts rotor	B	Require replacement of appropriate parts
Wear indicator device (mechanical) broken	Â	Further inspection required
Wear indicator device (mechanical) bent	Â	Further inspection required
Wear indicator device (mechanical) contacts rotor	Â	Further inspection required

WHEEL ATTACHMENT HARDWARE

NOTE: **For conditions noted below, also check condition of wheel stud holes. Proper lug nut torque is essential. Follow manufacturer's torque**

specifications and tightening sequence. DO NOT lubricate threads unless specified by the vehicle manufacturer.

Condition	Code	Procedure
Bent	A	Require replacement
Broken	A	Require replacement
NOTE: **Some manufacturers require replacement of all studs on any wheel if two or more studs or nuts on the same wheel are broken or missing.**		
Loose	A	Require repair or replacement of affected component
Lug nut flats rounded	A	Require replacement of nut
Lug nut installed backward	B	Require repair
Lug nut mating surface dished	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut seized	A	Require replacement of nut and/or stud
Stud incorrect	B	Require replacement of stud
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped (threads missing)	A	Require replacement of component with stripped threads

WHEEL BEARINGS, RACES AND SEALS

NOTE: **When replacing or repacking wheel bearings, grease seal replacement is required. You are not required to replace these components in axle sets. Determine the need to replace based upon the individual component conditions.**

Condition	Code	Procedure
Axle seal on drive axle leaking	A	Require replacement of seal and inspection of axle, bearing, housing, and vent tube
Bearing end-play exceeds specifications	B	Require adjustment of bearing, if possible If proper adjustment cannot be obtained, require replacement of bearing and race assembly.
Bearing rollers, balls or races are worn, pitted, or feel rough when rotated as an assembly or	B	Require replacement of bearing and race assembly
other damage affecting performance.	Â	Â
Seal leaking	A	Require replacement of seal and inspection of bearings
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary. Check vent. A plugged vent may force fluid past the seal.**		
Seal missing	C	Require replacement

WHEEL CYLINDERS

NOTE: **You are not required to replace or rebuild wheel cylinders in axle sets. However, when rebuilding or replacing a wheel cylinder due to the conditions that follow, you may suggest rebuilding or replacement of the other wheel cylinder (on the same axle) for preventive maintenance, for**

example, the part is close to the end of its useful life. Determine the need to rebuild or replace based upon the individual wheel cylinder conditions.

Condition	Code	Procedure
Attaching hardware bent	B	Require replacement of bent parts
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of corroded parts
Attaching hardware loose	A	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bleeder port damaged (if non-repairable)	A	Require replacement
Bleeder screw broken off in wheel cylinder (if non-repairable)	A	Require replacement
NOTE: **Only required if the hydraulic system must be opened.**		
Bleeder screw plugged	A	Require repair or replacement
NOTE: **Only required if the hydraulic system must be opened.**		
Bleeder screw seized	A	Require replacement
NOTE: **Seized is defined as bleeder screw that cannot be removed after a practical attempt at removing. Only required if the hydraulic system must be opened.**		
Bore corroded (pitted)	B	Require replacement
Bore grooved	A	Require replacement
Bore oversized	B	Require replacement
Dust boot missing	C	Require replacement of dust boot
Dust boot torn	A	Require replacement of dust boot
Leaking	A	Require rebuilding or replacement
NOTE: **Leaking is defined as a drop or more. Dampness is normal.**		
Loose	B	Require repair or replacement
Piston corroded, affecting performance	B	Require replacement of piston and rebuilding or replacement of wheel cylinder
Piston finish worn off	B	Require replacement of piston and rebuilding or replacement of wheel cylinder
Piston stuck in bore	A	Require replacement of wheel cylinder
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

WIRING HARNESSES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

YAW RATE SENSOR

Condition	Code	Procedure
Broken	A	Require replacement
Connector loose	A	Require repair or replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Out of position	B	Require re-positioning to vehicle manufacturer's specifications
Output signal incorrect	B	Require replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	

Code	Reason
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

AUTOMOTIVE TERMINOLOGY & DEFINITIONS

ABS

see 'anti-lock brake system "

ANCHOR PIN

a component located on the brake backing plate, on which the brake shoes rotate and to which the return springs are secured.

ANTI-LOCK BRAKE SYSTEM (ABS)

a computer controlled system that allows the vehicle to be controlled under heavy braking by releasing hydraulic pressure to wheels that are about to lock up and skid. Sensors located at the wheels, monitor rotating wheel speed in relation to other wheels and send the information to a control module that in turn controls a hydraulic modulator, which regulates hydraulic fluid pressure to each brake assembly.

ANTI-LOCK BRAKING SYSTEM (ABS)

ABS keeps the wheels from fully locking up while braking to allow the driver to maintain steering control. Without ABS, too much force applied to the brake pedal can cause one or more wheels to stop turning (lockup) and begin skidding, greatly reducing the capability of the driver to steer. With ABS, maximum force on the brake pedal slows each wheel to the point of maximum braking - without skidding.
Since all wheels are still rolling, the driver maintains steering control within the limits of traction. Many light trucks use rear-wheel ABS to prevent rear wheel lockup.

BACKING PLATE

the component to which the brake shoes, wheel cy/inder and related components are attached.

BLEEDER VALVE

a valve located on disc brake calipers, wheel cylinders and some master cylinders that allows air and fluid to be removed from the brake system.

BRAKE DRAG

a condition that occurs when brake pads or shoes are in continuous contact with the disc brake rotors or brake drums.

BRAKE DRUM

a round cast iron housing attached to an axle shaft or spindle, on which the brake shoes press to stop its rotation.

BRAKE FADE

phenomenon that takes place when the temperature of the friction surfaces increases to a point where the application of heavy pedal pressure results in little braking action.

BRAKE FLUID

the hydraulic fluid used to transmit hydraulic pressure through the brake lines in a brake system.

BRAKE FLUSHING

a procedure to clean the brake hydraulic system with fresh, clean fluid that should be performed whenever new parts are installed, if there is any doubt as to the grade of fluid in the system, if a glycol fluid has been mixed with a silicone-based fluid, or if the fluid has been contaminated with petroleum or mineral based fluids.

BRAKE HOSE

flexible hoses that connect the brake lines on the chassis with the calipers or wheel cylinders, or the junction block on a solid axle.

BRAKE LINE

metal tubing that carries the brake fluid from the master cylinder to other brake system components.

BRAKE PAD

see 'disc brake pad'.

BRAKE ROTOR

see 'disc brake rotor'.

BRAKE SHOE

friction material that is bonded or riveted to curved metal structures and attached to the backing plate. The brake shoes press on the brake drum to stop its rotation.

BURNISH

the process of polishing a part using the pressure of a sliding tool.

BURR

a ragged metal edge left on a part during machining.

CALIPER

see 'disc brake caliper'.

CHAFING

damage or wearing away caused by friction and rubbing.

CHAMFER

a bevel or taper at the edge of a hole or corner, usually cut at 45 degrees.

CLEARANCE

the specified distance between two components.

COMBINATION VALVE

a single unit in the hydraulic brake system that incorporates the metering and proportioning valves in conjunction with the pressure differential switch. Combination valves are categorized as being either two-function or three-function devices, depending on the number of functions they perform. A threefunction valve provides all of the aforementioned capabilities of metering, proportioning and warning. However, the two-function unit combines either the proportioning and warning light functions or the metering and warning light operations into a single component.

COMPENSATING PORT

an opening between the master cylinder bore and reservoir that allows brake fluid to return to the reservoir.

CONTRACTION

a reduction in size, drawing together, narrowing, shrinking or shortening; the opposite of expansion.

DATA LINK CONNECTOR

a means through which information about the state of the vehicle control system can be extracted with a scan tool. This information includes actual readouts on each sensor's input circuit and some actuator signals. It also includes any trouble codes stored. The data link connector is also used to disable the computer's ignition timing adjustments on some engines so base or reference timing can be measured with a timing light. Before OBD II, each OEM had a unique Data link Connector (DLC) and :alled it by a different name. With the advent of OBO-II, the DLC became standardized as a 16-pin connector to which the scan tool could be connected to read data and sometimes control outputs of the PCM.

DISC BRAKE CALIPER

a hydraulically actuated device in a disc brake system that is mounted straddling the brake disc. The caliper contains at least one piston and is used to provide clamping force of the brake pads on the disc.

DISC BRAKE PAD

friction material that is bonded or riveted to metal plates and mounted in the disc brake caliper. The brake pads are clamped against the disc brake rotor to stop its rotation.

DISC BRAKE ROTOR

a cast iron disc mounted on the wheel hub, which is clamped by the caliper and disc brake pads to slow and stop its rotation.

DISC BRAKE

a braking system that uses cast iron discs mounted on the wheel hubs, over which brake calipers are mounted. Hydraulic pressure from the brake system forces the caliper piston(s) against friction pads mounted in the calipers, which in turn clamp the brake discs, stopping their rotation.

DISTORTION

warp, twist or other deformation in a part.

DOT

department of transportation.

DRUM BRAKE

a braking system that uses cast iron drums mounted to the wheel hubs. Hydraulic pressure from the brake system forces pistons in the wheel cylinder to press friction lined brake shoes against the inside of the drum, stopping its rotation.

DUAL MASTER CYLINDER

a master cylinder that has one cylinder bore, but two pistons and two fluid reservoirs. Each piston applies hydraulic pressure to two wheels only. In the event one of the hydraulic circuits fails, the other provides enough braking power to stop the vehicle.

DUO-SERVO DRUM BRAKES

a drum brake design that provides increased stopping power due to the servo or self-energizing action of the brake shoes.

ELECTRONIC BRAKE-FORCE DISTRIBUTION

operates in conjunction with ABS to balance the force applied to brakes at front and rear wheels. Can prevent over-braking, improve brake-pad life, reduce "brake fade" caused by excessive heat, and ensure peak braking efficiency in all conditions.

ELECTRONIC CONTROL MODULE (ECM)

the computer in an electronic control system, also known as an electronic control unit (EGU).

ELECTRONIC CONTROL UNIT (ECU)

see 'electronic control module (ECM)'.

ELECTRONIC STABILITY CONTROL

the next logical evolution of ABS and traction control. It has ABS's hardware and two additional sensors: steering-wheel angle sensor, which measures the position and rate the steering-wheel is turning, and a yaw sensor, which measures the rate the vehicle is actually turning. By comparing them, the on-board computer will know if the vehicle is oversteering or understeering.

FEELER GAUGE

thin metal strip manufactured in precise thickness and used to measure clearance between parts; usually part of a set.

FIXED CALIPER

a brake caliper design that contains one or two pistons positioned on either side of the rotor. The caliper is rigidly attached to the spindle and the pads are applied with equal hydraulic pressure from both sides..

FIXED SEAL

a type of brake caliper seal that is installed in a groove in the caliper bore.

FLOATING CALIPER

a brake caliper design that uses an adapter, or anchor plate, which is bolted to the spindle. The caliper floats laterally across a pair of special bolts that are screwed into the adapter. As hydraulic pressure is applied to the piston, the inboard pad is forced against the rotor. This pressure causes the caliper to move inboard until an equal pressure is applied by the outside pad to the outer disc surface.

FRICTION

the resistance to the motion of two moving objects in contact with each other.

GO/NO-GO GAUGE

a measuring tool that tells if a tolerance is met or not.

HARD SPOT

in area in a casting which has become harder (more dense) than the surrounding material; areas in the friction surface of a brake drum or rotor that have become harder than the surrounding metal.

HOLD-DOWN SPRINGS

springs that are used to keep the brake shoes secured to the backing plate.

HYDRAULIC PRESSURE

pressure exerted through a liquid.

HYDRO-BOOST

a power brake system that uses power steering pump fluid pressure rather than intake manifold vacuum.

HYGROSCOPIC

the ability of a material or substance to attract water.

ID

inside diameter.

INNER BEARING RACE

inner part of a ball or roller bearing that provides a surface for the balls or rollers to rotate.

INTEGRAL ABS

an anti-lock braking system that substitutes the traditional master cylinder and power booster with a self-contained hydraulic modulator and high-pressure accumulator.

LEADING-TRAILING DRUM BRAKES

a non-servo drum brake system where both brake shoes are held in place against a solidly attached anchor mounted to the bottom of the backing plate.

MASTER CYLINDER

the primary fluid pressurizing device in some hydraulic systems. In automotive use, it is found in the brake and hydraulic clutch systems and is pedal-activated, either directly or through a vacuum assist unit.

METERING VALVE

a valve used on front disc/rear drum brake systems for the purpose of providing a simultaneous application of the front and rear friction materials. Located in the front brake hydraulic circuit, the metering valve delays front disc brake operation until the rear brakes shoes overcome the return spring tension.

MILLIMETER

the base of metric size measurement. One millimeter equals 0.039370-in. One inch is equal to 25.4 m m.

MODULATOR

a component in the ABS system that contains the solenoid valves that regulate hydraulic fluid pressure to the calipers or wheel cylinders.

NORMAL WEAR

the average expected wear when operating under normal conditions.

OEM

original equipment manufacturer.

OXIDATION

the process of combining with oxygen, resulting in rusting or burning. Rust is slow oxidation; fire is rapid oxidation.

PARKING BRAKE

a system that applies the brakes mechanically through a series of linkages and cables. Depending on the vehicle, the parking brake system will either be actuated using a foot pedal or a hand-operated lever.

PASCAL'S LAW

the law of physics stating that liquids are noncompressible, and that a force applied to the top of a liquid in a closed container is exerted equally in all directions.

PERMEABILITY

ability of a membrane or other material to permit a substance to pass through it.

PITTING

surface irregularities caused by corrosion or excess wear.

PLAY

the relative movement between or among parts.

POWER BOOSTER

a device that uses a diaphragm, engine vacuum and atmospheric pressure to assist the driver with brake application. Also known as a vacuum booster.

POWER BRAKES

a system that uses vacuum or hydraulic pressure to assist the driver with brake application.

PRELOAD

tightening a bearing a specified amount past zero lash to eliminate axial play.

PRESSURE DIFFERENTIAL SWITCH

a valve and switch assembly installed in dual circuit brake systems to alert the driver in the event of a pressure loss in one of the hydraulic circuits.

PRIMARY SHOE

the brake shoe in a duo-servo drum brake system that transfers part of its force to the secondary shoe. The brake shoe facing the front of the vehicle when the vehicle is moving forward.

PROPORTIONING VALVE

the proportioning valve is used to control hydraulic pressure to the rear brakes. When the pressure to the rear brakes reaches a predetermined level, the proportioning valve overcomes the force of its spring-loaded piston and stops the flow of fluid to the rear brakes. This action maintains rear brake system pressure at a lower level than the front brakes, keeping the rear brakes from locking during hard stops.

QUICK TAKE-UP MASTER CYLINDER

a master cylinder design that is used to prevent excessive brake pedal travel. The quick take-up master cylinder uses a larger rear cylinder bore and quick take-up valve. This arrangement provides a large volume of fluid at low pressure (light pedal application) during the initial part of the pedal stroke. Also called a step-bore master cylinder.

RACE

a channel in the inner or outer ring of an anti-friction bearing in which the balls or rollers operate.

REGENERATIVE BRAKING

process of recovering some of a hybrid or electric vehicle's kinetic energy by allowing the wheels to drive a traction motor as a generator, thereby producing electric power that is stored for later use. When the driver brakes, the motor becomes a generator, using the kinetic energy of the vehicle to generate electricity that can be stored in the battery for later use. Traditional friction brakes are also necessary, as well as a strategy for smoothly blending the two braking mechanisms. Regenerative and friction brakes need to be controlled electronically so that stopping ability is maximized to make the dual brake operation transparent to the driver.

RESIDUAL PRESSURE

remaining or leftover pressure.

RETURN SPRINGS

springs that secure the tops of the brake shoes to an anchor pin on the backing plate. These springs allow the shoes to move in and out laterally.

SECONDARY SHOE

the brake shoe in a duo-servo drum brake system that receives force from the primary shoe when the brakes are applied. The secondary shoe does most of the braking when the vehicle is traveling forward, so its lining is larger than that of the primary shoe.

SENDING UNIT

a mechanical, electrical, hydraulic or electromechanical device which transmits information to a gauge or other receiving unit.

SERVO

a device, such as an electric motor or hydraulic piston, that is controlled by an amplified signal from a low power command device.

SLIDING CALIPER

a brake caliper design that operates similarly to the floating design, however, it attaches to the anchor plate using only one attachment point.

SPONGINESS

the feel of a soft or mushy brake pedal usually caused by trapped air in the hydraulic system.

STAR WHEEL

the star shaped wheel that is attached to the screw of a drum brake shoe adjuster. If brake shoe-to-drum clearance is excessive, the wheel is turned by the self-adjuster lever when the brakes are applied with the vehicle in reverse, moving the brake shoes closer to the drum.

TAPER

a gradual decrease in width or thickness; the difference in diameter between the cylinder bore at the bottom of the hole and the bore at the top of the hole, just below the ridge.

TECHNICAL SERVICE BULLETIN (TSB)

information published by vehicle manufacturers that describe updated service procedures and service procedures that should be used to handle vehicle defects.

TENSION

stress exerted on an object by pulling that tends to extend the material.

TOLERANCE

the difference between the allowable maximum and minimum dimensions of a mechanical part; the basis for determining the accuracy of a fitting.

TORQUE SEQUENCE

a specified order in which a component's mounting bolts should be tightened

TORQUE WRENCH

a breaker bar or ratchet wrench with an indicator that measure the twisting effort applied to a fastener during tightening.

TORQUE

twisting effort on a shaft or bolt.

UNDERSIZE

when an inside or outside diameter has been machined to a dimension smaller than standard. Undersized bearings are used to compensate.

VACUUM BOOSTER

see 'power booster'.

VALVE

a device that controls the pressure, direction or rate of flow of a liquid or gas.

WARPAGE

a condition that exists when a part is bent or twisted; the degree to which a part deviates from flatness.

WHEEL CYLINDER

a cylinder connected to a drum brake hydraulic system. Hydraulic pressure in the system applies piston(s) in the wheel cylinder against the brake shoes, forcing the shoes against the inside of the brake drum and stopping its rotation.

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Drive Train & Transmission Systems

DRIVE TRAIN & TRANSMISSION SYSTEMS

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to

honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

DRIVETRAIN AND TRANSMISSION

NOTE: **When a procedure states that a required or suggested repair or replacement is recommended, the basis for the recommendation MUST be explained to the customer. If the customer asks whether there are alternatives to the recommendation, generally acceptable repair/replacement options must be explained, whether performed or not by the shop.**

NOTE: **Whenever transmission or drive-train service is performed that affects the suspension alignment, for example, removing the engine cradle, it is required that the alignment be checked and corrected if necessary.**

NOTE: **The conditions listed for the components included in this section assume that the problem has been isolated to the specific component through proper testing.**

ACTUATORS (ELECTRICAL)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, not affecting performance	2	Require repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

ACTUATORS (VACUUM)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware.
Attaching hardware missing	C	Require replacement of hardware.
Attaching hardware not functioning	A	Require repair or replacement of hardware.
Connector (Weatherpack type) leaking	A	Require repair or replacement.
Connector broken	A	Require repair or replacement.
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking (vacuum)	A	Require repair or replacement
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement

Condition	Code	Procedure
Out of adjustment	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

AUTOMATIC TRANSMISSION / TRANSAXLE ASSEMBLIES/CVTS

Condition	Code	Procedure
Any internal component failure that requires removal of the assembly from the vehicle for service.	A	Require repair or replacement of the automatic transmission / transaxle assembly.
NOTE: **It is required that the torque converter and all other failure-related components be inspected for cause and condition. For components not requiring removal of the assembly, refer to the component listing**		

AUTOMATIC TRANSMISSION FLUID

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement
NOTE: **Determine and correct cause.**		
Burned	Â	Further inspection required
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service

Condition	Code	Procedure
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Varnish deposits present on system components affecting performance	Â	Further inspection required

AXLES

Condition	Code	Procedure
Bent, affecting performance	A	Require replacement
Bent, beyond specification	B	Require repair or replacement
Broken	A	Require replacement
End play exceeds specifications	B	Require repair or replacement
Flange bent	A	Require replacement
Flange threads stripped	A	Require repair or replacement
Twisted	A	Require replacement
Worn, affecting performance	A	Require repair or replacement

BEARINGS AND RACES

NOTE: **When replacing or re-packing bearings, grease seal replacement is required. You are not required to replace these components in axle sets. Determine the need to replace based upon the individual component conditions that follow.**

Condition	Code	Procedure
Bearing end-play exceeds specifications	B	Require adjustment of bearing, if possible
NOTE: **If proper adjustment can't be obtained, require replacement of bearing assembly.**		
Bearing rollers, balls or races are worn, pitted, noisy, or feel rough when rotated as an assembly	B	Require replacement of bearing assembly

BELL CRANKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting performance	A	Require repair or replacement
Broken	A	Require repair or replacement
Cracked	A	Require repair or replacement
Missing	C	Require replacement
Worn, affecting performance	A	Require repair or replacement

BELL HOUSINGS

Condition	Code	Procedure
Bearing race loose in bore	A	Require repair or replacement
Broken, affecting performance	A	Require repair or replacement
Cracked	A	Require repair or replacement
Dowel pin holes worn, affecting performance	Â	See Dowel Pins, Guides, and Pilot Holes
Leaking Coolant	B	Require Repair or Replacement
NOTE: **This condition is found mostly on Hybrid vehicles with a liquid cooled inverter.**		
Machined surfaces damaged, affecting performance	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require repair or replacement

BUSHINGS (EXTERNAL)

Condition	Code	Procedure
Attaching hardware bent	B	Require repair or replacement of bent part if available, otherwise, replace bushing
Attaching hardware broken	A	Require repair or replacement of broken part if available, otherwise, replace bushing
Attaching hardware corroded, affecting structural Integrity	A	Require repair or replacement of corroded part if available, otherwise, replace bushing
Attaching hardware incorrect	B	Require repair or replacement of incorrect part if available, otherwise, replace bushing
Attaching hardware loose	A	Require repair or replacement of loose part if available, otherwise, replace bushing
Attaching hardware missing	C	Require repair or replacement of missing part if available, otherwise, replace bushing
Attaching hardware threads damaged	A	Require repair or replacement of part with damaged threads if available, otherwise, replace bushing
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of part with damaged threads if available, otherwise, replace bushing
Binding	A	Require repair or replacement
Contaminated	1	Suggest replacement
Deteriorated, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
Distorted, affecting performance	A	Require repair or replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **If noise isolated to bushing, suggest repair or replacement. Use only approved lubricant on rubber bushings. Petroleum-based lubricants may damage rubber bushings.**		
Rubber separating from internal metal sleeve on bonded bushing	A	Require replacement
Seized	A	Require replacement
Shifted out of position	B	Require repair or replacement
Split	A	Require replacement
Surface cracking (weather-checked)	Â	No service suggested or required
Worn affecting performance	A	Require repair or replacement
Worn, close to the end of Its useful life	1	Suggest replacement

CABLES (SPEEDOMETER)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require repair or replacement
Binding	A	Require repair or replacement
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	2	Suggest repair or replacement of bracket
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	2	Suggest repair or replacement of bracket
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Broken	A	Require replacement
Cracked	B	Require repair or replacement
Disconnected	A	Require repair or replacement
Kinked	A	Require repair or replacement
Melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Routed incorrectly, affecting performance	B	Require repair
Seized	A	Require repair or replacement

CABLES (TV, DETENT AND SHIFT)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require repair or replacement
Binding	A	Require repair or replacement

CARRIER BEARINGS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing rollers, balls or races are worn, pitted, noisy, or feel rough when rotated as an assembly	A	Require replacement of bearing assembly
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	2	Suggest repair or replacement of bracket
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Cracked	B	Require replacement
Rough (brinelling, spalling)	A	Require replacement
Rubber deteriorated, affecting performance	A	Require replacement
Seized	A	Require replacement

CLUTCH CABLES AND CABLE HOUSINGS

Condition	Code	Procedure
Broken	A	Require replacement
Cable bent	A	Require replacement
Cable binding	A	Require repair or replacement
Cable mounting loose	B	Require repair or replacement
Cable out of adjustment	B	Require repair or replacement
Frayed	B	Require replacement
Housing heat -damaged	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Seized	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require replacement

CLUTCH DISCS (MANUAL TRANSMISSIONS)

Condition	Code	Procedure
Backing plate cracked	B	Require replacement
Broken	A	Require replacement
Contaminated with oil	A	Require replacement
NOTE: **Determine source of oil and correct prior to repair or replacement of clutch disc.**		
Damper cushion broken	A	Require replacement
Damper cushion collapsed	A	Require replacement
Damper spring collapsed	A	Require replacement
Damper spring missing	C	Require replacement
NOTE: **Not all clutch discs have springs in all spring chambers on the disc.**		
Friction material cracked through	B	Require replacement
Friction material flaking or chunking	B	Require replacement
Friction material surface cracking	Â	No service suggested or required
Grooved	B	No service suggested or required unless the pressure plate or flywheel is being resurfaced or replaced. In this case, replacement of clutch disc is required
Ridged	B	No service suggested or required unless the pressure plate or flywheel is being resurfaced or replaced. In this case, replacement of clutch disc is required
Splines worn, affecting performance	A	Require replacement
Warped, affecting performance.	A	Require replacement
Wear exceeds specifications (where applicable)	B	Require replacement
Worn, affecting performance	A	Require replacement
Worn, not affecting performance yet close to the end of its useful life	1	Suggest replacement

CLUTCH FORKS

Condition	Code	Procedure
Bent, affecting performance	B	Require replacement
Broken	A	Require repair or replacement
Cracked	B	Require repair or replacement
Worn, affecting performance	A	Require replacement
Worn, not affecting performance yet close to the end of its useful life	1	Suggest replacement

CLUTCH LINKAGES (MECHANICAL)

Condition	Code	Procedure
Components missing	C	Require replacement of missing components
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage

Condition	Code	Procedure
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Worn to the extent that it no longer performs its intended function	A	Require repair or replacement

CLUTCH MASTER CYLINDERS

Condition	Code	Procedure
Cover gasket distorted	A	Require replacement of cover gasket
Cover gasket gummy	A	Require replacement of cover gasket
NOTE: **This condition may indicate contaminated fluid. Further inspection required.**		
Cylinder leaking fluid from rear of bore	A	Require repair or replacement
Cylinder leaking fluid internally	A	Require replacement
Dust boot missing	C	Require replacement of dust boot
Dust boot punctured	A	Require replacement of dust boot
Dust boot torn	A	Require replacement of dust boot
Fluid level incorrect	B	Require fluid level adjustment
Housing damaged, affecting performance	A	Require repair or replacement
Master cylinder has residue in reservoir	2	Further inspection required
NOTE: **Do not replace master cylinder unless it exhibits conditions listed for replacement.**		
Pushrod out of adjustment	B	Require Repair or Replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

CLUTCH PEDALS

Condition	Code	Procedure
Bent, affecting performance	A	Require repair or replacement
Bent, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Pedal pad missing	C	Require replacement of pedal pad
Pivot bushings worn, affecting performance	A	Require replacement of pivot bushings

CLUTCH PIVOTS

Condition	Code	Procedure
Bent, affecting performance	A	Require replacement

Condition	Code	Procedure
Broken	A	Require repair or replacement
Cracked	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require replacement
Worn, not affecting performance, but close to the end of its useful life	2	Suggest replacement

CLUTCH PRESSURE PLATES

Condition	Code	Procedure
Balance weight missing	C	Require replacement
Broken	A	Require replacement
Contact surface distorted	B	Require replacement
Cracks	B	Require replacement
Fingers bent	A	Require replacement
Hard spots	B	Require replacement
Scored	B	Require replacement
Spring rate less than specifications	B	Require replacement
Worn beyond specifications	B	Require replacement
Worn close to the end of its useful life	1	Suggest replacement
Worn, affecting performance	A	Require replacement

CLUTCH RELEASE BEARINGS

Condition	Code	Procedure
Collar broken	A	Require replacement
Cracked	B	Require replacement
Rough when rotated as an assembly	B	Require replacement
Seized	A	Require replacement
Wear exceeds specifications	B	Require replacement
Worn close to the end of its useful life	1	Suggest replacement
Worn, affecting performance	A	Require replacement

CLUTCH SLAVE CYLINDERS (CONCENTRIC)

Condition	Code	Procedure
Bearing rough when rotated as an assembly	B	Require replacement
Bearing seized	A	Require replacement
Bleeder pipe leaks	A	Require repair or replacement
Carrier assembly worn, affecting performance	A	Require replacement
Collar broken	A	Require replacement
Cracked	B	Require replacement
Housing leaks	A	Require replacement
Inoperative	A	Require replacement
Release binding	A	Require replacement
Spring broken	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require replacement

CLUTCH SLAVE CYLINDERS (CONVENTIONAL OR EXTERNAL)

Condition	Code	Procedure

Condition	Code	Procedure
Binding	A	Require repair or replacement
Bleeder port damaged (not repairable)	A	Require replacement
NOTE: **Only required if the hydraulic system must be opened.**		
Bleeder port damaged (repairable)	A	Require repair
NOTE: **Only required if the hydraulic system must be opened.**		
Bleeder screw broken off in slave cylinder	A	Require replacement
NOTE: **Only required if the hydraulic system must be opened.**		
Bleeder screw seized	A	Require replacement
NOTE: **Seized is defined as a bleeder screw that cannot be removed after a practical attempt at removing it has been made. Only required if the hydraulic system must be opened.**		
Bore corroded (pitted)	B	Require replacement
Bore grooved	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

COMPANION FLANGES

Condition	Code	Procedure
Bearing cap bore distorted	A	Require repair or replacement
Bent, affecting performance	A	Require replacement
Bolt holes elongated	A	Require repair or replacement
Bushing or seal surface worn, affecting performance	A	Require repair or replacement
Leaking through soft yoke plug	A	Require repair or replacement of soft yoke plug
Retainer strap bent	A	Require replacement of retainer strap
Slip yoke broken	A	Require replacement
Splines worn close to the end of their useful life	1	Suggest replacement
Splines worn, affecting performance	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
U-bolt damaged, affecting performance	A	Require replacement of U-bolts
Yoke damaged, affecting performance	A	Require repair or replacement

CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement

Condition	Code	Procedure
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Transmission connector leaking	See Transmission Assembly	Â
Voltage drop out of specification	A	Require repair or replacement

COOLER BYPASS VALVES

Condition	Code	Procedure
Inoperative	A	Require replacement
Installed incorrectly	A	Require repair
Leaking	A	Require repair or replacement
Restricted	A	Require repair or replacement

COOLER LINES

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Application incorrect	B	Require replacement

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Clamp corroded, not reusable	1	Suggest replacement
NOTE: **If clamp removed, require replacement.**		
Connected incorrectly	A	Require repair
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Cracked	B	Require repair or replacement
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Routed incorrectly	B	Require repair
Swollen	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

COOLERS

Condition	Code	Procedure
Air flow obstruction	A	Require repair
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connection leaking	A	Require repair or replacement
Contaminated	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	Â	No service suggested or required
Internal restrictions	B	Require repair or replacement
Leaking	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Tubes damaged, affecting performance	A	Require repair or replacement
Tubes damaged, not affecting performance	Â	No service suggested or required

CV JOINTS

Condition	Code	Procedure

Condition	Code	Procedure
Bearing, bushing or seal surface worn, affecting performance	A	Require repair or replacement
Boot clamp broken	A	Require repair or replacement of clamp
Boot clamp loose	A	Require repair or replacement of clamp
Boot clamp missing	C	Require repair or replacement of clamp
Boot leaking	A	Require replacement of CV boot
NOTE: **Further inspection of joint required before replacing boot.**		
Boot surface cracked, not leaking	2	Suggest replacement of CV boot
Cage broken	A	Require repair or replacement of CV joint
Housing damaged to the extent that it no longer performs its intended function	A	Require repair or replacement of CV joint
NOTE: **Housing assembly may appear blue in color from normal manufacturing process of heat treating the housing.**		
Housing worn to the extent that it no longer performs its intended function	A	Require repair or replacement
NOTE: **Housing assembly may appear blue in color from normal manufacturing process of heat treating the housing.**		
Internal parts binding	A	Require repair or replacement
Internal parts worn	A	Require repair or replacement
Lubricant missing	C	Require cleaning, inspection, and repacking of CV joint
Mounting holes elongated	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

DIFFERENTIAL AND FINAL DRIVE ASSEMBLIES

NOTE: **Does not include half shafts.**

Condition	Code	Procedure
Any internal component failure that requires removal of the assembly from the vehicle for service.	A	Require repair or replacement of the differential assembly
NOTE: **For components not requiring removal of the assembly, refer to the component listing.**		

DIFFERENTIAL FLUID

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement

Condition	Code	Procedure
NOTE: **Determine and correct cause.**		
Burned	Â	Further inspection required
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct hydraulic fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Rubber master/ clutch cylinder cover gasket distorted or gummy	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Varnish deposits present on system components affecting performance	Â	Further inspection required

DIP STICK TUBES

Condition	Code	Procedure
Broken	A	Require repair or replacement
Check ball missing	C	Require repair or replacement
Cracked	B	Require repair or replacement
Hold down bracket broken	A	Require repair or replacement
Hold down bracket missing	C	Require replacement
Leaking	B	Require repair or replacement

Condition	Code	Procedure
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

DIP STICKS (FLUID LEVEL INDICATORS)

Condition	Code	Procedure
Application incorrect	B	Require replacement
Broken	A	Require replacement
Compressed	A	Require repair or replacement
Missing	C	Require replacement
Modified	A	Require replacement
Stretched	A	Require repair or replacement

DOWEL PINS, GUIDES AND PILOT HOLES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Cracked	A	Require repair or replacement
Distorted	A	Require repair or replacement
Missing	C	Require replacement
Positioned incorrectly	B	Require repair or replacement
Stepped	A	Require repair or replacement
Worn to the extent that it no longer performs its intended function	A	Require repair or replacement

DRAIN PLUGS AND GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		
Missing	C	Require replacement
Threads Damaged	A	Require repair or replacement

DRIVE SHAFT FLANGES

Condition	Code	Procedure
Bearing cap bore distorted	A	Require repair or replacement
Bent, affecting performance	A	Require replacement
Bolt holes elongated	A	Require repair or replacement
Bushing or seal surface worn, affecting performance	A	Require repair or replacement
Leaking through soft yoke plug	A	Require repair or replacement of soft yoke plug
Retainer strap bent	A	Require replacement of retainer strap
Slip yoke broken	A	Require replacement
Splines worn close to the end of their useful life	1	Suggest replacement
Splines worn, affecting performance	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
U-bolt damaged, affecting performance	A	Require replacement of U-bolts

Condition	Code	Procedure
Yoke damaged, affecting performance	A	Require repair or replacement

DRIVE SHAFTS AND HALF SHAFTS

Condition	Code	Procedure
Balance weight missing	C	Require repair or replacement
Bearing cap bore distorted	A	Require repair or replacement
Bent	A	Require replacement
Bolt holes elongated	A	Require repair or replacement
Bushing or seal surface worn, affecting performance	A	Require repair or replacement
Leaking through soft yoke plug	A	Require repair or replacement of soft yoke
Out of balance	A	Require repair or replacement
Retainer strap bent	A	Require replacement of retainer strap
Slip yoke broken	A	Require replacement
Splines worn, affecting performance	A	Require repair or replacement
Splines worn, not affecting performance, but close to the end of their useful life	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
U-bolt damaged, affecting performance	A	Require replacement of U-bolts
Yoke damaged, affecting performance	A	Require repair or replacement of Yoke

DUST BOOTS

Condition	Code	Procedure
Cracked, not leaking	1	Suggest replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Torn	A	Require replacement
Weather checked, surface cracked	Â	No service suggested or required

ENGINE MOUNTS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Leaking (hydraulic mount)	A	Require replacement
Mounting hole worn, affecting performance	A	Require replacement
Mounting hole worn, not affecting performance	Â	No service suggested or required
Rubber deteriorated, affecting performance	A	Require replacement
Rubber deteriorated, not affecting performance	Â	No service suggested or required
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

EXCITER RINGS

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Bent	B	Require replacement

Condition	Code	Procedure
Contaminated, affecting performance	A	Require repair. Identify and correct cause
Cracked	B	Require replacement
Loose	A	Require replacement of worn parts
Missing	C	Require replacement
Number of teeth incorrect	B	Require replacement
Teeth broken	A	Require replacement
Teeth damaged, affecting performance	A	Require replacement

FILLER TUBES

Condition	Code	Procedure
Broken	A	Require repair or replacement
Check ball missing	C	Require repair or replacement
Cracked	B	Require repair or replacement
Hold down bracket broken	A	Require repair or replacement
Hold down bracket missing	C	Require replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

FILTERS AND SCREENS

Condition	Code	Procedure
At service interval	3	Suggest replacement
Bent, affecting performance	A	Require repair or replacement
Exceeding service interval	3	Suggest replacement
Missing	C	Require replacement
Near service interval	3	Suggest replacement
Restricted	A	Require repair or replacement
NOTE: **Further inspection may be required to determine the source of restriction or contamination.**		
Torn	A	Require replacement
Worn, affecting performance (metal or nylon screen type)	A	Require repair or replacement

FLANGES

Condition	Code	Procedure
Bearing cap bore distorted	A	Require repair or replacement
Bent, affecting performance	A	Require replacement
Bolt holes elongated	A	Require repair or replacement
Bushing or seal surface worn, affecting performance	A	Require repair or replacement
Leaking through soft yoke plug	A	Require repair or replacement of soft yoke plug
Retainer strap bent	A	Require replacement of retainer strap
Slip yoke broken	A	Require replacement
Splines worn close to the end of their useful life	1	Suggest replacement
Splines worn, affecting performance	A	Require replacement
Threads damaged	A	Require repair or replacement

Condition	Code	Procedure
Threads stripped (threads missing)	A	Require replacement
U-bolt damaged, affecting performance	A	Require replacement of U-bolts
Yoke damaged, affecting performance	A	Require repair or replacement

FLEX PLATES

Condition	Code	Procedure
Bent, affecting performance	A	Require replacement
Bent, not affecting performance	Â	No service suggested or required
Bolt or stud holes elongated	B	Require replacement
Broken	A	Require replacement
Cracked	B	Require replacement
Ring gear worn close to the end of its useful life	1	Suggest replacement
Ring gear worn to the extent that it no longer performs its intended function	A	Require replacement
Weights missing	A	Require repair or replacement

FLUID LEVEL INDICATORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Broken	A	Require replacement
Compressed	A	Require repair or replacement
Missing	C	Require replacement
Modified	A	Require replacement
Stretched	A	Require repair or replacement

FLUIDS AND LUBRICANTS

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement
NOTE: **Determine and correct cause.**		
Burned	Â	Further inspection required
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct brake fluid.**		

Condition	Code	Procedure
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct hydraulic fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Rubber master/ clutch cylinder cover gasket distorted or gummy	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Varnish deposits present on system components affecting performance	Â	Further inspection required

FLYWHEELS

NOTE: **Clutch disc replacement does not necessitate flywheel reconditioning, unless other conditions justify the reason to do so.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked (other than mounting area)	A	Require repair or replacement of hardware
NOTE: **Some manufacturers allow slight surface cracking in the friction surface.**		
Cracks in mounting area	B	Require replacement
Hard spots	B	Require repair or replacement
Ring gear teeth worn, affecting performance	A	Require replacement of ring gear
Runout exceeds specifications	B	Require repair or replacement
Scored	B	Require repair or replacement
Surface cracks after resurfacing to manufacturer's minimum specifications	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wear exceeds specifications	B	Require replacement
Worn, affecting performance	A	Require repair or replacement
Worn, not affecting performance, but close to the end of its useful life	1	Suggest repair or replacement

FORCE MOTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	1	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

GUIDES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Cracked	A	Require repair or replacement
Distorted	A	Require repair or replacement
Missing	C	Require replacement

Condition	Code	Procedure
Positioned incorrectly	B	Require repair or replacement
Stepped	A	Require repair or replacement
Worn to the extent that it no longer performs its intended function	A	Require repair or replacement

HALF SHAFTS

Condition	Code	Procedure
Balance weight missing	C	Require repair or replacement
Bearing cap bore distorted	A	Require repair or replacement
Bent	A	Require replacement
Bolt holes elongated	A	Require repair or replacement
Bushing or seal surface worn, affecting performance	A	Require repair or replacement
Leaking through soft yoke plug	A	Require repair or replacement of soft yoke plug
Out of balance	A	Require repair or replacement
Retainer strap bent	A	Require replacement of retainer strap
Slip yoke broken	A	Require replacement
Splines worn, affecting performance	A	Require repair or replacement
Splines worn, not affecting performance, but close to the end of their useful life	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
U-bolt damaged, affecting performance	A	Require replacement of U-bolts
Yoke damaged, affecting performance	A	Require repair or replacement of yoke

HOSES, LINES, AND TUBES

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked line or tube	A	Require replacement
Hard hose	1	Suggest replacement
Inner fabric (webbing) damaged	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged	1	Suggest replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	2	Suggest replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly	2	Suggest replacement
Safety clip missing	C	Require replacement
Spongy	1	Suggest repair or replacement
Stripped	A	Require replacement
Surface cracked (weather-checked)	1	Suggest repair or replacement
Swollen	B	Require replacement

Condition	Code	Procedure
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	1	Suggest repair or replacement

HOUSINGS (BELL, CASE, TAIL(EXTENSION) AND AUXILIARY)

Condition	Code	Procedure
Bearing race loose in bore	A	Require repair or replacement
Broken, affecting performance	A	Require repair or replacement
Cracked	B	Require repair or replacement
Dowel pin holes worn, affecting performance	A	Require repair or replacement
Machined surfaces damaged, affecting performance	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require repair or replacement

HYDRAULIC FLUID

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement
NOTE: **Determine and correct cause.**		
Burned	Â	Further inspection required
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct brake fluid.**		
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	Â	No service suggested or required
Fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct hydraulic fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Rubber master/ clutch cylinder cover gasket distorted or gummy	A	Require service

Condition	Code	Procedure
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Varnish deposits present on system components affecting performance	Â	Further inspection required

INTERMEDIATE SHAFT SUPPORT BEARINGS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing rollers, balls or races are worn, pitted, noisy, or feel rough when rotated as an assembly	A	Require replacement of bearing assembly
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	2	Suggest repair or replacement of bracket
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Cracked	B	Require replacement
Rough (brinelling, spalling)	A	Require replacement
Rubber deteriorated, affecting performance	A	Require replacement
Seized	A	Require replacement

KEY INTERLOCK SYSTEMS

NOTE: **See: Actuators (Electrical), Cables, Linkages (External), Switches**

LIMITED SLIPS

Condition	Code	Procedure
Any internal component failure that requires removal of the assembly from the vehicle for service.	A	Require repair or replacement of the differential assembly.
NOTE: **For components not requiring removal of the assembly, refer to the component listing.**		

LINES

Condition	**Code**	**Procedure**
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked line or tube	A	Require replacement
Hard hose	1	Suggest replacement
Inner fabric (webbing) damaged	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged	1	Suggest replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Suggest replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly	B	Suggest replacement
Safety clip missing	C	Require replacement
Spongy	1	Suggest repair or replacement
Stripped	A	Require replacement
Surface cracked (weather-checked)	I	Suggest repair or replacement
Swollen	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

LINKAGES (EXTERNAL)

Condition	**Code**	**Procedure**
Components missing	C	Require replacement of missing components
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Worn to the extent that it no longer performs its intended function	A	Require repair or replacement

LOCKING HUB ASSEMBLIES

Condition	Code	Procedure
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Loose	B	Require repair or replacement
Seized in any position	A	Require repair or replacement

LOCKING HUB CONTROL KNOBS

Condition	Code	Procedure
Damaged, affecting performance	A	Require replacement
Missing	C	Require replacement
Worn, affecting performance	A	Require replacement

LUBRICANTS

Condition	Code	Procedure
Additive Depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement
NOTE: **Determine and correct cause.**		
At service interval	3	Suggest replacement
Beyond service interval	3	Suggest replacement
Burned	Â	Further inspection required
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correctly specified hydraulic fluid.**		
Fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct hydraulic fluid.**		
Level incorrect	B	Require correction of fluid level
Near service interval	3	Suggest replacement
Oxidized	A	Require replacement of fluid
Rubber master cylinder cover gasket distorted and gummy	A	Require service
NOTE: **If a fluid other than brake fluid is present in the system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct brake fluid.**		

MANUAL TRANSMISSION FLUID

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement
NOTE: **Determine and correct cause.**		
Burned	Â	Further inspection required
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct brake fluid.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct hydraulic fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Rubber master/ clutch cylinder cover gasket distorted or gummy	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Varnish deposits present on system components affecting performance	Â	Further inspection required

MANUAL TRANSMISSION/TRANSAXLE ASSEMBLIES

Condition	Code	Procedure

Condition	Code	Procedure
Any internal component failure that requires removal of the assembly from the vehicle for service.	A	Require repair or replacement of the manual transmission / transaxle assembly.

NOTE:

For components not requiring removal of the assembly, refer to the component listing.

METAL CLAD SEALS

Condition	Code	Procedure
Leaking	A	Require repair or replacement

NOTE:

Require inspection of mating and sealing surface and repair or replace as necessary. Check vent. A plugged vent may force fluid past the seal.

METALASTIC JOINTS

NOTE: **These joints may be found on half and/or drive shafts. They are usually found on European vehicles featuring a three-lug drive flange. They may be equipped with a centering ball or pin.**

Condition	Code	Procedure
Drive flange bent	A	Require replacement
Drive flange damaged, affecting performance	A	Require replacement
Rubber drive joint cracked	2	Suggest replacement
Rubber drive joint damaged, affecting performance	A	Require replacement
Rubber drive joint split between mounting holes	A	Require replacement
Rubber drive joint torn at mounting holes	A	Require replacement
Rubber drive joint weather-cracked	Â	No service suggested or required

MODULATOR PINS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Missing	C	Require replacement

MODULATORS

Condition	Code	Procedure
Bent, affecting performance	A	Require replacement
Contaminated (water, fuel, etc.)	A	Require replacement

NOTE:

Further inspection is required to determine the cause of the contamination.

Condition	Code	Procedure
Housing cracked	A	Require replacement
Inoperative	A	Require replacement

NOTE:

Inoperative includes intermittent operation.

Condition	Code	Procedure
Leaking fluid externally	A	Require repair or replacement
Leaking fluid internally	A	Require replacement
Leaking vacuum	A	Require replacement

Condition	Code	Procedure
Nipple broken	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

MOUNTS (ENGINE, TRANSAXLE AND TRANSMISSION)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Leaking (hydraulic mount)	A	Require replacement
Mounting hole worn, affecting performance	A	Require replacement
Mounting hole worn, not affecting performance	Â	No service suggested or required
Rubber deteriorated, affecting performance	A	Require replacement
Rubber deteriorated, not affecting performance	Â	No service suggested or required
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

ODOMETER DRIVES (MECHANICAL)

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Teeth broken	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn close to the end of its useful life	1	Suggest replacement
Worn, affecting performance	A	Require replacement

ODOMETER HEADS (MECHANICAL)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Lens broken	A	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		

Condition	Code	Procedure
Lens cloudy	2	Suggest repair or replacement
NOTE: **If lens is available as a separate part, suggest replacement of lens only.**		
Lens missing	C	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Noisy	2	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

OIL PANS

Condition	Code	Procedure
Bent, interfering with filter or other internal components	A	Require repair or replacement
Leaking	A	Require repair or replacement

PANS

Condition	Code	Procedure
Bent, interfering with filter or other internal components	A	Require repair or replacement
Leaking	A	Require repair or replacement

PILOT HOLES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Cracked	A	Require repair or replacement
Distorted	A	Require repair or replacement
Missing	C	Require replacement
Positioned incorrectly	B	Require repair or replacement
Stepped	A	Require repair or replacement
Worn to the extent that it no longer performs its intended function	A	Require repair or replacement

PRESSURE PLATES

Condition	Code	Procedure
Balance weight missing	C	Require replacement
Broken	A	Require replacement
Contact surface distorted	B	Require replacement
Cracks	B	Require replacement
Fingers bent	A	Require replacement
Hard spots	B	Require replacement
Scored	B	Require replacement
Spring rate less than specifications	B	Require replacement

Condition	Code	Procedure
Worn beyond specifications	B	Require replacement
Worn close to the end of its useful life	1	Suggest replacement
Worn, affecting performance	A	Require replacement

RACES

NOTE: **When replacing or re-packing bearings, grease seal replacement is required. You are not required to replace these components in axle sets. Determine the need to replace based upon the individual component conditions that follow.**

Condition	Code	Procedure
Bearing end-play exceeds specifications	B	Require adjustment of bearing, if possible If proper adjustment cannot be obtained, require replacement of bearing assembly
NOTE: **When replacing or re-packing bearings, grease seal replacement is required. You are not required to replace these components in axle sets. Determine the need to replace based upon the individual component conditions**		
Bearing rollers, balls or races are worn, pitted, or feel rough when rotated as an assembly	B	Require replacement of bearing assembly
NOTE: **When replacing or re-packing bearings, grease seal replacement is required. You are not required to replace these components in axle sets. Determine the need to replace based upon the individual component conditions**		

RUBBER JOINTS (METALASTIC)

NOTE: **These joints may be found on half and/or drive shafts. They are usually found on European vehicles featuring a three-Jug drive flange. They may be equipped with a centering ball or pin.**

Condition	Code	Procedure
Drive flange bent	A	Require repair or replacement
Drive flange damaged, affecting performance	A	Require replacement
Rubber drive joint cracked	2	Suggest replacement
Rubber drive joint damaged, affecting performance	A	Require replacement
Rubber drive joint split between mounting holes	A	Require replacement
Rubber drive joint torn at mounting holes	A	Require replacement
Rubber drive joint weather-cracked	Â	No service suggested or required

SCREENS

Condition	Code	Procedure
At service interval	3	Suggest replacement
Bent, affecting performance	A	Require repair or replacement
Exceeding service interval	3	Suggest replacement
Missing	C	Require replacement
Near service interval	3	Suggest replacement
Restricted	A	Require repair or replacement
NOTE: **Further inspection may be required to determine the source of restriction or contamination.**		
Torn	A	Require replacement
Worn, affecting performance (metal or nylon screen type)	A	Require repair or replacement

SEALS (METAL CLAD)

<table>
<tr><th>Condition</th><th>Code</th><th>Procedure</th></tr>
<tr><td>Leaking</td><td>A</td><td>Require repair or replacement</td></tr>
<tr><td colspan="3">NOTE:
Require inspection of mating and sealing surface and repair or replace as necessary. Check vent. A plugged vent may force fluid past the seal.</td></tr>

Condition	Code	Procedure
NOTE: **Follow OEM recommended adjustment procedures. Repair or replace if out of specification.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SERVOS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking (vacuum)	A	Require repair or replacement
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage

Condition	Code	Procedure
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SHIFT INTERLOCK SYSTEMS (SELECTOR AND KEY INTERLOCK SYSTEMS)

NOTE: **See: Actuators (Electrical), Cables, Linkages (External), Switches**

Condition	Code	Procedure
Binding	A	Require repair or replacement
Broken	A	Require repair or replacement
Components missing	C	Require replacement of missing components
Loose, affecting performance	A	Require repair or replacement
Out of adjustment	B	Require repair
Worn, affecting performance	A	Require repair or replacement

SIDE COVERS

Condition	Code	Procedure
Bent, interfering with filter or other internal components	A	Require repair or replacement
Leaking	A	Require repair or replacement

SLIP YOKES

Condition	Code	Procedure
Bearing cap bore distorted	A	Require repair or replacement
Bent	A	Require replacement
Bolt holes elongated	A	Require repair or replacement
Bushing or seal surface worn, affecting performance	A	Require repair or replacement
Leaking through soft yoke plug	A	Require repair or replacement of soft yoke plug
Retainer strap bent	A	Require replacement of retainer strap

Condition	Code	Procedure
Slip yoke broken	A	Require replacement
Splines worn close to the end of their useful life	1	Suggest replacement
Splines worn, affecting performance	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
U-bolt damaged, affecting performance	A	Require replacement of U-bolts
Yoke damaged, affecting performance	A	Require repair or replacement

SOLENOIDS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware.
Attaching hardware not functioning	A	Require repair or replacement of hardware.
Connector (Weatherpack type) leaking	A	Require repair or replacement.
Connector broken	A	Require repair or replacement.
Connector melted, affecting performance	A	Require repair or replacement.
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement.
Inoperative	A	Require replacement.
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement.
Noisy	2	Suggest repair or replacement.
Out of adjustment	B	Require repair or replacement.
Terminal broken	A	Require repair or replacement.
Terminal burned, affecting performance	A	Require repair or replacement.
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement.
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement.
Terminal corroded, not affecting performance	1	Suggest repair or replacement.
Terminal loose, affecting performance	B	Require repair or replacement.
Terminal loose, not affecting performance	1	Suggest repair or replacement.

SPEED SENSORS (ELECTRONIC WHEEL AND VEHICLE)

Condition	Code	Procedure
Air gap incorrect	B	Require adjustment or replacement

Condition	Code	Procedure
NOTE: **If a sensor is not adjustable, further inspection is required to identify and correct cause.**		
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as metal particles or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Sensor housing cracked	2	Suggest replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead misrouted	B	Require re-routing according to vehicle manufacturer's specifications
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

SPEEDOMETER- DRIVEN GEAR HOUSING

Condition	Code	Procedure

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Teeth broken	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn close to the end of its useful life	1	Suggest replacement
Worn, affecting performance	A	Require replacement

SPEEDOMETER/ODOMETER DRIVES (MECHANICAL)

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Teeth broken	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn close to the end of its useful life	1	Suggest replacement
Worn, affecting performance	A	Require replacement

SPEEDOMETER/ODOMETER HEADS (MECHANICAL)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Lens broken	A	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Lens cloudy	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **If lens is available as a separate part, suggest replacement of lens only.**		
Lens missing	C	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Noisy	2	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SPEEDOMETERS/ODOMETERS (ELECTRONIC)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require replacement
Lens broken	A	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Lens cloudy	2	Suggest repair or replacement
NOTE: **If lens is available as a separate part, suggest replacement of lens only.**		
Lens missing	C	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only .**		
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Mechanical head noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

TONE WHEELS

NOTE: **If the toothed ring requires replacement and cannot be replaced as a separate component, replace the assembly of which the ring is a part.**

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Bent	B	Require replacement
Contaminated, affecting performance	A	Require repair. Identify and correct cause
Cracked	A	Require replacement
Loose	A	Require replacement of worn parts
Missing	C	Require replacement
Number of teeth incorrect	B	Require replacement
Teeth broken	A	Require replacement
Teeth damaged, affecting performance	A	Require replacement

TOOTHED RINGS (TONE WHEEL)

NOTE: **If the toothed ring requires replacement and cannot be replaced as a separate component, replace the assembly of which the ring is a part.**

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Bent	B	Require replacement
Contaminated, affecting performance	A	Require repair. Identify and correct cause
Cracked	A	Require replacement
Loose	A	Require replacement of worn parts
Missing	C	Require replacement
Number of teeth incorrect	B	Require replacement
Teeth broken	A	Require replacement
Teeth damaged, affecting performance	A	Require replacement

TORQUE CONVERTERS

Condition	Code	Procedure
Converter clutch lock-up operation is faulty	A	Require replacement
Cover shell damaged, affecting performance	A	Require replacement
Does not meet stall speed specification	B	Require replacement
End play exceeds specifications	B	Require replacement
Hub broken	A	Require replacement
Hub cracked	A	Require replacement
Internal component failure	A	Require replacement
Leaking	B	Require repair or replacement
Pilot broken	A	Require replacement
Pilot worn, affecting performance	A	Require replacement
Threads damaged	A	Require repair or replacement

Condition	Code	Procedure
Threads stripped (threads missing)	A	Require replacement
Weights missing	C	Require replacement

TRANSAXLE MOUNTS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Leaking (hydraulic mount)	A	Require replacement
Mounting hole worn, affecting performance	A	Require replacement
Mounting hole worn, not affecting performance	Â	No service suggested or required
Rubber deteriorated, affecting performance	A	Require replacement
Rubber deteriorated, not affecting performance	Â	No service suggested or required
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

TRANSDUCERS (TRANSMISSION)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation or out of specification.**		
Leaking (vacuum/fluid/air)	A	Require replacement
Out of adjustment	B	Further inspection required
NOTE: **Follow OEM recommended adjustment procedures. Repair or replace if out of specification.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

TRANSFER CASE ASSEMBLIES

<table>
<tr><th>Condition</th><th>Code</th><th>Procedure</th></tr>
<tr><td>Any internal component failure that requires removal of the assembly from the vehicle for service.</td><td>A</td><td>Require repair or replacement of the transfer case differential assembly</td></tr>
<tr><td colspan="3">NOTE:
For components not requiring removal of the assembly, refer to the component listing.</td></tr>
</table>

TRANSFER CASE FLUID

<table>

</table>

Condition	Code	Procedure
Oxidized	A	Require replacement of fluid
Rubber master/ clutch cylinder cover gasket distorted or gummy	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Varnish deposits present on system components affecting performance	Â	Further inspection required

TRANSMISSION COOLERS

Condition	Code	Procedure
Air flow obstruction	A	Require repair
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connection leaking	A	Require repair or replacement
Contaminated	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	Â	No service suggested or required
Internal restrictions	B	Require repair or replacement
Leaking	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Tubes damaged, affecting performance	A	Require repair or replacement
Tubes damaged, not affecting performance	Â	No service suggested or required

TRANSMISSION MOUNTS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Leaking (hydraulic mount)	A	Require replacement
Mounting hole worn, affecting performance	A	Require replacement
Mounting hole worn, not affecting performance	Â	No service suggested or required
Rubber deteriorated, affecting performance	A	Require replacement
Rubber deteriorated, not affecting performance	Â	No service suggested or required
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

TRANSMISSION PANS

Condition	Code	Procedure
Bent, interfering with filter or other Internal components	A	Require repair or replacement

Condition	Code	Procedure
Leaking	A	Require repair or replacement

TRANSMISSION RANGE INDICATORS (PRNDL)

Condition	Code	Procedure
Binding	A	Require repair or replacement
Broken	A	Require repair or replacement
Components missing	C	Require replacement of missing components
Loose, affecting performance	A	Require repair or replacement
Out of adjustment	B	Require repair
Worn, affecting performance	A	Require repair or replacement

TUBES

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked line or tube	A	Require replacement
Hard hose	1	Suggest replacement
Inner fabric (webbing) damaged	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged	1	Suggest replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Suggest replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly	B	Suggest replacement
Safety clip missing	C	Require replacement
Spongy	1	Suggest repair or replacement
Stripped	A	Require replacement
Surface cracked (weather-checked)	1	Suggest repair or replacement
Swollen	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

UNIVERSAL JOINTS (CARDAN OR CROSS TYPE)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing cap distorted	B	Require replacement
Binding	A	Require replacement

Condition	**Code**	**Procedure**
Cross (trunion) worn, affecting performance	A	Require replacement
Double cardan centering ball damaged	A	Require replacement
Double cardan centering ball worn, affecting performance	A	Require replacement
Double cardan centering spring broken	A	Require replacement
Double cardan centering spring missing	C	Require replacement
Double cardan centering spring weak	A	Require replacement
End cap seal cracked	2	Suggest replacement
End cap seal missing	C	Require replacement of seal
Grease fitting broken	A	Require replacement of grease fitting
NOTE: **A broken grease fitting does not require replacement of the U-Joint.**		
Grease fitting missing	C	Require replacement of grease fitting
NOTE: **A missing grease fitting does not require replacement of the U-Joint.**		
Rust-colored powder around end cap seals	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Worn, affecting performance	A	Require replacement

VACUUM CONTROLS

Condition	**Code**	**Procedure**
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement

Terminal corroded, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

VACUUM-OPERATED SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn affecting performance	B	Require replacement

VEHICLE SPEED SENSORS

Condition	Code	Procedure
Air gap incorrect	B	Require adjustment or replacement
NOTE: **If a sensor is not adjustable, further inspection is required to identify and correct cause.**		
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as metal particles or water. Require repair or replacement.**		
Inoperative	B	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Sensor housing cracked	2	Suggest replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead misrouted	B	Require re-routing according to vehicle manufacturer's specifications
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

VENTS

Condition	Code	Procedure
Broken	A	Require replacement
Missing	C	Require replacement
Plugged	A	Require repair or replacement

NOTE:

A plugged vent may force fluid past the seal.

VIBRATION DAMPERS

Condition	Code	Procedure
Broken	A	Require replacement
Missing	C	Require replacement
Out of position	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

WHEEL ATTACHMENT HARDWARE

NOTE: **For conditions noted below, also check conditions of wheel stud holes. Proper lug nut torque is essential. Follow recommended torque specifications and tightening sequence. DO NOT lubricate threads unless specified by the vehicle manufacturer.**

Condition	Code	Procedure
Bent	A	Require replacement
Broken	A	Require replacement

NOTE:

Some manufacturers require replacement of all studs on that wheel if two or more studs or nuts on the same wheel are broken or missing.

Condition	Code	Procedure
Loose	A	Require repair or replacement of affected component
Lug nut installed backward	B	Require repair or replacement
Lug nut mating surface dished	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut rounded	A	Require replacement of nut

NOTE:

Only required if removing wheel.

Condition	Code	Procedure
Lug nut seized	A	Require replacement of nut

Condition	Code	Procedure
NOTE: **Only required if removing wheel.**		
Stud incorrect	B	Require replacement of stud
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

WHEEL SPEED SENSORS

Condition	Code	Procedure
Air gap incorrect	B	Require adjustment or replacement
NOTE: **If a sensor is not adjustable, further inspection is required to identify and correct cause.**		
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as metal particles or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Sensor housing cracked	2	Suggest replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement

Condition	Code	Procedure
Wire lead corroded	A	Require repair or replacement
Wire lead misrouted	B	Require re-routing according to vehicle manufacturer's specifications
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

WIRING HARNESSES AND CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, not affecting performance	1	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Transmission connector leaking	See Transmission Assembly	Â
Voltage drop out of specification	A	Require repair or replacement

YOKES AND SLIP YOKES

Condition	Code	Procedure
Bearing cap bore distorted	A	Require repair or replacement
Bent	A	Require replacement
Bolt holes elongated	A	Require repair or replacement
Bushing or seal surface worn, affecting performance	A	Require repair or replacement
Leaking through soft yoke plug	A	Require repair or replacement of soft yoke plug
Retainer strap bent	A	Require replacement of retainer strap
Slip yoke broken	A	Require replacement
Splines worn close to the end of their useful life	1	Suggest replacement
Splines worn, affecting performance	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
U-bolt damaged, affecting performance	A	Require replacement of U-bolts
Yoke damaged, affecting performance	A	Require repair or replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

AUTOMOTIVE TERMINOLOGY & DEFINITIONS

ACTUATOR

a control device that delivers mechanical action in response to a vacuum or electrical signal; anything that the engine control computer uses to do something, such as trigger fuel injection or fire a spark plug. Most actuators on a computercontrolled engine system are activated by grounding their circuits rather than by actively powering them, since that protects the computer from short circuits.

ADDITIVE

in automotive terminology, a substance added to a liquid, such as engine oil, transmission fluid, gear oil or coolant to enhance its properties.

AUTO SHIFT MANUAL TRANSMISSION AND SELECT SHIFT MANUAL TRANSMISSION

select shift manual (SSM) and auto shift manual (ASM) use a combination of auto-clutch and shift-by-wire electronic control system technology to provide the customer a fun-to-shift experience along with significant fuel economy improvements over a base manual transmission. The Select Shift Manual mode allows a customer to command gear changes according to his/her personal preference like a conventional manual transmission. The Auto Shift Manual mode provides the customer automatic gear shifting much like an automatic transmission.

AUTOMATIC TRANSMISSION FLUID (ATF)

the oil that is used in an automatic transmission.

AUTOMATIC TRANSMISSION

a transmission that changes forward gears automatically.

AXLE HOUSING

an enclosure for the differential and drive axles.

AXLE

a rotating shaft that rotates another part, such as a wheel.

BALL BEARING

a friction-reducing bearing that uses a series of steel balls held between inner and outer bearing races such as in a roller clutch.

BAND

in an automatic transmission, a device used to prevent members of a planetary gearset from rotating.

BEARING RACE

the machined surface of a bearing assembly against which the needles, balls or rollers ride. The outer race is also called a cup.

BEARING

part that supports and reduces friction between a stationary and moving part or two moving parts.

BELL HOUSING

connects the engine to the transmission and encloses the clutch assembly. It also provides mounting points for part of the clutch release mechanism.

CARDAN UNIVERSAL JOINT

the most common type of universal joint used. Consists of a center cross, four bearing cups, each containing a set of needle roller bearings, grease seals and snap rings.

C-CLIP

part used to retain the axle shaft in a drive axle assembly

CLUTCH DISC

the part of a clutch that receives the driving motion from the flywheel and pressure plate assembly and transmits that motion to the transmission input shaft.

CLUTCH FACING

the friction material on a clutch disc.

CLUTCH FORK

also known as the release fork. The device which moves the throwout (release) bearing, activating the pressure plate.

CLUTCH PACK

in an automatic transmission, an assembled series of clutch friction discs and clutch plates that are alternately layered.

CLUTCH PRESSURE PLATE

the part of a clutch assembly that is used to hold the driven disc against the flywheel. The pressure plate is composed of a cover and coil springs, driving disc and release levers, or a diaphragm spring.

CLUTCH RELEASE BEARING

a sealed ball or roller bearing unit that rides on a sleeve over the transmission input shaft, and acts on the pressure plate to disengage the clutch disc when the clutch release mechanism is applied. Also called a throwout bearing.

CLUTCH THROWOUT BEARING

see 'clutch release bearing'.

CLUTCH

in a manual transmission, a device that allows the driver to engage and disengage the engine from the drivetrain; in an automatic transmission, a device capable of both holding and turning members of a planetary gearset; a device used to engage and disengage and A/C compressor.

CONSTANT MESH

in a transmission, where all gears are constantly in contact and turning with one another.

CONTINUOUSLY VARIABLE TRANSMISSION (CVT)

a continuously variable transmission is an automatic that can select any desired drive ratio within its operating range. Unlike a traditional three-, four-, or fivespeed automatic transmission the CVT is an "infinite speed" transmission, the CVT continually selects an optimum overall drive ratio between engine and drive wheels for all operating conditions, whether accelerating or cruising. Unlike conventional automatics, there are no perceptible shifts. During maximum acceleration, the drive ratio Is adjusted to maintain peak engine horsepower. At a constant vehicle speed, the ratio is set to maintain an engine rpm which will support the required power. A CVT provides smooth, fast acceleration and high cruising efficiency with the convenience of an automatic transmission.

COUNTERGEAR

a set of different size gears incorporated in one casting, used in a manual transmission.

DIFFERENTIAL CARRIER

enclosure for the differential and ring and pinion gears. Can be removable or integral part of axle housing. Also called differential housing.

DIFFERENTIAL CASE

housing for the differential pinion gears and side gears. Mounting point for ring gear.

DIFFERENTIAL PINION GEARS

gears that are meshed with the differential side gears and rotate on the differential pinion shaft inside the differential case.

DIFFERENTIAL PINION SHAFT

a shaft mounted inside the differential case, provides support and pivot for the differential pinion gears.

DIFFERENTIAL SIDE GEARS

gears that are meshed with the pinion gears inside the differential case and splined to the axle shafts.

DIFFERENTIAL

gear assembly that transmits power from the driveshaft to the wheels; allows the outside wheel to turn faster than the inside when cornering.

DIRECT DRIVE

downward gear engagement in which the input shaft and output shaft are locked together; the gearing in a drivetrain in which one turn of the crankshaft equals one turn of the wheels.

DOUBLE CARDAN UNIVERSAL JOINT

two cardan universal joints connected by a yoke; also called a constant velocity (CV) joint.

DOUBLE OFFSET JOINT

a Rzeppa type plunger CV-joint used on the inboard side of the interconnecting shaft.

DOWEL

a peg or pin which fits into corresponding holes used for holding two parts together or to locate two parts in a set position.

DRIVE MEMBER

a gear that drives or provides power for other gears in a planetary gearset.

DRIVELINE ANGLE

see 'driveshaft angle'.

DRIVELINE

all of the parts connecting the engine to the drive axle.

DRIVESHAFT ANGLE.

the installation angle of the driveshaft off the true horizontal; also called driveline angle.

DRIVESHAFT

transfers power from the transmission to the differential on a rear-wheel drive vehicle. Consists of a hollow metal tube with universal joints at each end, each of which is attached to yokes at the transmission and differential.

DRIVETRAIN

all of the components that generate power and transfer it to the vehicle's wheels.

ELECTRONIC AUTOMATIC TRANSMISSION

an electronic automatic transmission utilizes an electronic control module to signal when to shift. The module also determines when to lock and unlock the torque converter. By controlling these functions electronically rather than mechanically, the transmission can be tuned for better driveability.

ENDPLAY

the amount of axial or end-to-end movement in a shaft due to clearance in the bearings; the regulated movement of a component, usually a shaft, during operation.

EXCESSIVE WEAR

in mechanical terms, wear of a component that exceeds designed limits; wear caused by overloading a part that is in an out-of-balance condition, resulting in lower-than-normal life expectancy of the part being subjected to the adverse operating condition.

EXTENSION HOUSING

aluminum or cast iron enclosure for the transmission output shaft and bearings, speedometer drive and driven gears. Provides support for driveshaft slip yoke.

FLANGE

a projecting rim or collar on a component used for holding it in place, giving it strength or guiding it into place or attaching it; a part mounted on the pinion gear that provides the mounting point for the rear universal joint of the driveshaft.

FLYWHEEL

a cast iron or steel wheel mounted to the end of the crankshaft; helps to smooth the engine's power delivery, the teeth around its circumference provide an engagement for the starter, and it provides the mounting points for the pressure plate and friction surface for the clutch disc.

FOUR WHEEL DRIVE (4WD)

system that supplies power to both the front and rear wheels of the vehicle when activated.

FREE PLAY

the measurable travel in a mechanical device between the time force is applied and work is accomplished; looseness in a linkage between the start of application and the actual movement of the device, such as the movement in the steering wheel before the wheels start to turn.

FREE TRAVEL

distance a clutch pedal moves before it begins to take up slack in the clutch linkage; essentially the same as free play, usually applied to shaft movement.

FREEWHEEL

a mechanical device that engages the driving member to impart motion to a driven member in one direction but not the other; in automotive terms, a device that permits the driveshaft to continue turning when its speed exceeds that of the crankshaft, thus allowing free coasting with the gear train engaged.

FRONT WHEEL DRIVE

the entire drivetrain is located at the front of and drives the front wheels of the vehicle.

FULL FLOATING AXLE

system where the weight of the vehicle is supported by the axle housing and the axle bearing is located outside of the axle housing; most often used on trucks.

FULLY SYNCHRONIZED

in a manual transmission, where gears are changed using synchronizers.

GEAR PITCH

number of teeth per given unit of pitch diameter. Gear pitch is determined by dividing the number of teeth by the pitch diameter of the gear.

GEAR RATIO

the number of revolutions a driving gear must turn to rotate the driven gear through one revolution. Numerical value determined by dividing the number of teeth on the driven gear by the number of teeth on the driving gear; the ratio between the number of teeth on meshing gears.

GEAR REDUCTION

when a smaller gear drives a larger gear, there is a speed reduction but an increase in torque.

GEAR

a toothed wheel, disc, etc. designed to mesh with another or with the thread of a worm; used to transfer or change motion.

GOVERNOR PRESSURE

the change in line pressure that takes place as a result of an increase in vehicle speed.

GOVERNOR

a device used on non-electronic automatic transmissions, which regulates the operation of the shift valves inside the valve body according to vehicle speed.

HELICAL GEAR

a gear in which the teeth are cut so as to form a spiral; gear with teeth that are cut at an angle or are spiral to the gear's axis of rotation.

HUNTING GEARSET

differential gearset where any one pinion gear tooth contacts all ring gear teeth.

HYPOID GEAR

bevel-cut gear in a system in which the driven gear is not in the same plane as the drive gear. A type of spiral, beveled ring and pinion gearset in a differential. Hypoid gears mesh below the ring gear centerline.

INPUT SHAFT

the shaft that is splined to the clutch disc and transfers power from the engine into the transmission; the shaft to which torque is applied, usually carrying the drive gear or gears.

INSERT SPRING.

exerts pressure on the inserts in a synchronizer assembly.

INSERT

a part of the synchronizer assembly that fits between the hub and sleeve, also called key or plate. The insert spring pushes the inserts into the sleeve, helping to center the sleeve on the hub.

LIMITED SLIP DIFFERENTIAL

a type of differential that uses clutches to supply a major portion of the drive torque to the wheel that has better traction when one wheel is slipping,

LINE PRESSURE

in an automatic transmission, the hydraulic pressure of the fluid after it leaves the pump and is regulated by the pressure regulator.

LIVE AXLE

an axle on which the wheels are firmly affixed, with the axle driving the wheels.

MAINLINE PRESSURE

in an automatic transmission, pressure that is regulated in the hydraulic system.

MESH

to fit closely together or interlock, as the fit of gear teeth.

NEEDLE BEARING

an anti-friction device that consists of a number (usually a large number) of thin rollers riding within races.

NEUTRAL START SWITCH

a switch that prevents starter engagement if the transmission is in another gear besides Park or Neutral.

NONHUNTING GEARSET

differential gearset in which one drive pinion gear tooth contacts only three ring gear teeth after several rotations.

OIL COOLER

device used to remove heat from the engine or transmission oil. There are oil-to-air coolers and oil coolers that are incorporated into the vehicle's cooling system.

ORIGINAL EQUIPMENT MANUFACTURER (OEM)

the original manufacturer of a vehicle or engine.

OUTER BEARING RACE

outer part of a bailor roller bearing that provides a surface for the balls or rollers to rotate. Can be integral with the bearing or a separate part.

OUT-OF-ROUND

when a previously round hole or bore has different diameters when measured at different points due to wear or distortion.

OUTPUT SHAFT

the shaft that delivers the power that has come through the transmission or transaxle.

OVERDRIVE

a gear assembly that outputs more shaft revolutions than were input.

OVERRUNNING CLUTCH

a clutch that locks in one direction and overruns or freewheels in the other.

PINION GEAR

the smaller, drive gear of the ring and pinion gearset; one of the gears inside the differential that rotates on the differential pinion shaft; rotates around the sun gear in a planetary gearset.

PINION

the smaller of two meshing gears.

PLANETARY CARRIER

houses the pinion gears in a planetary gearset.

PLANETARY GEARSET

a gear system consisting of three primary components: a sun gear, a planetary pinion carrier and a ring or internal gear.

POWERTRAIN CONTROL MODULE (PCM)

on vehicles with computer control systems, the main computer that determines engine operation based on sensor inputs and by using its actuator outputs. The PCM may also control transmission operation.

PRESSURE PLATE

the driving member of the clutch assembly. Coil springs or a diaphragm spring in the pressure plate exert pressure on the clutch disc, holding it against the flywheel.

REAR WHEEL DRIVE

system where the driveline drives the rear wheels of the vehicle. Most often the engine is located in the front of the vehicle and a transmission and drive shaft connect to a drive axle, however there are also systems where the entire drive line is located toward the rear of the vehicle.

RELEASE BEARING

see 'clutch release bearing'.

REVERSE IDLER GEAR

a gear used to reverse the direction of power in a transmission.

RING GEAR

the larger, driven gear of the ring and pinion gearset; the largest member in a planetary gearset, also known as the internal gear or annulus. The internal teeth of the gear mesh with and rotate on the planetary pinions.

ROTARY FLOW

torque converter oil flow associated with the coupling stage of operation.

SEAL

a part, usually made of rubber or plastic, installed around a moving part or shaft to prevent leaks.

SEMI-FLOATING AXLE

system where the axle bearing is located inside the axle housing and the weight of the vehicle is supported by the axle.

SHIFT FORK

a device in a manual transmission that moves the synchronizer assembly sleeve, in response to movement from the shift linkage.

SHIFT RAILS

the parts of transmission shift linkage that transfer motion from the driver-controlled gear shift lever to the shift forks.

SHIFTER

the lever operated by the driver to shift the transmission. The shifter is attached directly to internal linkage in the transmission or it is mounted on the outside of the transmission or on the frame or vehicle floor, and connected to the transmission or trans axle by external linkage rods or cables.

SLAVE CYLINDER

a device that is connected to the release bearing in a hydraulic clutch system. When the clutch pedal is depressed, hydraulic fluid flows from the master cylinder through the hydraulic fluid line to the slave cylinder. Pressure in the system causes the slave cylinder to act on the release bearing, disengaging the clutch

SLIP YOKE

a driveline component that is splined to the transmission output shaft and connected to the driveshaft front U-joint. Allows in and out movement on the transmission extension housing in response to rear suspension movement.

SLIP

condition caused when a driving part rotates faster than a driven part.

SPLINES

grooves cut into the outside or inside surface of a component to enable it to fit with another component having corresponding grooves. Commonly used to keep a component secured on a rotating shaft.

SPRAG CLUTCH

a type of overrunning clutch.

SUMP

the reservoir that holds the oil for the pump.

SYNCHRONIZER

a type of clutch assembly used in a manual transmission to shift gears. Consists of a hub splined to the main shaft, inserts (keys) and insert springs, outer sleeve and blocking rings. There are grooves machined into the sleeves to capture the shift forks, which transfer the motion from the gearshift linkage. The sleeve moves along the splined inner hub in response to the shift fork, forcing the blocking ring against the gear cone and then, when the gear is at the same speed, slides over the blocking ring and gear engagement teeth, locking the gear to the synchronizer hub and shaft.

THROWOUT BEARING

see 'clutch release bearing'.

THRUST BEARING

a bearing that separates rotating parts from each other and non-rotating parts, and absorb thrust loads; a bearing with side surfaces that controls the fore and aft movement of a shaft.

TORQUE CONVERTER CLUTCH

a device located inside the torque converter that mechanically links the engine and transmission together.

TORQUE CONVERTER

a fluid coupling device used to transfer engine torque from the crankshaft to the transmission.

TORQUE STEER

the tendency of many front -wheel-drive vehicles with half-shafts of unequal length, to turn somewhat from the desired direction when accelerating, especially in a curve, or when decelerating in a curve.

TRANSFER CASE

attached to or connected to the transmission in a four-wheel drive vehicle. Transfers power to both front and rear axles.

TRANSMISSION CONTROL MODULE (TCM)

the computer that controls the transmission.

TRANSMISSION

transfers the engine's power to the driveshaft and the rear wheels. Contains a series of gears that provide torque multiplication, so the vehicle can be moved from a standstill and also cruise at highway speeds at lower engine rpms.

TRANSVERSE

perpendicular or at a right angle to a front-to-back centerline.

TRIPOD JOINT

a type of CV-joint consisting of a spider, which is splined to the interconnecting shaft of the halfshaft, three rollers that turn on needle roller bearings located between the spider and rollers, a housing, or yoke, that is part of the stub shaft, and a boot. Used on the inboard side of the halfshaft.

UNIVERSAL JOINT (U-JOINT)

a joint that allows the drives haft to transmit torque at different angles as the suspension moves up and down.

VACUUM MODULATOR

a device used to vary line pressure according to engine load in an automatic transmission.

VALVE BODY

in an automatic transmission, the housing that contains most of the valves used for transmission operation.

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Electrical Systems

ELECTRICAL SYSTEMS

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to

honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	**Reasons to Suggest Repair or Replacement**
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

ELECTRICAL SYSTEMS

ACTUATOR MOTORS (ELECTRIC)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

ACTUATOR MOTORS (VACUUM)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement

Condition	Code	Procedure
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking (vacuum)	A	Require repair or replacement
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement

AIR BAGS

NOTE: **For all air bag components and conditions, refer to vehicle manufacturer's specifications for diagnosis and parts replacement.**

ALTERNATORS AND GENERATORS

NOTE: **If components have been added that increase vehicle electrical load requirement (for example, sound systems, air conditioning, alarm systems, etc.), charging system output must meet the increased demand.**

Condition	Code	Procedure
Alternator output meets OEM specification but is insufficient for add on electrical load	2	Suggest upgrade of alternator or removal of excess electrical load
Alternator's rated output is below OEM specification	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware non-functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Diode inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Housing broken, affecting performance	A	Require repair or replacement
Housing broken, not affecting performance	Â	No service suggested or required
Housing cracked, affecting performance	A	Require repair or replacement
Housing cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Noisy	2	Suggest repair or replacement
Pulley incorrect	B	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Terminal resistance (voltage drop) out of specification	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Voltage drop out of specification	A	Require repair or replacement

AMPLIFIERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Sound quality poor	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ANTENNAS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting performance	2	Suggest repair or replacement
Binding	2	Suggest repair or replacement
Broken	A	Require replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation or out of specification.**		
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Missing	C	Require replacement
Motor runs continuously	A	Require or replacement
Power antenna noisy	2	Suggest repair or replacement
Sticking	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

BATTERIES

NOTE: **Proper operation of any electrical system or component can be affected by battery condition. The battery(ies) must meet or exceed minimum specification for vehicle as equipped and test to that specific battery's CCA.**

Definition of Terms

Battery Performance Testing - Testing that determines whether or not a battery meets both vehicle OEM and battery manufacturer's specifications.

Cold Cranking Amp (CCA) Rating - The number of amperes a new, fully charged battery at 0Â° F (-17.8Â° C) can deliver for 30 seconds and maintain at least a voltage of 1.2 volts per cell (7.2 volts for a 12-volt battery).

Cranking Amps (CA) - The number of amperes a new, fully charged battery, typically at 32Â° F (0Â° C) can deliver for 30 seconds and maintain at least a voltage of 1.2 volts per cell (7.2 volts for a 12volt battery).

OEM Cranking Amps - The minimum CCA required by the original vehicle manufacturer for a specific vehicle.

Condition	Code	Procedure
Battery frozen	Â	Further inspection required
NOTE: **Do not attempt to charge a frozen battery. Allow battery to warm thoroughly and then performance-test. If battery fails performance test, require replacement.**		
Battery tests near the ""end of its useful life"" utilizing a tester or on-board monitor able to accurately determine this condition	1	Suggest Replacement
Case leaking	A	Require replacement
Casing swollen	A	Further inspection required
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Circuit open internally	A	Require replacement
Electrolyte contamination	A	Further inspection required
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Electrolyte discoloration	A	Further inspection required

Condition	Code	Procedure
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Fails to accept and hold charge	A	Require replacement
NOTE: **This phrase refers to a battery that fails to either accept and/or retain a charge using appropriate times listed in the Battery Charging Guide of the BCI Service Manual, battery charger operating manual, or battery manufacturer' s specifications.**		
Fluid level low	B	Further inspection required
NOTE: **Determine cause of low fluid level. Refill to proper level(s) with water (distilled water preferred). Recharge battery and performance-test.**		
NOTE: **If battery does not meet specifications, require replacement.**		
NOTE: **If battery is sealed type (non-removable filler caps), require replacement.**		
Out of performance specification for battery	B	Require replacement
NOTE: **The battery may meet vehicle's OEM specifications for that vehicle but test below the minimum specifications defined by the battery manufacturer.**		
Out of specification for application	B	Require replacement
NOTE: **The battery may meet battery manufacturer's specifications but test below the minimum specification defined by the vehicle's OEM for that vehicle.**		
Post (top or side) burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Post (top or side) burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Post (top or side) corroded, affecting performance	A	Require repair
Post (top or side) corroded, not affecting performance	2	Suggest repair
Post (top or side) loose	A	Require replacement
Post (top or side) melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Post (top or side) melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**

Condition	Code	Procedure
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

BATTERY CABLES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
NOTE: **Exposed conductor at replacement (aftermarket) terminal end does not require repair or replacement.**		
Insulation damaged, conductors not exposed	1	Suggest replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Voltage drop out of specification	A	Require repair or replacement

BATTERY TRAYS AND HOLD DOWN HARDWARE

Condition	Code	Procedure
Battery improperly secured	2	Suggest repair
Bent, affecting performance	A	Require repair or replacement
Bent, not affecting performance	Â	No service suggested or required
Broken, affecting performance	A	Require repair or replacement
Broken, not affecting performance	Â	No service suggested or required
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Water drain clogged	A	Require repair

BATTERY WIRES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
NOTE: **Exposed conductor at replacement (aftermarket) terminal end does not require repair or replacement.**		
Insulation damaged, conductors not exposed	1	Suggest replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement
Worn so it contacts bottom of pulley	A	Require replacement

BULB SOCKETS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require repair or replacement
Bulb seized in socket	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of socket.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of socket.**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	**Code**	**Procedure**
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Leaking	B	Require repair or replacement
Melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

BULBS, SEALED BEAMS AND LEDS

NOTE: **Does not include soldered-in components.**

Condition	**Code**	**Procedure**
Adjustment out of specification	B	Require repair or replacement
Application incorrect	B	Require replacement
NOTE: **Application incorrect includes wrong bulb coating or color.**		
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Base burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base corroded, affecting performance	A	Require repair or replacement
Base corroded, not affecting performance	2	Suggest repair or replacement
Base leaking	A	Require repair or replacement
Base loose, affecting performance	B	Require repair or replacement
Base loose, not affecting performance	1	Suggest repair or replacement
Base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		

Condition	Code	Procedure
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Burned out	A	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked	B	Require replacement
Intermittent	A	Require replacement
Lamp base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Seized in socket	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

CD PLAYERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Skips	A	Require repair or replacement
Sound quality poor	A	Require repair or replacement
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Speed incorrect	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CIGARETTE LIGHTER ASSEMBLIES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Loose	B	Require repair or replacement
Missing	2	Suggest replacement
Sticking	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

CIRCUIT BREAKERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Blown	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

CLUTCH SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware

Condition	Code	Procedure
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement

Condition	Code	Procedure
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest repair or replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

CONTROL MODULES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required
NOTE: **Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).**		
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair

Condition	Code	Procedure
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CRUISE CONTROL BRAKE SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement

Oil-soaked (spongy)	1	Suggest replacement
Restricted	A	Require repair or replacement
Surface cracks (dry-rotted)	1	Suggest replacement

CRUISE CONTROL VEHICLE SPEED SENSORS

Condition	Code	Procedure
Air gap incorrect	B	Require adjustment to vehicle manufacturer's specifications

Condition	Code	Procedure
NOTE: **If a sensor is not adjustable, further inspection is required to identify and correct cause.**		
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Housing cracked	B	Require replacement
Internal resistance does not meet specifications	B	Require replacement
NOTE: **Component failure may be caused by water intrusion into the wiring harness. Always check insulation for damage and wiring for excessive resistance.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
NOTE: **Some integral bearing assemblies with sensors may require replacement.**		
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
NOTE: **Component failure may be caused by water intrusion into the wiring harness. Always check insulation for damage and wiring for excessive resistance.**		
Surface contaminated	2	Suggest cleaning; identify and correct source
Tip bent	B	Require replacement
Tip broken	B	Require replacement
Tip missing	B	Require replacement
Wire lead burned	A	Require replacement
Wire lead conductors exposed	B	Require replacement
Wire lead corroded	A	Require replacement
Wire lead open	A	Require replacement
Wire lead shorted	A	Require replacement

DEFOGGERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

DEFROSTERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

DELAYS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

DIMMERS

Condition	Code	Procedure

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

ELECTRIC HEATERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement

Condition	Code	Procedure
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

EQUALIZERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Sound quality poor	A	Require repair or replacement
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FUSE BLOCKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	Â	No service suggested or required
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Melted, affecting performance	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Melted, not affecting performance	2	Suggest replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

FUSE BOXES AND BLOCKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	Â	No service suggested or required
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Melted, affecting performance	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Melted, not affecting performance	2	Suggest replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

FUSES, FUSIBLE LINKS AND CIRCUIT BREAKERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Blown	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement

FUSIBLE LINKS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Blown	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement

Condition	Code	Procedure
Missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement

GAUGES

NOTE: **Includes odometers, speedometers, and tachometers (except cable-driven).**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require replacement
Lens broken	A	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Lens cloudy	2	Suggest repair or replacement
NOTE: **If lens is available as a separate part, suggest replacement of lens only.**		
Lens missing	C	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Mechanical head noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

GENERATORS

NOTE: **If components have been added that increase vehicle electrical load requirement (for example, sound systems, air conditioning, alarm systems, etc.), charging system output must meet the increased demand.**

Condition	Code	Procedure
Alternator output meets OEM specification but is insufficient for add on electrical load	2	Suggest upgrade of alternator or removal of excess electrical load
Alternator's rated output is below OEM specification	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware non-functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Diode inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Housing broken, affecting performance	A	Require repair or replacement
Housing broken, not affecting performance	Â	No service suggested or required
Housing cracked, affecting performance	A	Require repair or replacement
Housing cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Noisy	2	Suggest repair or replacement
Pulley incorrect	B	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Terminal resistance (voltage drop) out of specification	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Voltage drop out of specification	A	Require repair or replacement

GROUND CABLES AND STRAPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Insulation damaged, exposing conductors	2	Suggest replacement
Loose	A	Require repair
Missing	C	Require replacement
Open	A	Require repair or replacement
Resistance high	A	Require repair or replacement
Terminal resistance (voltage drop) is out of specification	B	Require repair or replacement
Voltage drop out of specification	B	Require repair or replacement

GROUND STRAPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Insulation damaged, exposing conductors	2	Suggest replacement
Loose	A	Require repair
Missing	C	Require replacement
Open	A	Require repair or replacement
Resistance high	A	Require repair or replacement
Terminal resistance (voltage drop) is out of specification	B	Require repair or replacement
Voltage drop out of specification	B	Require repair or replacement

HEADLIGHT ADJUSTERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, preventing adjustment	A	Require repair or replacement
Broken	A	Require repair or replacement
Indicator broken	A	Require replacement
Indicator missing	C	Require replacement
Missing	C	Require replacement of adjusters
Seized	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

HEATING ELEMENTS (DEFROSTERS, DEFOGGERS, ELECTRIC HEATERS AND SEATS)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

HORNS AND SIRENS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Out of adjustment	B	Require adjustment
Sound quality poor	A	Require repair or replacement. Further inspection required
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

IGNITION SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

INDICATOR LIGHTS

Condition	Code	Procedure
Does not come on during bulb check	Â	Further inspection required
NOTE: **See service manual for further information.**		
Fails to function properly during test mode	Â	Further inspection required
NOTE: **See service manual for further information.**		
On constantly	Â	Further inspection required
NOTE: **See service manual for further information.**		
On intermittently	Â	Further inspection required
NOTE: **See service manual for further information.**		

KEYLESS ENTRY KEYPADS AND TRANSMITTERS

Condition	Code	Procedure

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

KEYLESS ENTRY TRANSMITTERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Terminal broken	A	Require repair or replacement

Condition	Code	Procedure
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

LEDS

NOTE: **Does not include soldered-in components.**

Condition	Code	Procedure
Adjustment out of specification	B	Require repair or replacement
Application incorrect	B	Require replacement
NOTE: **Application incorrect includes wrong bulb coating or color.**		
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Base burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base corroded, affecting performance	A	Require repair or replacement
Base corroded, not affecting performance	2	Suggest repair or replacement
Base leaking	A	Require repair or replacement
Base loose, affecting performance	B	Require repair or replacement
Base loose, not affecting performance	1	Suggest repair or replacement
Base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Burned out	A	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked	B	Require replacement
Intermittent	A	Require replacement
Lamp base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Seized in socket	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

LENSES

Condition	Code	Procedure
Adjustment out of specification	B	Require repair
Application incorrect	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	Â	No service suggested or required

Condition	Code	Procedure
Cracked	B	Require replacement
Discolored	A	Require replacement
Leaking	B	Require repair or replacement
Melted, affecting performance	A	Require replacement
Melted, not affecting performance	2	Suggest replacement
Missing	C	Require replacement

MICROPHONES

Condition	Code	Procedure
Application incorrect	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Membrane torn	A	Require replacement
Missing	C	Require replacement
Polarity reversed	A	Require repair
Sound quality poor	A	Require repair or replacement. Further inspection required
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

MIRRORS (ELECTROCHROMATIC AND HEATED)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Cracked	B	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

MOTORS

Condition	Code	Procedure
Amperage draw out of specification	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bracket bent	A	Require repair or replacement
Bracket broken	A	Require repair or replacement
Bracket cracked	A	Require repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket missing	C	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Drive mechanism damaged, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Further inspection required to determine cause.**		
Drive mechanism damaged, not affecting performance	2	Suggest repair or replacement
NOTE: **Further inspection required to determine cause.**		
Fails to disengage	A	Require repair or replacement
Housing broken, affecting performance	A	Suggest repair or replacement
Housing broken, not affecting performance	Â	No service suggested or required
Housing cracked, affecting performance	A	Require repair or replacement
Housing cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	Â	No service suggested or required
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Further inspection required
NOTE: **Follow OEM recommended adjustment procedures. Repair or replace if out of specification.**		
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement

Condition	Code	Procedure
Wire lead shorted	A	Require repair or replacement

NEUTRAL SAFETY SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

ODOMETERS, SPEEDOMETERS AND TACHOMETERS (CABLE DRIVEN)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Drive cable broken	A	Require replacement
Drive cable noisy	2	Suggest repair or replacement
Inoperative	A	Further inspection required
NOTE: **Inoperative includes intermittent operation, out of OEM specification, or out of range.**		
Leaking	B	Require replacement
Lens broken	A	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Lens cloudy	2	Suggest repair or replacement
NOTE: **If lens is available as a separate part, suggest replacement of lens only.**		
Lens missing	C	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

ODOMETERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement

Condition	Code	Procedure
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require replacement
Lens broken	A	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Lens cloudy	2	Suggest repair or replacement
NOTE: **If lens is available as a separate part, suggest replacement of lens only.**		
Lens missing	C	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Mechanical head noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

POWER DISTRIBUTION CENTER

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	Â	No service suggested or required
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Burned, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of fuse box.**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Melted, affecting performance	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Melted, not affecting performance	2	Suggest replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

PULLEYS

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting performance	A	Require replacement
Cracked	B	Require replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Pulley damaged, affecting belt life	A	Require replacement

RECEIVERS, AMPLIFIERS, EQUALIZERS AND SUB-WOOFER VOLUME CONTROLS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Sound quality poor	A	Require repair or replacement
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

RELAY BOXES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	Â	No service suggested or required
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of relay box.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of relay box.**		
Connector (Weatherpack type) leaking	A	Require repair or replacement

Condition	Code	Procedure
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Cover missing	C	Require replacement of cover
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Melted, affecting performance	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Melted, not affecting performance	2	Suggest replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

RELAYS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Housing broken	A	Require replacement
Housing cracked	2	Suggest replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement

Condition	Code	Procedure
Terminal loose, not affecting performance	1	Suggest repair or replacement

SEALED BEAMS

NOTE: **Does not include soldered-in components.**

Condition	Code	Procedure
Adjustment out of specification	B	Require repair or replacement
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Base burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base corroded, affecting performance	A	Require repair or replacement
Base corroded, not affecting performance	2	Suggest repair or replacement
Base leaking	A	Require repair or replacement
Base loose, affecting performance	B	Require repair or replacement
Base loose, not affecting performance	1	Suggest repair or replacement
Base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Burned out	A	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Cracked	B	Require replacement
Intermittent	A	Require replacement
Lamp base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Seized in socket	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SEAT HEATERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

SECURITY ALARM SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

SIRENS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Out of adjustment	B	Require adjustment
Sound quality poor	A	Require repair or replacement. Further inspection required
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

SOLENOIDS

NOTE: **For starter solenoids that are integral to the starter assembly, see Starters. For starter relays, see Relays.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage

Condition	Code	Procedure
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SPEAKERS AND MICROPHONES

Condition	Code	Procedure
Application incorrect	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Membrane torn	A	Require replacement
Missing	C	Require replacement
Polarity reversed	A	Require repair
Sound quality poor	A	Require repair or replacement. Further inspection required
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SPEEDOMETER AND TACHOMETER LINKAGES AND CABLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require repair or replacement
Binding	A	Require repair or replacement
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Further inspection required to determine cause. Require inspection of ring gear and service as needed.**		
Fails to disengage	A	Require repair or replacement
Housing broken, affecting performance	A	Require repair or replacement
Housing broken, not affecting performance	Â	No service suggested or required
Housing cracked, affecting performance	A	Require repair or replacement
Housing cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Noisy	2	Suggest repair or replacement
Shimmed incorrectly	B	Require repair
Starter shaft bushing missing	C	Require replacement
NOTE: **Bushing may be in bell housing.**		
Starter shaft bushing worn, affecting performance	A	Require replacement
Starter shaft bushing worn, not affecting performance	1	Suggest replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SUB-WOOFER VOLUME CONTROL

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement

Condition	Code	Procedure
Sound quality poor	A	Require repair or replacement
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement

SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

TACHOMETER CABLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require repair or replacement
Binding	A	Require repair or replacement
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Broken	A	Require replacement
Cracked	B	Require repair or replacement
Disconnected	A	Require repair or replacement
Kinked	A	Require repair or replacement
Melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Routed incorrectly	B	Suggest repair
Seized	A	Require repair or replacement

TACHOMETERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require replacement
Lens broken	A	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Lens cloudy	2	Suggest repair or replacement
NOTE: **If lens is available as a separate part, suggest replacement of lens only.**		
Lens missing	C	Require repair or replacement
NOTE: **If lens is available as a separate part, require replacement of lens only.**		
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Mechanical head noisy	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement

TAPE PLAYERS AND CD PLAYERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement

Condition	Code	Procedure
Malfunctioning	A	Require repair or replacement
NOTE: **Malfunctioning includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Skips	A	Require repair or replacement
Sound quality poor	A	Require repair or replacement
NOTE: **Make sure poor sound quality is not caused by ignition/charging system or other forms of electrical interference.**		
Speed incorrect	A	Require repair or replacement

NOTE: **Further inspection required to determine cause.**		
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation or out of specification.**		
Leaking (vacuum/fluid/air)	A	Require replacement
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	Â	No service suggested or required
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Out of adjustment	B	Further inspection required
NOTE: **Follow OEM recommended adjustment procedures. Repair or replace if out of specification.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

VACUUM ACCUMULATORS (RESERVOIRS)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement

VOLTAGE REGULATORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement

Condition	Code	Procedure
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

WASHER FLUID LEVEL SENDERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

WASHER PUMPS

Condition	Code	Procedure

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking externally	A	Require repair or replacement
Leaking internally	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

WIPER ARMS AND BLADES

NOTE: **Windshield coatings or waxes can cause blades to not function as intended. Clean surface before making final judgment about blade replacement.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching socket stripped	A	Require replacement
Bent	A	Require repair or replacement
Loose	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement

Condition	Code	Procedure
Size incorrect	2	Suggest replacement
Tension insufficient	B	Require repair or replacement
Torn	A	Require replacement
Worn, affecting performance	A	Require replacement
Worn, not affecting performance	1	Suggest replacement

WIPER BLADES

NOTE: **Windshield coatings or waxes can cause blades to not function as intended. Clean surface before making final judgment about blade replacement.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching socket stripped	A	Require replacement
Bent	A	Require repair or replacement
Loose	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Size incorrect	2	Suggest replacement
Tension insufficient	B	Require repair or replacement
Torn	A	Require replacement
Worn, affecting performance	A	Require replacement
Worn, not affecting performance	1	Suggest replacement

WIPER HOSES AND NOZZLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Blocked	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Spray pattern incorrect	2	Suggest repair or replacement
Surface cracks (dry-rotted)	1	Suggest replacement

WIPER LINKAGES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching stud stripped	A	Require replacement
Bent	A	Require repair or replacement
Inoperative	A	Require replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Loose	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Tension insufficient	B	Require repair or replacement
Worn, affecting performance	A	Require replacement
Worn, not affecting performance	1	Suggest replacement

WIPER NOZZLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Blocked	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Spray pattern incorrect	2	Suggest repair or replacement
Surface cracks (dry-rotted)	1	Suggest replacement

WIPER PUMP RESERVOIRS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cap missing	C	Require replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement

WIRING HARNESSES AND CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement

Condition	Code	Procedure
Insulation damaged, conductors not exposed	1	Suggest repair or replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

AUTOMOTIVE TERMINOLOGY & DEFINITIONS

ACTUATOR

a control device that delivers mechanical action in response to a vacuum or electrical signal; anything that the engine control computer uses to do something, such as trigger fuel injection or fire a spark plug. Most actuators on a computercontrolled engine system are activated by grounding their circuits rather than by actively powering them, since that protects the computer from short circuits.

AEMD (AUTOMOTIVE ELECTRIC DRIVE MOTOR)

a U.S. Department of Energy program to develop low-cost traction drive motors for automotive applications.

AIR BAGS

air bags are fabric bags that are filled quickly with a gas to provide supplemental protection for vehicle passengers during some collisions. Side-impact air bags are becoming increasingly available. Air bags are most effective in protecting vehicle occupants who are properly belted.

ALTERNATING CURRENT (A C)

electrical current that flows in one direction, from positive to negative, and then reverses direction, from negative to positive.

ALTERNATOR

a belt driven device that provides electrical current for the vehicle's charging system.

AMMETER

an instrument for measuring the strength of electrical current flow in a circuit in terms of amperes.

AMPERAGE

the amount of electrical current flowing in a circuit.

AMPERE (AMP)

a unit for measuring the strength (rate of flow) of an electrical current.

AMPLIFIER

a device with electron tubes or semiconductors used to increase the voltage or current of a signal.

AMPLIFY

to enlarge or strengthen original characteristics. Usually used in reference to electronics.

ANION

negative ion. Alkali, molten carbonate, and solid oxide fuel cells are "anion-mobile" cells - anions migrate through the electrolyte toward the anode.

ANODE

one of two electrodes in a fuel cell or battery. The anode, the negative post of the fuel cell, conducts the electrons that are freed from the hydrogen molecules so that they can be used in an external circuit. It has channels etched into it that disperse the hydrogen gas equally over the surface of the catalyst.

ARCING

the ability of electrical energy to jump across an air gap.

ARMATURE

a laminated, soft iron core wrapped by wire that converts 11ectrical energy to mechanical energy.

BATTERY ACID

the sulfuric acid solution used as the electrolyte in a battery.

BATTERY CELL

the part of a battery made from two dissimilar metals and an acid solution. A cell stores chemical energy to be used later as electrical energy.

BATTERY SAVER

the battery saver system is an effective way to prevent complete battery discharge when the engine is shut down. Based on the preset time-limit, the system automatically disconnects the battery load when the battery is not being charged. Depressing the reset push button will enable the battery to be reconnected for additional periods of time. Critical systems can be set up to have battery power maintained.

BATTERY

a device that produces electricity through, electrochemical action.

BENDIX DRIVE

the starter drive gear that is attached to the starter motor armature and engages the gear teeth on the flywheel.

BRUSH

a bar of conductive material that rides on the commutator of a generator or motor.

CAPACITOR

a device, made up of two or more conducting plates, separated by an insulator, used to store an electric surge or charge of current.

CATHODE

one of two electrodes in a fuel cell or battery. The cathode, the positive post of the fuel cell, has channels etched into it that distribute the oxygen to the surface of the catalyst. It also conducts the electrons back from the external circuit to the catalyst, where they can recombine with the hydrogen ions and oxygen to form water.

CATION

positive ion. Phosphoric acid and proton exchange membrane (PEM) fuel cells are "cation-mobile" cells - the cation migrates through the electrolyte toward the cathode.

CHARGING SYSTEM

the system that supplies electrical power for vehicle operation and recharges the battery.

CIRCUIT BREAKER

a device used in an electrical circuit to interrupt current flow in the event of an overload or short.

CIRCUIT

a path through which electricity flows before returning to its source.

COLD CRANKING AMPS

the amount of cranking amperes that a battery can deliver in 30 seconds at OÂ°F (- 18Â°C).

COMMUTATOR

a slotted ring located at the end of the armature of a generator or motor. The commutator provides the electrical connection between the armature and brushes.

CONDUCTIVITY

transmission of electricity by metallic substances. Metals have high electrical conductivity, and with few exceptions, their conductivity decreases with increasing temperature.

CONDUCTOR

a material that provides a path for the flow of electrical current or heat.

CONTINUITY

the condition that exists in a working electrical circuit. A circuit that is unbroken, not open.

CORRODE

gradual loss from a metal surface from chemical action.

CORROSION

deteriorative loss of a metal as a result of environmental reactions.

CORROSIVITY

the characteristic of a material that enables it to dissolve metals and other materials or burn the skin.

DELAYED ACCESSORY POWER

delayed accessory power continues electric power temporarily to certain convenience features after vehicle power has been turned off. For example, the feature allows the customer to close a window without reinserting the key. Delayed accessories include radio and power windows, power moon roof and message center.

DIGITAL SIGNAL PROCESSING AUDIO SYSTEM

a Digital Signal Processing (DSP) system modifies audio signals digitally to achieve better control of sound quality. DSP can be used for standard functions such as volume, balance, fade and tone control, as well as AM and FM stereo decoding. It also allows advanced audio processing such as concert hall emulation, sound shaping and adaptive noise reduction filtering.

DIGITAL VOLT/OHMMETER (DVOM)

an instrument that measures volts, ohms and amps and displays the results numerically.

DIGITAL

a voltage signal that uses on and off pulses.

DISCHARGE

the flow of current from a battery; to remove the refrigerant from an air conditioning system.

DIVERSITY ANTENNA

a diversity antenna system uses two antennas mounted at different locations on the vehicle and automatically chooses one that provides the better FM radio signal.

DUTY CYCLE

a signal that varies the ratio of on time to off time, resulting in a square wave that can range between zero and 100 percent or may be high or low, and off may be high or low; in a process, the ratio of on time to total cycle time; in fuel injectors, the percentage of on-time to total cycle time; in solenoids, the percentage of on-time to total cycle time.

ELECTRICITY

electric current used as a power source. Electricity can be generated from a variety of feedstocks, including oil, coal, nuclear, hydro, natural gas, wind, and solar. In electric vehicles, onboard rechargeable batteries power electric motors.

ELECTROCHEMISTRY

science that deals with the relation of electricity to chemical changes and with the interconversion of chemical and electrical energy.

ELECTRODE

electrical terminal that conducts an electric current into or out of a fuel cell.

ELECTRODE

a terminal that conducts an electric current into or away from the conducting part of a circuit, such as the terminal of a battery; firing terminals found in a spark plug.

ELECTROLYSIS

chemical and electrical decomposition process that can damage metals such as brass, copper and aluminum in the cooling system; the decomposition of an electrolyte by the action of an electric current passing through it.

ELECTROLYTE

chemical compound that conducts electricity from one electrode to the other inside a fuel cell.

ELECTROLYTE

a material whose atoms become ionized (electrically charged) in solution. In automobiles, the battery electrolyte is a mixture of sulfuric acid and water.

ELECTROMAGNET

an iron core surrounded by a coil of wire that temporarily becomes a magnet when an electric current flows through the wire.

ELECTROMAGNETIC INDUCTION

moving a wire through a magnetic field to create current flow in the wire.

ELECTROMECHANICAL

refers to a device that incorporates both electrical and mechanical principles together in its operation.

ELECTRONIC

pertaining to the control of systems or devices by the use of small electrical signals and various semiconductor devices and circuits.

EMITTER

in a transistor, the region or layer of semiconductor material from which electrons are injected into the base region.

ENERGY

the capacity for doing work and overcoming resistance.

FIELD COIL

a wire coil on an alternator rotor or starter motor frame; a field coil produces a magnetic field when energized.

FLUX DENSITY

the degree of concentration of the magnetic lines of force that emanate from a magnetic sensor; when the tooth of a reluctor aligns with the sensor tip, the magnetic lines of force are squeezed together, which increases flux density.

FLYWHEEL

a mechanical battery that stores kinetic energy. A flywheel is essentially a spinning wheel with a motor. Flywheels can be more responsive than chemical batteries, and they are less susceptible to the effects of weather.

FREQUENCY

the number of cycles of a periodic waveform typically measured in one second intervals or hertz (cycles per second).

FUSE

a metal circuit protection device that melts when there is a circuit overload or short.

FUSIBLE LINK

a smaller gauge wire that is included in an electrical circuit to provide circuit protection. The smaller gauge wire will melt when the circuit is overloaded.

GENERATOR

a device that converts mechanical energy into electrical energy; SAE J1930 nomenclature for an alternator; a generating device that uses diode rectifiers to convert ac to dc.

GROUND CIRCUIT

that part of the circuit that is connected electrically to the negative terminal of the battery. Every electric circuit has a power and ground side. Most computer actuations consist of completing the ground side of an actuator's circuit; this protects the computer from short circuits. Resistance in a ground circuit will reduce the current through it and cause deterioration in the function of the circuit.

GROUND

a connecting body whose electrical potential is zero to which an electrical circuit can be connected.

HALL EFFECT

when current flows through a thin wafer of semiconductor material, and a magnetic field crosses it at a right angle, a voltage known as a Hall effect voltage will be generated at the edge of the material. Interrupting the magnetic field turns off the voltage. This is the principle used by Hall effect sensors.

HEAT SINK

part of a system designed to be at a lower temperature than its surroundings, used to dissipate heat from that system; device to dissipate heat and protect parts.

HIGH INTENSITY DISCHARGE HEADLAMPS

high intensity discharge (HID) headlamps provide a brighter, whiter light for increased forward visibility. They produce about 2 times as much light as conventional halogen bulbs and have a distinct appearance. Also, they are more durable than filament bulbs and require 37 percent less power to operate.

HIGH TENSION

that part of a system that operates under or carries high voltage; in an ignition system, voltages in the secondary circuit of the system as opposed to the low, primary circuit voltage.

HYDROMETER

an instrument used to measure the specific gravity of a solution.

IMPEDANCE

the total resistance of an electrical device measured in ohms.

INDUCTION

the process by which an electric or magnetic effect is produced in an electrical conductor or magnetic body, when it is exposed to variation of a field of force. Induction is the principle used in an ignition coil to increase voltage.

INSULATED CIRCUIT.

a circuit that includes all of the high-current cables and connections from the battery to the starter motor.

INSULATOR

a non-conductive material used to insulate wires in an electrical circuit.

INTEGRATED CIRCUIT

an electrical circuit containing many interconnected amplifying devices and circuit elements formed on a single body or chip of semiconductor material; diodes, transistors and other electronic components mounted on semiconductor material and able to perform numerous functions.

ION CHROMATOGRAPHY

a form of liquid chromatography that uses ion-exchange resins to separate atomic or molecular ions based on their interaction with the resin.

ION

atom that carries a positive or negative charge because of the loss or gain of an electron.

KEEP-ALIVE MEMORY

a series of vehicle battery-powered memory locations in the microcomputer that store information on input failure, identified in normal operations for use in diagnostic routines; adapts some calibration parameters to compensate for changes in the vehicle system.

LIGHT EMITTING DIODE (LED)

a digital electronic display device which can be used as a simple signal light or arranged to show letters and/or numbers.

LIQUID CRYSTAL DIODE (LCD)

a digital electronic display device made of a special glass and liquid, which requires a separate light source.

MAGNET

any substance that attracts iron or an iron, steel or any ferrous metal alloy.

MAGNETIC FIELD

the areas surrounding the poles of a magnet which are affected by its forces of attraction or repulsion; the region of space in which there is a measurable magnetic force.

MAGNETIC GAUGES

electrical analog gauges that use magnetic forces to move the needle left or right.

MAGNETIC PULSE GENERATOR

a sensor used to monitor the position of any point on a rotating part such as a crankshaft or input shaft.

MEMORY PROFILE SYSTEM

the Memory Profile System offers different drivers the ability to set into memory their preferred positions for several comfort and convenience features. A driver is identified by a unique key fob or entry code, and the vehicle systems automatically adjust to his or her settings. Depending on the vehicle, some of the following features can be included in the memory profile: Seat position Steering wheel position (tilt/telescope) Mirror positions Safety belt "D" ring height Pedal positions Radio stations Power steering assist level Ride firmness

MEMORY

part of a computer that stores or holds programs and other data.

MERCURY SWITCH

a type of switch that uses the flow of liquid metal, Mercury, to complete the electrical circuit. Mercury switches are frequently used to control trunk and underhood lights.

MICROPROCESSOR

the portion of a microcomputer that receives sensor input and handles calculations.

MODULE

an electronic control unit.

MOTOR

a machine that converts electrical energy into mechanical energy.

MOTOR

in an HEV, an electric traction motor converts electrical energy from the energy storage unit to mechanical energy that drives the wheels of the vehicle. Unlike a traditional vehicle, where the engine must "ramp up" before full torque can be provided, an electric motor provides full torque at low speeds. This characteristic gives the vehicle excellent "off the line" acceleration.

OHM

a unit of electrical resistance of a circuit in which an electromotive force of one volt maintains a current of one ampere, named after German physicist Georg Ohm.

OHMMETER

an instrument that measures electrical resistance in ohms.

OHM'S LAW

a basic law of electricity expressing the relationship between current, resistance and voltage in any electrical circuit. Ohm's law states that the voltage in a circuit is equal to the current multiplied by the resistance.

PARALLEL CIRCUIT

a circuit with more than one path for the current to follow.

PARALLEL CONFIGURATION

a hybrid electric vehicle (HEV) with a parallel configuration has a direct mechanical connection between the power unit and the wheels, as in a conventional vehicle, but also has an electric motor that drives the wheels. For example, a parallel vehicle could use the power created from an internal combustion engine for highway driving and the power from the electric motor for accelerating.

PERIOD

in an electrical signal the period is the amount of time it takes for one cycle of an electrical signal to repeat itself; the number of periods that occur in one second is the frequency of the signal.

PHASE

any point or points of parallel movements or oscillations, in or out of synchronization; the rotational positions of the U-joints and yokes in a driveline.

PHOTOVOLTAIC PANEL

photovoltaic panels contain cells that convert sunlight into electricity. While solar-powered vehicles are not currently feasible for production, solar panels could be used to power vehicle components, such as a fan to exhaust hot interior air when the vehicle is parked in the sun or to recharge the vehicle battery. Photovoltaic panels can be integrated into the hood, roof, sunroof, deck lid or spoiler.

PICKUP COIL

a weak, permanent magnet-and-wire assembly which forms a position sensor.

PIEZOELECTRIC SENSOR

a sensor that generates voltage from physical shock or motion, a knock sensor.

POLARITY

the condition of being positive or negative relative to a reference point or object; the particular state (positive or negative) with reference to the two magnetic poles.

POTENTIOMETER

a device that changes voltage by varying its internal resistance.

PROGRAM

a set of instructions or procedures that a computer must follow when controlling a system.

PULSE WIDTH MODULATED

electronic control of a solenoid that rapidly cycles it on and off many times per second in order to achieve a specific output.

PULSE WIDTH

the length of time during which a circuit is energized.

RANDOM ACCESS MEMORY (RAM)

a type of memory used in a computer to store information temporarily.

READ-ONLY MEMORY (ROM)

a type of memory used in a computer to store information permanently, as opposed to the temporary storage provided by random-access memory (RAM).

RECTIFIER

a device that changes alternating current (AC) into direct current (DC).

RECTIFY

to change one type of voltage to another.

REFERENCE PULSE

a voltage signal generated by the crankshaft position sensor (or distributor, or camshaft position sensor - all equivalent components for this purpose). The voltage signal is sent to the computer as a fixed number of degrees BTDC for each cylinder, with the signal for cylinder No.1 distinguishable from the signal for the others.

REFERENCE VOLTAGE

the voltage supplied by the system computer to certain sensors. The sensors reduce the voltage by a specific amount, according to their function, and send the signal back to the computer. The computer then uses the reduced voltage signal to interpret the information sent.

RELAY

an electromagnetic switch that uses low amperage current to control a circuit with high amperage.

RELUCTOR

in an electronic ignition, the trigger wheel mounted on the distributor shaft that triggers the pickup coil, which in turn signals the control module to fire the coil.

REMOTE LIGHTING SYSTEM

the Remote Lighting System removes the sources of light from the lamp fixture. Instead, light for all fixtures is generated from a single "light battery". Light is transmitted to the various fixtures and accessories via fiber optics or light pipes. The advantages of remote lighting include reduced power consumption, greater durability and more flexibility in packaging and styling lamp fixtures.

RESISTANCE

the opposition offered by a substance or body to the passage of electric current through it.

RESISTOR

an electrical device installed in a circuit to lower voltage and current flow.

RHEOSTAT

a variable resistor used to control current flow in a circuit.

SATURATION

point at which current flowing through a coil or wire has built up the maximum magnetic field.

SEMICONDUCTOR

a material that is neither a good conductor of electricity nor a good insulator.

SENSOR

any mechanism by which the engine control computer can measure some variable on the engine, such as coolant temperature or engine speed. Each sensor works by sending the computer a signal of some sort, a coded electronic message that corresponds to some point on the range of the variable measured by that sensor.

SERIES CIRCUIT

a circuit that has only one path for current to follow.

SERIES CONFIGURATION

some hybrid electric vehicles (HEVs) use a series configuration, in which the heat engine or fuel cell together with a generator produce electricity for the battery pack and electric motor. Series HEVs have no mechanical connection between the hybrid power unit and the wheels; this means that all motive power is transferred from chemical energy to mechanical energy, to electrical energy, and back to mechanical energy to drive the wheels.

SERIES-PARALLEL CIRCUIT

a circuit that combines series and parallel circuits.

SHORT CIRCUIT

a condition that occurs in an electrical circuit when the current bypasses the intended load and takes a path with little or no resistance, such as another circuit or ground.

SHUNT

an alternate path through which electrical current or fluids may flow.

SOLENOID

a coil of wire that becomes an electromagnet when current flows through it. It then loses its magnetism when the current flow is turned off. The solenoid contains an iron plunger inside the wire coil that is spring loaded to one position. When the solenoid is energized, the plunger moves to the other position.

SOLID STATE

an electrical device with no moving parts.

SPECIFIC GRAVITY

the ratio of the weight or mass of the given volume of a substance to that of an equal volume of another substance, e.g. - water for liquids and solids; air or hydrogen for gases, are used as standards.

SPLICE

to join or unite by weaving, binding, soldering, cementing, etc., usually at the ends of two objects.

SQUARE WAVE/SINE WAVE

voltage fluctuations of different shapes in an electric circuit. The square wave goes immediately from one voltage to the other; the sine wave gradually changes, going through the intervening values. An electromagnetic pulse generator like a wheel speed sensor or a reluctor-type distributor pickup produces a sine wave. Hall Effect sensors, photoelectric switches, and other on-off signal generators produce square waves. For many purposes, square waves are easier for computers to work with, so on many vehicles there are electronic devices to modify sine waves into square waves.

STARTER

the electric motor that is used to start an engine.

STATOR

a device located between the impeller and turbine in a torque converter. It contains specifically angled blades around both sides of its circumference to redirect the flow of fluid coming off the turbine, which increases the force of the fluid driving the turbine, resulting in torque multiplication.

STEPPER MOTOR

an electric motor that can move to a specific position on its range of travel.

SWITCH

a device used to open, close or direct the current in an electrical circuit.

THERMISTOR

a temperature sensitive variable resistor in which the resistance decreases as its ternperature increases.

TRANSDUCER

a device that changes a force into an electrical signal.

TRANSDUCER

device that converts variations in one energy form into corresponding variations in another, usually electrical.

TRANSISTOR

an electronic device produced by joining three sections of semiconductor materials. Used as a switching or amplifying device.

ULTRACAPACITOR

ultracapacitors are higher specific energy and power versions of electrolytic capacitors-devices that store energy as an electrostatic charge. They are electrochemical systems that store energy in a polarized liquid layer at the interface between an ionically conducting electrolyte and a conducting electrode. Energy storage capacity increases by increasing the surface area of the interface. Ultracapacitors are being developed as primary energy devices for power assist during acceleration and hill climbing, as well as recovery of braking energy.

VARIABLE RELUCTANCE SENSOR

a magnetic sensor that generates its own alternating current voltage based on the interference of a moving object across its tip.

VARIABLE RESISTOR

a resistor that can be adjusted so the amount of resistance produced in the circuit changes.

VOLT

unit of electromotive force. One volt of electromotive force applied steadily to a conductor of one-ohm resistance produces a current of one ampere.

VOLTAGE DROP

voltage lost by the passage of electrical current through resistance.

VOLTAGE REGULATOR

a device used to control the output of an alternator or generator.

VOLTMETER

an instrument used to measure voltage in a circuit.

WATT

a unit of measurement of electrical power. One volt multiplied by one amp equals one watt.

ZENER DIODE

a silicone diode that allows current to flow in the opposite direction, once an applied voltage reaches a certain level.

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Engine Performance And Maintenance

ENGINE PERFORMANCE AND MAINTENANCE (INCLUDING EXHAUST SYSTEMS)

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

ENGINE PERFORMANCE AND MAINTENANCE

NOTE: **CHEMICAL ENGINE DECARBONIZATION is a process utilizing chemicals to remove soft and semi-hardened gum, varnish, resin and carbon deposits from the air/fuel delivery systems and combustion chambers of gasoline internal combustion engines, providing benefits that include improved fuel economy, performance and driveability and reduced emissions. This process is performed to remove deposits preferably prior to deposit accumulation and hardening which may require costly mechanical deposit removal or component replacement.**

NOTE: **SUGGEST Chemical Engine Decarbonization service every 15,000 miles or 12 months.**

NOTE: **CONTAMINATED OIL SYSTEM SERVICE is an event based process**

(beyond that of a normal oil and filter change) performed to remove coolant, water or fuel contamination. Contamination increases oil's oxidation rate and has been shown to result in increased engine wear and reduced oil flow.

CAUTION: **Some OEM's (including GM and Honda) have issued Technical Service Bulletins dvising that Chemical Crankcase Flushing may damage some engine components and that such damage will not be covered by the manufacturer's new car warranty.**

ACCELERATOR PEDAL POSITION SENSOR

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	B	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ACCESSORY BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		

Condition	Code	Procedure
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement
Worn so it contacts bottom of pulley	A	Require replacement

ACCESSORY PULLEYS

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting performance	A	Require replacement
Cracked	A	Require replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Pulley damaged, affecting belt life	A	Require replacement

AIR CONDITIONING CYCLING SWITCHES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		

Condition	Code	Procedure
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

AIR CONDITIONING PRESSURE SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

AIR DUCTS AND TUBES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require repair or replacement

AIR FILTER ELEMENTS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Leaking	A	Require replacement
Melted	A	Required replacement
Missing	C	Require replacement
Paper filter element oil-soaked	A	Require replacement
NOTE: **Further inspection required to determine cause.**		
Restricted, affecting performance	A	Require replacement
Water-contaminated	A	Require replacement
NOTE: **Further inspection required to determine cause.**		

AIR FILTER GASKETS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Missing	C	Require replacement

AIR FILTER HOUSINGS AND GASKETS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement
Missing	C	Require replacement

AIR FUEL RATIO SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement

Condition	Code	Procedure
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

AIR INJECTION CONTROL SOLENOIDS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

AIR PLENUMS

Condition	Code	Procedure

Condition	Code	Procedure
Integrated air or fuel control components inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Internal air or fuel components damaged, affecting performance	A	Require repair or replacement of component
Internal air or fuel components damaged, not affecting performance	Ã,Â	No service suggested or required
Internal air or fuel components missing	C	Require replacement of component
Leaking	A	Require repair or replacement
Restricted	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

AIR PUMP BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
At or beyond service interval	3	Suggest replacement to comply with vehicle OEM recommended service intervals
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement
Worn so it contacts bottom of pulley	A	Require replacement

AIR PUMPS (ELECTRIC DRIVEN)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

AIR TUBES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require repair or replacement

ASPIRATOR, CHECK AND DECEL VALVES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Melted, affecting performance	A	Require replacement
Melted, not affecting performance	Ã,Â	No service suggested or required
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

BAFFLES

Condition	Code	Procedure

Condition	Code	Procedure
Application incorrect, affecting cooling system performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting cooling system performance	A	Require repair or replacement
Blocked, affecting cooling system performance	A	Require repair or replacement
Broken, affecting cooling system performance	A	Require repair or replacement
Cracked, affecting cooling system performance	A	Require repair or replacement
Loose, affecting cooling system performance	A	Require repair
Loose, not affecting cooling system performance	2	Suggest repair
Missing, affecting cooling system performance	C	Require replacement

BALLAST PRIMARY SUPPLY RESISTOR WIRES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Conductor exposed	A	Require replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Insulation overheated	A	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

BALLAST RESISTORS AND PRIMARY SUPPLY RESISTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware

Condition	Code	Procedure
Conductor exposed	A	Require replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Insulation overheated	A	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

BAROMETRIC PRESSURE SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

NOTE:

Determine cause and correct prior to repair or replacement of part.

Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

BATTERIES

NOTE: **Proper operation of any electrical system or component can be affected by battery condition. The battery(ies) must meet or exceed minimum specification for vehicle as equipped and test to that specific battery's CCA.**

Definition of Terms

Battery Performance Testing - Testing that determines whether or not a battery meets both vehicle OEM and battery manufacturer's specifications.

Cold Cranking Amp (CCA) Rating - The number of amperes a new, fully charged battery at 0Ã,Â° F (-17.8Ã,Â° C) can deliver for 30 seconds and maintain at least a voltage of 1.2 volts per cell (7.2 volts for a 12-volt battery).

Cranking Amps (CA) - The number of amperes a new, fully charged battery, typically at 32Ã,Â° F (0Ã,Â° C) can deliver for 30 seconds and maintain at least a voltage of 1.2 volts per cell (7.2 volts for a 12volt battery).

OEM Cranking Amps - The minimum CCA required by the original vehicle manufacturer for a specific vehicle.

Condition	Code	Procedure
Battery frozen	Ã,Â	Further inspection required

NOTE:

Do not attempt to charge a frozen battery. Allow battery to warm thoroughly and then performance-test. If battery fails performance test, require replacement.

Battery tests near the ""end of its useful life"" utilizing a tester or on-board monitor able to accurately determine this condition	1	Suggest Replacement
Case leaking	A	Require replacement
Casing swollen	A	Further inspection required

Condition	Code	Procedure
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Circuit open internally	A	Require replacement
Electrolyte contamination	A	Further inspection required
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Electrolyte discoloration	A	Further inspection required
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Fails to accept and hold charge	A	Require replacement
NOTE: **This phrase refers to a battery that fails to either accept and/or retain a charge using appropriate times listed in the Battery Charging Guide of the BCI Service Manual, battery charger operating manual, or battery manufacturer's specifications.**		
Fluid level low	B	Further inspection required
NOTE: **Determine cause of low fluid level. Refill to proper level(s) with water (distilled water preferred). Recharge battery and performance-test. If battery does not meet specifications, require replacement. If battery is sealed type (non-removable filler caps), require replacement.**		
Out of performance specification for battery	B	Require replacement
NOTE: **The battery may meet vehicle's OEM specifications for that vehicle but test below the minimum specifications defined by the battery manufacturer.**		
Out of specification for application	B	Require replacement
NOTE: **The battery may meet battery manufacturer's specifications but test below the minimum specification defined by the vehicle's OEM for that vehicle.**		
Post (top or side) burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Post (top or side) burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Post (top or side) corroded, affecting performance	A	Require repair
Post (top or side) corroded, not affecting performance	2	Suggest repair
Post (top or side) loose	A	Require replacement
Post (top or side) melted, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Post (top or side) melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Specific gravity low	B	Further inspection required
NOTE: **Recharge and test to manufacturer's specifications. If battery fails performance test, require replacement.**		
State of charge low	A	Further inspection required
NOTE: **Recharge and test to manufacturer's specifications. If battery fails performance test, require replacement.**		
Top dirty	2	Suggest cleaning battery
Top wet	A	Require cleaning battery Further inspection required
NOTE: **Check fluid level and adjust to manufacturer's specification. Suggest checking charging system for proper operation.**		
Vent cap loose	A	Require repair or replacement of vent cap
Vent cap missing	C	Require replacement of vent cap

BATTERY CABLES, WIRES AND CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
NOTE: **Exposed conductor at replacement (aftermarket) terminal end does not require repair or replacement.**		
Insulation damaged, conductors not exposed	1	Suggest replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

BATTERY CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
NOTE: **Exposed conductor at replacement (aftermarket) terminal end does not require repair or replacement.**		
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement

Condition	Code	Procedure
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

BATTERY TRAYS AND HOLD DOWN HARDWARE

Condition	Code	Procedure
Battery improperly secured	2	Suggest repair
Bent, affecting performance	A	Require repair or replacement
Bent, not affecting performance	Ã,Â	No service suggested or required
Broken, affecting performance	A	Require repair or replacement
Broken, not affecting performance	Ã,Â	No service suggested or required
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Water drain clogged	A	Require repair

BATTERY WIRES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
NOTE: **Exposed conductor at replacement (aftermarket) terminal end does not require repair or replacement.**		
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

BELT IDLER ASSEMBLIES (ACCESSORY AND CAM BELTS)

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearings worn	1	Suggest replacement
Cracked	2	Suggest replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Seized	A	Require repair or replacement

BELT TENSIONERS (ACCESSORY AND CAM BELT)

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearings worn	1	Suggest replacement
Belt tension incorrect	B	Require adjustment or repair
Cracked	B	Suggest replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Pulley damaged, affecting belt life	A	Require replacement
Seized	A	Require repair or replacement

BELT-DRIVEN AIR PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Pulley alignment incorrect	B	Require repair or replacement
Pulley bent	A	Require replacement
Pulley cracked	A	Require replacement
Pulley loose	A	Require repair or replacement
Pulley missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

BOOST CONTROL MECHANISM

Condition	Code	Procedure
Boost pressure incorrect	A	Require repair or replacement. Further inspection required
NOTE: **Incorrect boost pressure includes intermittent operation.**		
Leaking	A	Require repair or replacement

CAMSHAFT POSITION SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CARBURETORS AND CHOKES

NOTE: **Proper operation of a carburetor includes the ability to control air/fuel mixtures during all phases or driving operation to comply with all federal and local emissions standards. Adjustments are to be considered repairs.**

Condition	Code	Procedure
15,000 miles or 12 months beyond most recent Chemical Engine Decarbonization	5	Suggest chemical engine decarbonization
Air/fuel control incorrect	B	Require repair or replacement
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Components binding	A	Require repair or replacement
Components damaged, affecting operation or performance	A	Require repair or replacement
Components missing	C	Require replacement of components
Contaminated	A	Require repair or replacement. Further inspection required
NOTE: **Some components may be serviceable; check for accepted cleaning procedure. Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Controlling linkages binding	A	Require repair or replacement of linkage
Leaking	B	Require repair or replacement
Mechanical operation incorrect	B	Require repair or replacement
Operating incorrectly	B	Require repair or replacement

CASTING CORE PLUGS AND EXPANSION PLUGS

Condition	Code	Procedure
Leaking	A	Require replacement
Material type incorrect	2	Suggest replacement

CHARGE AIR COOLERS ""INTERCOOLERS"" (CAC)

Condition	Code	Procedure
Air-to-air intercooler leaking, affecting boost performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking coolant	A	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require repair or replacement

CHECK VALVES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Melted, affecting performance	A	Require replacement
Melted, not affecting performance	Ã,Â	No service suggested or required
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

CHEMICAL ENGINE DECARBONIZATION

NOTE: **CHEMICAL ENGINE DECARBONIZATION is a process utilizing chemicals to remove soft and semi-hardened gum, varnish, resin and carbon deposits from the air/fuel delivery systems and combustion chambers of gasoline internal combustion engines, providing benefits that include improved fuel economy, performance and driveability and reduced emissions. This process is performed to remove deposits preferably prior to deposit accumulation and hardening which may require costly mechanical deposit removal or component replacement.**

NOTE: **SUGGEST Chemical Engine Decarbonization service every 15,000 miles or 12 months.**

CHOKES

Condition	Code	Procedure
Air/fuel control incorrect	B	Require repair or replacement

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Components binding	A	Require repair or replacement
Components damaged, affecting operation or performance	A	Require repair or replacement
Components missing	C	Require replacement of components
Contaminated	A	Require repair or replacement. Further inspection required
NOTE: **Some components may be serviceable; check for accepted cleaning procedure. Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Controlling linkages binding	A	Require repair or replacement of linkage
Leaking	B	Require repair or replacement
Mechanical operation incorrect	B	Require repair or replacement
Operating incorrectly	B	Require repair or replacement

CLUTCH PEDAL POSITION SWITCHES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement

Condition	Code	Procedure
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

COLD START INJECTORS

NOTE: **You are not required to replace injectors in sets. However, you may suggest replacement of all injectors for preventive maintenance.**

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Flow restricted	B	Require repair or replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation, out of OEM specification. Some components may be serviceable.**		
Leaking	A	Require repair or replacement
Resistance out of specification	B	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

COMBUSTION CHAMBER CLEANING

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

COOLANT RECOVERY TANKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement
Missing (if original equipment)	C	Require replacement

COOLANT

Condition	Code	Procedure
Acidity (pH) incorrect	1	Suggest correction or replacement
At or beyond service interval	3	Suggest replacement

Condition	Code	Procedure
NOTE: **The system should be drained and/ or flushed and refilled with correct coolant according to OEM recommended service interval and procedures.**		
Contaminated	B	Require replacement or recycling Further inspection required
NOTE: **Determine source of contamination and require correction prior to coolant replacement.**		
Fluid discolored	Ã,Â	No service Suggested or Required
NOTE: **Further testing necessary to determine condition of fluid.**		
Level incorrect	B	Require correction of fluid level
NOTE: **Determine source of incorrect level and suggest repair.**		
Mixture incorrect	B	Require correction or replacement
Type incorrect	B	Require replacement

COOLING FAN MOTOR MODULES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Housing cracked	2	Suggest repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation or failure to perform all functions.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

COOLING FAN MOTOR RELAYS AND MODULES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Housing cracked	2	Suggest repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation or failure to perform all functions.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

COOLING FAN MOTOR RESISTORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Missing	C	Require replacement
Open	A	Require replacement
Resistance out of specification	B	Require repair or replacement
Shorted	A	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

COOLING FAN MOTOR SENSORS AND SWITCHES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

COOLING FAN MOTOR SWITCHES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement

Condition	Code	Procedure
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

COOLING FAN MOTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Hydraulic fan motor leaking	A	Require repair or replacement
Inoperative	A	Require replacement
NOTE: **Check fan motor/controls. Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Noisy	2	Suggest replacement
Rotation incorrect for application	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Vibration	1	Suggest replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CRANKSHAFT POSITION SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CYLINDER DEACTIVATION SOLENOID

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

CYLINDER HEAD ASSEMBLIES

NOTE: **A Cylinder Head Assembly is a cylinder head fitted with valves, associated springs, retainers, and on overhead camshaft cylinder heads (ORC), camshaft, camshaft bearings, lash adjusters, tappets and rockers.**

Condition	Code	Procedure
Adjustable valve lash is out of specification	B	Require repair
Combustion efficiency is reduced due to carbon deposits in the combustion chamber	2	Suggest repair
Combustion efficiency is reduced due to carbon deposits on the intake valve	2	Suggest repair
Internal component failure (any component)	A	Require repair or replacement of cylinder head assembly
NOTE: **It is Required that all other failure-related components be inspected for cause and condition. Additional components or assemblies may be Suggested for repair or replacement, such as a water pump on a short block (reason code 4, technician's recommendation based on substantial and informed experience). For example: If there is a failed head gasket with an external coolant leak, in addition to Requiring replacement of the head gasket, inspection of the following for cause and condition is Required: Block, Cooling System, Cylinder Head. It may be suggested that additional inspections be performed, such as the other head gasket on a V - type engine.**		

DECEL VALVES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Melted, affecting performance	A	Require replacement
Melted, not affecting performance	Ã,Â	No service suggested or required
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

DEFLECTORS

Condition	Code	Procedure
Application incorrect, affecting cooling system performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting cooling system performance	A	Require repair or replacement
Blocked, affecting cooling system performance	A	Require repair or replacement
Broken, affecting cooling system performance	A	Require repair or replacement
Cracked, affecting cooling system performance	A	Require repair or replacement
Loose, affecting cooling system performance	A	Require repair
Loose, not affecting cooling system performance	2	Suggest repair
Missing, affecting cooling system performance	C	Require replacement

DIP STICK TUBES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Bent	2	Suggest repair or replacement
Broken, affecting performance (for example, fuel mixture)	A	Require repair or replacement
Broken, not affecting performance	2	Suggest repair or replacement
Leaking, affecting performance (for example, fuel mixture)	A	Require repair or replacement
Leaking, not affecting performance	2	Suggest repair or replacement
Missing	C	Require replacement

DIP STICKS AND TUBES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Bent	2	Suggest repair or replacement

Condition	Code	Procedure
Broken, affecting performance (for example, fuel mixture)	A	Require repair or replacement
Broken, not affecting performance	2	Suggest repair or replacement
Leaking, affecting performance (for example, fuel mixture)	A	Require repair or replacement
Leaking, not affecting performance	2	Suggest repair or replacement
Missing	C	Require replacement

DISTRIBUTOR ADVANCES AND RETARDERS (MECHANICAL AND VACUUM)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding	A	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Out of specification	B	Require repair or replacement

DISTRIBUTOR BOOTS AND SHIELDS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Deteriorated	A	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Torn	A	Require replacement

DISTRIBUTOR CAPS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Arcing	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Burned	A	Require replacement
Carbon button missing	A	Require replacement
Carbon button worn, affecting performance	A	Require replacement
Carbon button worn, not affecting performance	1	Suggest replacement
Carbon-tracked	A	Require replacement
Cracked	B	Require replacement
Loose	B	Suggest repair or replacement

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

NOTE:

Determine cause and correct prior to repair or replacement of part.

Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal eroded, affecting performance	A	Require repair or replacement
Terminal eroded, not affecting performance	Ã,Â	No service suggested or required
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

DISTRIBUTOR RETARDERS (MECHANICAL AND VACUUM)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding	A	Require repair or replacement
Inoperative	A	Require repair or replacement

NOTE:

Inoperative includes intermittent operation.

Leaking	A	Require replacement
Out of specification	B	Require repair or replacement

DISTRIBUTOR ROTORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Carbon-tracked	A	Require replacement
Contact burned	A	Require replacement
Corroded	1	Suggest replacement
Eroded	1	Suggest replacement
Loose	B	Require repair or replacement
Out of specification	B	Require replacement

DISTRIBUTOR SHIELDS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding	A	Require repair or replacement
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Out of specification	B	Require repair or replacement

DISTRIBUTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bushings worn, affecting performance	A	Require repair or replacement
Bushings worn, not affecting performance	1	Suggest repair or replacement
Cam lobes worn, affecting performance	A	Require repair or replacement
Cam lobes worn, not affecting performance	1	Suggest repair or replacement
Gear broken	A	Require repair or replacement
Gear worn, affecting performance	A	Require replacement
Gear worn, not affecting performance	Ã,Â	No service suggested or required
Integrated pickup triggering device loose	A	Require repair or replacement
Integrated pickup triggering device magnetism incorrect	A	Require repair or replacement
Leaking oil internally	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Pickup triggering device (reluctor) broken	A	Require repair or replacement
Pickup triggering device (reluctor) loose	A	Require repair or replacement
Pickup triggering device (reluctor) weak	A	Require repair or replacement
Reluctor (pickup triggering device) broken	A	Require repair or replacement
Reluctor (pickup triggering device) loose	A	Require repair or replacement
Reluctor (pickup triggering device) weak	A	Require repair or replacement
Shaft bent	A	Require replacement
Thrust washer broken	A	Require repair or replacement
Thrust washer missing	C	Require repair or replacement
Thrust washer worn, affecting performance	A	Require repair or replacement
Thrust washer worn, not affecting performance	1	Suggest repair or replacement

EARLY FUEL EVAPORATION VALVES (HEAT RISER ASSEMBLIES)

Condition	Code	Procedure
Broken	A	Require replacement of affected parts
Diaphragm inoperative	A	Further inspection required
NOTE: **Inoperative includes intermittent operation. If the inoperative diaphragm is separate from the heat riser, then require replacement of the inoperative diaphragm. If the inoperative diaphragm is part of the heat riser, then replace the heat riser.**		
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement
Seized	A	Require replacement of affected parts
Spring broken	B	Require replacement of spring(s)
Spring inoperative	A	Require replacement of spring(s)

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		

EGR COOLERS

Condition	Code	Procedure
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require repair or replacement

EGR EXHAUST MANIFOLD PASSAGES

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement

EGR INTAKE AND EXHAUST MANIFOLD PASSAGES

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement

EGR PLATES AND COOLERS

Condition	Code	Procedure
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require repair or replacement

ELECTRONIC SPARK CONTROL MODULES

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	A	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement of source.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Includes inoperative, intermittent operation or failure to perform all functions.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ELECTRONIC TRANSMISSION CONTROL DEVICES

Condition	Code	Procedure
Application Incorrect	B	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation or failure to perform all functions.**		
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ELECTRONIC TRANSMISSION FEEDBACK DEVICES

Condition	Code	Procedure
Application Incorrect	B	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ENGINE COOLANT TEMPERATURE SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement

Condition	Code	Procedure
Wire lead shorted	A	Require repair or replacement

ENGINE COOLING SYSTEMS

NOTE: **Overheating, poor engine performance, and insufficient cabin heat can be affected by, but are not limited to, all of the components in the engine cooling system**

ENGINE COVERS (OIL PAN, VALVE COVER, TIMING COVER)

Condition	Code	Procedure
Attaching hardware incorrect	B	Require replacement
Attaching hardware loose	A	Require repair or replacement
Attaching hardware missing	C	Require replacement
Baffle loose	2	Suggest repair or replacement
Baffle missing	C	Require replacement
Bent, affecting performance	A	Require repair or replacement
Bent, not affecting performance	Ã,Â	No service suggested or required
Cracked (not leaking)	2	Suggest repair or replacement
Leaking externally	A	Require repair or replacement
Leaking internally, causing fluid contamination	A	Require repair or replacement
Missing	C	Require replacement
Restricted passage	A	Require repair or replacement
Threads damaged	A	Require repair or replacement

ENGINE DECARBONIZATION

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

ENGINE OIL CANISTERS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Bulged	A	Require replacement. Further inspection required
NOTE: **Inspect pressure relief valve.**		
Canister attaching hardware broken	A	Require repair or replacement of hardware
Canister attaching hardware loose	A	Require repair
Canister attaching hardware missing	C	Require replacement
Canister attaching hardware not functioning	A	Require repair or replacement of hardware
Center tube collapsed	A	Require replacement. Further inspection required
NOTE: **Inspect bypass.**		
Dented	2	Suggest replacement. Further inspection required

Condition	Code	Procedure
NOTE: **Determine cause, such as broken motor mount.**		
Leaking	B	Require repair or replacement

ENGINE OIL COOLERS (EXTERNAL)

Condition	Code	Procedure
Air flow restriction	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bypassed	A	Require repair or replacement
Connection leaking	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	2	Suggest repair or replacement
Fluid flow restrictions	A	Require repair or replacement
Internal restrictions, affecting performance	A	Require repair or replacement
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

ENGINE OIL DRAIN PLUGS AND GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
NOTE: **Some OEMs require replacement of drain plug gasket when removing drain plug. Inspect threads in oil pan for damage.**		

ENGINE OIL FILTERS AND CANISTERS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Bulged	A	Require replacement. Further inspection required
NOTE: **Inspect pressure relief valve.**		
Canister attaching hardware broken	A	Require repair or replacement of hardware
Canister attaching hardware loose	A	Require repair
Canister attaching hardware missing	C	Require replacement
Canister attaching hardware not functioning	A	Require repair or replacement of hardware

Condition	Code	Procedure
Center tube collapsed	A	Require replacement. Further inspection required
NOTE: **Inspect bypass.**		
Dented	2	Suggest replacement. Further inspection required
NOTE: **Determine cause, such as broken motor mount.**		
Leaking	B	Require repair or replacement

ENGINE OIL GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
NOTE: **Some OEMs require replacement of drain plug gasket when removing drain plug. Inspect threads in oil pan for damage.**		

ENGINE OIL PRESSURE GAUGES (MECHANICAL)

Condition	Code	Procedure
Indicates out of range	B	Further inspection required
NOTE: **Gauge may indicate problem with contaminated oil, level, pressure, or temperature, or problem with gauge.**		
Inoperative	A	Further inspection required
NOTE: **Gauge may indicate problem with contaminated oil, level, pressure, or temperature, or problem with gauge. Inoperative includes intermittent operation, out of OEM specification, or out of range. Further inspection required to determine cause.**		
Leaking	B	Require repair or replacement
Reads inaccurately	2	Suggest repair or replacement

ENGINE OIL

Condition	Code	Procedure
Additive Depletion	A	Require replacement of fluid
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Contaminated	A	Require replacement of oil and filter; Further Inspection Required
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water when changing oil.**		

Condition	Code	Procedure
Fluid discolored	Ã,Â	No Service Suggested or Required
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid incorrect	B	Require service
Level Incorrect	B	Adjust to correct level. Further Inspection Required.
NOTE: **Determine cause of incorrect level such as leaking gaskets or contamination by engine coolant, fuel or water.**		
Oxidized	A	Require replacement of fluid

EVAPORATIVE EMISSIONS (EVAP) CANISTER FILTERS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with OEM recommended service interval
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Missing	C	Require replacement
Restricted, affecting performance	A	Require replacement
Restricted, not affecting performance	1	Suggest replacement
Water-contaminated	A	Require replacement

EVAPORATIVE EMISSIONS (EVAP) CANISTER PURGE DEVICES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

EVAPORATIVE EMISSIONS (EVAP) CANISTERS

Condition	Code	Procedure
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Missing	C	Require replacement
Saturated	A	Require replacement

EVAPORATIVE EMISSIONS (EVAP) FEEDBACK DEVICES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

EXHAUST GAS RECIRCULATION DEVICES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement

Condition	Code	Procedure
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	1	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

EXHAUST GAS RECIRCULATION FEEDBACK DEVICES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	1	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

EXPANSION PLUGS

Condition	Code	Procedure
Leaking	A	Require replacement
Material type incorrect	2	Suggest replacement

FAN CONTROL SENSOR

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FUEL ACCUMULATORS AND DAMPERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connections leaking	A	Require repair or replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement

FUEL AND COLD START INJECTORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Flow restricted	B	Require repair or replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation, out of OEM specification. Some components may be serviceable.**		

Condition	**Code**	**Procedure**
Leaking	A	Require repair or replacement
Resistance out of specification	B	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

FUEL CAPS

Condition	**Code**	**Procedure**
Application incorrect	B	Require replacement
Fails to maintain proper pressure	A	Require replacement
Gaskets missing	C	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Plugged (vacuum and pressure relief)	A	Require replacement
Seals missing	C	Require replacement

FUEL DAMPERS

Condition	**Code**	**Procedure**
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connections leaking	A	Require repair or replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement

FUEL DELIVERY CHECK VALVES

Condition	**Code**	**Procedure**
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking externally	A	Require repair or replacement
Missing	C	Require replacement
Pressure leaking (bleeds down)	A	Require repair or replacement

FUEL DISTRIBUTORS (BOSCH CIS)

Condition	Code	Procedure
15,000 miles or 12 months beyond most recent Chemical Engine Decarbonization	5	Suggest chemical engine decarbonization
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require repair or replacement
Out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement. Further inspection required
NOTE: **Some components may be serviceable; check for accepted cleaning procedure.**		

FUEL FILLER NECKS AND RESTRICTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Restricted	2	Suggest repair or replacement

FUEL FILTERS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with OEM recommended service interval
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require replacement
Restricted, not affecting performance	1	Suggest replacement
Water-contaminated	2	Suggest replacement

FUEL INJECTOR CLEANING

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

FUEL INJECTORS

Condition	Code	Procedure
15,000 miles or 12 months beyond most recent Chemical Engine Decarbonization	5	Suggest chemical engine decarbonization
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FUEL LEVEL SENDERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FUEL PRESSURE REGULATORS

Condition	Code	Procedure
Contaminated	2	Suggest repair or replacement. Further inspection required
NOTE: **Some components may be serviceable; check for accepted cleaning procedure. Determine source of contamination. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking (internally or externally)	A	Require repair or replacement
Pressure out of specification	B	Require repair or replacement
Vapor bypass restricted	A	Require repair or replacement

FUEL PUMPS (IN-TANK, EXTERNAL, ELECTRICAL OR MECHANICAL)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require replacement
NOTE: **Determine source of contamination. Require repair or replacement.**		
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Leaking externally (includes pulsator)	A	Require repair or replacement
Leaking internally (includes pulsator)	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FUEL RAILS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Contaminated	A	Require replacement
NOTE: **Determine source of contamination. Require repair or replacement.**		
Leaking	A	Require repair or replacement
Restricted	A	Require repair or replacement
Rust-pitted	1	Suggest replacement

FUEL RESTRICTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Restricted	2	Suggest repair or replacement

FUEL SYSTEM CLEANING SERVICE

NOTE: See CHEMICAL ENGINE DECARBONIZATION.

FUEL TANKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Baffles loose	A	Require repair or replacement
Contaminated	A	Require repair
NOTE: **Determine source of contamination. Require repair or replacement.**		
Corroded internally	A	Require repair or replacement
Distorted, affecting performance	B	Require replacement
Distorted, not affecting performance	Ã,Â	No service suggested or required
Leaking	A	Require repair or replacement

FUEL

Condition	Code	Procedure
Contaminated	B	Require repair or replacement
NOTE: **Determine of source of contamination. Require repair or replacement.**		
Fuel incorrect	B	Require flushing of system
NOTE: **If a fuel other than specification fuel is present in the system, the required service is to flush and fill with the correct fuel.**		

GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

GROMMETS (VALVE COVER)

Condition	Code	Procedure
Leaking	A	Suggest repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

HARMONIC DAMPERS

Condition	Code	Procedure
Application incorrect	B	Require replacement

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	B	Require replacement
Dented (fluid type only)	A	Require replacement
Keyway distorted	A	Require repair or replacement
Leaking (fluid damper only)	A	Require replacement
Loose	A	Require replacement
Noisy	A	Require replacement
Outer ring slipped out of position	A	Require replacement
Positioned incorrectly	A	Require repair or replacement
Rubber damping material deteriorated	1	Suggest replacement
Seal surface worn, causing a leak	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

HEATER CONTROL VALVES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bypassed	A	Require replacement
Coolant leak	A	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Restricted	A	Require repair or replacement
Vacuum leak	A	Require repair or replacement

HEATER CORES

Condition	Code	Procedure
Air flow restriction	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bypassed	A	Require repair or replacement
Connection leaking	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	2	Suggest repair or replacement
Internal restrictions, affecting performance	A	Require repair or replacement
Leaking	B	Require repair or replacement
Missing	C	Require replacement

HOSE CLAMPS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

HOSE CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

HOSE COUPLERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

HOSES AND TUBE COUPLERS, CONNECTORS AND CLAMPS

NOTE: **When replacing fuel lines and hoses, replace with product that meets or exceeds OEM design specifications.**

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

HOSES AND TUBES (FUEL LINES, RADIATOR, VACUUM, BY-PASS, HEATER, RECOVERY TANK AND OIL COOLERS)

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Dry-rotted	1	Suggest repair or replacement
Hard	1	Suggest repair or replacement
Inner fabric (webbing) damaged	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged	1	Suggest replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Safety clip missing	C	Require replacement
Spongy	1	Suggest repair or replacement
Stripped	A	Require replacement
Swollen	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

HOUSINGS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Housing corroded	1	Suggest replacement of housing
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Installation incorrect	B	Require repair or replacement
Leaking	A	Require repair or replacement
Thermostat missing	C	Require replacement of thermostat
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

IDLE AIR CONTROLS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

IDLE SPEED CONTROL ACTUATORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement

Condition	Code	Procedure
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

IGNITION BOOTS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Carbon-tracked	A	Require replacement
Corroded	1	Suggest repair or replacement
Insulation leaking (shorted)	A	Require repair or replacement
Metal heat shield bent	2	Suggest repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Resistance incorrect	B	Require replacement
Routed incorrectly	B	Suggest repair

Condition	Code	Procedure
NOTE: **If improper routing affects the performance of other systems, require repair. Proper routing, hardware, heatshields, etc., are intended to prevent premature failure of secondary ignition components.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

IGNITION COIL TOWERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Carbon-tracked	A	Require replacement
Corroded	1	Suggest repair or replacement
Insulation leaking (shorted)	A	Require repair or replacement
Metal heat shield bent	2	Suggest repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Resistance incorrect	B	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

IGNITION COILS

Condition	Code	Procedure
Arcing	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement

Condition	Code	Procedure
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require replacement
Corroded, not affecting performance	2	Suggest replacement
Distorted	Ã,Â	No service suggested or required
NOTE: **Distortion may be the result of overheating; coil should be tested.**		
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Oil leaking	A	Require replacement
Out of specification	B	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

IGNITION CONTROL MODULES (ICM)

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required
NOTE: **Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	A	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

IGNITION SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

IGNITION TERMINALS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Carbon-tracked	A	Require replacement
Corroded	1	Suggest repair or replacement
Insulation leaking (shorted)	A	Require repair or replacement
Metal heat shield bent	2	Suggest repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Resistance incorrect	B	Require replacement
Routed incorrectly	B	Suggest repair
NOTE: **If improper routing affects the performance of other systems, require repair. Proper routing, hardware, heatshields, etc., are intended to prevent premature failure of secondary ignition components.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

IGNITION WIRES (SECONDARY)

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Carbon-tracked	A	Require replacement
Corroded	1	Suggest repair or replacement
Insulation leaking (shorted)	A	Require repair or replacement
Metal heat shield bent	2	Suggest repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Resistance incorrect	B	Require replacement
Routed incorrectly	B	Suggest repair
NOTE: **If improper routing affects the performance of other systems, require repair. Proper routing, hardware, heatshields, etc., are intended to prevent premature failure of secondary ignition components.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

INERTIA FUEL SHUT-OFF SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

INTAKE AIR TEMPERATURE SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

INTAKE CLEANING

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

INTAKE MANIFOLDS

Condition	Code	Procedure
15,000 miles or 12 months beyond most recent Chemical Engine Decarbonization	5	Suggest chemical engine decarbonization
Corroded, affecting sealability	A	Require repair or replacement
Integrated air or fuel control components inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Internal air or fuel components damaged, affecting performance	A	Require repair or replacement of component
Internal air or fuel components damaged, not affecting performance	Ã,Â	No service suggested or required
Internal air or fuel components missing	C	Require replacement of component
Leaking	A	Require repair or replacement
Out of specification	B	Require replacement
Restricted	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Warped	B	Require repair or replacement

IN-TANK FUEL STRAINERS

Condition	Code	Procedure
Missing	C	Require replacement
Restricted	A	Require repair or replacement
Torn	A	Require replacement

INTERCOOLERS

Condition	Code	Procedure
Air-to-air intercooler leaking, affecting boost performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking coolant	A	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require repair or replacement

KNOCK SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

Condition	Code	Procedure
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

LIQUID VAPOR SEPARATORS

Condition	Code	Procedure
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require replacement
Missing	C	Require replacement
Restricted	A	Require repair or replacement

LONG BLOCK ASSEMBLIES

NOTE: **A Long Block Assembly is a short block assembly together with a cylinder head assembly and all those components fitted within the rocker or cam cover, and timing cover (the whole presented as an assembly). A rebuilt or new oil pump, or kit shall be supplied or fitted as appropriate.**

Condition	Code	Procedure
Combustion efficiency is reduced due to carbon deposits in the combustion chamber	2	Suggest repair
Internal component failure (any component)	A	Require repair or replacement of the long block assembly
NOTE: **It is Required that all other failure-related components be inspected for cause and condition. Additional components or assemblies may be Suggested for repair or replacement such as a water pump on a short block (reason code 4, technician's recommendation based on substantial and informed experience). For example: If there is a failed head gasket with an external coolant leak, in addition to Requiring replacement of the head gasket, inspection of the following for cause and condition is Required: Block, Cooling System, Cylinder Head. It may be Suggested that additional inspections be performed, such as the other head gasket on a V -type engine.**		

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement

Condition	**Code**	**Procedure**
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

MASS AIR FLOW (MAF) SENSORS

Condition	**Code**	**Procedure**
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

METAL AIR MANIFOLDS AND PIPES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require repair of injection tube or replacement of manifold
Corroded, affecting structural integrity	1	Suggest replacement of injection tube or manifold
Leaking	A	Require repair of injection tube or replacement of manifold
Loose	A	Require repair
Missing	C	Require replacement
Restricted	A	Require replacement of injection tube or manifold
Threads damaged	A	Require repair
Threads stripped (threads missing)	A	Require replacement

METAL AIR PIPES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware

Condition	Code	Procedure
Broken	A	Require repair of injection tube or replacement of manifold
Corroded, affecting structural integrity	1	Suggest replacement of injection tube or manifold
Leaking	A	Require repair of injection tube or replacement of manifold
Loose	A	Require repair
Missing	C	Require replacement
Restricted	A	Require replacement of injection tube or manifold
Threads damaged	A	Require repair
Threads stripped (threads missing)	A	Require replacement

MIX CONTROL SOLENOIDS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

MOTOR MOUNTS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Leaking (hydraulic mount)	A	Require replacement
Mounting hole worn, affecting performance	A	Require replacement
Mounting hole worn, not affecting performance	Ã,Â	No service suggested or required
Rubber deteriorated, affecting performance	A	Require replacement
Rubber deteriorated, not affecting performance	Ã,Â	No service suggested or required
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

OIL PANS

Condition	Code	Procedure
Attaching hardware incorrect	B	Require replacement
Attaching hardware loose	A	Require repair or replacement
Attaching hardware missing	C	Require replacement
Baffle loose	2	Suggest repair or replacement
Baffle missing	C	Require replacement
Bent, affecting performance	A	Require repair or replacement
Bent, not affecting performance	Ã,Â	No service suggested or required
Cracked (not leaking)	2	Suggest repair or replacement
Leaking externally	A	Require repair or replacement
Leaking internally, causing fluid contamination	A	Require repair or replacement
Missing	C	Require replacement
Restricted passage	A	Require repair or replacement
Threads damaged	A	Require repair or replacement

OIL PRESSURE SENDING UNITS

Condition	Code	Procedure
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require replacement
Output signal incorrect	B	Require repair or replacement

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

OIL PUMP PICK-UP SCREENS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bypass stuck	A	Require repair or replacement
Cracked	A	Require repair or replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement
Positioned incorrectly	A	Require repair or replacement
Restricted	A	Require repair or replacement
Screen torn	A	Require replacement

OIL PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require repair or replacement
Housing cracked	B	Require repair or replacement
Leaking	B	Require repair or replacement
Pressure relief valve stuck	A	Require repair or replacement
Seized	A	Require repair or replacement
Worn beyond specifications	B	Require repair or replacement

O-RINGS, GASKETS, SEALS AND SPRING LOCKS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

PARK NEUTRAL POSITION SWITCHES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

PCV BREATHER ELEMENTS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require replacement
Melted	A	Required replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require replacement
Restricted, not affecting performance	1	Suggest replacement
Water-contaminated	A	Require replacement

PCV ORIFICES

Condition	Code	Procedure
At or beyond service interval	3	Suggest repair or replacement to comply with OEM recommended service intervals
Leaking	A	Require replacement
Missing	C	Require replacement
Restricted	A	Require repair or replacement

PCV VALVES

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Grommet broken	A	Require repair or replacement of grommet
Grommet missing	C	Require replacement of grommet
Grommet not functioning	A	Require repair or replacement of grommet
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Missing	C	Require replacement
Restricted	A	Require replacement

PICK-UP ASSEMBLIES (INCLUDES MAGNETIC, HALL EFFECT AND OPTICAL)

Condition	Code	Procedure
Adjustment incorrect	B	Require repair
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement

Condition	Code	Procedure
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation. Refer to OEM recommended service procedures.**		
Oil-soaked	A	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

POWER STEERING PRESSURE SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement

Condition	Code	Procedure
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

POWERTRAIN CONTROL MODULES (PCM) AND PROM

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required
NOTE: **Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).**		
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation or failure to perform all functions.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement

Condition	**Code**	**Procedure**
Terminal burned, affecting performance	A	Require repair or replacement

NOTE:

Determine cause and correct prior to repair or replacement of part.

Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

POWERTRAIN CONTROL PROM

Condition	**Code**	**Procedure**
Application incorrect	B	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required

NOTE:

Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).

Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

NOTE:

Determine cause and correct prior to repair or replacement of part.

Connector missing	C	Require repair
Contaminated	A	Require repair or replacement

NOTE:

Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.

Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement

NOTE:

Includes inoperative, intermittent operation or failure to perform all functions.

Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: Determine cause and correct prior to repair or replacement of part.		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

PRESSURIZED EXPANSION TANK CAPS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Coolant recovery check valve inoperative	A	Require replacement
NOTE: Inoperative includes intermittent operation.		
Fails to maintain proper pressure	B	Require replacement
Gasket missing	C	Require replacement of gasket
Missing	C	Require replacement
Seal missing	C	Require replacement of seal

RADIATOR / COOLING FAN BLADES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require replacement
Broken	A	Require replacement
Cracked	B	Require replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement

RADIATOR / COOLING FAN CLUTCHES

NOTE: **Some lateral movement, measured at the fan blade tip, may be normal.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing noisy	A	Require replacement

Condition	Code	Procedure
Bearing worn	A	Require replacement
Fastener loose	A	Require repair or replacement of fastener
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Suggest replacement
Seized	A	Require replacement
Slips (insufficient fan speed)	A	Require replacement
Thermal control incorrect	B	Require repair or replacement

RADIATOR CAPS AND PRESSURIZED EXPANSION TANK CAPS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Coolant recovery check valve inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Fails to maintain proper pressure	B	Require replacement
Gasket missing	C	Require replacement of gasket
Missing	C	Require replacement
Seal missing	C	Require replacement of seal

RADIATORS

Condition	Code	Procedure
Air flow restriction	A	Require repair
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connection leaking	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	2	Suggest repair or replacement
Internal oil cooler leaking	A	Require repair or replacement
Internal restrictions, affecting performance	A	Require repair or replacement
Internal restrictions, not affecting performance	2	Suggest repair or replacement
Leaking	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Tubes damaged, affecting performance	A	Require repair or replacement
Tubes damaged, not affecting performance	Ã,Â	No service suggested or required

ROLL OVER VALVES

Condition	Code	Procedure
Inoperative	A	Require replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require replacement
Missing	C	Require replacement

SEALING COMPOUNDS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

SEALS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

SECONDARY AIR INJECTION SYSTEM MANAGEMENT DEVICES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

SENSORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
Leaking (vacuum/fluid/air)	A	Require replacement
Out of adjustment	B	Further inspection required
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SHORT BLOCK ASSEMBLIES

NOTE: **A Short Block Assembly is a cylinder block and all those components contained within the limits of the block deck or decks, the pan rail, the block rear face and the timing cover (where fitted), including the crankshaft.**

Condition	Code	Procedure
Combustion efficiency is reduced due to carbon deposits in the combustion chamber	2	Suggest repair
Internal component failure (any component)	A	Require repair or replacement of the short block assembly

Condition	Code	Procedure
NOTE: **It is Required that all other failure-related components be inspected for cause and condition. Additional components or assemblies may be Suggested for repair or replacement, such as a water pump on a short block (reason code 4, technician's recommendation based on substantial and informed experience). For example: If there is a failed head gasket with an external coolant leak, in addition to Requiring replacement of the head gasket, inspection of the following for cause and condition is Required: Block, Cooling System, Cylinder Head. It may be Suggested that additional inspections be performed, such as the other head gasket on a V -type engine.**		

SHROUDS, BAFFLES AND DEFLECTORS

Condition	Code	Procedure
Application incorrect, affecting cooling system performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting cooling system performance	A	Require repair or replacement
Blocked, affecting cooling system performance	A	Require repair or replacement
Broken, affecting cooling system performance	A	Require repair or replacement
Cracked, affecting cooling system performance	A	Require repair or replacement
Loose, affecting cooling system performance	A	Require repair
Loose, not affecting cooling system performance	2	Suggest repair
Missing, affecting cooling system performance	C	Require replacement

SPARK PLUGS

NOTE: **You are not required to replace spark plugs in sets. However, you may suggest replacement of the other plugs for preventive maintenance.**

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Electrode eroded	1	Suggest replacement
Fouled	A	Require repair or replacement
NOTE: **Determine cause of fouling and suggest repair.**		
Gap incorrect	B	Require repair or replacement
Improperly Indexed	Ã,Â	Remove and Reinstall following manufacturers installation requirements
Insulation broken	A	Require replacement
Insulator cracked	A	Require replacement
Leaking compression	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SPRING LOCKS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

SUPER CHARGERS

Condition	Code	Procedure
Attaching hardware damaged, affecting operation or performance	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Bearing noisy	A	Require replacement
Bearing worn	A	Require replacement
Boost pressure incorrect	A	Require repair or replacement
NOTE: **Boost pressure problems may be caused by other systems or components.**		
Clearance out of specification	B	Require repair or replacement
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

THERMAL VACUUM VALVES

Condition	Code	Procedure
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

THERMOSTATIC AIR DOOR ASSEMBLIES

Condition	Code	Procedure
Attaching hardware damaged, affecting operation or performance	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Binding	A	Require repair or replacement
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Seized	A	Require repair or replacement

THERMOSTATS AND HOUSINGS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Housing corroded	1	Suggest replacement of housing
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Installation incorrect	B	Require repair or replacement
Leaking	A	Require repair or replacement
Thermostat missing	C	Require replacement of thermostat
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

THROTTLE BODIES

Condition	Code	Procedure
15,000 miles or 12 months beyond most recent Chemical Engine Decarbonization	5	Suggest chemical engine decarbonization
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Deposits on throttle body components	A	Require repair
NOTE: **Some throttles are coated by manufacturer; follow OEM-recommended procedures.**		
Leaking	A	Require repair or replacement
Restricted, affecting performance	A	Require repair
NOTE: **Some components may be serviceable; check for accepted cleaning procedure.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Throttle shaft binding, affecting performance	A	Require repair or replacement
Throttle shaft worn, affecting performance	A	Require repair or replacement
Throttle shaft worn, not affecting performance	1	Suggest repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

THROTTLE BODY CLEANING

NOTE: See CHEMICAL ENGINE DECARBONIZATION.

THROTTLE CABLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require repair or replacement
Binding	A	Require repair or replacement

Condition	Code	Procedure
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Ã,Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Ã,Â	No service suggested or required
Bracket Corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Broken	A	Require replacement
Cracked	B	Require repair or replacement
Disconnected	A	Require repair or replacement
Kinked	A	Require repair or replacement
Melted	A	Require repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
NOTE: **Follow OEM recommended adjustment procedures. Require repair or replacement if out of specification.**		
Routed incorrectly	B	Suggest repair
Seized	A	Require repair or replacement

THROTTLE LINKAGES AND CABLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require repair or replacement
Binding	A	Require repair or replacement
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Ã,Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Ã,Â	No service suggested or required
Bracket Corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Broken	A	Require replacement
Cracked	B	Require repair or replacement
Disconnected	A	Require repair or replacement
Kinked	A	Require repair or replacement
Melted	A	Require repair or replacement
Missing	C	Require replacement

Condition	Code	Procedure
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
NOTE: **Follow OEM recommended adjustment procedures. Require repair or replacement if out of specification.**		
Routed incorrectly	B	Suggest repair
Seized	A	Require repair or replacement

THROTTLE POSITION SENSORS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

THROTTLE POSITION SWITCHES

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

TIMING BELT SPROCKETS

Condition	Code	Procedure
Alignment incorrect	B	Require repair
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require replacement
Cracked	B	Require replacement
Key damaged	A	Require replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement

Condition	Code	Procedure
Pulley damaged, affecting belt life	A	Require replacement
Sprocket damaged, affecting belt life	A	Require repair or replacement
Sprocket loose	B	Require repair or replacement
Sprocket-to-shaft alignment incorrect	B	Require repair or replacement

TIMING BELTS

Condition	Code	Procedure
Adjustment incorrect	B	Suggest adjustment
NOTE: **Inspect belt tensioners, pulleys, and cover.**		
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
At or beyond service interval	3	Suggest replacement to comply with vehicle OEM recommended service intervals
Broken	A	Require replacement
Cam timing out of specification	B	Require repair
Cracked	1	Suggest replacement
Fluid-soaked	1	Suggest replacement. Further inspection required
Frayed	1	Suggest replacement
Missing	C	Require replacement
NOTE: **Internal engine damage may result from timing belt damage/failure.**		
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Teeth missing	A	Require replacement
Tension out of specification	B	Require adjustment or replacement

TIMING COVERS

Condition	Code	Procedure
Attaching hardware incorrect	B	Require replacement
Attaching hardware loose	A	Require repair or replacement
Attaching hardware missing	C	Require replacement
Baffle loose	2	Suggest repair or replacement
Baffle missing	C	Require replacement
Bent, affecting performance	A	Require repair or replacement
Bent, not affecting performance	Ã,Â	No service suggested or required
Cracked (not leaking)	2	Suggest repair or replacement
Leaking externally	A	Require repair or replacement
Leaking internally, causing fluid contamination	A	Require repair or replacement
Missing	C	Require replacement
Restricted passage	A	Require repair or replacement
Threads damaged	A	Require repair or replacement

TORQUE STRUTS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding	A	Require replacement
Body dented	A	Further inspection required
NOTE: **Require replacement of units where dents restrict strut piston rod movement. If dents don't restrict movement, no service is suggested or required.**		
Body punctured	A	Require replacement
Bushing deteriorated, affecting performance	A	Require replacement
Bushing deteriorated, not affecting performance	Ã,Â	No service suggested or required
Bushings missing	C	Require replacement
Bushings separated from mounting eye	1	Suggest replacement
Damping (none)	A	Require replacement
Leaking oil, enough for fluid to be running down the body	A	Require replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **If noise is isolated to shock or strut, suggest replacement.**		
Piston rod bent	A	Require replacement
Piston rod broken	A	Require replacement
Seized	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

TRANSMISSION RANGE SWITCHES

Condition	Code	Procedure
Application Incorrect	B	Require repair or replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		

Condition	Code	Procedure
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance .	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

TUBE CLAMPS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

TUBE CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

TUBE COUPLERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

TUBES

Condition	Code	Procedure
Application incorrect	B	Require replacement

Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Voltage drop out of specification	A	Require repair or replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

AUTOMOTIVE TERMINOLOGY & DEFINITIONS

ACCELERATION

an increase in velocity or speed.

ADDITIVE

in automotive terminology, a substance added to a liquid, such as engine oil, transmission fluid, gear oil or coolant to enhance its properties.

ADVANCED TECHNOLOGY VEHICLE (ATV)

a vehicle that combines new engine/power/drivetrain systems to significantly improve fuel economy. This includes hybrid power systems and fuel cells, as well as some specialized electric vehicles.

AIR GAP

a specified space between two components. Space or gap between spark plug electrodes, motor and generator armatures Ind field shoes. The space or gap between the compressor drive hub and pulley assembly.

AIR INJECTION REACTION (AIR) SYSTEM

a system that provides fresh air to the exhaust system under controlled conditions to reduce emissions. The air source can be a pulse-air pump or an electrically or belt driven pump. Upstream air injection goes into the exhaust manifold to assist in after-burning HC laden exhaust gases. Downstream air injection goes into the oxidation bed of the catalytic converter to help oxidize HC and CO emissions.

AIR PUMP

device to produce a flow of air at higher-thanatmospheric pressure. Normally referred to as a thermactor air supply pump.

AIR/FUEL RATIO

the proportion of air to fuel by weight in the fuel mixture drawn into the engine.

ALLOY

mixture containing mostly metals. For example, brass is an alloy of copper and zinc. Steel contains iron and other metals, but also carbon

ALTERNATIVE FUEL VEHICLE (AFV)

as defined by the Energy Policy Act, any dedicated, flexible-fuel, or dual-fuel vehicle designed to operate on at least one alternative fuel.

ALTERNATIVE FUEL

alternative fuel, also known as non-conventional fuels, is any material or substance that can be used as a fuel, other than fossil fuels, or conventional fuels of petroleum (oil), coal, propane, and natural gas. The term "alternative fuels" usually refers to a source of which energy is renewable. Methanol, denatured ethanol, and other alcohols; mixtures containing 85% or more by volume of methanol, denatured ethanol, and other alcohols with gasoline or other fuels; natural gas; liquefied petroleum gas; hydrogen; coal-derived liquid fuels; non-alcohol fuels (such as biodiesel) derived from biological material; and electricity. 'P-Series' fuels were added to this list since the original definition in EPAct.

AMBIENT TEMPERATURE

the temperature of the medium surrounding an object

ANTIFREEZE

a material such as ethylene glycol which is added to water to lower its freezing point; used in an automobile's cooling system.

B100

100% (neat) biodiesel.

B20

a blend of biodiesel fuel with petroleum-based diesel where 20% of the volume is biodiesel.

BABBITT

a soft bearing alloy used in engine bearings.

BACK PRESSURE

pressure created by a blockage or restriction in an exhaust system.

BACKFIRE

the sudden combustion of gasses in the intake or exhaust manifold, resulting in a loud explosion.

BALANCE SHAFT

a weighted shaft used on some engines to dampen or reduce vibration.

BALLAST RESISTOR

resistor in the primary side of the ignition system hat is used to reduce voltage by approximately 4-5 volts.

BATTERY

batteries are the principal energy storage devices for hybrid electric vehicles (HEVs). Desirable attributes of high-power batteries for HEV applications are high-peak and pulse-specific power, high specific energy at pulse power, a high charge acceptance to maximize regenerative braking utilization, and long calendar and cycle life. Developing methods/designs to balance the packs electrically and thermally, developing accurate techniques to determine a battery's state of charge, and developing abuse-tolerant batteries, and recyclability are additional technical challenges.

BDC

bottom dead center, when the piston is at its lower limit in the cylinder bore.

BEARING CAP

the lower half of the bearing saddle. It is removable, as in main cap or rod cap.

BEARING CLEARANCE

the space between a bearing and its corresponding component's loaded surface. Bearing clearances are commonly provided to allow lubrication between the parts.

BEARING CRUSH

the bearing is slightly larger at its parting lines so that when the two halves of the bearing are tightened together, the bearing seats firmly in its bore. This keeps the bearing from rotating.

BEARING LINING

the bearing surface area of a bearing, it is usually made up of an alloy of several metals, including lead.

BEARING SPREAD

the condition in which the distance across the outer edges of the bearing insert is slightly greater than the diameter of the housing bore. A bearing is spread slightly apart at its paning halves so that it snaps into place in its bore and remains there during assembly.

BEFORE TOP DEAD CENTER (BTDC)

the degrees of crankshaft rotation just before the piston in a specific cylinder reaches TDC, the highest point in its vertical travel on the compression stroke. On most vehicles, spark occurs a certain number of degrees of crankshaft rotation BTDC.

BI-FUEL VEHICLE

a vehicle with two separate fuel systems designed to run on either an alternative fuel, or gasoline or diesel, using only one fuel at a time. Bi-fuel vehicles are referred to as "dual-fuel" vehicles in the Clean Air Act Amendments and Energy Policy Act.

BIOCK

the casting made up of cylinders and the crankcase.

BLOWBY

the unburned fuel and products of combustion that are forced past the piston rings and into the crankcase during the combustion stroke.

BOOST PRESSURE.

term used when a turbocharger increases the air pressure entering an engine above atmospheric pressure.

BORE GAUGE

a precision measuring instrument used to measure the diameter of a bore.

BORE

a cylindrical hole.

BOSS

the part of a piston that fits around its pin.

BOTTOM DEAD CENTER (BDC)

when the piston is at its lower limit in the cylinder bore.

BRAKE HORSEPOWER

power developed by an engine as measured at the flywheel or crankshaft.

BRAKE-SPECIFIC FUEL CONSUMPTION

the ratio of engine fuel consumption to power output. It is a measure of engine efficiency.

BTDC

see 'before top dead center'.

CAMSHAFT BEARING

a bearing that supports the camshaft journal. On some engines it is full round and pressed in place. On some OHC engines the camshaft bearing is made up of two shells like a connecting rod bearing.

CAMSHAFT FOLLOWER

on OHC engines the equivalent of a rocker arm.

CAMSHAFT JOURNAL

the bearing area of a camshaft.

CAMSHAFT LOBE

the eccentric on a camshaft that acts on lifters or followers and in turn, other valvetrain components as the camshaft is rotated, to open the intake and exhaust valves.

CAMSHAFT POSITION SENSOR (CMP)

a magnetic, hall effect, optical or magneto resistive sensor usually mounted internally in the engine to inform the ECM or PCM of piston position on the intake stroke for timing and synchronization of sequential fuel injection.

CAMSHAFT SPROCKET

the sprocket on a camshaft that is turned by a chain or belt from the crankshaft. The camshaft sprocket has twice as many teeth as the crankshaft sprocket.

CARBON DIOXIDE (CO_2)

A product of combustion that has become an environmental concern in recent years. CO_2 does not directly impair human health, but is a greenhouse gas that traps the Earth's heat and contributes to the potential for global warming.

CARBON MONOXIDE (CO)

a colorless, odorless gas, which is highly poisonous. CO is produced by incomplete combustion. It is absorbed by the bloodstream 400 times faster than oxygen.

CARBON

a hard or soft nonmetallic element that forms in an engine's combustion chamber when oil is burned.

CARBURETOR

a device that atomizes air and fuel in a proportion that is burnable in the engine.

CASTING

metal that is manufactured by pouring it into a mold. It is more porous than forged metal and does not conduct heat as well. It is less expensive to manufacture, however.

CATALYTIC CONVERTER

an emission control device located in the exhaust system that contains catalysts, which reduce hydrocarbons, carbon monoxide and nitrogen oxides in the exhaust gases.

CATALYTIC OXIDATION

process of oxidizing unburned hydrocarbons and carbon monoxide by means of a catalytic reaction to reduce pollution.

CHOKE

a device used on carbureted vehicles to reduce the amount of air entering the intake manifold while leaving the amount of fuel unchanged. The purpose of a choke is to richen the mixture enough that a cold engine can still get enough vaporized fuel to start.

CLOSED LOOP

electronic feedback system in which sensors provide constant information on what is taking place in the engine; the state of the engine control computer system when it is working normally, at full operating temperature and normal speeds with the oxygen sensor switching. The fuel injection quantity is determined by the set of inputs from the engine control computer's sensors, most specifically the oxygen sensor in the exhaust stream. A closed loop system samples its output and uses that sampling to modify the next inputs.

CLOSED-LOOP CARBURETION

system in which the fuel/air ratio in the engine is carefully controlled to optimize emissions performance. A closed-loop system uses a fuel metering correction signal to optimize fuel metering.

COIL-ON-PLUG IGNITION

a Coil-on-Plug ignition system uses one ignition coil for each cylinder attached to the spark plug. The system replaces remote ignition coils and high-voltage ignition wires in a distributorless ignition system.

COLD START

difficulty of starting an internal combustion engine in cold weather because of gasoline, which evaporates more slowly when it is cold; oil, which gets thicker in cold weather; and the chemical reactions inside the battery, which progress more slowly in cold weather.

COMBUSTION CHAMBER

enclosure formed by a pocket in the cylinder head and the top of the piston, where the spark plug ignites the compressed air/fuel mixture. The volume of the cylinder above the piston when the piston is at TDC.

COMBUSTION

the burning of the air/fuel mixture.

COMMON RAIL DIRECT INJECTION (CDI)

a fuel-injection system that uses a single "rail" (fuel line) that maintains constant fuel pressure regardless of injection sequence (also called common rail injection). The engine's electronic timing regulates fuel-injection timing and quantity according to data from sensors on the camshafts and crankshafts so that compression and injection occur independently. Fuel is injected only as needed, which reduces fuel consumption and emissions.

COMPRESSION IGNITION

the form of ignition that initiates combustion in a diesel engine. The rapid compression of air within the cylinders generates the heat required to ignite the fuel as it is injected.

COMPRESSION RATIO

ratio of the volume in the cylinder above the piston when the piston is at bottom dead center to the volume in the cylinder above the piston when the piston is at top dead center.

COMPRESSION RINGS

usually the top two rings on a piston, they form a seal between the piston and cylinder wall to compress the air fuel mixture in the cylinder.

COMPRESSION STROKE

the second stroke of the 4-stroke engine cycle, in which the piston moves from bottom dead center and the intake valve is closed, trapping and compressing the air/fuel mixture in the cylinder.

COMPRESSION

in a solid material, compression is the opposite of tension. In a gas, compression causes the gas to be confined in a smaller area, raising its temperature and pressure.

COMPRESSION-IGNITION DIRECT-INJECTION (CIDI) ENGINE

commonly called the diesel engine, has the highest thermal efficiency of any internal combustion engine. Challenges to improvements include a lower specific power than the gasoline engine; significant particulate matter and nitrogen oxides in the exhaust; and the noise, vibration, and smell of the engine.

CONNECTING ROD BEARINGS

the plain bearing shells located in the big end of the connecting rod that support the connecting rod and piston on the crankshaft.

CONNECTING ROD CAP

the removable part of the big end of the connecting rod.

CONNECTING ROD

a rod that connects the crankshaft to the piston and enables the reciprocating motion of the piston to turn the crankshaft.

CONTINUOUS INJECTION

a system that uses fuel under pressure to maintain or change the fuel injection area.

COOLANT

the mixture of water and antifreeze used in an engine's cooling system to maintain the engine's temperature throughout Its operating range.

COOLING FAN

a mechanically or electrically driven propeller that draws air through the radiator.

COOLING SYSTEM

the system used to remove excess heat from an engine and transfer it to the atmosphere. Includes the radiator, cooling fan, hoses, water pump, thermostat and engine coolant passages.

CORROSION INHIBITORS

additives used to inhibit corrosion (e.g., rust) in the fuel system.

CRANK THROW

distance from the crankshaft main bearing centerline to the connecting rod journal centerline. The stroke of any engine is the crank throw.

CRANK WEB

unmachined portion of a crankshaft that lies between two crank pins or between a crankpin and main bearing journal.

CRANKCASE

the lower part of an engine block that houses the crankshaft.

CRANKPIN

the part of the crankshaft to which the connecting rod is attached.

CRANKSHAFT JOURNALS

the bearing areas of a crankshaft are the main and rod journals.

CRANKSHAFT POSITION SENSOR (CKP)

a magnetic, hall effect, optical or magneto resistive sensor usually mounted internally in the engine, externally to the engine or in the distributor to inform the ECM or PCM of crankshaft position, location of No.1 piston, and crankshaft speed for ignition timing and other calculations needed by the system where rpm is an input.

CRANKSHAFT PULLEY

the belt drive pulley mounted on the front of the vibration damper.

CRANKSHAFT THRUST COLLAR

a flat machined area that is 90 degrees to the crankshaft main journals. The flange of the thrust main bearing rides against it to control cranksnan end tnrust.

CRANKSHAFT

a lower engine part with main and rod bearing journals. It converts reciprocating motion to rotary motion.

CROSSFLOW RADIATOR

a radiator in which coolant enters on one side, travels through tubes, and collects on the opposite side (see downflow radiator).

CRUSH

the bearing is slightly larger at its parting lines so that when the two halves of the bearing are tightened together, the bearing seats firmly in its bore. This keeps the bearing from rotating.

CYLINDER HEAD

the casting that contains the valves and valve springs, and covers the top of the cylinders.

CYLINDER LEAKAGE TEST

in engine diagnostic test where the piston in the cylinder to be tested is brought to top dead center (TDC) on the compression stroke and compressed air is pumped into the cylinder through the spark plug hole. Where the air leaks out shows the location of the compression leak. A leakage tester will compare the air leaking out of the cylinder to the amount of air being put into it, expressed as a percentage.

CYLINDER SLEEVE

a replacement iron liner that fits into a cylinder bore. It can be either wet or dry. The outside diameter of wet sleeves contacts the coolant.

CYLINDER WALLS

the walls of the cylinder bore.

CYLINDER

round hole in the engine block for the piston.

DAMPER

a device mounted on the front of the crankshaft. It reduces the torsional or twisting vibration that occurs along the length of the crankshaft in multiple cylinder engines. It is also called a harmonic balancer.

DEAD CENTER

the extreme upper or lower position of the crankshaft throw at which the piston is not moving in either direction.

DECK

the top of the engine block where the cylinder head is attached.

DETONATION

abnormal combustion of an air fuel mixture. When pressure in the cylinder becomes excessive and the mixture explodes violently, instead of burning in a controlled manner. The sound of detonation can be heard as the cylinder walls vibrate. Detonation is sometimes confused with preignition or ping.

DIAGNOSTIC TROUBLE CODE (DTC)

a code that represents and can be used to identify a malfunction in a computer control system.

DIE CASTING

an accurate casting made by pouring pressurized molten material into a mold or die.

DIESEL ENGINE

any internal-combustion engine in which air is compressed to a sufficiently high temperature to ignite fuel injected into a cylinder. A diesel engine differs from other internal-combustion engines, such as gasoline engines, in that it employs no ignition devices, such as an electric spark. For this reason, it is often called a compression-ignition engine.

DIESEL FUEL

petroleum products normally used as fuel for diesel engines are components of crude oil having heavy hydrocarbons containing at least 12 to 16 carbon atoms per molecule. These heavier fractions are taken from crude oil after the more volatile portions used in gasoline are removed.

DIESELING

a condition by which hot spots in the combustion chamber(s) cause the engine to run on after the key is turned off.

DIRECT IGNITION

distributorless ignition system in which spark distribution is controlled by the computer.

DIRECT INJECTION (DI)

in DI, fuel is injected directly into the cylinder, as is typical in a diesel engine (also called direct fuel injection). Most other internal combustion engines use either carburetion (in which the air and fuel are mixed long before the air enters the cylinder) or port fuel injection (in which the fuel is injected just in front of the cylinder intake valve).

DIRECT INJECTION ENGINE

direct injection (DI) refers to fuel injected directly into the combustion chamber above the piston. Direct Injection has long been used on large diesel engines. Smaller diesels are increasingly adopting direct injection (vs. indirect injection into a pre-chamber). Direct Injection also can be used in spark ignition (generally gasoline) engines instead of port fuel injection - for cleaner emissions, increased full throttle power and potentially for lean-burn operation.

DIRECT INJECTION SPARK IGNITION (DISI)

with direct injection spark ignition (DISI) engines, fuel is injected in one of two ways depending on operating conditions. Lean burn operation (at part throttle), injects fuel after the air has entered, causing higher fuel concentration near the injector and spark plug for easy ignition. This is known as stratified charge. The overall air/fuel ratio is lean for better fuel consumption. At full power, fuel is injected at the same time as air (same as for conventional) to promote good mixing. Fuel evaporating in the combustion chamber cools the air slightly for higher volumetric efficiency and power. Since all fuel being injected goes directly into the cylinder, it can be metered more precisely, promoting cleaner emissions.

DIRECT INJECTION

a fuel injection system wherein fuel is sprayed directly into the combustion chamber, that is, no precombustion chambers or manifold injection.

DISPLACEMENT

the volume of a cylinder displaced by the piston as it moves from TDC to BDC (a complete stroke).

DISTILLATION CURVE

the percentages of gasoline that evaporate at various temperatures. The distillation curve is an important indicator for fuel standards such as volatility (vaporization).

DRIVEABILITY

the degree to which a vehicle operates properly, including starting, running smoothly, accelerating and delivering reasonable fuel mileage.

DRY SLEEVE

a sleeve, that when installed in a cylinder block, does come into contact with coolant.

DTC

see 'diagnostic trouble code',

DUAL-FUEL VEHICLE

vehicle designed to operate on a combination of an alternative fuel and a conventional fuel. This includes (a) vehicles that use a mixture of gasoline or diesel and an alternative fuel in one fuel tank, commonly called flexible-fuel vehicles; and (b) vehicles capable of operating either on an alternative fuel, a conventional fuel, or both, simultaneously using two fuel systems. They are commonly called bi-fuel vehicles.

DURATION

the length of time that a valve remains open, measured in crankshaft degrees.

DWELL TIME

degree of crankshaft rotation during which the primary circuit is on.

DYKEM BLUE

a dye which is painted on a valve seat in order to determine seat concentricity. The valve is inserted into the guide, lightly seated, and rotated about 1/8 in. A continuous blue line should appear all the way around the valve face if the valve and seat are mating properly. Open patches or breaks in the line indicate that the seat is not concentric and the low spots are not making contact.

E85

a mixture of 85% denatured ethanol and 15% gasoline, by volume; an alternative engine fuel.

E93

ethanol mixture that contains 93% ethanol, 5% methanol and 2% kerosene, by volume.

E95

ethanol/gasoline mixture that contains 95% denatured ethanol and 5% gasoline, by volume.

EGR VALVE POSITION SENSOR

a sensor mounted on the EGR valve that signals the engine control computer regarding EGR valve pintle position and EGR flow.

EGR VALVE

see 'exhaust gas recirculation (EGR) valve',

EMBEDABILITY

the ability of the bearing lining material to absorb contaminants.

ENGINE BLOCK

the casting made up of cylinders and the crankcase.

ENGINE CONTROL MODULE (ECM)

the electronic computer that controls engine operation. ECM is synonymous with ECA, ECU, SBEC or SMEC. It is less powerful than the PCM or VCM in that it controls only engine operation.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

a sensor which works by a negative coefficient thermistor that loses resistance as its temperature goes up (just like the intake air temperature sensor). When the computer applies its 5-volt reference signal to the sensor, this voltage is reduced through a ground circuit by an amount corresponding to the temperature of the engine coolant.

ENGINE DISPLACEMENT

the volume displaced by all of the pistons in all of an engine's cylinders.

ENGINE

a device that converts heat energy into mechanical energy.

EQUIVALENCE RATIO

actual air/fuel ratio divided by the stoichiometric air/fuel ratio. An air/fuel mixture is said to be stoichiometric when fuel combustion consumes all of the initial reacting species in going to completion.

ETHANOL

a liquid alcohol made by fermenting sugars derived from starches in plants, such as corn or sugar cane (CH3CH2OH, ethyl or grain alcohol). When denatured (made unfit for human consumption), it can be used as an engine fuel. Can be produced chemically from ethylene or biologically from the fermentation of various sugars from carbohydrates found in agricultural crops and cellulosic residues from crops or wood. Used in the United States as a gasoline octane enhancer and oxygenate, it increases octane 2.5 to 3.0 numbers at 10% concentration. Ethanol also can be used in higher concentration in alternative fuel vehicles optimized for its use.

ETHYL TERTIARY BUTYL ETHER (ETBE)

a fuel oxygenate used as a gasoline additive to increase octane and reduce engine knock.

EVAPORATIVE EMISSION (EVAP) CANISTER PURGE SOLENOID

"EVAP" canister purging is controlled by the engine control computer, which determines when the canister should be purged based on various sensor inputs. When purging is needed the computer operates the purge solenoid, which controls the vacuum to purge the canister. Generally, the purge solenoid is activated when the engine is running above idle speed and at normal operating temperature.

EVAPORATIVE EMISSION (EVAP) CANISTER PURGE VALVE

a valve on the line between the EVAP canister and the intake manifold. When the engine is running, under certain operating conditions, the valve opens, fresh air is drawn in through the canister air filter and the air and fuel vapors are drawn into the engine and burned, purging the canister.

EVAPORATIVE EMISSION (EVAP) CANISTER

a charcoal-filled container with lines to the top of the fuel tank, to the intake manifold and to the air cleaner. The charcoal element adsorbs fuel vapors from the gas tank and stores them until the engine is running at normal operating temperatures and speeds. Then, a valve between the canister and engine opens, fresh air is drawn in through the canister air filter and the air and fuel vapors are drawn into the engine and burned, purging the canister.

EVAPORATIVE EMISSION (EVAP) SYSTEM

an emission control system that prevents HC emissions from escaping the fuel system to atmosphere.

EVAPORATIVE EMISSIONS

hydrocarbon vapors that escape from a fuel storage tank or a vehicle fuel tank or vehicle fuel system.

EXHAUST AFTERTREATMENT

a method of controlling emissions from internal combustion engines - primarily Nox - by applying air pollution control technologies to engine exhaust (as opposed to treatments applied to the engine's intake air or during in-cylinder combustion stages).

EXHAUST GAS RECIRCULATION (EGR) SYSTEM.

helps prevent the formation of oxides of nitrogen (Nox) by recirculating a certain amount of exhaust as an inert gas through the intake manifold to keep the peak combustion temperatures below what would form those chemical compounds. The computer determines when and how much exhaust to recirculate based on information from all its other sensors. It then actuates the EGR solenoid, which opens a vacuum circuit or operates an electronic circuit or operates an electronic circuit to actually work the EGR valve. The computer uses a duty-cycle (percentage of on-time) signal to activate the solenoid.

EXHAUST GAS RECIRCULATION (EGR) VALVE

component in the EGR system, used to meter a controlled amount of exhaust gas into the intake air stream.

EXHAUST GAS RECIRCULATION (EGR)

an emissions control technique that reuses engine exhaust gases as part of the intake air supply to help reduce harmful emissions (especially Nox).

EXHAUST MANIFOLD

the part of the exhaust system that is fastened to the cylinder head.

EXHAUST PIPE

the pipe between the exhaust manifold and muffler.

EXHAUST PORT

the passage or opening in a four stroke cylinder head for the exhaust valve.

EXHAUST STROKE.

the final stroke in a 4-stroke cycle engine during which the exhaust valve is open and the intake valve is closed, exhausting the combusted gases.

EXHAUST VALVE

poppet valves in the cylinder head that control the flow of exhaust from the engine.

FEEDBACK

a basic concept in the way the engine control system works. 'Feedback' refers to the mechanism whereby the computer is able to measure the Oxygen in the exhaust stream and then modify the amount of fuel injected into the intake manifold to optimize exhaust emissions by keeping the air/fuel ratio at stoichiometry.

FLEXIBLE-FUEL VEHICLE (FFV)

a Vehicle with a common fuel tank designed to run on varying blends of unleaded gasoline with either ethanol or methanol.

FLOATING PIN

a piston pin that moves in the piston and the small end of a connecting rod. It is held in place by retaining clips in the pin bosses.

FLOODING

a condition in which unvaporized fuel in the intake manifold and/or combustion area, prevents the engine from starting.

FLUTTER

as applied to engine valves, refers to a condition wherein the valve is not held tightly on its seat due to a weak valve spring, during the time the cam is not lifting it.

FOOT POUND

a unit of measurement for torque. One foot pound is the torque obtained by a force of one pound applied to a wrench handle that is 12-in. long; a unit of energy required to raise a weight of one pound, a distance of one foot.

FOUR STROKE CYCLE ENGINE

an engine, either gasoline or diesel that uses four strokes: intake, compression, power and exhaust. A firing impulse occurs every two turns of the crankshaft. When this engine is a gasoline engine it is also called an Otto cycle engine after its inventor. A diesel engine is called a Diesel cycle engine for the same reason.

FREEZE PLUG

another name for core plug.

FUEL FLEXIBLE

ability of a vehicle to operate on either (a) a wide range of fuels blends (e.g., blends of gasoline and alcohol) or (b) two different fuels carried aboard the vehicle (e.g., gasoline and compressed natural gas).

FUEL INJECTION

a system that sprays fuel directly into the intake air stream.

FUEL INJECTOR

an electrically-opened nozzle that sprays finely atomized fuel through its aperture into the intake manifold during a cylinder's intake stroke. On some vehicles, these injections are sequential, on others, the injectors are fired all at once or in banks.

FUEL PRESSURE REGULATOR

uses intake manifold vacuum, or more properly intake manifold absolute pressure (MAP), to modify the pressure in the fuel rail. The fuel pump can pump more fuel than the engine can use, so the system routes the extra fuel back to the tank through the fuel pressure regulator.

FUEL PUMP (FP) RELAY

the computer controls the electric fuel pump by energizing the fuel pump relay. It does so by grounding the fuel pump relay coil circuit. The relay then directly supplies power to the fuel pump.

FUEL PUMP

a mechanical or electronic device that draws fuel from the fuel tank and sends it to the carburetor or fuel injection system.

FUEL RAIL

a manifold used to connect fuel injectors to the fuel pump

FUEL SHUTOFF

works by de-energizing the fuel pump relay. This occurs if the engine speed sensor indicates excessive engine speed or if the vehicle speed sensor indicates a certain mph.

FUEL TRIM (STFT / LTFT)

fuel delivery (volume) adjustments based on closed loop feedback. values above the nominal value (0%) indicate increased injector pulse width (IPW); values below 0% indicate decreased injector pulse width. Positive percentages indicate richening air/fuel ratio; negative percentages indicate a leaning air/fuel ratio. Short Term Fuel Trim (STFT) is based on current oxygen sensor switching values. Long Term Fuel Trim (LTFT) is a learned value used to compensate for continual deviation of STFT from the nominal value. For example, if STFT continually signals richening the air/fuel ratio, it will reach a value sufficient to increment the LTFT to a richer value.

FUEL, IGNITION OR SPARK MAP

a multi-dimensional 'map' that correlates engine speed, temperature, load and other factors into a specific spark advance and fuel injection pulse width for that set of conditions. There are several such 'maps' in the computer's hardwired memory. The fine-tuning of the fuel mixture is completed by the signal from the oxygen sensor. On some vehicles, a knock sensor is included to fine-tune the ignition advance to accommodate differences in fuel octane rating and engine wear.

GAS TURBINE

a rotary engine that draws energy from a fuel-air mixture. A compressor raises the pressure and temperature of the inlet air. The air is then moved into a burner, where fuel is injected and combusted to raise the temperature of the air. Power is produced when the heated, high-pressure mixture is expanded and cooled through the turbine.

GASKET

a material such as artificial rubber, cork, or steel used to seal between parts that would otherwise leak fuel, coolant, lubricants or combustion gases.

GLOW PLUG

an electrically heated wire that helps ignite diesel fuel when a compression ignition engine is cold and the compression process may not raise the air to a high enough temperature for ignition.

HARMONIC BALANCER

a device that reduces the torsional or twisting vibration that occurs along the length of the crankshaft in multiple cylinder engines. It is also called a vibration damper.

HEATED OXYGEN SENSOR(HO2S)

an oxygen sensor with a resistance element built into it to shorten the time needed to bring the sensor to operating temperature. Heated oxygen sensors will keep the sensor at operating temperature during idle, low speeds, and in very cold weather. The HO2's heater is on whenever the ignition switch is on.

HEMISPHERICAL COMBUSTION CHAMBER

a combustion chamber shape that resembles a half a globe. The valves are on the sides of the spark plug, which is in the center.

HG

the chemical symbol for the element mercury. Engine vacuum is measured in inches of mercury or in/Hg

HONE

abrasive tool for correcting small irregularities or differences in diameter in a cylinder, such as an engine cylinder or brake caliper; to enlarge or smooth a bore with a rotating tool containing an abrasive material.

HORSEPOWER (HP)

measurement of an engine's ability to perform work. One horsepower is the energy required to lift 550 pounds 1 foot in 1 second.

HOUSING BORE

the machined bore in a block or head where a bearing will be installed.

IDLE AIR CONTROL (IAC) VALVE

controls the amount of air allowed to bypass the closed throttle to keep the engine at the proper idle speed. The computer also controls the idle speed of the engine, depending on engine coolant temperature and the number of accessories such as headlights, air conditioning, etc. that are engaged. The idle air control (lAC) valve controls air flow through a throttle bypass passage by means of a stepper motor, an electric motor that can move to a specific location in its travel. Based on the information from its sensors and the parameters in its memory, the computer sends a duty-cycle (percentage of on-time) signal to the lAC valve motor to open or close the bypass to increase or slow the idle speed. This signal can range from zero to 100 percent, and corresponds to the amount of airflow the computer determines is needed. Displayed on the scan tool as counts or percentage.

IGNITABILITY

characteristic of a solid that enables it to spontaneously ignite. Any liquid with a flash point below 140Ã‚Â°F is said to possess ignitability.

IGNITION COIL

transforms the low 12-volt battery ignition primary current into the high voltage secondary current that fires the spark in the plugs. The current through the primary coil windings builds up an electromagnetic field around the ferrous core of the coil. When the current is suddenly shut off, the electromagnetic field collapses and generates the high voltage in the secondary windings.

IGNITION CONTROL MODULE (ICM)

the computer does not directly operate the ignition coil, because of the comparatively high voltages and currents involved. Instead, it signals the ignition control module when to fire the spark. The (ICM) has a power transistor which turns on the ignition primary circuit to charge the coil by building an electromagnetic field around the ferrous core, and fires the spark by shutting off the current to the primary circuit, al/owing the field to collapse and generate a high voltage spark current in the coil secondary circuit. The ignition control module typically includes additional internal circuits to perform other functions such as calculating dwell. Some modern systems have dwell and timing control in the PCM regulating the ICM to the duties of an on-off switch for the coil.

IGNITION SWITCH

a key operated switch located on the steering column, that connects and disconnects power to the ignition and electrical systems.

IGNITION SYSTEM

the components that produce the spark to ignite the air/fuel mixture in the combustion chamber.

IGNITION TIMING

refers in crankshaft degrees to the position of the piston in the cylinder when the spark occurs.

I-HEAD

a valve arrangement in most modern engines where the valve is positioned above the piston (in the cylinder head). The engine can be either an OHC (overhead cam) or pushrod type.

IMPELLER

commonly referred to as a pump, the impeller is the rear halt ot the torque converter shell that drives the turbine; a driving nember in a turbine or pump.

INCH POUND

one twelfth of a foot pound.

INJECTOR

a device which receives metered fuel under relatively low pressure and is activated either electrically or mechanically to spray the fuel under relatively high pressure into the engine.

INSERT GUIDES

valve guides that are pressed fit in the cylinder head

INSTALLED SPRING HEIGHT

distance from the valve spring seat to the underside of the valve spring retainer.

INSTALLED STEM HEIGHT

distance from the valve spring seat to the stem tip.

INTAKE AIR TEMPERATURE (IAT) SENSOR

works by a negative coefficient thermistor that loses resistance as its temperature goes up (like the engine coolant temperature sensor). When the computer applies its 5-volt reference signal to the sensor, this voltage is reduced through a ground circuit by an amount corresponding to the temperature of the intake air.

INTAKE MANIFOLD

a part with runners that connect the fuel system to the intake valve ports.

INTAKE PORT

the passage or opening in a cylinder head that is closed by the intake valve.

INTAKE STROKE

the first stroke of a 4-stroke cycle engine in which the intake valve is open and the exhaust valve is closed, during which the downward motion of the piston draws the fuel/air mixture into the cylinder.

INTAKE VALVE

also called inlet valve, it closes off the intake port and opens it at the correct time in response to movement from the cam lobe.

INTEGRAL GUIDES

valve guides that are part of the cylinder head.

INTEGRAL SEATS

valve seats that are part of the head.

INTERCOOLER

a component on some turbocharged engines used to cool the compressed intake air.

INTERNAL COMBUSTION ENGINE (ICE)

engine that converts the energy contained in the fuel inside the engine into motion. Combustion engines use the pressure created by the expansion of the gases to do mechanical work.

JET

precisely-sized, calibrated hole in a hollow passage through which fuel or air can pass.

JOURNAL

the bearing surface on a shaft.

KEEPERS

small locks that hold the valve retainer onto the valve stem. Also called split locks.

KNOCK SENSOR(KS)

a sensor used in the engine control system that detects preignition, detonation and knocking. It contains a piezoelectric crystal that produces an AC voltage under vibration.

LAPPING

the process of fitltng one surface to another by rubbing them together with an abrasive material between the two surfaces.

LASH ADJUSTER

a device for adjusting valve lash or maintaining zero lash in certain types of OHC engines. The lash adjuster is stationary in the cylinder head, with one end of a cam follower mounted on top of it. The other end of the follower acts on the valve stem when the camshaft lobe, which is positioned over the center of the follower, pushes the follower down.

LASH

the amount of clearance between components in a geartrain or valvetrain.

LEAN BURN ENGINE

a lean burn engine is designed to operate with a very lean air-fuel ratio during light load conditions. Most modern gasoline engines are controlled to run at a chemically correct (stoichiometric) air fuel ratio (about 14.7:1) to make the three-way catalyst operate at high efficiency, reducing tailpipe emissions. Lean burn engines mix more air with the fuel when full power is not needed, resulting in better fuel economy. Air/fuel ratio in lean burn engines can be as high as 20:1. When full power is needed, such as during acceleration or hill climbing, a lean burn engine reverts to a stoichiometric (14.7:1) ratio or richer.

LIFTER BORES

the holes in an engine block that the litters fit into.

LIFTER

the valvetrain part that rides on the camshaft lobe.

LITER (L)

a metric measurement used to calculate the volume displacement of an engine. One liter is equal to 1,000 cubic centimeters or 61 cubic inches.

LOBE

the eccentric part of the camshaft that moves the lifter.

LOCATING LUG

the tab on a bearing back that fits into the slot in the main or rod bearing bore to locate it properly.

M85

85% methanol and 15% unleaded gasoline by volume, used as a motor fuel in FFVs.

MAF SENSOR

see 'mass airflow sensor'.

MAIN BEARING CAPS

the lower removable lower halves of the main bearing bores.

MAIN BEARING CLEARANCE

the clearance between the main bearing journal and its bearings.

MAIN BEARING JOURNAL

the central, load-bearing points along the axis of a crankshaft, where the main bearings support the shaft in the block.

MAIN BEARING SADDLE BORES

the housings that are machined for main bearings.

MAIN BEARINGS

the plain bearings that support the crankshaft in the engine block.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR

a sensor that measures changes in intake manifold pressure resulting from changes in engine load and speed. The pressure in the intake manifold as referenced to a perfect vacuum. Manifold vacuum is the difference between MAP and atmosphere pressure. For example, in a standard atmosphere (sea level) the pressure is 29.92 inches of mercury, 101 kilopascals, or 0 inches of vacuum.

MANIFOLD ABSOLUTE PRESSURE

measure of the degree of vacuum or pressure within an intake manifold.

MANIFOLD VACUUM

relatively low pressure in an engine's intake manifold just below the throttle plate(s). Manifold vacuum is highest at idle and drops during acceleration.

MAP SENSOR

see 'manifold absolute pressure sensor'.

MASS AIRFLOW (MAF) SENSOR

a sensor in a fuel injection system that measures the mass (weight/density) of the incoming air flowing through a meter. The measurement transmitted to the PCM is usually either a frequency or a voltage.

MISFIRE

failure of an explosion to occur in one or more cylinders whiIe the engine is running; can be continuous or intermittent failure.

MISS

a lack of power observed in one or more cylinders, either regularly or intermittently.

MULTI-PORT FUEL INJECTION (MFI)

a fuel injection system in which there is one fuel injector for each cylinder.

MULTIVISCOSITY OIL

chemically-modified oil that has been tested for viscosity at cold and hot temperatures.

MUSHROOM LIFTERS

lifters with contact faces that are wider than the lifter bore. They must be installed through the bottom of the lifter bores, before the cam is installed.

MUSHROOMED VALVE STEM TIP

a folding over of the metal at the tip of the valve stem in response to pounding from too loose a valve adjustment or a defective hydraulic lifter.

NITROGEN OXIDES (NOX)

a by-product of the combustion process when using petroleum-based fuels; one of the primary causes of acid rain and a contributor to global warming.

OHC ENGINE

overhead cam engine. An engine with the camshaft located in the cylinder head.

OIL CLEARANCE

the difference between the inside bearing diameter and the journal's diameter.

OIL GALLERY

a line that supplies oil to areas of the engine block or cylinder head.

OIL GROOVE

a groove machined in the bearing surface that provides a channel for oil flow.

OIL PAN

the part that encloses the crankcase at the lower end of the block.

OIL PRESSURE

the pressure that results from resistance to flow from the oil pump. As the pump turns faster, it produces more flow. A relief valve limits the amount of pressure it can produce.

OIL PUMP PICKUP

the screen that filters and keeps debris out of the oil pump.

OIL PUMP

the pump that circulates lubricating oil throughout the engine, usually driven by the camshaft (by way of the distributor).

OIL RINGS

the bottom ring on the pistons, scrapes excess oil from the cylinder walls to keep it from entering and burning in the combustion chamber.

ON-BOARD DIAGNOSTICS (OBD)

a diagnostic software system in the ECM or PCM that monitors computer inputs, outputs, and resultant engine/transmission operations for failure. OBD-l is thought of as any of the systems in use before OBD-ll , typically 1979 to 1995 systems, although some OEMs started transitioning to OBD-ll in 1994 and 1995. OBD-ll has been a federally mandated system since 1996, it monitors emission control systems for degradation as well as for failures.

OPEN-LOOP FUEL CONTROL

system in which the air/fuel mixture is preset by design with no feedback correction signal to optimize fuel metering.

OSCILLOSCOPE

an instrument that displays electrical activity in the form of line patterns on a screen.

OVERBORE

the dimension by which a machined hole is larger than the standard size.

OVERHEAD CAM (OHC) ENGINE

an engine with the camshaft located in the cylinder head.

OVERHEAD VALVE ENGINE

an I-head engine. The intake and exhaust valves are located in the cylinder head.

OXIDES OF NITROGEN (NOX)

regulated air pollutants, primarily NO and NO2 but including other substances in minute concentrations. Under the high pressure and temperature conditions in an engine, nitrogen and oxygen atoms in the air react to form various Nox. Like hydrocarbons, Nox are precursors to the formation of smog. They also contribute to the formation of acid rain.

OXYGEN SENSOR (O2S)

a sensor that consists of a ceramic zirconium thimble, coated on each side with a very thin film of platinum. Once it reaches operating temperature of 600Ã‚Â°F, the oxygen sensor begins to function as a very low current battery, producing between 0 and 1.0 volt with the output corresponding to the difference in oxygen between the exhaust and the ambient air. The signal from the oxygen sensor enables the computer to keep the air/fuel mixture as close as possible to the stoichiometric mixture. Under normal conditions, the oxygen sensor signal should fluctuate above and below 450 millivolts several times a second while the system is in closed loop.

PARTICULATE TRAP

diesel vehicle emission control device that traps and incinerates diesel particulate emissions after they are exhausted from the engine but before they are expelled into the atmosphere.

PCV SYSTEM

see 'positive crankcase ventilation system'.

PCV VALVE

a part of the positive crankcase ventilation system. Meters crankcase vapors into the intake manifold.

PISTON HEAD

the part of the piston that is above the rings.

PISTON PIN

see 'wrist pin',

PISTON RING

an open-ended ring which fits into a groove on the outer diameter of the piston. Its chief function is to form a seal between the piston and cylinder wall. Most automotive pistons have three rings: two for compression sealing, one for oil sealing.

PISTON SLAP

a noise that result from excessive piston to cylinder wall clearance.

PISTON

the cylindrical component that is attached to the connecting rod and moves up and down in the cylinder bore. The top of the piston forms the bottom of the combustion chamber. When combustion occurs, the piston is forced downward in the cylinder, moving the connecting rod which in turn rotates the crankshaft.

PLASMA-ASSISTED CATALYSIS

a diesel exhaust treatment system that uses a small amount of electricity from the engine to generate a nonthermal plasma (NTP) on a ceramic surface. The resulting reaction can reduce Nox and particulates by up to 90% without onboard chemicals or heating.

PLASTIGAGE

a plastic material that is compressed between a bearing and journal, and the resulting compressed material measured to determine the clearance.

PORT FUEL INJECTION (PFI)

port fuel injection (used spark-ignition engines) have injectors in the intake port near the valve. During the intake stroke, fuel sprayed into the port enters the combustion chamber along with the air charge.

PORT FUEL INJECTION

a fuel injection system that uses one injector at each cylinder, making fuel distribution exactly equal among all the cylinders.

PORTS

valve openings in a cylinder head.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

a system that controls crankcase emissions by using a valve to meter crankcase vapors nto the intake manifold.

POWER STROKE

the third stroke of a four-stroke cycle engine which begins with the combustion of the fuel/air mixture, driving the piston away from top dead center, which then exerts turning force on the crankshaft.

PRECOMBUSTION CHAMBER

a diesel engine design with a small combustion chamber in the cylinder head that contains the fuel injector. The fuel is ignited in this chamber. This design is often used with automotive diesels because of lower combustion pressures and because fuel quality is not as critical.

PREIGNITION

also called ping, it is abnormal combustion of the air/fuel mixture before it is time to do so. A hot surface or carbon deposit in the combustion chamber ignites the air/fuel mixture before the spark plug is fired. The sound of preignition can be heard as the cylinder walls vibrate. Detonation is sometimes confused with preignition.

PRIMARY CIRCUIT

the low-voltage circuit of an ignition system.

PRUSSIAN BLUE

a paste used to determine the contact area between two parts, such as the height of the valve seat on the valve face.

PUMP OCTANE

the octane as posted on retail gasoline dispensers as (R+M)/2; same as Antiknock Index.

PUSH ROD

a rod between the lifter and rocker arm. They are sometimes hollow to allow oil distribution to the valves.

RADIATOR CAP

a device that seals the radiator and maintains a set pressure in the cooling system.

RADIATOR

the part of the cooling system that acts as a heat exchanger, transferring heat to atmosphere. It consists of a core and holding tanks connected to the cooling system by hoses.

REAR MAIN OIL SEAL

a seal that fits around the rear of the crankshaft to prevent oil leaks.

RECIPROCATING

an up and down or back and forth motion.

RIDGE REAMER

a tool used to remove the ridge from the top of a cylinder bore.

RIDGE

a raised area at the top of a cylinder bore created by ring lear. The ridge occurs because the piston ring does not travel all the way to the top of the bore, thereby leaving an unused portion of cylinder bore above the limit of ring travel. This ridge will usually be more pronounced on high mileage engines.

RIDGED HONE

a hone that removes metal and imparts a precise finish and crosshatch to the bore.

RING END GAP

the clearance between the ends of a piston ring when installed in the cylinder bore.

RING FILE

a tool used to trim the ends of a piston ring to bring the ring end gap within specification.

RING LANDS

the raised parts between the piston ring grooves.

ROCKER ARM

a pivot lever mounted on a round shaft or a stud. One end of the rocker arm is applied by the push rod and the other end acts upon the valve stem.

ROCKER SHAFT

a round pipe that is mounted parallel on top of the cylinder head. All of the rocker arms on the head are mounted on it.

ROCKER STUD

a stud that is pressed or threaded into a cylinder head on which the rocker arm is mounted.

SCAN TOOL DATA

Information from the ECM, PCM ,or VCM that is displayed on the scan tool. This data includes component and system values on the data stream, DTCs, and on some systems, freeze frame data, system monitors and readiness monitors.

SEAT

a surface (Usually machined) upon which another part rests or seats (e.g., valve seat).

SEQUENTIAL FUEL INJECTION (SFI)

a fuel injection system that uses one electronically pulsed fuel injector for each cylinder. The injectors are pulsed in firing-order sequence, ordinarily during the engine's intake stroke for that cylinder.

SERPENTINE BELT

a flat, ribbed drive belt that makes multiple angles, driving several components.

SLUDGE

when oil is not changed often enough, moisture and by products of combustion combine in the engine oil to form sludge.

SPARK KNOCK

engine noise caused by abnormal, uncontrolled combustion due to preignition or detonation.

SPARK PLUG

an electrical device that is connected to a high voltage source. The high voltage travels down an electrode inside the spark plug and arcs across an air gap, thereby creating the spark that starts the combustion process in the combustion chamber.

SPARK-IGNITION (SI) ENGINE

an internal combustion engine in which the fuel mixture is ignited electrically. A spark-ignition engine runs on an Otto cycle - most gasoline engines run on a modified Otto cycle. This cycle uses a homogeneous air-fuel mixture that is combined before it enters the combustion chamber. Once in the combustion chamber, the mixture is compressed, then ignited by a spark plug (spark ignition). The engine is controlled by limiting the amount of air allowed inside through the use of a throttling valve placed on the air intake (carburetor or throttle body).

STOICHIOMETRIC.

chemically correct. An air/fuel mixture is considered stoichiometric when it is neither too rich nor too lean; an ideal mixture is composed of 14.7 parts air to one part fuel.

STROKE

the distance the piston moves from TDC to BDC.

SUPERCHARGER

a compressor, mechanically driven by the engine's crankshaft, that pumps air into the intake manifold.

SWIRL COMBUSTION

a swirling of the air/fuel mixture in a corkscrew pattern that improves combustion.

TAILPIPE EMISSIONS

EPA-regulated vehicle exhaust emissions released through the vehicle tailpipe. Tailpipe emissions do not include evaporative and refueling emissions, which are also regulated by EPA. EPA publishes allowable emission levels and vehicle certification standards in the Code of Federal Regulations.

TDC

see 'top dead center'.

TETRAETHYL LEAD OR LEAD

an octane enhancer. One gram of lead increases the octane of one gallon of gasoline about 6 numbers. The EPA has phased down the use of lead in gasoline as it has been determined to be a health hazard. Lead has been prohibited in highway vehicle gasoline since January 1, 1996.

THREE-WAY CATALYTIC CONVERTER (TWC)

a catalytic converter system that reduces exhaust gas emission levels. Usually consists of two beds of catalyst, the upstream bed (reduction bed) reducing Nox emissions to nitrogen and oxygen and the downstream bed (oxidation bed) reducing HC and CO emissions to CO2, 02, and H2O.

THROTTLE BODY INJECTION (TBI)

also called central fuel injection, it has an intake manifold like that used with a carburetor. One or more fuel injectors are mounted in the throttle body, which resembles a carburetor in physical appearance.

THROTTLE POSITION (TP) SENSOR

a potentiometer that is mechanically connected to the throttle shaft of the throttle body assembly. It provides an input to the vehicle computer control system regarding throttle position. The TP sensor reduces the 5-volt reference voltage supplied by the computer to an amount corresponding to the degree to which the driver is holding the throttle open by foot.

THROTTLE VALVE (TV) PRESSURE.

in an automatic transmission, line pressure that passes through the valley of the throttle pressure spool valve.

TIMING BELT

a toothed reinforced belt used to drive the camshaft from a sprocket on the crankshaft.

TIMING CHAIN

a chain that drives the camshaft from a sprocket on thecrankshatt.

TIMING GEARS

gears that drive the camshaft from the crankshaft.

TIMING

refers in crankshaft degrees to the position of the piston in the cylinder. When referring to camshaft timing, it is when the valves open. When referring to ignition timing, it is when the spark occurs.

TOP DEAD CENTER (TDC)

the position of the crankshaft for a specific cylinder when the piston is at the highest point in its vertical travel on the compression stroke.

TORQUE

the turning force produced by an engine.

TORQUE-TO-YIELD HEAD BOLTS

head bolts that are often not reusable. They are torqued into yield, which means that they have purposely stretched beyond the point where they will return to their original length. This provides more uniform clamping force.

TP SENSOR

see 'throttle position sensor'.

TURBINE

machine for generating rotary mechanical power from the energy in a stream of fluid. The energy, originally in the form of head or pressure energy, is converted to velocity energy by passing through a system of stationary andmoving blades in the turbine.

TURBOCHARGER

an exhaust driven pump which compresses intake air and forces it into the combustion chambers at higher than atmospheric pressure. The increased air pressure allows more fuel to be burned and results in increased horsepower being produced.

UMBRELLA TYPE VALVE SEALS

valve guide seals that fit tightly on the valve stem. They move up and down with the valve stem acting like an umbrella to shield oil away.

VACUUM ADVANCE

a distributor mounted mechanism that controls spark advance in response to engine vacuum.

VALVE COVER

an enclosure fastened to the top of a cylinder head, over the valvetrain.

VALVE DURATION

the length of time, in degrees of crankshaft rotation, that a valve is open.

VALVE FACE

the area of the valve that contacts the valve seat.

VALVE FLOAT

when valves remain open, usually at high rpm, due to weak or broken valve springs.

VALVE GUIDE KNURLING

a method of refinishing the inside of a valve guide by restoring its original size. This method can be used on guides worn less than 0.007-in.

VALVE GUIDE LINER

a thin bronze bushing installed in a valve guide to restore it to original size.

VALVE GUIDE

a bore in the cylinder head that the valve stem fits into.

VALVE KEEPERS

small locks that hold the valve retainer onto the valve stem. Also called split locks.

VALVE LASH

the amount of clearance in the valvetrain when the lifter is on the base circle of the camshaft lobe.

VALVE LIFT

the distance from the valve seat when the valve is fully open.

VALVE LIFTER

a small cylinder that fits into a bore above the cam lobe. It acts on a push rod and rocker arm to open the valve.

VALVE ROTATOR

a part found at the end of some valve springs that rotates the valve each time it opens. This aids in providing even cooling to the valve.

VALVE SEAL

a seal located over the valve stem, used to prevent oil from leaking down the valve guide and into the combustion chamber.

VALVE SEAT

the machined surface that the valve face seats against.

VALVE SPRING COMPRESSOR

a tool used to compress the valve spring on a cylinder head. When the valve spring is compressed, the valve keepers can be removed, then the spring is released and the spring, valve spring retainer and valve can be removed from the cylinder head.

VALVE SPRING INSTALLED HEIGHT

the specified distance between the machined spring seat on the cylinder head to the underside of the valve spring retainer. Both grinding the valve and grinding the valve seat result in an increase in this dimension. A shim can be installed under the spring to restore the original installed height for proper spring tension.

VALVE SPRING RETAINER

the part that connects the valve spring to the valve and holds the valve against the cylinder head. It is held to the valve by keepers.

VALVE SPRING SEATS

metal shims used, usually on aluminum cylinder heads, to protect the head from the bottom of the valve spring.

VALVE SPRING

a small coil spring used to keep the valve closed against the valve seat.

VALVE STEM

the part of the valve that is inside the valve guide.

VALVE TIMING

set rotations of the camshaft and crankshaft to open/close valves at proper intervals during the piston strokes for optimal operation of an engine.

VALVE TRAIN GEOMETRY

the dynamic relationship between the rocker arm and valve stem during the time when the valve is opening and closing.

VALVETRAIN

parts that convert camshaft movement to valve movement. These include the camshaft, cam timing parts, lifters or cam followers, push rods, rocker arms, valve and spring.

VARIABLE FUEL VEHICLE (VFV)

a vehicle that has the capacity of burning any combination of gasoline and an alternative fuel. Also known as a flexible-fuel vehicle.

VARIABLE VALVE TIMING

variable valve timing allows the point at which an engine's valves open and close to change with operating conditions - such as engine speed and throttle position. In addition to changing the valve timing with respect to the crankshaft, some systems also change the duration the valve is open and the extent to which it opens. Varying these parameters allows the engine to operate more efficiently at all engine speeds while maintaining driveability.

VIBRATION DAMPER

see 'harmonic balancer'.

WASTEGATE

a valve used to limit the boost developed in a turbocharger. A wastegate allows some of an engine's exhaust flow to bypass the turbocharger's turbine under certain conditions.

WATER JACKET

also called a cooling jacket, it is the hollow area of a casting designed for coolant flow.

WET SLEEVE

a sleeve, which when installed in a cylinder block, is exposed to coolant.

WRIST PIN

a hollow metal tube that secures the piston to the connecting rod and allows the piston to swivel on the rod. Also called a piston pin.

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Exhaust Systems

EXHAUST SYSTEMS

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to

honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

EXHAUST SYSTEMS

WARNING: **Federal EPA rules prohibit altering an exhaust system in any way that defeats the emission reduction components of a vehicle. Be sure to review and adhere to EPA policy on removing and replacing catalytic converters. Where state or local laws are stricter, they take precedence over these guidelines.**

NOTE: **Some exhaust systems are of a welded design. It is not required that the entire system be replaced. Determine the need to replace individual components based on conditions of component.**

CATALYTIC CONVERTERS

Condition	Code	Procedure
Air injection tube broken	A	Require repair or replacement of injection tube or replacement of catalytic converter
Air injection tube burnt	A	Require repair or replacement of injection tube or replacement of catalytic converter
Air injection tube leaking	A	Require repair or replacement of injection tube or replacement of catalytic converter
Air injection tube loose	A	Require repair or replacement of injection tube or replacement of catalytic converter
Air injection tube restricted	A	Require repair or replacement of injection tube or replacement of catalytic converter
Air injection tube threads damaged	A	Require repair or replacement of injection tube or replacement of catalytic converter
Air injection tube threads stripped (threads missing)	A	Require repair or replacement of injection tube or replacement of catalytic converter
Body Cracked	B	Require repair or replacement
Converter empty	A	Require repair or replacement
Converter fill plug missing	C	Require repair or replacement
Converter missing	C	Require repair or replacement
Exhaust gases leaking	A	Require repair or replacement
Flanges leaking	A	Require repair or replacement of flanges
Inlet pipes cracked	B	Require repair or replacement
Internal rattle (except pellet-type)	2	Further Inspection required
NOTE: **If the converter is breaking up, suggest converter replacement. If an object has fallen into the converter, remove object**		
Mounting brackets that are part of converter broken	A	Require repair or replacement
Obvious overheating	Require testing of converter	

Condition	Code	Procedure
NOTE: **Overheating is caused by something other than the converter. Further diagnosis is required to determine the cause of the overheating.**		
Outlet pipes cracked	B	Require repair or replacement
Pieces of catalyst material found downstream	1	Suggest replacement
Plugged	A	Require replacement
NOTE: **Determine cause and correct to ensure that new converter will not become plugged.**		
Testing has determined that existing converter has been lead-poisoned, contaminated or failed testing	A	Require repair or replacement

EXHAUST AND TAIL PIPES

Condition	Code	Procedure
Broken bracket	A	Require repair or replacement
Pipe Bent Out Of Position	B	Require repair or replacement
Pipe Broken	A	Require repair or replacement
Pipe Cracked	B	Require repair or replacement
Pipe Leaking	A	Require replacement
Pipe Missing	C	Require replacement
Pipe Plugged	A	Require replacement
Pipe Weak Due To Corrosion, But No Leaks Present	1	Suggest replacement
Weld Broken	A	Require repair or replacement

EXHAUST CONNECTIONS

Condition	Code	Procedure
Attaching hardware Incorrect	B	Require replacement of hardware
Clamp broken	A	Require replacement
Clamp Loose	A	Require repair or replacement
Clamp missing	C	Require replacement
Corroded, affecting structural integrity	1	Suggest replacement
Incorrect type (i.e. Flange, Ball & Socket, etc.)	B	Require replacement
Leaking	A	Require repair
Loose	A	Require repair

HANGERS

Condition	Code	Procedure
Broken	A	Require replacement
Corroded, affecting structural integrity	1	Suggest replacement
Incorrect type	B	Require replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Out of position	B	Require repair or replacement

Condition	Code	Procedure
Rubber deteriorated	1	Suggest replacement

HEAT RISERS (MECHANICAL EFE DEVICES)

Condition	Code	Procedure
Broken	A	Require replacement of affected parts
Diaphragm Inoperative	A	Require replacement
NOTE: **If the inoperative diaphragm is separate from the heat riser, then require replacement of the inoperative diaphragm. If the inoperative diaphragm is part of the heat riser, then replace the heatriser**		
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement of affected parts
Seized	A	Require repair or replacement of affected parts
Spring broken	B	Require replacement of spring(s)
Spring Inoperative	A	Require replacement of spring(s)

HEAT SHIELDS

Condition	Code	Procedure
Bent, affecting performance	B	Require repair or replacement
Broken	A	Require replacement
Corroded affecting structural integrity	1	Suggest replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement

MANIFOLDS (CAST AND TUBE TYPE)

Condition	Code	Procedure
Air injection tube in manifold broken	A	Require repair or replacement of injection tube or replacement of manifold
Air injection tube in manifold corroded, affecting structural integrity	1	Suggest replacement of Injection tube or manifold
Air injection tube in manifold leaking	A	Require repair or replacement of injection tube or replacement of manifold
Air injection tube in manifold loose	A	Require repair
Air injection tube in manifold restricted	A	Require replacement of injection tube or manifold
Air injection tube in manifold threads damaged	A	Require repair of injection tube or manifold
Air injection tube in manifold threads stripped (threads missing)	A	Require replacement of injection tube or manifold
Bolt Broken	A	Require replacement of bolt(s)

Condition	Code	Procedure
Bolt Loose	A	Require tightening or replacement of bolt(s)
Bolt Missing	C	Require replacement of bolt(s)
Corroded, affecting sealability	A	Require repair or replacement
Cylinder head threads stripped	A	Require repair or replacement of cylinder head
Gasket leaking	A	Require tightening or replacement of gasket
Heat Stove Bent	B	Require Repair Or Replacement of Stove
NOTE: **Stove may not be available separately. This may require replacement of manifold.**		
Heat Stove Broken	A	Require replacement of stove
NOTE: **Stove may not be available separately. This may require replacement of manifold.**		
Heat Stove Corroded, Affecting Structural Integrity	1	Suggest replacement of stove
NOTE: **Stove may not be available separately. This may require replacement of manifold.**		
Heat Stove Missing	C	Require replacement of stove
NOTE: **Stove may not be available separately. This may require replacement of manifold.**		
Manifold Broken	A	Require repair or replacement
Manifold Cracked	B	Require repair or replacement
Manifold Warped	A	Require repair or replacement
Out of specification	B	Require repair or replacement
Stud broken	A	Require replacement of stud
Stud missing	C	Require replacement of stud
Stud threads damaged	A	Require Repair Or Replacement of Stud
Stud threads stripped (threads missing)	A	Require replacement of stud

MECHANICAL EFE DEVICES

Condition	Code	Procedure
Broken	A	Require replacement of affected parts
Diaphragm Inoperative	A	Require replacement
NOTE: **If the inoperative diaphragm is separate from the heat riser, then require replacement of the inoperative diaphragm. If the inoperative diaphragm is part of the heat riser, then replace the heatriser**		
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement of affected parts
Seized	A	Require repair or replacement of affected arts

Condition	Code	Procedure
Spring broken	B	Require replacement of spring(s)
Spring Inoperative	A	Require replacement of spring(s)

MUFFLER VALVE

Condition	Code	Procedure
Inoperative	A	Require repair or replacement
NOTE: **It may be necessary to replace the muffler assembly to correct this condition.**		

MUFFLERS AND RESONATORS

Condition	Code	Procedure
Body shell distorted, affecting performance or structural integrity	A	Require replacement
Corrosion Hole	A	Require replacement
Missing	C	Require replacement
Mounting bracket broken	A	Require repair or replacement
Mounting bracket cracked	B	Require repair or replacement
Nipple Cracked	A	Require repair or replacement
Nipple Loose	B	Require replacement
Outer wrap peeling (Exhaust Not Leaking)	1	Suggest replacement
Plugged	A	Require replacement
Puncture (other than drain hole)	A	Require replacement
Rattling or knocking noise from inside muffler	B	Require replacement
Seam open (exhaust leaking)	A	Require replacement
Sound quality unsatisfactory	2	Suggest replacement to address customer need and/or request
Split (exhaust leaking)	A	Require replacement
NOTE: **Further diagnosis required to determine cause of the split seam (i.e. Backfiring).**		
Weak due to corrosion, but no leaks present	1	Suggest replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Heating, Ventilation And Air Conditioning Systems

HEATING, VENTILATION & AIR CONDITIONING SYSTEMS

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to

honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	**Reasons to Suggest Repair or Replacement**
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

HEATING, VENTILATION & AIR CONDITIONING SYSTEMS

NOTE: AIR CONDITIONING SYSTEM FLUSHING utilizes chemicals or refrigerant to remove oil, debris and contaminants from the evaporator, condenser, hoses or metal lines.

NOTE: An INLINE FILTER, both high and low side, protects a/c components from residual debris in the system. An inline filter or suction screen is suggested when a condenser, evaporator, compressor, expansion valve, accumulator/drier, hoses or metal lines is replaced, or if debris is found in the system during an a/c repair. An inline filter is suggested to help prevent future component damage and increase system longevity.

ACCUMULATORS

Condition	Code	Procedure
NOTE: **When replacing this component it is suggested to install or replace high and low side inline filters to prevent future component damage (see Code 5).**		
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Beyond vehicle manufacturer's service interval	3	Suggest replacement
Desiccant at the end of its useful life (saturated with moisture)	1	Suggest repair or replacement
Desiccant bag deteriorated	A	Require replacement. Further inspection required
NOTE: **Inspect system to determine effects of desiccant bag deterioration.**		
Leaking	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Tubing connection leaking	A	Require repair or replacement

ACTUATORS (ELECTRICAL)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

ACTUATORS (VACUUM)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking (vacuum)	A	Require repair or replacement
Linkage bent, affecting performance	A	Require repair or replacement of linkage
Linkage bent, not affecting performance	2	Suggest repair or replacement of linkage
Linkage binding, affecting performance	A	Require repair or replacement of linkage
Linkage binding, not affecting performance	1	Suggest repair or replacement of linkage
Linkage broken	A	Require repair or replacement of linkage
Linkage loose, affecting performance	A	Require repair or replacement of linkage
Linkage loose, not affecting performance	1	Suggest repair or replacement of linkage
Linkage missing	C	Require replacement
Linkage noisy	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement

AIR CONDITIONING FITTINGS

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Clamp corroded, not reusable	1	Suggest replacement
Connected incorrectly	A	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Cracked	A	Require repair or replacement
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Routed incorrectly	B	Require repair
Swollen	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

AIR CONDITIONING HOSES

NOTE: **When replacing this component it is suggested to install or replace high and low side inline filters to prevent future component damage (see Code 5).**

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Clamp corroded, not reusable	1	Suggest replacement
Connected incorrectly	A	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Cracked	A	Require repair or replacement
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Routed incorrectly	B	Require repair
Swollen	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

AIR CONDITIONING METAL LINES

NOTE: **When replacing this component it is suggested to install or replace high and low side inline filters to prevent future component damage (see Code 5).**

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Clamp corroded, not reusable	1	Suggest replacement
Connected incorrectly	A	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Cracked	A	Require repair or replacement
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Routed incorrectly	B	Require repair
Swollen	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

AIR CONTROL DOORS

Condition	Code	Procedure

Condition	Code	Procedure
Air control door binding	A	Require repair or replacement
Air control door broken	A	Require repair or replacement
Air control door leaking	A	Require repair or replacement
Air control door seized	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	2	Suggest repair or replacement
Drain hole restricted	A	Require repair
Drain plugged	A	Require repair
Duct disconnected	A	Require repair or replacement
Duct leaking	A	Require repair or replacement
Duct missing	C	Require replacement
Duct restricted	A	Require repair or replacement
Leaking	B	Require repair or replacement
Noisy	2	Suggest cleaning or repair
Odor	2	Suggest cleaning or repair
Restricted	A	Require cleaning, repair, or replacement

AIR DAMS (EXTERNAL)

Condition	Code	Procedure
Application incorrect, affecting air conditioning system performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting air conditioning system performance	A	Require repair or replacement
Blocked, affecting air conditioning system performance	A	Require repair or replacement
Broken, affecting air conditioning system performance	A	Require repair or replacement
Cracked, affecting air conditioning system performance	A	Require repair or replacement
Loose, affecting air conditioning system performance	A	Require repair
Loose, not affecting air conditioning system performance	2	Suggest repair
Missing, affecting air conditioning system performance	C	Require replacement

AIR DISTRIBUTION SYSTEM

Condition	Code	Procedure
Air control door binding	A	Require repair or replacement
Air control door broken	A	Require repair or replacement
Air control door leaking	A	Require repair or replacement
Air control door seized	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	2	Suggest repair or replacement
Drain hole restricted	A	Require repair
Drain plugged	A	Require repair
Duct disconnected	A	Require repair or replacement
Duct leaking	A	Require repair or replacement
Duct missing	C	Require replacement
Duct restricted	A	Require repair or replacement
Leaking	B	Require repair or replacement
Noisy	2	Suggest cleaning or repair
Odor	2	Suggest cleaning or repair
Restricted	A	Require cleaning, repair, or replacement

BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Serpentine belt routed incorrectly	B	Require repair
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement
Worn so it contacts bottom of pulley	A	Require replacement

BLEND DOORS

Condition	Code	Procedure
Air control door binding	A	Require repair or replacement
Air control door broken	A	Require repair or replacement
Air control door leaking	A	Require repair or replacement
Air control door seized	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	2	Suggest repair or replacement
Drain hole restricted	A	Require repair
Drain plugged	A	Require repair
Duct disconnected	A	Require repair or replacement
Duct leaking	A	Require repair or replacement

Condition	Code	Procedure
Duct missing	C	Require replacement
Duct restricted	A	Require repair or replacement
Leaking	B	Require repair or replacement
Noisy	2	Suggest cleaning or repair
Odor	2	Suggest cleaning or repair
Restricted	A	Require cleaning, repair, or replacement

BLOWER FANS (BLOWER WHEEL OR SQUIRREL CAGE)

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Cracked	B	Require replacement
Distorted	A	Require replacement
Fins missing	C	Require replacement
Hub separated	A	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Mounting loose	A	Require repair or replacement
Noisy	2	Suggest replacement
Out of balance	A	Require repair or replacement

BLOWER MOTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Current draw out of specification	B	Require repair or replacement
Inoperative	A	Require replacement

Condition	Code	Procedure
NOTE: **Check fan motor/controls. Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Motor speed insufficient	2	Suggest repair or replacement
Noisy	2	Suggest replacement
Rotation incorrect for application	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Vibration	1	Suggest replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

BLOWER RESISTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware,
Attaching hardware not functioning	A	Require repair or replacement of hardware
Conductor exposed	A	Require replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	1	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Insulation overheated	A	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

BLOWER SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
NOTE: **Missing includes high pressure cut-off switches not installed during a retrofit from R12 to 134a.**		
Out of adjustment	B	Require repair or replacement
Pressure switch leaking	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

CABIN AIR FILTERS

Condition	Code	Procedure
Air flow obstruction	A	Require cleaning or replacement
At or beyond service interval	3	Suggest replacement
Microbial growth causing odor	A	Require replacement of filter
Missing	C	Require replacement

CIRCUIT BREAKERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Blown	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Insulation damaged, conductors exposed	A	Suggest repair or replacement
Missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

COMPRESSOR CLUTCH ASSEMBLIES

Condition	Code	Procedure
Air gap incorrect	B	Require repair or replacement

Condition	Code	Procedure
Bearing seized	A	Require replacement of bearing or assembly
Bearing worn, affecting performance	A	Require replacement of bearing or assembly
Coil shows signs of overheating	1	Suggest replacement of coil
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Hub broken	A	Require replacement
Hub cracked	B	Require replacement
Hub loose on shaft	A	Require replacement
Hub scored, affecting performance	A	Require replacement
Hub warped, affecting performance	A	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Noisy	2	Suggest repair or replacement
Slips	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Will not disengage	A	Require repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

COMPRESSORS

NOTE: **When replacing this component it is suggested to install or replace high and low side inline filters to prevent future component damage (see Code 5).**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Housing broken, affecting performance	A	Require repair or replacement
Housing broken, not affecting performance	Â	No service suggested or required
Housing cracked, affecting performance	A	Require repair or replacement
Housing cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
NOTE: **Compressor noise can also be caused by low oil level, state of charge, air contamination, or type of refrigerant.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement

Condition	Code	Procedure
Threads stripped (threads missing)	A	Require replacement
Tubing connection leaking	A	Require repair or replacement
Vibration	1	Suggest replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CONDENSER AIR SEALS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Missing	C	Require replacement

CONDENSER FAN MOTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Hydraulic fan motor leaking	A	Require repair or replacement
Inoperative	A	Require replacement
NOTE: **Check fan motor/controls. Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Noisy	2	Suggest replacement
Rotation incorrect for application	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Vibration	1	Suggest replacement
Wire lead conductors exposed	B	Require repair or replacement

Condition	Code	Procedure
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CONDENSERS

NOTE: **When replacing this component it is suggested to install or replace high and low side inline filters to prevent future component damage (see Code 5).**

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Air flow obstruction, affecting performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting performance	A	Require repair or replacement
Bent, not affecting performance	Â	No service suggested or required
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Leaking	A	Require repair or replacement
Restricted internally	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Circuit open	A	Require repair or replacement
Circuit resistance (voltage drop) out of specification	A	Require repair or replacement

Condition	Code	Procedure
Circuit shorted	A	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Diode open	A	Require repair or replacement
Diode shorted	A	Require repair or replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Protective shield (conduit) melted	2	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

CONTROL CABLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding	A	Require repair or replacement
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket Corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Broken	A	Require repair or replacement
Cracked	2	Suggest repair or replacement
Disconnected	A	Require repair or replacement
Kinked	2	Suggest repair or replacement
Melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Out of adjustment	B	Require repair or replacement
NOTE: **Follow OEM recommended adjustment procedures. Require repair or replacement if out of specification.**		
Routed incorrectly	B	Suggest repair
Seized	A	Require repair or replacement

CONTROL HEADS (FUNCTION SELECTORS)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	2	Suggest require replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
Melted, not affecting performance	Â	No service suggested or required
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement

CONTROL LINKAGES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent, affecting performance	A	Require repair or replacement
Binding	A	Require repair or replacement
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Broken	A	Require replacement
Cracked	B	Require repair or replacement
Disconnected	A	Require repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Out of adjustment	B	Require repair or replacement
NOTE: **Follow OEM recommended adjustment procedures. Require repair or replacement if out of specification.**		
Seized	A	Require repair or replacement

CONTROL MODULES

NOTE: **Includes, but not limited to: IRCM, Coolant Fan Control Module (CFCM), AC Controller, Amplifier, Programmers, Control Heads, Power Modules, etc.**

Condition	Code	Procedure

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Code set (if applicable)	A	Further inspection required
NOTE: **Refer to manufacturer's diagnostic trouble code procedure and require repair or replacement of affected component(s).**		
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement. Check for accepted cleaning procedure.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

COOLANT

Condition	Code	Procedure

Condition	Code	Procedure
Acidity (pH) incorrect	1	Suggest correction or replacement
At or beyond service interval	3	Suggest replacement
Contaminated	B	Require replacement or recycling. Further inspection required
NOTE: **Determine source of contamination and require correction prior to coolant replacement.**		
Fluid discolored	Â	No service suggested or required
NOTE: **Further testing necessary to determine condition of fluid.**		
Level incorrect	B	Require filling to proper level
NOTE: **Determine source of incorrect level and suggest repair.**		
Mixture incorrect	B	Require correction or replacement
Type incorrect	B	Require replacement

COOLING FAN BLADES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bent	A	Require replacement
Broken	A	Require replacement
Cracked	B	Require replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement

COOLING FAN CLUTCHES

NOTE: **Some lateral movement, measured at the fan blade tip, may be normal.**

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing noisy	A	Require replacement
Bearing worn	A	Require replacement
Fastener loose	A	Require repair or replacement of fastener
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Suggest replacement

Condition	Code	Procedure
Seized	A	Require replacement
Slips (insufficient fan speed)	A	Require replacement
Thermal control incorrect	B	Require repair or replacement

COOLING FAN MOTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Hydraulic fan motor leaking	A	Require repair or replacement
Inoperative	A	Require replacement
NOTE: **Check fan motor/controls. Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Noisy	2	Suggest replacement
Rotation incorrect for application	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Vibration	1	Suggest replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

EVAPORATOR DRAIN TUBES

Condition	Code	Procedure
Disconnected	A	Require repair
Leaking	A	Require replacement
Missing	C	Require replacement

Condition	Code	Procedure
Restricted	A	Require repair or replacement
Routed incorrectly	B	Require repair

EVAPORATOR FILTERS

Condition	Code	Procedure
Air flow obstruction	A	Require cleaning or replacement
At or beyond service interval	3	Suggest replacement
Microbial growth causing odor	A	Require replacement of filter
Missing	C	Require replacement

EVAPORATOR PRESSURE REGULATORS (EPRS)

Condition	Code	Procedure
Inoperative	A	Require repair or replacement

NOTE:

Inoperative includes intermittent operation.

EVAPORATORS

NOTE: **When replacing this component it is suggested to install or replace high and low side inline filters to prevent future component damage (see Code 5).**

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Air flow obstruction, affecting performance	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Evaporator foam seal leaking	A	Require replacement
Evaporator foam seal missing	C	Require replacement
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Leaking	B	Require repair or replacement

Condition	Code	Procedure
Microbial growth causing odor	2	Suggest microbial odor removal
NOTE: **If the evaporator case is contaminated with debris, it may be necessary to remove the debris before applying microbial odor treatment.**		
Restricted internally	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

EXPANSION VALVES

NOTE: **Expansion valves indicated for use on R134a systems are acceptable for R12 systems.**

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Corroded internally	1	Suggest replacement
Filter screen torn	A	Require replacement of screen
Inoperative	A	Require repair or replacement
NOTE: **Expansion valve operation may be affected by capillary tube location, corrosion, and insulation tape. Inoperative includes intermittent operation.**		
Leaking	B	Require replacement
Restricted	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

FUNCTION SELECTORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	2	Suggest require replacement
Leaking	B	Require repair or replacement

Condition	**Code**	**Procedure**
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	Â	No service suggested or required
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FUSES, FUSIBLE LINKS AND CIRCUIT BREAKERS

Condition	**Code**	**Procedure**
Application incorrect	B	Require replacement
Blown	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Insulation damaged, conductors exposed	A	Suggest repair or replacement
Missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

FUSIBLE LINKS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Blown	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Insulation damaged, conductors exposed	A	Suggest repair or replacement
Missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

HEATER CASES

Condition	Code	Procedure
Air control door binding	A	Require repair or replacement
Air control door broken	A	Require repair or replacement
Air control door leaking	A	Require repair or replacement
Air control door seized	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	2	Suggest repair or replacement
Drain hole restricted	A	Require repair
Drain plugged	A	Require repair
Duct disconnected	A	Require repair or replacement
Duct leaking	A	Require repair or replacement
Duct missing	C	Require replacement
Duct restricted	A	Require repair or replacement
Leaking	B	Require repair or replacement
Microbial growth causing odor	2	Suggest microbial odor removal
NOTE: **If the heater case is contaminated with debris, it may be necessary to remove the debris before applying microbial odor treatment.**		
Noisy	2	Suggest cleaning or repair
Restricted	A	Require cleaning, repair, or replacement

HEATER CONTROL VALVES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding	2	Suggest repair or replacement
Coolant leak	A	Require repair or replacement
Disconnected	A	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Restricted	A	Require repair or replacement
Seized	A	Require repair or replacement
Vacuum leak	A	Require repair or replacement

HEATER CORES

Condition	Code	Procedure
Air flow obstruction	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connection leaking	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Disconnected	A	Require repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	Â	No service suggested or required

Condition	Code	Procedure
Internal restrictions, affecting performance	A	Require repair or replacement
Leaking	B	Require repair or replacement
Missing	C	Require replacement

HEATER HOSES

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require repair or replacement
Hard (brittle)	1	Suggest repair or replacement
Inner fabric (webbing) damaged	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged	1	Suggest replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Suggest replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly	B	Suggest repair
Safety clip missing	C	Require replacement
Spongy	1	Suggest repair or replacement
Stripped	A	Require replacement
Surface cracks (dry-rotted)	1	Suggest repair or replacement
Swollen	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

HIGH PRESSURE RELIEF VALVES (HPRV)

Condition	Code	Procedure
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

IDLERS

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing worn	1	Suggest replacement
Belt tension incorrect	B	Require adjustment or repair
Bracket cracked	A	Require repair or replacement
Housing cracked	A	Require repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Pulley damaged, affecting belt life	A	Require replacement
Seized	A	Require repair or replacement

IN-LINE FILTERS

Condition	Code	Procedure
Connection leaking	A	Require repair or replacement
Leaking	B	Require repair or replacement
Restricted	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

METAL FITTINGS

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Clamp corroded, not reusable	1	Suggest replacement
Connected incorrectly	A	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Cracked	B	Require repair or replacement
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	B	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Routed incorrectly	B	Require repair
Swollen	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

METAL LINES

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	Â	No service suggested or required
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Clamp corroded, not reusable	1	Suggest replacement
Connected incorrectly	A	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	Â	No service suggested or required
Cracked	B	Require repair or replacement
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Swollen	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

MIX AND AIR CONTROL DOORS (BLEND DOORS)

Condition	Code	Procedure
Air control door binding	A	Require repair or replacement
Air control door broken	A	Require repair or replacement
Air control door leaking	A	Require repair or replacement
Air control door seized	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	2	Suggest repair or replacement
Drain hole restricted	A	Require repair
Drain plugged	A	Require repair
Duct disconnected	A	Require repair or replacement
Duct leaking	A	Require repair or replacement
Duct missing	C	Require replacement
Duct restricted	A	Require repair or replacement
Leaking	B	Require repair or replacement
Noisy	2	Suggest cleaning or repair
Odor	2	Suggest cleaning or repair

Condition	Code	Procedure
Restricted	A	Require cleaning, repair, or replacement

ORIFACE TUBES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Bypassing internally	A	Require repair or replacement
Filter screen torn	A	Require replacement
Installation incorrect	B	Require repair
Restricted	A	Require repair or replacement

O-RINGS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

PILOT-OPERATED ABSOLUTES (POAS)

Condition	Code	Procedure
Connection damaged	B	Require repair or replacement
Fitting damaged	B	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Threads stripped (threads missing)	A	Require replacement

PLENUMS

Condition	Code	Procedure
Air control door binding	A	Require repair or replacement
Air control door broken	A	Require repair or replacement
Air control door leaking	A	Require repair or replacement
Air control door seized	A	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	2	Suggest repair or replacement
Drain hole restricted	A	Require repair
Drain plugged	A	Require repair
Duct disconnected	A	Require repair or replacement
Duct leaking	A	Require repair or replacement
Duct missing	C	Require replacement
Duct restricted	A	Require repair or replacement

Condition	Code	Procedure
Leaking	B	Require repair or replacement
Noisy	2	Suggest cleaning or repair
Odor	2	Suggest cleaning or repair
Restricted	A	Require cleaning, repair, or replacement

PRESSURE CONTROL VALVES

Condition	Code	Procedure
Connection damaged	B	Require repair or replacement
Fitting damaged	B	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

PRESSURE SENSORS

NOTE: **Includes, but not limited to, In-Car Temperature, Ambient Air Temperature, Sun Load Sensor, etc.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Calibration incorrect	B	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

PULLEYS

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing noisy	2	Suggest replacement
Bearing seized	A	Require repair or replacement
Bearing worn	1	Suggest replacement
Cracked	B	Require replacement
Loose	B	Require repair or replacement
Missing	C	Require replacement
Pulley damaged, affecting belt life	A	Require replacement

RADIATORS

Condition	Code	Procedure
Air flow obstruction	A	Require repair
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connection leaking	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Drain inoperative	A	Require repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	Â	No service suggested or required
Internal oil cooler leaking	A	Require repair or replacement
Internal restrictions	B	Require repair or replacement
Leaking	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Tubes damaged, affecting performance	A	Require repair or replacement
Tubes damaged, not affecting performance	Â	No service suggested or required

RECEIVER-DRIERS

NOTE: **For VIRs, see Valves in Receiver (VIRs). When replacing this component it is suggested to install or replace high and low side inline filters to prevent future component**

Condition	Code	Procedure
damage (see Code 5).	Â	Â
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Contaminated, affecting performance	A	Require replacement
Desiccant at the end of its useful life (saturated with moisture)	1	Suggest repair or replacement
Desiccant bag deteriorated	A	Require replacement. Further inspection required
NOTE: **Inspect system to determine effects of desiccant bag deterioration.**		
Fusible plug leaking	A	Require replacement of plug
Leaking	B	Require replacement
Pressure relief device leaking	A	Require replacement of pressure relief device
Restricted	A	Require repair or replacement
Sight glass no longer transparent	2	Suggest replacement of drier
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Tubing connection leaking	A	Require repair or replacement

REFRIGERANT OIL

Condition	Code	Procedure
Contaminated	A	Require repair or replacement
Overfilled	B	Require repair
Underfilled	B	Require repair

REFRIGERANT

NOTE: **Refrigerants include any SNAP (Significant New Alternative Policy)-approved blends.**

Condition	Code	Procedure
Contaminated (other than refrigerant blends)	B	Require service to remove contamination
Different types of refrigerants in the same system (other than refrigerant blends)	B	Require repair
Overcharged	B	Require repair
Refrigerant type does not match fittings and label	B	Require repair
Undercharged	B	Require repair

RELAYS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Housing broken	A	Require replacement
Housing cracked	2	Suggest replacement

Condition	Code	Procedure
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SEALS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

SERVICE PORTS

Condition	Code	Procedure
Application does not match refrigerant type	B	Require replacement
Leaking	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Valve cap leaking	A	Require repair or replacement of cap
Valve cap missing	C	Require replacement of valve cap
Valve core sticking	B	Require repair or replacement

SPRING LOCK COUPLINGS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

SUCTION THROTTLING VALVES (STVS)

Condition	Code	Procedure
Connection damaged	B	Require repair or replacement
Fitting damaged	B	Require repair or replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SWITCHES (ELECTRICAL)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Missing	C	Require replacement
NOTE: **Missing includes high pressure cut-off switches not installed during a retrofit from R12 to 134a.**		
Out of adjustment	B	Require repair or replacement
Pressure switch leaking	A	Require repair or replacement

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

TENSIONERS

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearing worn	1	Suggest replacement
Belt tension incorrect	B	Require adjustment or repair
Bracket cracked	A	Require repair or replacement
Housing cracked	B	Require repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Pulley damaged, affecting belt life	A	Require replacement
Seized	A	Require repair or replacement

THERMISTORS AND PRESSURE SENSORS

NOTE: **Includes, but not limited to, In-Car Temperature, Ambient Air Temperature, Sun Load Sensor, etc.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Calibration incorrect	B	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Missing	C	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

THERMOSTATS AND HOUSINGS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cracked	B	Require replacement
Housing corroded	1	Suggest replacement of housing
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Installation incorrect	B	Require repair or replacement
Leaking	A	Require repair or replacement
Thermostat missing	C	Require replacement of thermostat
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

VACUUM HOSES AND TUBES

Condition	Code	Procedure
Disconnected	A	Require repair
Leaking	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	A	Require repair or replacement

Condition	Code	Procedure
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Restricted	A	Require repair or replacement
Routing incorrect	B	Require repair
Surface cracks (dry-rotted)	1	Suggest replacement

VACUUM RESERVOIRS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Check valve leaking internally	A	Require replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Restricted	A	Require repair or replacement

VACUUM TUBES

Condition	Code	Procedure
Disconnected	A	Require repair
Melted	A	Require repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Restricted	A	Require repair or replacement
Routing incorrect	B	Require repair
Surface cracks (dry-rotted)	1	Suggest replacement

VALVES IN RECEIVER (VIRS)

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	Â	No service suggested or required
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	Â	No service suggested or required
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket holes elongated, affecting performance	A	Require repair or replacement
Bracket holes elongated, not affecting performance	Â	No service suggested or required
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Connection damaged	B	Require repair or replacement
Contaminated, affecting performance	A	Require replacement

Condition	Code	Procedure
Corroded internally	1	Suggest replacement
Desiccant at the end of its useful life (saturated with moisture)	1	Suggest repair or replacement
Desiccant bag deteriorated	A	Require replacement. Further inspection required
NOTE: **Inspect system to determine effects of desiccant bag deterioration.**		
Filter screen torn	A	Require replacement of screen
Fitting damaged	B	Require repair or replacement
Fusible plug leaking	A	Require replacement of plug
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Pressure relief device leaking	A	Require replacement of pressure relief device
Restricted	A	Require repair or replacement
Sight glass no longer transparent	2	Suggest replacement of drier
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Tubing connection leaking	A	Require repair or replacement

WATER PUMPS (ELECTRIC AUXILIARY)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Vibration	1	Suggest replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

WIRING HARNESSES AND CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Circuit open	A	Require repair or replacement
Circuit resistance (voltage drop) out of specification	A	Require repair or replacement
Circuit shorted	A	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector melted, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Diode open	A	Require repair or replacement
Diode shorted	A	Require repair or replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Protective shield (conduit) melted	2	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

AUTOMOTIVE TERMINOLOGY & DEFINITIONS

ACCUMULATOR

a servo action device in an automatic transmission that cushions the motion of a clutch; in an air conditioning system, a device that combines the suction throttling valve and POA valves as well as the receiver/dryer; a component used to store or hold liquid refrigerant in an air conditioning system that also contains a jesiccant; in a non-integral ABS system, a chamber that temporarily stores fluid during the pressure decrease phase of ABS operation; in an integral ABS system , a sealed vessel containing a thick flexible diaphragm that separates brake fluid from high-pressure nitrogen gas.

ACTUATOR

a control device that delivers mechanical action in response to a vacuum or electrical signal; anything that the engine control computer uses to do something, such as trigger fuel injection or fire a spark plug. Most actuators on a computercontrolled engine system are activated by grounding their circuits rather than by actively powering them, since that protects the computer from short circuits.

AERATION

to expose to the air or mix with air, as with a liquid; to charge a liquid with gas.

AIR CONDITIONING (A/C)

a system that cools and dehumidifies the air entering the passenger compartment of a vehicle.

AIR DUCT

a tube, channel or other tubular structure used to carry air to a specific location.

AMBIENT TEMPERATURE SWITCH

a switch that prevents air conditioner operation below a certain ambient temperature.

AMBIENT TEMPERATURE

the temperature of the air surrounding an object.

ATMOSPHERIC PRESSURE

the pressure exerted on an object by the weight of the earth's atmosphere. At sea level, 14.7 psi, less at higher altitudes.

ATOMIZATION

the breaking down of a fluid into a fine mist that can be suspended in air.

AUTOMATIC TEMPERATURE CONTROL SYSTEM

a climate control system that uses the heating and air conditioning systems to maintain the interior temperature selected by the vehicle's passengers.

AUXILIARY CLIMATE CONTROL DEVICES

specialized add-on heating units, or combination heating/cooling units, that operate with the truck engine turned off. They eliminate the need to leave engines idling solely to heat or cool the cab and sleeper compartment.

BIMETALLIC

two kinds of metal, with different thermal expansion rates, that when attached to one another, the resulting assembly will bend in the direction of the metal that expands the least.

BLEND DOOR

a door in the heating and air conditioning system that controls the temperature of the air going into the passenger compartment.

BLOWER MOTOR.

the electric motor which drives the fan that circulates air inside the vehicle passenger compartment.

BOILING POINT

the temperature at which a liquid turns to vapor.

CAPILLARY TUBE

a thin, gas-filled tube that senses the temperature of the evaporator and relays this information to the thermostat and/or expansion valve.

CARBON DIOXIDE (CO2)

a colorless, odorless, noncombustible gas, heavier than air; can be compressed into a super-cold solid known as dry ice; changes from solid to vapor at - 78.5Â°C.

CELSIUS

the basis of the metric system of temperature measurement in which water's boiling point is 100Â°C and its freezing point is 0 C.

CHARGE

the electrical current that passes through the battery to restore it to full power; to fill, or bring up to the specific level, an A/C system with refrigerant; the required amount of refrigerant for an A/C system.

CHECK VALVE

a gate or valve that allows passage of a gas or liquid in one direction only.

CHLOROFLUOROCARBON (CFC)

any organic chemical compounds made up of carbon, chlorine and fluorine atoms, usually used in refrigeration. R12 is a CFC.

CLUTCH CYCLING SWITCH

a device that opens and closes the circuit that engages the air conditioning compressor clutch based on pressure or temperature.

COMPRESSOR

an engine driven device that compresses refrigerant gas and pumps it through the air conditioning system.

CONDENSATION

the process of a vapor becoming a liquid; the opposite of evaporation.

CONDENSE

to cool a vapor to below its boiling point, where it then condenses into a liquid.

CONDENSER

a device, similar to a radiator, in which the refrigerant loses heat and changes state from a high-pressure gas to a high pressure liquid as it dissipates heat to the surrounding air.

CORE PLUGS.

plugs that fill holes in a block or head left from the casting process. Also called freeze, welsh or expansion plugs.

CYCLING CLUTCH SYSTEM

an A/C system that controls temperature by switching the compressor clutch on and off.

DEGREE

used to designate temperature readings or 1 degree as a 1/360 part of a circle.

DEHUMIDIFY

to remove moisture (humidity) from the air.

DESICCANT

any hygroscopic material that removes and traps moisture, usually found in a bag in the accumulator or receiver/drier in air conditioning systems.

DIAPHRAGM

flexible, impermeable membrane on which pressure acts to produce mechanical movement; in automotive terminology, any disc-shaped device; can be as diverse as thin membranes that separate two chambers in a component, and large metal discs that activate clutch pressure plates.

DOWNFLOW RADIATOR

a radiator in which coolant enters the top of the radiator and is drawn downward by gravity (see crossflow radiator).

DUAL-ZONE CLIMATE CONTROL

allows individualized control of heating and air conditioning. Most systems are adjustable for the driver and front passenger; others feature a third adjustment for rear passengers.

EVACUATE

the process of applying vacuum to a closed refrigeration system to remove air and moisture.

EVAPORATION

the process through which a liquid is turned into vapor.

EVAPORATOR

a heat exchanger, in which low-pressure refrigerant flows and changes state, absorbing heat from the surrounding air.

EXPANSION TUBE

used in some air conditioning systems, a component with a fixed opening through which refrigerant passes as it is metered into the evaporator core. Also called an orifice tube.

EXPANSION VALVE

used on some air conditioning systems, a temperature sensitive device that meters the flow of refrigerant into the evaporator core. Also called a thermostatic expansion valve (TXV).

FAHRENHEIT

a scale of temperature measurement with the boiling point of water at 212Â°F. In the metric system, water's boiling point is 100Â°Celsius.

FAIL-SAFE COOLING SYSTEM

a fail-safe cooling system allows a vehicle to be driven under limited power in the event that engine coolant is lost. In case of a ruptured hose, the engine operates in an emergency mode with limited power for driving a short distance (10-50 miles depending on the system). This eliminates the cost and inconvenience of having the vehicle towed to a service station and does not leave the customer stranded.

FAN CLUTCH

a device attached to a mechanically driven cooling fan that allows the fan to freewheel when the engine is cold or the vehicle is driven at speed.

FAN SHROUD

an enclosure that routes air through the radiator cooling fins.

FAN

a mechanically or electrically driven propeller that draws or pushes air through the radiator, condenser, heater core or evaporator core.

FIXED ORIFICE TUBE

a method of controlling refrigerant flow in an air conditioning system whereby the rate of flow is determined by the pressure difference across an orifice.

FREON

DuPont registered trade name for R-12 (dichlorodifluoromethane).

GREENHOUSE GASES

gases, such as carbon dioxide, Nox, methane, and water vapor, that help capture heat from the sun in the lower atmosphere of the earth. As the amount of greenhouse gases in the atmosphere increases, more heat is captured, which can lead to global warming (the greenhouse effect).

HEAD PRESSURE

the pressure of the refrigerant at the compressor outlet.

HEAT EXCHANGER

device (e.g., a radiator) that is designed to transfer heat from the hot coolant that flows through it to the air blown through it by the fan.

HEATER CORE

a radiator-like device used to heat the inside of a vehicle. Hot coolant is pumped through it by the water pump, and heat from the coolant moves from the heater core to the passenger compartment as the blower fan forces air through it.

HIGH SIDE

the high-pressure half of an A/C system, usually refers to all components between the compressor outlet and the expansion valve or expansion tube. In this part of the A/C system, the refrigerant is in a liquid form.

HUMIDITY

moisture in air, usually referred to as relative humidity since the amount of moisture air can hold increases as temperature increases.

HVAC

acronym for Heating, Ventilation and Air Conditioning.

LATENT HEAT OF CONDENSATION

the amount of heat given off as a vapor changes state from a gas to a liquid without the temperature changing.

LATENT HEAT OF EVAPORATION

the amount of heat needed for a liquid to change state to a vapor without the temperature changing.

LEAK DETECTOR

a tool used to locate refrigerant leaks.

LOW SIDE

the suction side of an A/C system between the evaporator core inlet (after the expansion valve or expansion tube) and the compressor. In this part of the A/C system, the refrigerant is in a gas form.

MANIFOLD GAUGE SET

the set of gauges that attaches to the high and low side of the A/C system and used for diagnosis.

ORIFICE TUBE

used in some air conditioning systems, a component with a fixed opening through which refrigerant passes as it is metered into the evaporator core. Also called an expansion tube.

ORIFICE

a precisely sized hole that controls the flow of fluid.

O-RING SEAL

a sealing ring, usually made of rubber and installed in a groove; a type of valve seal that fits into a valve stem groove under the valve keepers.

PAG

polyalkyline glycol oil (lubricant) used with A/C systems containing R- 134a refrigerant.

PHOSGENE GAS

a poisonous gas produced when R- 12 refrigerant is burned.

POROSITY

the condition of having pores through which fluids, gases or light can pass; tiny holes in casting caused by air bubbles.

POUNDS PER SQUARE INCH (PSI)

a unit of measure for pressure.

PRESSURE

the exertion of force upon a body, measured in pounds per square inch on a gauge.

PSI

measurement of pressure in pounds per square inch.

R12

the generic term for CFC refrigerant used in older A/C systems. Also called Freon.

R134A

generic term for a modern refrigerant that does not contain CFCs and does not harm the ozone layer.

RECEIVER/DRIER

an A/C system component into which high-pressure liquid refrigerant flows and is temporarily stored and dehydrated, usually located between the condenser outlet and expansion valve.

RECLAIM

to send refrigerant to an off-site facility where it is restored to its original purity so that it may be reused.

RECOVER

to remove refrigerant from a system and store it temporarily.

RECYCLE

to remove contaminants such as moisture, particulates, etc, from refrigerant and re-introduce it into the A/C system.

REFRIGERANT CYCLE

the complete loop or circuit that refrigerant passes through as it changes state from a vapor, to a liquid, then back to a vapor.

REFRIGERANT OIL

either a mineral or synthetic oil designed specifically for A/C systems.

REFRIGERANT

a chemical compound used in an A/C system to remove heat from the evaporator and transfer it to the condenser.

SCHRADER VALVE

a spring operated valve used to open and close the service outlets in an A/C system. They are the service valves used to attach manifold gauges and to charge or evacuate the system.

SERVICE PORT

any of the various designs of fittings that allow service tools such as manifold gauges to be attached to an A/C system. See also Schrader valve.

SUCTION LINE

the low side tube and/or hose leading from the evaporator core outlet to the compressor inlet.

SUCTION

exists in a vessel when the pressure is lower than the atmospheric pressure.

SUPERHEAT SWITCH

a switch, usually mounted on the compressor on certain A/C systems that completes the circuit to the thermal limiter switch.

SUPERHEAT

the addition of more heat to a gas after it has already vaporized; the heat added to vaporized refrigerant after it has changed state from a liquid to a gas controlled by the expansion valve.

TENSIONER

a device used with a timing chain or belt to maintain its tension.

THERMOSTAT

a device installed in the cooling system that allows the engine to come to operating temperature quickly and then maintain a minimum operating temperature.

THERMOSTATIC EXPANSION VALVE (TXV)

used on some air conditioning systems, a temperature sensitive device that meters the flow of refrigerant into the evaporator core. Also called an expansion valve.

VACUUM

a pressure lower than atmospheric.

VAPOR

a substance in a gaseous state. Liquid becomes vapor when brought above the boiling point.

WATER PUMP

a device used to circulate coolant through the engine.

WATER VALVE

a device used to control the flow of hot coolant to the heater core, usually operated by cable or vacuum.

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Routine Inspection Reference Guide

ROUTINE INSPECTION REFERENCE GUIDE

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to

honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

MAINTENANCE OVERVIEW

ANTIFREEZE/COOLANT

The main function of the Engine Cooling System is to carry heat away from the engine and maintain the desired operating temperature. This is accomplished by circulating antifreeze/coolant through the engine, where heat is generated, and carrying it to the radiator to be cooled.

Over the past decade internal combustion engines have become more fuel efficient; however, most of the energy in the gasoline (perhaps 70%) is converted into heat, and the cooling system keeps the engine from overheating by transferring this heat to the air. But the cooling system also has several other functions.

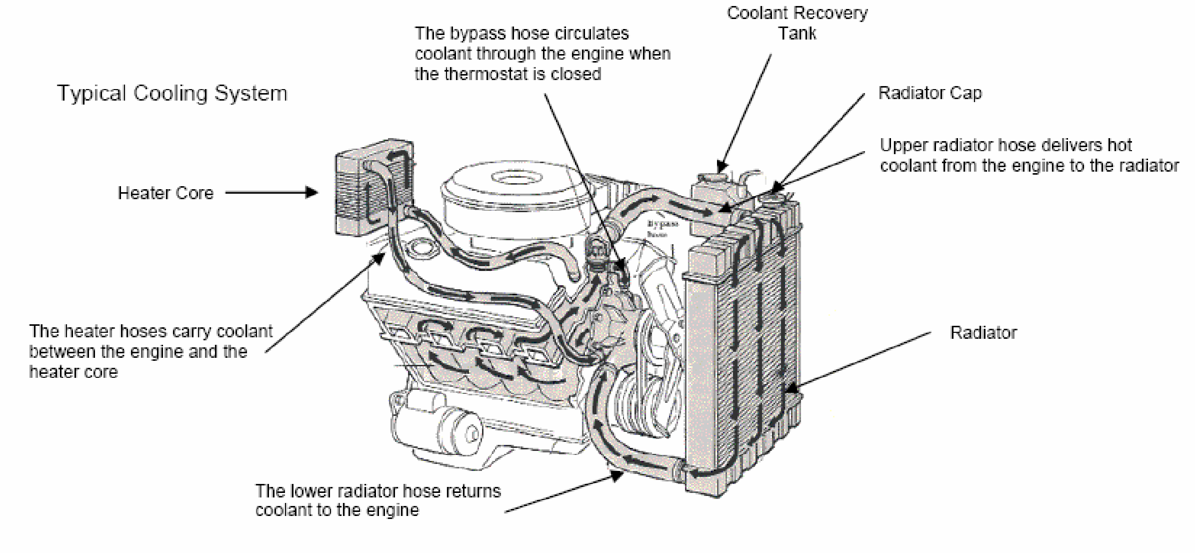
An automobile engine runs best at a fairly high temperature. When the engine is cold, components wear out faster, and the engine is less efficient and releases more pollutants into the atmosphere. The cooling system is designed to allow the engine to heat up as quickly as possible, and then to keep the engine at a constant temperature.

Modern automobiles operate in a wide variety of ambient temperatures, from well below freezing to well over 100 F. The fluid used to cool the engine must have a very low freezing point, a high boiling point, and it must have the ability to transfer a lot of heat.

An adequate amount of an antifreeze/coolant and water mixture is necessary to reduce the possibility of engine overheating and freezing, and to prevent rust and corrosion in the cooling system.

Water is one of the most effective fluids for holding heat, but water freezes at too high a temperature to be used in car engines. The fluid that most cars use is a mixture of water and ethylene glycol, also known as antifreeze. By adding ethylene glycol to water, the boiling and freezing points are improved significantly.

The temperature of the coolant can sometimes reach 250 to 275 F (121 to 135 C). Even with ethylene glycol added, these temperatures would boil the coolant. The cooling system is pressurized, which further raises the boiling point of the coolant. Most automobiles have around 14 to 15 pounds per square inch (psi), which raises the boiling point approximately 45 F so the coolant can endure the high temperatures produced in the engine.



Typical Cooling System
The bypass hose circulates coolant through the engine when the thermostat is closed
Coolant Recovery Tank
Radiator Cap
Upper radiator hose delivers hot coolant from the engine to the radiator
Heater Core
Bypass hose
The heater hoses carry coolant between the engine and the heater core
Radiator
The lower radiator hose returns coolant to the engine

Fig. 1: Typical Cooling System

Hoses showing obvious signs of wear such as cracks, cuts, stiffness, bulges, excessive softness or abrasions should be replaced.

The National Automotive Radiator Service Association (NARSA) recommends a seven (7)-point preventative cooling system maintenance check at least once every two years. The program is designed to identify any areas that need attention, and consists of:

- a visual inspection of all cooling system components, including belts and hoses
- a radiator cap test to check for the recommended system pressure level
- a thermostat check for proper opening and closing
- a pressure test to identify any external leaks to the cooling system parts; including the radiator, water pump, engine coolant passages, radiator and heater hoses and heater core
- an internal leak test to check for combustion gas leakage into the cooling system
- an engine fan test for proper operation h a system power flush and refill with car manufacturer's recommended concentration of coolant

VISUAL INSPECTION

What you are looking for is the condition of the belts and hoses. The radiator hoses and heater hoses are easily inspected just by opening the hood and looking. You want to be sure that the hoses have no cracking or splitting and that there is no bulging or swelling at the ends. If there is any sign of problems, the hose should be replaced with the correct part number for the year, make and model of the vehicle. Never use a universal hose unless it is an emergency and a proper molded hose is not available.

Heater hoses are usually straight runs and are not molded, so a universal hose is fine to use and often is all that is available. Make sure that you use the proper inside diameter for the hose being replaced. For either the radiator hoses or the heater hoses, make sure that you route the replacement hose in the same way that the original hose was running. Position the hose away from any obstruction that can possibly damage it and always use new hose clamps. After you refill the cooling system with coolant, do a pressure test to make sure that there are no leaks.

RADIATOR CAP TEST

A radiator cap is designed to maintain pressure in the cooling system at a certain maximum pressure. If the cooling system exceeds that pressure, a valve in the cap opens to bleed the excessive pressure into the reserve tank. Once the engine has cooled off, a negative pressure begins to develop in the cooling system. When this happens, a second valve in the cap allows the coolant to be siphoned back into the radiator from the coolant reservoir. If the cap should fail, the engine can easily overheat. A pressure test of the radiator cap is a quick way to tell if the cap is doing its job. It should be able to hold its rated pressure for two minutes.

ENGINE FAN

The radiator cooling fan is an important part of the cooling system operation. While a fan is not really needed while a vehicle is traveling down the highway, it is extremely important when driving slowly or stopped with the engine running. In the past, the fan was attached to the engine and was driven by the fan belt. The speed of the fan was directly proportional to the speed of the engine; a viscous fan drive was developed in order to disengage the fan when it was not needed.

With computer controls, the engine-driven fans gave way to electric fans mounted directly on the radiator. A temperature sensor determined when the engine was beginning to run too hot and turned on the fan to draw air through the radiator to cool the engine. On many cars, there were two fans mounted side by side to make sure that the radiator had a uniform air flow for the width of the unit.

When the car is in motion, the speed of the air entering the grill is usually sufficient to keep the coolant at the proper temperature and the fans shut off. When the vehicle is stopped, there is no air flow and the fan is turned on when the engine reaches a designated temperature.

When the A/C is turned on the fan circuit would power the fans regardless of engine temperature. The air conditioning system always requires a good air flow through the condenser mounted in front of the radiator. If the air flow stopped, the air-conditioned air coming through the dash outlets would immediately start warming up.

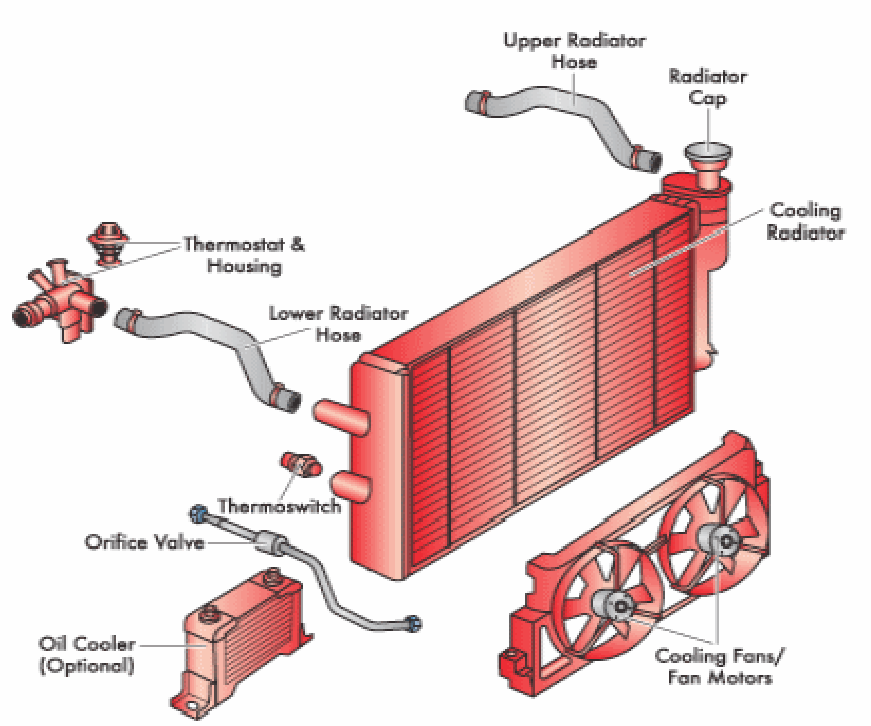


Fig. 2: Typical Cooling Fan

COOLING SYSTEM POWER FLUSH AND REFILL

Old coolant can be replaced by draining it out and replacing it with fresh coolant; however, power flushing will remove all the old coolant and pull out any sediment and scale along with it. Power flushing requires special equipment and generally requires the thermostat to be removed, the lower radiator hose disconnected, and the flush machine connected in line. Water and, sometimes, a cleaning agent are pumped through the cooling system in a reverse path from the normal coolant flow. When completed, the hose is reconnected and a new thermostat is installed. The cooling system is refilled with the appropriate amount of antifreeze to bring the coolant to the proper mixture of antifreeze and water. For most vehicles and most climates, the mixture is 50 / 50. In colder climates, more antifreeze is used, but must never exceed 75 percent antifreeze. Follow the vehicle manufacturers' procedures and recommendations.

BELTS (EXCEPT TIMING BELTS)

On most older vehicles, the water pump is driven by a V belt or serpentine belt on the front of the engine that is also responsible for driving the alternator, power steering pump and air conditioner compressor. These types of belts are easy to inspect and replace if they are worn. You are looking for dry cracking on the inside surface of the belt.

On later vehicles, the water pump is often driven by the timing belt. This belt usually has a specific life expectancy at which time it must be replaced to insure that it does not fail. Since the timing belt is inside the engine and will require partial engine disassembly to inspect, it is very important to replace it at the correct interval.

Low belt tension, contamination and belt vibration are common sources of belt noise. A screeching or squealing noise that occurs when pulling away from a stop normally indicates a lack of tension; check belt tension and automatic tensioners.

A grinding noise can result from damaged bearings, which must be replaced, aligned and lubricated to eliminate the noise and further damage. Vibration and noise can develop over time as drive components such as pulleys and spring tensioners wear, bearings and brackets loosen, or belts wear and stretch.

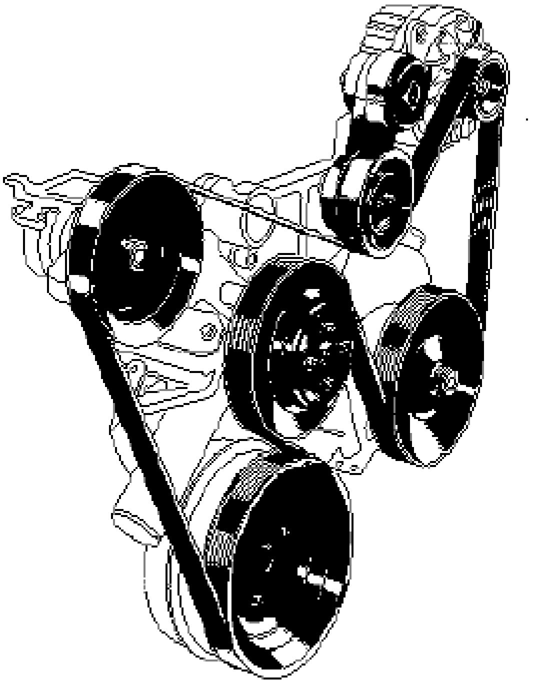

Fig. 3: Typical Accessory Drive Belt

The angle between belt span and pulley is the critical factor responsible for causing the "chirp" associated with misalignment noise. The presence of high humidity (or a damp belt) often increases the likelihood for misalignment noise to occur. Misalignment angle can result from many different combinations of pulley positions - parallel and angular are two typical examples.

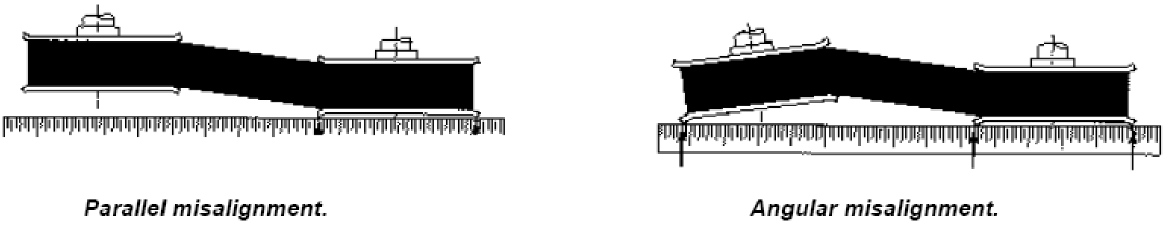

Fig. 4: Accessory Drive Belt Misalignment

Whenever a vehicle owner complains of belt noise, determine the type of noise and under what circumstances it occurs. The correction for a noise problem caused by belt misalignment is not likely to resolve a slip noise problem that may be caused by insufficient tension or other problem. The highest occurrence of belt noise due to misalignment comes from short belt spans entering large diameter pulleys. In the case of severe misalignment, repositioning of drive components may be required. Pulley alignment and tension must be correct for the drive to operate properly.

BELT TENSIONER

Belt tensioners are used to maintain constant tension on the belt, extending both belt and accessory drive bearing life.

NOTE: **A tensioner cannot be rebuilt since internal parts are not available. Never try to disassemble a tensioner unit. Injury may result.**

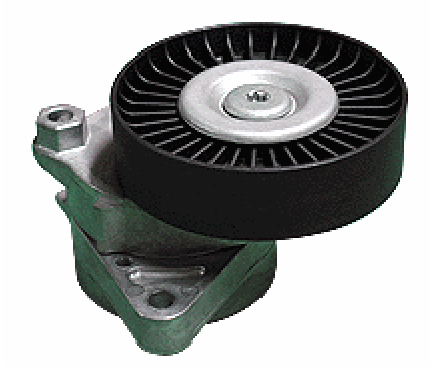

Fig. 5: Typical Accessory Dive Belt Tensioner

AUTOMATIC TRANSMISSION FLUID

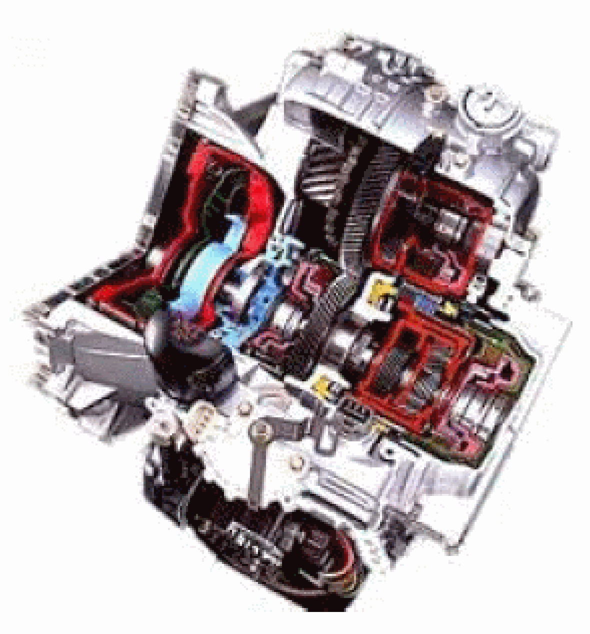

Fig. 6: Crosssection Of Automatic Transmission - Typical

Automatic transmission fluid (ATF) is the fluid used in vehicles with a self-shifting or automatic transmission. It is typically colored red or green to distinguish it from motor oil and other fluids in the vehicle. The fluid is a highly refined mineral oil optimized for the special requirements of an automatic transmission, such as valve operation, clutch and band operation, torque converter and gear lubrication. ATF is also used as a hydraulic medium in some power-assisted steering systems and as a lubricant in some 4WD transfer cases.

ATF usually contains an additive package with anti-foam additives, detergents and dispersants, anti-oxidation compounds, surfactants and petroleum dye. There are many specifications for ATF, such as the DEXRON and MERCON series, and the vehicle manufacturer will identify the ATF specification appropriate for each vehicle. The vehicle's owner's manual will typically list the ATF specification(s) that are recommended by the manufacturer. Some manufacturers will recommend different ATF products for different kinds of vehicle use, such as frequent trailer towing or vehicles that are used for longer periods between routine maintenance.

Overused ATF often has reduced lubrication properties and abrasive friction materials (from clutches and bands) suspended in it; failure to replace such fluid will accelerate transmission wear and could eventually ruin a transmission. Color is not an indication of the service life of an ATF as most ATF products will darken with use. The manufacturer's recommended service interval is a more reliable measure of ATF life.

AUTOMATIC TRANSMISSION FLUID EXCHANGE & FILTER REPLACEMENT

Automatic transmission fluid lubricates, cools and cleans internal components of the transmission. It also helps to maintain the hydraulic pressure necessary for the transmission to function. The additives in the transmission fluid can be depleted over time and should be replaced following the manufacturer's recommended service interval.

ENGINE OIL

The temperature range the oil is exposed to in most vehicles can be wide, ranging from cold ambient temperatures in the winter before the vehicle is started up to hot operating temperatures when the vehicle is fully warmed up in hot summer weather. A "specific" oil will have high viscosity when cold and a low viscosity at the engine's operating temperature. The difference in viscosities for any single-grade oil is too large between the extremes of temperature. To bring the difference in viscosities closer together, additives called viscosity index improvers are added to the oil. This creates "multi-grade" oil which has the viscosity of the first number when cold and the viscosity of the second number when hot. This allows one type of oil to be generally used all year.

In engines, there is inevitably some exposure of the oil to products of internal combustion, and microscopic particles from black soot accumulate in the oil during operation. Also the rubbing of metal engine parts inevitably produces some microscopic metallic particles from the wearing of the surfaces. Such particles could circulate in the oil and grind against the part surfaces causing wear. The oil filter removes many of the particles and sludge, but eventually the oil filter can become clogged, if used for extremely long periods. The motor oil and especially the additives also undergo thermal and mechanical degradation. For these reasons, the oil and the oil filter need to be periodically replaced.

Most vehicle manufacturers utilize a time/mileage-based schedule. Time-based intervals account for both the short trip driver who does fewer miles, but builds up more contaminates, as well as the long highway trips that are much easier on the oil. Many vehicle manufacturers list somewhat higher intervals for changing of oil and filter, with "severe" service requiring more frequent changes. This generally applies to vehicles that are mostly used in "Stopand- Go" driving conditions; experience extended periods of idling; or used for short trips of under 10 miles, where the oil does not get to full operating temperature and other adverse conditions.

Some vehicle manufacturers have installed engine Oil Life Monitors using computer calculations to estimate the oil's condition based on the factors which degrade it. Conditions such as RPMs, temperatures, and trip length are factored in to the equation; and one system adds an optical sensor for determining the clarity of the oil in the engine.

OIL LIFE
100%

Fig. 7: Engine Oil Life Monitor Display Example

AIR FILTERS

The engine air filter prevents dirt from entering the engine's cylinders, where it would cause mechanical wear and oil contamination. Most fuel injected vehicles use a pleated paper filter element in the form of a flat panel. This filter is usually placed inside a plastic box connected to the throttle body with an intake tube. Older vehicles that use carburetors or throttle body fuel injection typically use a cylindrical air filter, usually a few inches high and between 6 and 16 inches in diameter, positioned above the carburetor or throttle body and may incorporate ducting to provide cool and/or warm inlet air, and secured with a metal or plastic lid.

A Pleated paper filter element is used for most automobile engine air cleaners, because they are efficient, easy to service, and cost-effective. The pleated-paper filter is sized appropriately for the airflow volumes encountered in a particular application and present only minor restriction to air flow until the filter has become clogged with dirt.

CABIN AIR FILTER

The cabin air filter is typically a pleated-paper filter that is placed in the outside-air intake for the vehicle's passenger compartment. Some of these filters are rectangular and similar in shape to the combustion air filter. Others are uniquely shaped to fit the available space of particular vehicles' outside-air intakes. Clogged or dirty cabin air filters can significantly reduce airflow from the cabin vents, as well as introduce allergens into the cabin air stream.

BRAKE FLUID

The purpose of brake fluid is to:

1. Utilize hydraulic pressure to apply force on brake components that use a friction material to slow the vehicle
2. Protect the brake system from corrosion

Motor vehicle brake fluids are hygroscopic and absorb moisture when exposed to the atmosphere and in service. Water contamination from any source, including mechanical or accidental additions of free water, will appreciably lower the original boiling point of the brake fluid and increase its viscosity at low ambient temperatures. Water contamination may cause corrosion of brake cylinder bores and pistons, and may seriously affect the braking efficiency and safety of the brake actuating system. While moisture is definitely an issue with brake fluids, no consistent and accurate measurement identifying the percentage of moisture that is detrimental to brake fluid performance has been found in the literature. In addition, no specification exists for an in-use brake fluid boiling point that can be identified by a testing procedure and therefore no recommendation for replacement based on moisture content can be made with confidence.

It has been demonstrated that corrosion inhibitors in brake fluid deplete over time and can be severely depleted by 36 months. The depletion of corrosion inhibitors results in corrosion. Copper is not found in new brake fluid and is used as a brazing alloy in the brake lines, which represent a high surface area for brake fluid contact. Copper is the first metal to corrode in a brake system, and is a principle contaminate in brake fluid. Copper levels increase slowly and stably over time. The slow and steady increase in copper levels provides a means to predict the age of brake fluid under normal conditions. The age of the brake fluid can help determine when brake fluid should be serviced according to OEM recommendations when applicable. Copper can also directly affect ABS components as it can plate to the valve and valve seats.

Iron levels begin to sharply increase when the copper levels reach 150-250 ppm indicating corrosion of iron components. This also allows copper levels to be used to predict when iron levels will increase or the start of component corrosion and the depletion of corrosion inhibitors. Once iron corrosion begins copper acts as a catalyst to speed corrosion. At this point (iron corrosion) it is evident that the brake fluid no longer performs the intended purpose of protecting the system from corrosion.

A copper content of 200 ppm or greater indicates a depletion of corrosion inhibitors in the brake fluid and Brake Fluid Replacement is Required.

BATTERY

The automotive battery is an electrochemical device that produces voltage and delivers current. In an automotive battery the electrochemical action can be reversed, recharging the battery, providing many years of service. Batteries emit hydrogen gas while charging and the battery case cannot be completely sealed. Batteries (maintenance free) have small vents on the side forcing the gases to go through baffles to escape. This process allows the liquid to condense and flow back to the bottom of the battery.

The purpose of the battery is to supply current to the starter motor, provide current to the ignition system while cranking, to supply additional current when the demand is higher than the alternator can supply and to act as an electrical reservoir. Batteries are rated in cold cranking amps. This represents the current the battery can produce for 30 seconds at 0 degrees before the battery voltage drops below 7.2 volts.

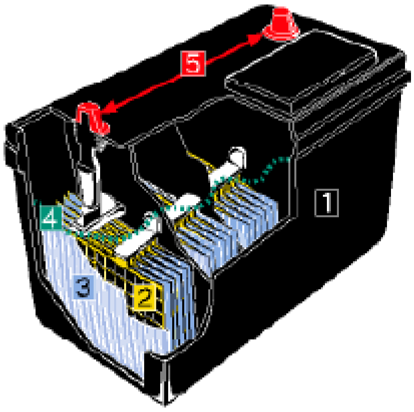

Fig. 8: Typical Battery Components

BATTERY CABLES

Battery cables are large diameter, multi-stranded wire which conveys the high current (250+ amps) necessary to operate the starter motor. Some battery cables will have a smaller wire, soldered to the terminal, which is used to either operate a smaller device or to provide an additional ground. When the smaller cable burns it indicates a high resistance in the heavy cable.

Even maintenance free batteries need periodic inspection and cleaning to insure they stay in good working order. Inspect the battery to see that it is clean and that it is held securely in its carrier. Some corrosion naturally collects around the battery. Electrolyte condensation contains corrosive sulfuric acid, which eats away the metal of battery terminals, cable ends and battery hold-down parts.

POWER STEERING

Power steering is a system for reducing the steering effort on cars by using an external power source to assist in turning the wheels. Most vehicles have power steering and the trend to front wheel drive, greater vehicle mass and wider tires means that modern vehicles would be extremely difficult to maneuver at low speeds (e.g. when parking) without assistance.

POWER STEERING FLUID

Power Steering Fluid is the hydraulic component in power steering systems and is charged with pressure transfer and component protection. It fails when it stops performing one of its tasks. When a fluid becomes oxidized, its resistance to flow is greater and it decreases its ability to protect components and transfer pressure. The more common failure mode of PSF is internal and external contamination, and excess particles in fluid promote component wear and can lead to component failures, including seals, shafts and gears.

Most power steering systems work by using a belt driven pump to provide hydraulic pressure to the system. This hydraulic pressure is generated by a rotary-vane pump which is driven by the vehicle's engine. As the speed of the engine increases, the pressure in the hydraulic fluid also increases, hence a relief valve is incorporated into the system to allow excess pressure to be bled away. Some of the hydraulic systems also include an electronic pressure valve which can reduce the hydraulic pressure of the power steering lines as the vehicle's speed increases (Variable assist power steering).

Electric Power Steering uses sensors to detect the motion and torque of the steering column and a computer module applies electric motor to provide power assist. This allows variable assist power steering to be applied depending on driving conditions. In the event of component failure, a mechanical linkage such as a rack and pinion serves as a back-up in a manner similar to that of hydraulic systems. Electric power steering is usually limited to smaller vehicles rather than trucks and SUVs. Electric systems have a significant advantage in fuel efficiency because there is no hydraulic pump constantly running, whether assistance is required or not.

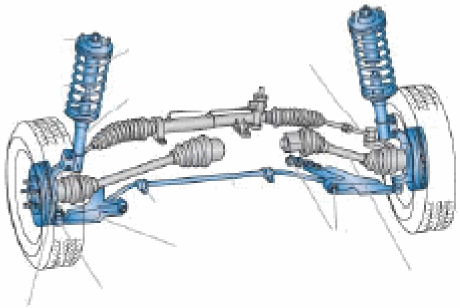

Fig. 9: Typical Front Suspension & Steering Components

WIPER BLADES

Worn wiper blades are dangerous. Ozone, airborne contaminants, oil, sunlight and dirt all act to weaken and reduce your wiper blades' ability to keep your view unobstructed. And exposure to sunlight and ozone cause the wiper blades to age, even if they're not used much. Weather also plays a critical role in your windshield wiper blades' deterioration. Freezing temperatures make the rubber in your wiper blades hard and brittle, which increases their tendency to crack or tear. Hot weather warps the rubber and prevents the blade from wiping your windshield cleanly.

Heavy use is hard on the wipers because dust, abrasives, road grime and bug juice wear away the cutting edge the blade needs to wipe cleanly. Even road dirt acts like an abrasive to wear away the flat surface necessary for a good squeegee effect. Rubber also deteriorates over time. As blades age, they lose their flexibility and are less able to wipe cleanly. They may develop a permanent set or curvature, which prevents full contact with your windshield.

A wiper blades ability to clean the glass depends on:

- The slope and area of the windshield: Windshields are sloped for improved aerodynamics and a "cab-forward" windshield with a lot of surface area directs more wind against the wipers, and can force the blades away from the windshield at high speeds unless the wiper system is designed to resist lift.
- The amount of spring tension on the wiper arm: This is important to keep the wiper blade in tight contact with the windshield and provide a squeegee effect.
- The number of pressure points or claws holding the blade: The more claws a blade has, the broader the area over which the pressure of the wiper arm is spread. More claws also provide increased flexibility so the blade can more easily follow the curvature of a large, sloping windshield for full side-to-side contact.

Code	Reason
	Required
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
	Suggested/Optional
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

Your vehicle has been inspected following the Uniform Inspection and Communication Standards developed by the Motorist Assurance Program. MAP produces materials that give motorists the information and encouragement to take greater responsibility for their vehicles—through proper maintenance. We encourage participating service and repair shops to adopt the MAP Pledge of Assurance to their Customers and the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction. For more information visit: www.motorist.org

DISCLAIMER: This document may be used as a guide when performing vehicle inspection. This form is not to be used as an estimate form and may not comply with Local or State Laws. The Motorist Assurance Program is not responsible for the performance and accuracy of the motor vehicle inspection performed using this document.

ROUTINE INSPECTION - UICS

BRAKE SYSTEMS

NOTE: Some states may have specifications that differ from OEM. Check your local/state regulations. Where state or local laws are stricter, they take precedence over these guidelines.

BRAKE FLUID

NOTE: Most manufacturers prohibit the use of DOT 5 brake fluid in a system equipped with ABS. DOT 3, DOT 4, and DOT 5.1 brake fluids are clear or light amber in color. DOT 5 brake fluid is violet in color. Correct fluid type is normally stamped on the master cylinder cover.

NOTE: Fluid Flush - a process using a sufficient volume of fluid to help remove

contaminants and replacing the contaminated fluid with new fluid of the same type and specification. At times a chemical may be used to enhance removal.

NOTE: **Fluid Exchange/Replace - draining (evacuating) old fluid and replacing it with new fluid of the correct type and specification.**

BULBS AND LEDS

NOTE: **Does not include soldered-in components.**

Condition	Code	Procedure

Condition	Code	Procedure
Application incorrect	B	Require replacement
NOTE: **Application incorrect includes wrong bulb coating or color.**		
Base burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base corroded, affecting performance	A	Require repair or replacement
Base corroded, not affecting performance	2	Suggest repair or replacement
Base loose, affecting performance	B	Require repair or replacement
Base loose, not affecting performance	1	Suggest repair or replacement
Burned out	A	Require replacement
Intermittent	A	Require replacement
Missing	C	Require replacement
Seized in socket	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Blistered	B	Require replacement
Expansion affecting performance	A	Require Replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Incorrectly secured	B	Require repair
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly	B	Require repair

LENSES

Condition	Code	Procedure
Application incorrect	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	No Service Suggested or Required	
Cracked	B	Require replacement
Discolored	A	Require replacement
Leaking	B	Require repair or replacement
Melted, affecting performance	A	Require replacement
Melted, not affecting performance	2	Suggest replacement
Missing	C	Require replacement

LUG NUT

Condition	Code	Procedure
Lug nut flats rounded	A	Require replacement of nut
Lug nut installed backward	B	Require repair
Lug nut mating surface dished	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut seized	A	Require replacement of nut and/or stud
Stud incorrect	B	Require replacement of stud
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped (threads missing)	A	Require replacement of component with stripped threads

MASTER CYLINDER COVER GASKET

Condition	Code	Procedure
Rubber master cylinder cover gasket distorted and gummy	A	Require replacement of the gasket

NOTE:

This condition may indicate contaminated brake fluid. See Brake Fluid.

PARKING BRAKE CABLE

Condition	Code	Procedure
Cable improperly adjusted	B	Require cable adjustment
Cable or individual wires in the cable are broken	A	Require replacement of cable assembly
Cable sticking	A	Require cable lubrication
Cable stuck inside conduit and cannot be lubricated so that parking brake functions properly	A	Require replacement of cable assembly

VACUUM HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Blistered	B	Require replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Incorrectly secured	B	Require repair
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly	B	Require repair

WHEEL ATTACHMENT HARDWARE

NOTE: **For conditions noted below, also check condition of wheel stud holes. Proper lug nut torque is essential. Follow manufacturer's torque specifications and tightening sequence. DO NOT lubricate threads unless specified by the vehicle manufacturer.**

Condition	Code	Procedure
Bent	A	Require replacement
Broken	A	Require replacement

Condition	Code	Procedure
NOTE: **Some manufacturers require replacement of all studs on any wheel if two or more studs or nuts on the same wheel are broken or missing.**		
Loose	A	Require repair or replacement of affected component
Lug nut flats rounded	A	Require replacement of nut
Lug nut installed backward	B	Require repair
Lug nut mating surface dished	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut seized	A	Require replacement of nut and/or stud
Stud incorrect	B	Require replacement of stud
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped (threads missing)	A	Require replacement of component with stripped threads

WHEEL BEARINGS, RACES AND SEALS

NOTE: **When replacing or repacking wheel bearings, grease seal replacement is required. You are not required to replace these components in axle sets. Determine the need to replace based upon the individual component conditions.**

Condition	Code	Procedure
Axle seal on drive axle leaking	A	Require replacement of seal and inspection of axle, bearing, housing, and vent tube
Bearing end-play exceeds specifications	B	Require adjustment of bearing, if possible If proper adjustment cannot be obtained, require replacement of bearing and race assembly
Bearing rollers, balls or races are worn, pitted, or feel rough when rotated as an assembly or other damage affecting performance.	B	Require replacement of bearing and race assembly
Seal leaking	A	Require replacement of seal and inspection of bearings
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary. Check vent. A plugged vent may force fluid past the seal.**		
Seal missing	C	Require replacement

DRIVETRAIN AND TRANSMISSION

NOTE: **When a procedure states that a required or suggested repair or replacement is recommended, the basis for the recommendation MUST be explained to the customer. If the customer asks whether there are alternatives to the recommendation, generally acceptable repair/replacement options must be explained, whether performed or not by the shop.**

NOTE: **Whenever transmission or drive-train service is performed that affects the suspension alignment, for example, removing the engine cradle, it is required that the alignment be checked and corrected if necessary.**

NOTE: **The conditions listed for the components included in this section assume that the problem has been isolated to the specific component through proper testing.**

AUTOMATIC TRANSMISSION FLUID

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement
NOTE: **Determine and correct cause.**		
Burned	Further inspection required	
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	No Service Suggested or Required	
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Varnish deposits present on system components affecting performance	Further inspection required	

CLUTCH MASTER CYLINDERS

Condition	Code	Procedure
Cover gasket distorted	A	Require replacement of cover gasket
Cover gasket gummy	A	Require replacement of cover gasket
NOTE: **This condition may indicate contaminated fluid. Further inspection required.**		
Cylinder leaking fluid from rear of bore	A	Require repair or replacement
Cylinder leaking fluid internally	A	Require replacement
Dust boot missing	C	Require replacement of dust boot
Dust boot punctured	A	Require replacement of dust boot
Dust boot torn	A	Require replacement of dust boot
Fluid level incorrect	B	Require fluid level adjustment
Housing damaged, affecting performance	A	Require repair or replacement
Master cylinder has residue in reservoir	2	Further inspection required
NOTE: **Do not replace master cylinder unless it exhibits conditions listed for replacement.**		
Pushrod out of adjustment	B	Require Repair or Replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

COOLER LINES

Condition	Code	Procedure
Abrasion damage, affecting structural integrity	A	Require repair or replacement
Abrasion damage, not affecting structural integrity	No Service Suggested or Required	
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Clamp corroded, not reusable	1	Suggest replacement
NOTE: **If clamp removed, require replacement.**		
Connected incorrectly	A	Require repair
Corroded, affecting structural integrity	A	Require replacement
Corroded, not affecting structural integrity	No Service Suggested or Required	
Cracked	B	Require repair or replacement

Condition	Code	Procedure
Fitting type incorrect (such as compression fitting)	B	Require replacement
Flange leaking	A	Require repair or replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Routed incorrectly	B	Require repair
Swollen	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

COOLERS

Condition	Code	Procedure
Air flow obstruction	A	Require repair
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connection leaking	A	Require repair or replacement
Contaminated	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	No Service Suggested or Required	
Internal restrictions	B	Require repair or replacement
Leaking	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Tubes damaged, affecting performance	A	Require repair or replacement
Tubes damaged, not affecting performance	No Service Suggested or Required	

DIFFERENTIAL FLUID

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement

Condition	Code	Procedure
NOTE: **Determine and correct cause.**		
Burned	Further inspection required	
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	No Service Suggested or Required	
NOTE: **Further testing necessary to determine condition of fluid.**		
fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct hydraulic fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Rubber master/ clutch cylinder cover gasket distorted or gummy	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Varnish deposits present on system components affecting performance	Further inspection required

MOUNTS (ENGINE, TRANSAXLE AND TRANSMISSION)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken	A	Require replacement
Leaking (hydraulic mount)	A	Require replacement
Mounting hole worn, affecting performance	A	Require replacement
Mounting hole worn, not affecting performance	No Service Suggested or Required	
Rubber deteriorated, affecting performance	A	Require replacement
Rubber deteriorated, not affecting performance	No Service Suggested or Required	
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

TRANSFER CASE FLUID

Condition	Code	Procedure
Additive depletion	A	Require replacement of fluid
Application incorrect	B	Require replacement
NOTE: **Determine and correct cause.**		
Burned	Further inspection required	
NOTE: **Fluid that is burned indicates a serious problem. Determine and correct the cause.**		
Contaminated, for example, fluid other than the specified fluid present	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct brake fluid.**		
Contaminated, for example, fluid other than the specified fluid present	B	Require service
NOTE: **If a fluid other than the specified fluid is present in the hydraulic system which DOES NOT affect the rubber parts, the required service is to flush and fill following OEM specified procedure with the correct hydraulic fluid.**		
Fluid at or beyond service interval	3	Suggest replacement
Fluid discolored	No Service Suggested or Required	

Condition	Code	Procedure
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid incorrect	B	Require service
NOTE: **If a fluid other than the correctly specified fluid is present in the hydraulic system, the required service is to flush and fill with the correct hydraulic fluid.**		
Level incorrect	B	Require correction of fluid level
Oxidized	A	Require replacement of fluid
Rubber master/ clutch cylinder cover gasket distorted or gummy	A	Require service
NOTE: **If an incorrect fluid is present in the hydraulic system which DOES affect the rubber parts, the required service is to: 1) remove all components having rubber parts from the system, 2) flush lines, 3) repair or replace all components having rubber parts, and 4) fill with correct fluid.**		
Varnish deposits present on system components affecting performance	Further inspection required	

VACUUM HOSES

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked line or tube	A	Require replacement
Hard hose	1	Suggest replacement
Inner fabric (webbing) damaged	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted, affecting performance	B	Require repair or replacement
Missing	C	Require replacement
Outer covering damaged	1	Suggest replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Suggest replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly	B	Suggest replacement
Safety clip missing	C	Require replacement
Spongy	1	Suggest repair or replacement
Stripped	A	Require replacement
Surface cracked (weather-checked)	1	Suggest repair or replacement

Condition	Code	Procedure
Swollen	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

ELECTRICAL SYSTEMS

BATTERIES

NOTE: **Proper operation of any electrical system or component can be affected by battery condition. The battery(ies) must meet or exceed minimum specification for vehicle as equipped and test to that specific battery's CCA.**

Definition of Terms

Battery Performance Testing - Testing that determines whether or not a battery meets both vehicle OEM and battery manufacturer's specifications.

Cold Cranking Amp (CCA) Rating - The number of amperes a new, fully charged battery at 0Ã,Â° F (-17.8Ã,Â° C) can deliver for 30 seconds and maintain at least a voltage of 1.2 volts per cell (7.2 volts for a 12-volt battery).

Cranking Amps (CA) - The number of amperes a new, fully charged battery, typically at 32Ã,Â° F (0Ã,Â° C) can deliver for 30 seconds and maintain at least a voltage of 1.2 volts per cell (7.2 volts for a 12volt battery).

OEM Cranking Amps - The minimum CCA required by the original vehicle manufacturer for a specific vehicle.

Condition	Code	Procedure
Battery frozen	Further inspection required	
NOTE: **Do not attempt to charge a frozen battery. Allow battery to warm thoroughly and then performance-test. If battery fails performance test, require replacement.**		
Battery tests near the ""end of its useful life"" utilizing a tester or on-board monitor able to accurately determine this condition	1	Suggest Replacement
Case leaking	A	Require replacement
Casing swollen	A	Further inspection required
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Circuit open internally	A	Require replacement
Electrolyte contamination	A	Further inspection required
NOTE: **No service suggested or required unless the battery fails performance test, in which case, require replacement.**		
Electrolyte discoloration	A	Further inspection required

Threads stripped (threads missing)	A	Require replacement

FUSES, FUSIBLE LINKS AND CIRCUIT BREAKERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Blown	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Corroded, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Inoperative	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
Missing	C	Require replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement

GROUND CABLES AND STRAPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Insulation damaged, exposing conductors	2	Suggest replacement
Loose	A	Require repair
Missing	C	Require replacement
Open	A	Require repair or replacement
Resistance high	A	Require repair or replacement
Terminal resistance (voltage drop) is out of specification	B	Require repair or replacement
Voltage drop out of specification	B	Require repair or replacement

GROUND STRAPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Insulation damaged, exposing conductors	2	Suggest replacement
Loose	A	Require repair
Missing	C	Require replacement
Open	A	Require repair or replacement
Resistance high	A	Require repair or replacement
Terminal resistance (voltage drop) is out of specification	B	Require repair or replacement
Voltage drop out of specification	B	Require repair or replacement

LENSES

Condition	Code	Procedure
Adjustment out of specification	B	Require repair
Application incorrect	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Broken, affecting performance	A	Require replacement
Broken, not affecting performance	No Service Suggested or Required	
Cracked	B	Require replacement
Discolored	A	Require replacement
Leaking	B	Require repair or replacement
Melted, affecting performance	A	Require replacement
Melted, not affecting performance	2	Suggest replacement
Missing	C	Require replacement

SEALED BEAMS

NOTE: **Does not include soldered-in components.**

Condition	Code	Procedure
Adjustment out of specification	B	Require repair or replacement
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Base burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Base corroded, affecting performance	A	Require repair or replacement
Base corroded, not affecting performance	2	Suggest repair or replacement
Base leaking	A	Require repair or replacement
Base loose, affecting performance	B	Require repair or replacement
Base loose, not affecting performance	1	Suggest repair or replacement
Base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Bracket bent, affecting performance	A	Require repair or replacement
Bracket bent, not affecting performance	No Service Suggested or Required	
Bracket broken, affecting performance	A	Require replacement
Bracket broken, not affecting performance	No Service Suggested or Required	
Bracket corroded, affecting performance	A	Require repair or replacement
Bracket corroded, not affecting performance	2	Suggest repair or replacement
Bracket cracked, affecting performance	A	Require repair or replacement
Bracket cracked, not affecting performance	1	Suggest repair or replacement
Bracket loose, affecting performance	A	Require repair or replacement
Bracket loose, not affecting performance	1	Suggest repair or replacement
Bracket missing	C	Require replacement
Burned out	A	Require replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		

Condition	Code	Procedure
Connector missing	C	Require replacement
Corroded, affecting performance	A	Require repair or replacement
Corroded, not affecting performance	2	Suggest repair or replacement
Cracked	B	Require replacement
Intermittent	A	Require replacement
Lamp base melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Seized in socket	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

WASHER PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation.**		
Leaking externally	A	Require repair or replacement
Leaking internally	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Resistance out of specification	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

WIPER ARMS AND BLADES

NOTE: **Windshield coatings or waxes can cause blades to not function as intended. Clean surface before making final judgment about blade replacement.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching socket stripped	A	Require replacement
Bent	A	Require repair or replacement
Loose	2	Suggest repair or replacement
Missing	C	Require replacement
Noisy	2	Suggest repair or replacement
Size incorrect	2	Suggest replacement
Tension insufficient	B	Require repair or replacement
Torn	A	Require replacement
Worn, affecting performance	A	Require replacement

Condition	Code	Procedure
Worn, not affecting performance	1	Suggest replacement

WIPER HOSES AND NOZZLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Blocked	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Spray pattern incorrect	2	Suggest repair or replacement
Surface cracks (dry-rotted)	1	Suggest replacement

WIPER PUMP RESERVOIRS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Cap missing	C	Require replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement

ENGINE PERFORMANCE AND MAINTENANCE

NOTE: **CHEMICAL ENGINE DECARBONIZATION is a process utilizing chemicals to remove soft and semi-hardened gum, varnish, resin and carbon deposits from the air/fuel delivery systems and combustion chambers of gasoline internal combustion engines, providing benefits that include improved fuel economy, performance and driveability and reduced emissions. This process is performed to remove deposits preferably prior to deposit accumulation and hardening which may require costly mechanical deposit removal or component replacement.**

NOTE: **SUGGEST Chemical Engine Decarbonization service every 15,000 miles or 12 months.**

NOTE: **CONTAMINATED OIL SYSTEM SERVICE is an event based process (beyond that of a normal oil and filter change) performed to remove coolant, water or fuel contamination. Contamination increases oil's oxidation rate and has been shown to result in increased engine wear and reduced oil flow. CAUTION: Some OEM's (including GM and Honda) have issued Technical Service Bulletins advising that Chemical Crankcase Flushing may damage some engine components and that such damage will not be covered by the manufacturer's new car warranty.**

ACCESSORY BELTS

Condition	Code	Procedure

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement
Worn so it contacts bottom of pulley	A	Require replacement

AIR FILTER ELEMENTS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Leaking	A	Require replacement
Melted	A	Required replacement
Missing	C	Require replacement
Paper filter element oil-soaked	A	Require replacement
NOTE: **Further inspection required to determine cause.**		
Restricted, affecting performance	A	Require replacement
Water-contaminated	A	Require replacement
NOTE: **Further inspection required to determine cause.**		

AIR FILTER GASKETS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement
Missing	C	Require replacement

AIR FILTER HOUSINGS AND GASKETS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement
Missing	C	Require replacement

AIR PUMP BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**

Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest replacement
NOTE: **Exposed conductor at replacement (aftermarket) terminal end does not require repair or replacement.**		
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Suggest repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

BELT IDLER ASSEMBLIES (ACCESSORY AND CAM BELTS)

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearings worn	1	Suggest replacement
Cracked	2	Suggest replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Seized	A	Require repair or replacement

BELT TENSIONERS (ACCESSORY AND CAM BELT)

Condition	Code	Procedure
Alignment incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Bearings worn	1	Suggest replacement
Belt tension incorrect	B	Require adjustment or repair
Cracked	B	Suggest replacement
Missing	C	Require replacement
Noisy	2	Suggest replacement
Pulley damaged, affecting belt life	A	Require replacement
Seized	A	Require repair or replacement

CHEMICAL ENGINE DECARBONIZATION

NOTE: **Chemical engine decarbonization is a process utilizing chemicals to remove soft and semi-hardened gum, varnish, resin and carbon deposits from the air/fuel delivery systems and combustion chambers of gasoline internal combustion engines, providing benefits that include improved fuel economy, performance and driveability and reduced emissions. This process is performed to remove deposits preferably prior to deposit accumulation and hardening which may require costly mechanical deposit removal or component replacement.**

NOTE: **SUGGEST Chemical Engine Decarbonization service every 15,000 miles or 12 months.**

COMBUSTION CHAMBER CLEANING

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

COOLANT RECOVERY TANKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require repair or replacement

Condition	**Code**	**Procedure**
Missing (if original equipment)	C	Require replacement

COOLANT

Condition	**Code**	**Procedure**
Acidity (pH) incorrect	1	Suggest correction or replacement
At or beyond service interval	3	Suggest replacement
NOTE: **The system should be drained and/ or flushed and refilled with correct coolant according to OEM recommended service interval and procedures.**		
Contaminated	B	Require replacement or recycling Further inspection required
NOTE: **Determine source of contamination and require correction prior to coolant replacement.**		
Fluid discolored	No Service Suggested or Required	
NOTE: **Further testing necessary to determine condition of fluid.**		
Level incorrect	B	Require correction of fluid level
NOTE: **Determine source of incorrect level and suggest repair.**		
Mixture incorrect	B	Require correction or replacement
Type incorrect	B	Require replacement

DISTRIBUTOR CAPS

Condition	**Code**	**Procedure**
Application incorrect	B	Require replacement
Arcing	A	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Burned	A	Require replacement
Carbon button missing	A	Require replacement
Carbon button worn, affecting performance	A	Require replacement
Carbon button worn, not affecting performance	1	Suggest replacement
Carbon-tracked	A	Require replacement
Cracked	B	Require replacement
Loose	B	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal eroded, affecting performance	A	Require repair or replacement
Terminal eroded, not affecting performance	No Service Suggested or Required	
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

DISTRIBUTOR ROTORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Carbon-tracked	A	Require replacement
Contact burned	A	Require replacement
Corroded	1	Suggest replacement
Eroded	1	Suggest replacement
Loose	B	Require repair or replacement
Out of specification	B	Require replacement

ENGINE COOLING SYSTEMS

NOTE: **Overheating, poor engine performance, and insufficient cabin heat can be affected by, but are not limited to, all of the components in the engine cooling system.**

ENGINE DECARBONIZATION

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

ENGINE OIL DRAIN PLUGS AND GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
NOTE: **Some OEMs require replacement of drain plug gasket when removing drain plug. Inspect threads in oil pan for damage.**		

ENGINE OIL FILTERS AND CANISTERS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Bulged	A	Require replacement. Further inspection required
NOTE: **Inspect pressure relief valve.**		
Canister attaching hardware broken	A	Require repair or replacement of hardware
Canister attaching hardware loose	A	Require repair
Canister attaching hardware missing	C	Require replacement
Canister attaching hardware not functioning	A	Require repair or replacement of hardware
Center tube collapsed	A	Require replacement. Further inspection required
NOTE: **Inspect bypass.**		
Dented	2	Suggest replacement. Further inspection required
NOTE: **Determine cause, such as broken motor mount.**		
Leaking	B	Require repair or replacement

ENGINE OIL

Condition	Code	Procedure
Additive Depletion	A	Require replacement of fluid
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Contaminated	A	Require replacement of oil and filter; Further Inspection Required
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water when changing oil.**		
Fluid discolored	No Service Suggested or Required	
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid incorrect	B	Require service
Level Incorrect	B	Adjust to correct level. Further Inspection Required.
NOTE: **Determine cause of incorrect level such as leaking gaskets or contamination by engine coolant, fuel or water.**		
Oxidized	A	Require replacement of fluid

FUEL FILTERS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with OEM recommended service interval
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require replacement
Restricted, not affecting performance	1	Suggest replacement
Water-contaminated	2	Suggest replacement

FUEL INJECTOR CLEANING

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

FUEL INJECTORS

Condition	Code	Procedure
15,000 miles or 12 months beyond most recent Chemical Engine Decarbonization	5	Suggest chemical engine decarbonization
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement

Condition	Code	Procedure
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

FUEL SYSTEM CLEANING SERVICE

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

HOSE CLAMPS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

HOSE CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	A	Require replacement

Condition	Code	Procedure
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

HOSE COUPLERS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Safety clip missing (not leaking)	C	Require replacement of safety clip
Stripped	A	Require replacement

HOSES AND TUBES (FUEL LINES, RADIATOR, VACUUM, BY-PASS, HEATER, RECOVERY TANK AND OIL COOLERS)

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Connected incorrectly	A	Require repair
Corroded, not reusable	1	Suggest replacement
Cracked	B	Require replacement
Dry-rotted	1	Suggest repair or replacement
Hard	1	Suggest repair or replacement
Inner fabric (webbing) damaged	A	Require replacement
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Outer covering damaged	1	Suggest replacement
Outer covering damaged to the extent that the inner fabric is visible	A	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Safety clip missing	C	Require replacement
Spongy	1	Suggest repair or replacement
Stripped	A	Require replacement

Condition	Code	Procedure
Swollen	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

IGNITION WIRES (SECONDARY)

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Carbon-tracked	A	Require replacement
Corroded	1	Suggest repair or replacement
Insulation leaking (shorted)	A	Require repair or replacement
Metal heat shield bent	2	Suggest repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Resistance incorrect	B	Require replacement
Routed incorrectly	B	Suggest repair

NOTE:

If improper routing affects the performance of other systems, require repair. Proper routing, hardware, heatshields, etc., are intended to prevent premature failure of secondary ignition components.

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

NOTE:

Determine cause and correct prior to repair or replacement of part.

Condition	Code	Procedure
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

INTAKE CLEANING

NOTE: **See CHEMICAL ENGINE DECARBONIZATION.**

O2 SENSORS

Condition	Code	Procedure

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require repair or replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement. Further inspection required
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	A	Require repair or replacement
Missing	C	Require replacement
Resistance out of specification	B	Require repair or replacement
Restricted, affecting performance	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement

Condition	Code	Procedure
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

PCV BREATHER ELEMENTS

Condition	Code	Procedure
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Leaking	A	Require replacement
Melted	A	Required replacement
Missing	C	Require replacement
Restricted, affecting performance	A	Require replacement
Restricted, not affecting performance	1	Suggest replacement
Water-contaminated	A	Require replacement

PCV VALVES

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement to comply with vehicle's OEM recommended service intervals
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Grommet broken	A	Require repair or replacement of grommet
Grommet missing	C	Require replacement of grommet
Grommet not functioning	A	Require repair or replacement of grommet
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	A	Require replacement
Missing	C	Require replacement
Restricted	A	Require replacement

RADIATOR CAPS AND PRESSURIZED EXPANSION TANK CAPS

Condition	Code	Procedure
Application incorrect	B	Require replacement

Condition	Code	Procedure
Coolant recovery check valve inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Fails to maintain proper pressure	B	Require replacement
Gasket missing	C	Require replacement of gasket
Missing	C	Require replacement
Seal missing	C	Require replacement of seal

SPARK PLUGS

NOTE: **You are not required to replace spark plugs in sets. However, you may suggest replacement of the other plugs for preventive maintenance.**

Condition	Code	Procedure
Application incorrect	B	Require replacement
At or beyond service interval	3	Suggest replacement
Electrode eroded	1	Suggest replacement
Fouled	A	Require repair or replacement
NOTE: **Determine cause of fouling and suggest repair.**		
Gap incorrect	B	Require repair or replacement
Improperly Indexed	Remove and Reinstall following manufacturers installation requirements	
Insulation broken	A	Require replacement
Insulator cracked	A	Require replacement
Leaking compression	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

THERMOSTATS AND HOUSINGS

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Housing corroded	1	Suggest replacement of housing
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Installation incorrect	B	Require repair or replacement
Leaking	A	Require repair or replacement

Condition	Code	Procedure
Thermostat missing	C	Require replacement of thermostat
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement

THROTTLE BODY CLEANING

NOTE: See CHEMICAL ENGINE DECARBONIZATION.

TIMING BELTS

Condition	Code	Procedure
Adjustment incorrect	B	Suggest adjustment
NOTE: **Inspect belt tensioners, pulleys, and cover.**		
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
At or beyond service interval	3	Suggest replacement to comply with vehicle OEM recommended service intervals
Broken	A	Require replacement
Cam timing out of specification	B	Require repair
Cracked	1	Suggest replacement
Fluid-soaked	1	Suggest replacement. Further inspection required
Frayed	1	Suggest replacement
Missing	C	Require replacement
NOTE: **Internal engine damage may result from timing belt damage/failure.**		
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Teeth missing	A	Require replacement
Tension out of specification	B	Require adjustment or replacement

VACUUM HOSES, TUBES AND CONNECTIONS (NON-METALLIC)

Condition	Code	Procedure
Leaking	A	Require repair or replacement
Melted	A	Require replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Restricted	A	Require repair or replacement
Surface cracks (dry-rotted)	1	Suggest replacement

EXHAUST SYSTEMS

WARNING: **Federal EPA rules prohibit altering an exhaust system in any way that defeats the emission reduction components of a vehicle. Be sure to review and adhere to EPA policy on removing and replacing catalytic converters. Where state or local laws are stricter, they take precedence over these guidelines.**

NOTE: **Some exhaust systems are of a welded design. It is not required that the entire system be replaced. Determine the need to replace individual components based on conditions of component.**

EXHAUST AND TAIL PIPES

Condition	Code	Procedure
Broken bracket	A	Require repair or replacement
Pipe Bent Out Of Position	B	Require repair or replacement
Pipe Broken	A	Require repair or replacement
Pipe Cracked	B	Require repair or replacement
Pipe Leaking	A	Require replacement
Pipe Missing	C	Require replacement
Pipe Plugged	A	Require replacement
Pipe Weak Due To Corrosion, But No Leaks Present	1	Suggest replacement
Weld Broken	A	Require repair or replacement

HEATING, VENTILATION AND AIR CONDITIONING SYSTEMS

NOTE: **AIR CONDITIONING SYSTEM FLUSHING utilizes chemicals or refrigerant to remove oil, debris and contaminants from the evaporator, condenser, hoses or metal lines.**

NOTE: **An INLINE FILTER, both high and low side, protects a/c components from residual debris in the system. An inline filter or suction screen is suggested when a condenser, evaporator, compressor, expansion valve, accumulator/drier, hoses or metal lines is replaced, or if debris is found in the system during an a/c repair. An inline filter is suggested to help prevent future component damage and increase system longevity.**

BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Serpentine belt routed incorrectly	B	Require repair
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement

Condition	Code	Procedure
Worn so it contacts bottom of pulley	A	Require replacement

CABIN AIR FILTERS

Condition	Code	Procedure
Air flow obstruction	A	Require cleaning or replacement
At or beyond service interval	3	Suggest replacement
Microbial growth causing odor	A	Require replacement of filter
Missing	C	Require replacement

COOLANT

Condition	Code	Procedure
Acidity (pH) incorrect	1	Suggest correction or replacement
At or beyond service interval	3	Suggest replacement
Contaminated	B	Require replacement or recycling. Further inspection required
NOTE: **Determine source of contamination and require correction prior to coolant replacement.**		
Fluid discolored	No Service Suggested or Required	
NOTE: **Further testing necessary to determine condition of fluid.**		
Level incorrect	B	Require filling to proper level
NOTE: **Determine source of incorrect level and suggest repair.**		
Mixture incorrect	B	Require correction or replacement
Type incorrect	B	Require replacement

EVAPORATOR DRAIN TUBES

Condition	Code	Procedure
Disconnected	A	Require repair
Leaking	A	Require replacement
Missing	C	Require replacement
Restricted	A	Require repair or replacement
Routed incorrectly	B	Require repair

EVAPORATOR FILTERS

Condition	Code	Procedure
Air flow obstruction	A	Require cleaning or replacement
At or beyond service interval	3	Suggest replacement
Microbial growth causing odor	A	Require replacement of filter
Missing	C	Require replacement

IN-LINE FILTERS

Condition	Code	Procedure
Connection leaking	A	Require repair or replacement
Leaking	B	Require repair or replacement
Restricted	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

VACUUM HOSES AND TUBES

Condition	Code	Procedure
Disconnected	A	Require repair
Leaking	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	A	Require repair or replacement
Missing	C	Require replacement
Oil-soaked (spongy)	1	Suggest replacement
Restricted	A	Require repair or replacement
Routing incorrect	B	Require repair
Surface cracks (dry-rotted)	1	Suggest replacement

STEERING AND SUSPENSION, WHEEL ALIGNMENT, WHEELS AND TIRES

NOTE: **Steering and Suspension are complex systems made up of a variety of interdependent components and controls. For proper vehicle handling, ride, and tire wear, a thorough inspection is required whenever suspension work is being performed.**

NOTE: **Listed repair conditions assume that the problem has been isolated to the specific component by proper testing procedures. When replacing steering and/or suspension components which may affect an alignment angle, you are required to check and adjust alignment as needed. Refer to the OEM specifications for both ride height and alignment angle tolerances.**

NOTE: **Improper alignment geometry, and/or improper tire/wheel fitment may affect other systems such as Adaptive Cruise Control, Electronic Stability Control, Electronic Traction Control and Variable Ratio Steering. These systems may require attention after an alignment or suspension service is performed. Care must be taken to identify these vehicles/systems before any repair procedures are performed. Failure to follow OEM guidelines when servicing interrelated systems could result in an unsafe condition.**

CAUTION: **Do not use ride height altering or load compensating components, such as variable rate springs or coil over shocks on vehicles with height sensing or load sensing proportioning- valve equipped braking systems, unless these components are supplied as original equipment.**

HYDRAULIC HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Blistered	B	Require replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Secured incorrectly	B	Require repair

POWER STEERING BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Serpentine belt routed incorrectly	B	Require repair
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement
Worn so it contacts bottom of pulley	A	Require replacement

POWER STEERING FLUID

Condition	Code	Procedure
50,000 miles or greater on OE fluid (in absence of published manufacturer interval)	5	Suggest Replacement
NOTE: **One time only fluid exchange**		
Additive Depletion	A	Require replacement of fluid
Fluid at or beyond service interval	3	Suggest fluid replacement

Condition	Code	Procedure
Fluid contaminated (i.e. fluid other than power steering fluid present)	B	Require flushing and refilling of the system
NOTE: **Determine and correct source of contamination. OEM specifications must be followed for fluid type.**		
Fluid discolored	No Service Suggested or Required	
NOTE: **Further testing necessary to determine condition of fluid.**		
Fluid level incorrect	B	Require adjustment of fluid level
Fluid type incorrect	B	Require flushing and refilling with correct fluid
Oxidized	A	Require replacement of fluid

POWER STEERING HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Blistered	B	Require replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Secured incorrectly	B	Require repair

SHOCK ABSORBERS, STRUT CARTRIDGES AND STRUT ASSEMBLIES

NOTE: **You are not required to replace shocks or struts in axle sets. However, when replacing a shock or strut due to the conditions that follow, you may suggest replacement of the other shock or strut on the same axle for one or more of the following: improved performance or preventive maintenance; part is close to the end of its useful life; to extend tire life; to balance ride and handling; or to improve stopping distance. When replacing steering and/or suspension components which may affect an alignment angle, you are required to check and adjust alignment as needed. Refer to the OEM specifications. Under no circumstances should**

a technician bend struts or strut housings. A vehicle's load-carrying and handling abilities are limited by its suspension, tires, brakes, and driveline. Installing coil over shocks or any other load assist device does not increase the vehicle's load capacity. See the vehicle owner's manual for more details. If vehicle is equipped with OEM coil over shocks, apply the conditions for coil springs from the Springs: Coil, Leaf, and Torsion Bar section of the Steering and Suspension guidelines. If the vehicle is equipped with add-on coil over shocks, you may suggest replacement with standard shocks for a spring-related condition.

Condition	Code	Procedure
50,000 miles or greater on OEM Shocks or Struts	1	Suggest Replacement
NOTE: **Applies only to OEM hydraulic fluid and/or gas charged shocks and struts, NOT electronically controlled units.**		
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require replacement
Body dented	A	Further inspection required
NOTE: **Require replacement of units where dents restrict shock or strut piston rod movement. If dents don't restrict movement, no service is suggested or required. Especially critical on mono-tube shocks.**		
Body punctured	A	Require replacement
Brake hose bracket bent	B	Require repair or replacement
Brake hose bracket missing	C	Require replacement
Brake hose bracket threads damaged	A	Require repair or replacement
Brake hose bracket threads stripped (threads missing)	C	Require replacement
Compression bumper missing	C	Require replacement of compression bumper
Compression bumper split	1	Suggest replacement of compression bumper
Damping (none)	A	Require replacement
Dust boot (bellows) missing	C	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of shock or strut (reason code 2). This condition can lead to damage of the piston rod, which causes piston rod seal wear.**		
Dust boot (bellows) split	A	Require replacement of boot

Condition	Code	Procedure
NOTE: **If boot is not available as a separate component, suggest replacement of shock or strut (reason code 2). This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Dust boot (bellows) torn	A	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of shock or strut (reason code 2). This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Dust shield broken	2	Suggest replacement
NOTE: **This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Dust shield missing	2	Suggest replacement
NOTE: **This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Gland nut (strut housing cap) is not removable using appropriate tool	A	Require replacement of nut and/or housing
NOTE: **Only required if replacing cartridge.**		
Gland nut (strut housing cap) threads damaged	A	Require repair or replacement of nut
Housing dented	A	Further inspection required
NOTE: **Require replacement of units where dents restrict shock or strut piston rod movement. If dents don't restrict movement, no service is suggested or required. Especially critical on mono-tube shocks.**		
Housing punctured	A	Require replacement
Jounce bumper missing	C	Require replacement of jounce bumper
Jounce bumper split	1	Suggest replacement of jounce bumper
Leaking oil, enough for fluid to be running down the body	A	Require replacement
NOTE: **If the strut cartridge has been replaced previously, the oil on the strut housing may be filler oil. The technician must identify the source of the oil.**		
Noisy	2	Further inspection required
NOTE: **If noise is isolated to shock or strut, suggest replacement.**		
Piston rod bent	A	Require replacement
Piston rod broken	A	Require replacement
Piston rod has surface defect	2	Suggest replacement

Condition	Code	Procedure
Piston rod threads damaged	A	Require repair or replacement
Piston rod threads stripped (threads missing)	A	Require replacement
Seized	A	Require replacement
Shock missing	C	Require replacement
Strut housing bent	A	Require replacement
Strut housing cap (gland nut) is not removable using appropriate tool	A	Require replacement of nut and/or housing
NOTE: **Only required if replacing cartridge.**		
Strut housing cap (gland nut) threads damaged	A	Require repair or replacement of nut
Strut housing cap (gland nut) threads stripped (threads missing)	A	Require replacement of nut
Strut housing severely corroded, affecting structural integrity	A	Require replacement
Strut housing threads damaged	A	Require repair or replacement
Strut housing threads stripped (threads missing)	A	Require replacement
Tire cupping	A	Further inspection required
NOTE: **Although shocks or struts may have contributed to tire cupping, an inspection is needed of the entire suspension system. If the shock or strut is found to be contributing to the tire cupping, require replacement.**		

STRUT RODS

Condition	Code	Procedure
Adjusting nut seized	A	Require repair or replacement of hardware
NOTE: **Only required if an alignment is being performed and adjustment of the strut in question is required.**		
Attaching (mating) hole oversized	A	Require repair or replacement of bracket or frame
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Attaching point on bracket or frame corroded, affecting structural integrity	A	Require repair of bracket or frame
Bent, affecting performance	A	Require replacement

Condition	Code	Procedure
Mating (attaching) hole oversized	A	Require repair or replacement of bracket or frame
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

TIRE PRESSURE MONITORING SYSTEM

NOTE: **A Tire Pressure Monitoring System (TPMS) is designed to detect and alert the driver should the air pressure level in one or more of the vehicle's tires, up to all four tires, fall below the manufacturer's recommended inflation pressure or another pre-set level.**

NOTE: **NHTSA does not consider installation of an aftermarket or replacement tire or rim that is not compatible with the TPMS to be a "make inoperative" situation under 49 U.S.C. 30122, provided that the entity does not disable the TPMS malfunction indicator.**

TIRE PRESSURE SENSORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent failure.**		
Loose	B	Require repair or replacement
Missing (Non-OE Wheel and/or Tire Applications)	2	Suggest replacement if appropriate sensor is available
Missing (OE Wheel and Tire Applications)	C	Replacement Reqiuired
Not Responding	Further inspection required	
NOTE: **If sensor does not Wake Up, follow manufacturers recommended diagnostic procedure to determine cause**		

TIRES

NOTE: **These guidelines do not apply to split rims. Some vehicle manufacturers restrict replacement of tires to specific brands, types, or sizes. High pressure temporary compact spare tires should not be used with any other rims or wheels, nor should standard tires, snow tires, wheel covers, or trim rings be used with high pressure compact spare rims or wheels. Attempting to mount a tire of one diameter on a wheel of a different diameter or flange type may result in serious injury or death. Only specially trained persons should de-mount or mount tires. Explosions of tire and wheel assembly can result from improper mounting, possibly causing serious injury or death. Consult the vehicle owner's manual or vehicle placard for correct size, speed rating, designation, and cold inflation pressure of the original tires. Do not exceed the maximum load or inflation capacity of the tire specified by the Tire and Rim Association When replacing tires, it is suggested that the replacement tires match or**

exceed the OEM speed rating designation. If tires of different speed rating designations are mixed on the same vehicle, the tires may vary in handling characteristics. Do not mix different speed rating designations on the same axle. Do not mix radials with non-radial tires on the same axle, as this may affect vehicle handling and stability. If radial tires and bias or bias-belted ply tires are mixed on the same vehicle, the radials must be on the rear. High-pressure temporary compact spare tires are exempt from this rule. Do not mix size or type (Run Flat, all season, performance, mud and snow) of tires on the same axle. If any flammable emergency tire inflation product has been used on a tire, consult inflation product, manufacturer's product information label for tire deflation procedures to avoid possible serious injury or death. In some vehicles, changing the tire diameter from factory-equipped size can affect drive ability, as well as the performance of ABS and other vehicle systems. Consult the vehicle manufacturer's specifications.

Condition	**Code**	**Procedure**
Air pressure incorrect	B	Require repair
Bead broken	A	Require replacement
Bead leaking, caused by tire	A	Require repair or replacement
Bead wire/cord exposed	A	Require replacement
Cord or belt material exposed	A	Require replacement
Cord ply separations	A	Require replacement
Directional/asymmetrical tires mounted incorrectly	B	Require remounting and/or repositioning
Irregular tread wear, affecting performance	2	Suggest replacement
NOTE: **Determine and correct cause of irregular tire wear.**		
Load ratings less than OEM specifications	B	Require replacement
Mixed tread types (all season, performance, mud and snow) on same axle	A	Require replacement
Number of punctures exceeds manufacturer's limit	B	Require replacement
Out of balance	B	Require rebalance of tire/wheel assembly
Ply separation	A	Require replacement
Pull or lead, caused by tire	A	Require repair or replacement
Radial and bias or bias-belted ply tires on same axle	B	Require repair or replacement
Radials are on the front and not on the rear	B	Require repair or replacement
NOTE: **If radials and bias or bias-belted ply tires are on the same vehicle, the radials must be on the rear axle, except for high-pressure temporary spares.**		
Run flat damage	A	Require replacement
Shoulder cut	A	Require replacement
Shoulder puncture	A	Require replacement
Shoulder with plug	A	Require replacement
Sidewall bulge	A	Require replacement
Sidewall cut	A	Require replacement
Sidewall indentation	No service required or suggested	

Condition	Code	Procedure
Sidewall puncture	A	Require replacement
Sidewall with plug	A	Require replacement
Speed rating designations different on same axle	2	Suggest rotation or replacement
Tire and wheel assembly has excessive run-out	B	Require repair or replacement of appropriate part
NOTE: **Excessive is defined as enough to contribute to performance problems. Match mounting may correct run-out. If not, require replacement of appropriate part. Refer to manufacturer's specifications.**		
Tires with excessive diameter difference on an all-wheel drive vehicle or four-wheel drive vehicle	B	Require replacement
NOTE: **Excessive diameter difference is defined as exceeding manufacturer's specifications or, if no manufacturer's specifications exist, with more than 1/4"" diameter difference.**		
Tires with excessive diameter difference on the same side of a dual-wheel application	B	Require replacement
NOTE: **Excessive diameter difference is defined as exceeding manufacturer's specifications or, if no manufacturer's specifications exist, with more than 1/4"" diameter difference.**		
Tread area puncture larger in diameter than manufacturer's specifications	B	Require replacement
Tread missing pieces (chunking), exposing cord	A	Require replacement
Tread missing pieces (chunking), not exposing cord	1	Suggest replacement
Tread separations	A	Require replacement
Tube in tubeless tire	3	Suggest removal of tube
NOTE: **Most manufacturers do not recommend tubes in tubeless tires. Inspect tire and wheel . Assembly to determine the reason for a tube in tubeless tire. Recommendation for repair or replacement should be based upon condition of tires and! Or wheel listed in these guidelines.**		
Weather-checking	No service required or suggested	
Worn to tread wear indicators	B	Require replacement

VALVE STEMS

NOTE: **Most tire manufacturers suggest replacement of non-TPMS valve stems any time a new tire is installed. For TPMS valve stems, the manufacturer may require replacement of the valve stem, o-ring seals, washers, gaskets, valve cores, compression washers and/or locking nut.**

Condition	Code	Procedure
Bent	2	Suggest replacement
Broken	A	Require replacement

Condition	**Code**	**Procedure**
Cap seized	A	Require repair or replacement
Cut, but not leaking	1	Suggest replacement
Deteriorated (cracking, dry rot)	1	Suggest replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
O-Ring leaking	A	Require replacement of O-Ring
Threads damaged	A	Require repair or replacement
Threads stripped	A	Require replacement
Valve cap missing	C	Require replacement of cap

WHEEL ATTACHMENT HARDWARE

NOTE: **For conditions noted below, also check condition of wheel stud holes. Proper lug nut torque is essential. Follow recommended torque specifications and tightening sequence. DO NOT lubricate threads unless specified by the vehicle manufacturer.**

Condition	**Code**	**Procedure**
Bent	A	Require replacement
Broken	A	Require replacement
NOTE: **Some manufacturers require replacement of all studs on that wheel if two or more studs or nuts on the same wheel are broken or missing.**		
Locking lug nut locking groove damaged	A	Require replacement
Loose	A	Require repair or replacement of affected component
Lug nut installed backward	B	Require repair or replacement
Lug nut mating surface distorted	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut missing	C	Require replacement
Lug nut rounded	A	Require replacement of nut
NOTE: **Only required if removing wheel.**		
Lug nut seized	A	Require replacement of nut
NOTE: **Only required if removing wheel.**		
Stud incorrect	B	Require replacement of stud
Stud missing	C	Require replacement
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped	A	Require replacement of component with stripped threads

WHEEL BEARINGS, RACES AND SEALS

NOTE: **When replacing or repacking wheel bearings, grease seal replacement is required. You are not required to replace these components in axle sets.**

Determine the need to replace based upon the individual component conditions that follow.

Condition	Code	Procedure
Axle seal on drive axle leaking	A	Require replacement of seal and inspection of axle, bearing, housing, and vent tube
Bearing end-play exceeds specifications	B	Require adjustment of bearing, if possible If proper adjustment cannot be obtained, require replacement of bearing and race assembly
Bearing rollers, balls or races are worn, pitted, or feel rough when rotated as an assembly or other damage affecting performance.	B	Require replacement of bearing and race assembly
Seal leaking	A	Require replacement of seal and inspection of bearings
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary. Check vent. A plugged vent may force fluid past the seal.**		
Seal missing	C	Require replacement

WHEEL & TIRE SUPPLEMENT

Steering and suspension are complex systems made up of a variety of interdependent components. For proper vehicle handling, ride, and tire wear, a thorough inspection is required whenever suspension work is being performed. Conditions listed assume that the problem has been isolated to the specific component by proper testing procedures.

NOTE: **When replacing steering and/or suspension components that may affect an alignment angle, you are required to check and adjust alignment as needed. Refer to the OEM specifications.**

CAUTION: **Do not use ride height altering or load compensating components, such as variable rate springs and coil over shocks, on vehicles with height or load sensing proportioning valve-equipped braking systems, unless these components are original equipment.**

NOTE: **Depending on the air suspension design, there are some aftermarket products available to eliminate the air ride suspension on certain vehicles. If the system has been eliminated with one of these products, then no service is suggested or required.**

WARNING: **These guidelines do not apply to split rims.**

TIRES

When replacing tires, it is suggested that the replacement tires match or exceed the OEM speed rating designation. If tires of different speed rating designations are mixed on the same vehicle, the tires may vary in handling characteristics. Do not mix different speed rating designations on the same axle.

Consult the vehicle owner's manual or vehicle placard for correct tire size, service description, load index, speed rating and cold inflation pressure of the original tires. Do not exceed the maximum load or inflation capacity of the tire specified by the Tire and Rim Association (www.us-tra.org)

When replacing fewer than ALL tires on a vehicle, follow the vehicle manufacturer's recommendations as to the placement of the new tires. If it is not possible to follow the vehicle manufacturer's tire replacement recommendations, remember to replace tires on the same axle with the same size, construction, speed rating, and, if possible, similar tread pattern.

Do not mix radials with non-radial tires on the same axle, as this may affect vehicle handling and stability. If radial tires and non-radial tires are mixed on the same vehicle, the radials must be on the rear. If radial and non-radial tires are used on a vehicle equipped with dual rear tires, radial tires may be used on either axle. High-pressure temporary compact spare tires are exempt from this rule.

Do not mix size or type (all season, performance, mud and snow) of tires on the same axle. When replacing only two tires on front or rear drive vehicles, follow the vehicle manufacturer's recommendations concerning placement. If it is not possible to follow OE recommendations, it is preferable to place the two new tires on the rear for greater stability, greater adhesion affecting steering -- on other than dry pavement -- and overall safety, regardless of whether the vehicle is front or rear wheel drive.

It is particularly important to match all tire sizes and constructions on 4-wheel (4x4) and all-wheel (AWD) drive vehicles unless otherwise specified by vehicle manufacturer. Ideally, all four tires should be replaced at the same time. Some vehicle manufacturers restrict replacement of tires to specific brands, types, or sizes.

MOUNTING TIRES

Only specially trained persons should de-mount or mount tires. Explosions of tire and wheel assembly can result from improper mounting, possibly causing serious injury or death. High pressure temporary compact spare tires should not be used with any other rims or wheels, nor should standard tires, snow tires, wheel covers, or trim rings be used with high pressure compact spare rims or wheels.

Mount tires only on same or approved rim widths.

Attempting to mount a tire of one diameter on a wheel of a different diameter , bead taper or flange type may result in serious injury or death.

If any flammable emergency tire inflation product has been used in a tire, consult inflation product manufacturer's product information label for tire deflation procedures to avoid possible serious injury or death.

VEHICLE TIRE PLACARD

Since 1968, cars and light trucks sold in the United States have been required to have a tire information sticker, called a vehicle tire placard. The vehicle tire placard indicates the size of the original equipment tires (including the spare), cold inflation pressure for the tires on both axles as well as the spare, and load index or range. Depending on the vehicle, the vehicle tire placard will either be located on the edge of any door, the doorpost, glove box, fuel door or inside trunk lid. If the tire placard is missing, consult the owner's manual, vehicle manufacturer, or tire manufacturer regarding applicable tire information.

Always refer to the vehicle manufacturer's recommendations before replacing tires. Tires should always be replaced with the same size designation, or approved options, as recommended. Never choose a smaller size with less load carrying capacity than the size on the tire placard. (Some vehicle manufacturers require different-sized tires for either the front or rear axles.)

NOTE: **It is not always possible to select a replacement tire with exactly the same size as shown on the placard. Consult with a vehicle or tire manufacturer for replacement recommendations.**

TIRE ROTATION

The front tires on most vehicles tend to wear out faster than the rear tires. This is due to the effects of steering the vehicle and the weight transfer that occurs during braking. To ensure that all four tires wear evenly, it is important to rotate them on a regular basis. Tire rotation helps maintain balanced handling because it allows all four tires to wear at the same rate. Keep in mind, as tire wear reduces tread depth, it increases the tires' response to driver inputs. Consequently, by equalizing tire wear at all four corners, dry road performance is actually enhanced. Another advantage of regular rotation is that it allows the tires to be replaced in complete sets rather than in pairs. This maintains handling continuity. It also enables drivers to take advantage of the latest in tire technology, instead of trying to match a pair of older tires.

Most manufacturers list rotation intervals in the scheduled maintenance section of the vehicle service manual and/or the owner's manual. Tire rotation patterns can also be found in these books. If this information is unavailable for a particular vehicle, rotate the tires every 5-7,000 miles following the appropriate rotation sequence shown in the illustrations. After completing a tire rotation, be sure to reset inflation pressures to the manufacturer's recommended specifications indicated on the vehicle tire placard.

To ensure that the proper amount of clamping force is applied to each fastener, follow these guidelines:

- Make sure the area around the lug holes, as well as the wheel and hub mating surfaces are clean and dry. A wire brush can be used to remove corrosion and other debris. Wipe the areas clean using a shop rag.
- Inspect the bolt holes for damage. Do not use a wheel if the bolt holes are deformed.
- Inspect the wheel studs and lug nuts or lug bolts and bolt holes (depending on the vehicle) for damage. Replace or repair any damaged or worn components.
- Always follow a star pattern when tightening lugs.

WHEEL LUG NUT TORQUE & CLAMPING FORCE

Although proper wheel lug nut torque is important, it does not guarantee that the required clamping force will be achieved. For example, excessive corrosion on the wheel and hub mating surfaces will result in improper clamping force, even when the lugs are tightened with a calibrated torque wrench. Low clamping force can also occur if the threads are dirty. This is because dirt causes interference between the mating threads. As a result, the torque wrench will register the correct reading but the clamping force will be inadequate. To improve the chances of achieving the precise clamping force between the wheel and hub, proper torque must be applied to clean components in good condition. Specifications for wheel lug nut torque can be found in the `Tire and Wheel' section of most vehicle service manuals. When specifications are indicated as a range, adjust the torque wrench to the middle of the range to compensate for normal variations in tool calibration.

Fig. 13: Popular Tire Rotation Patterns - Without Dual Rear Wheels

Never rotate directional tires from side-to-side since this will reverse their direction of rotation. Directional tires can only be rotated from front to rear or vice versa. Directional tires are typically used on high-performance cars and can be identified by the arrows imprinted on the sidewall.

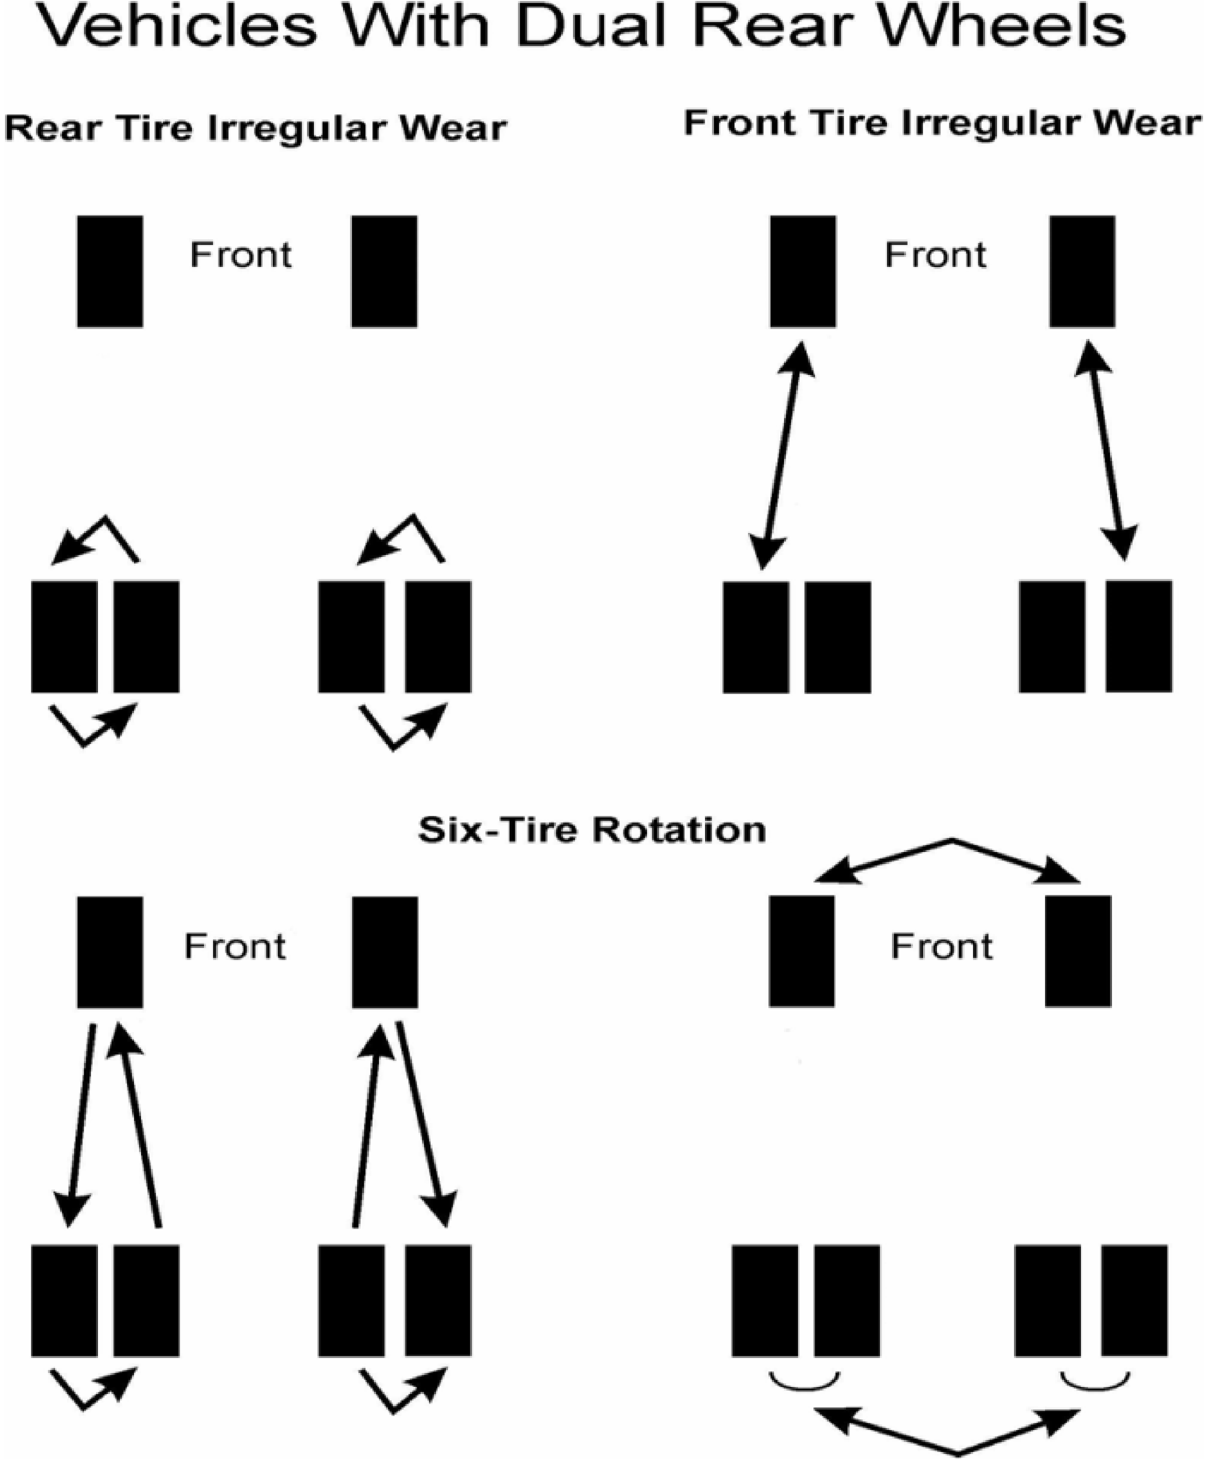

Fig. 14: Popular Tire Rotation Patterns - With Dual Rear Wheels

Some tires cannot be rotated in the manners described. Such tires include uni-directional tires and tires with asymmetric tread designs. Also, some vehicles may have different-sized tires mounted on the front and rear axles, and these different-sized tires also have rotation restrictions. Check your owner's manual or with a tire manufacturer or a tire dealer for proper recommendations for these specific cases.

WHEELS AND RIMS

The wheels on today's vehicles are made of steel, aluminum, or aluminum alloy (a combination of two or more metals). Steel wheels are the least expensive to produce, which is why they come as original equipment on many passenger cars and light trucks. The center section includes the bolt circle, or mounting holes, and is used to attach the wheel to the vehicle. The flange is the outermost lip of the rim, and is the area typically used for attaching wheel (balancing) weights. The rim is formed by rolling a strip of metal and then welding the two ends together. The interior section of the rim has a smaller diameter section called a drop center. This area provides the means for removing and installing a tire, since the bead is not designed to stretch. During removal or installation, most of the tire bead is pushed into the drop center so that the exposed portion can be pulled over the rim. The edges of the rim are flared to form the bead seats, which hold the tire and provide the airtight seal. Many rims include safety humps. These are small elevations on the inside of the bead seats. Safety humps help prevent the tire from falling into the drop center during a blowout. This allows the driver to maintain better directional control of a vehicle running on one or more deflated tires.

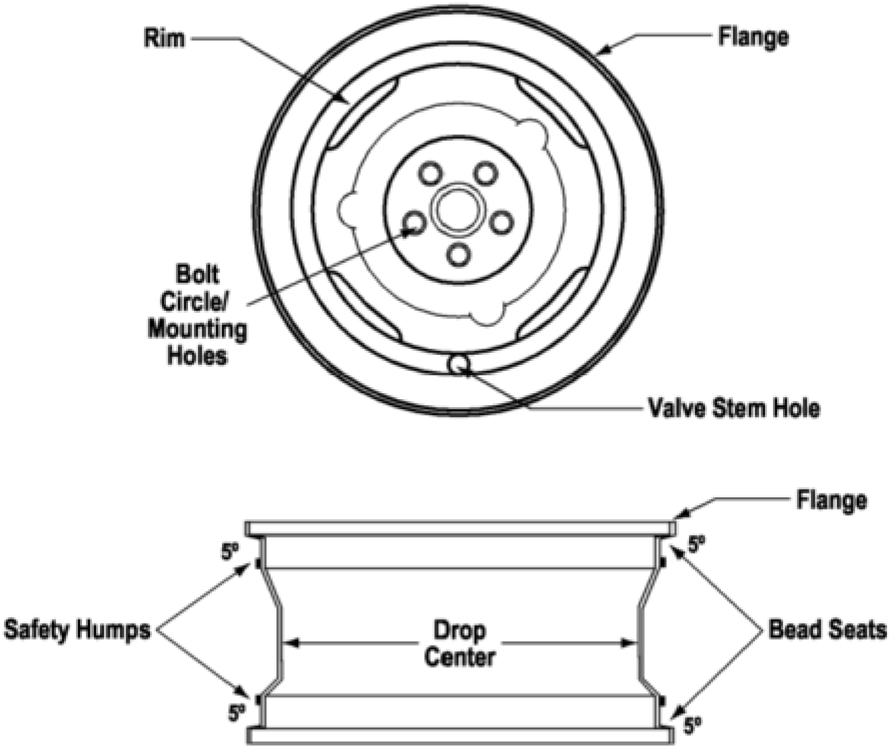

Fig. 15: Steel Wheel

WARNING: **Mounting a regular tire on a high-pressure compact spare wheel is not permitted. Attempting to mount a tire of one diameter on a wheel of a different diameter or flange type may result in serious injury or death. Mount tires only on approved rim widths. If the wheel identification stamp is not legible, or cannot be found, do not use the wheel until the size and type have been properly identified. Load, cold inflation pressure, and tire construction forces imposed on the rim/wheel must not exceed the rim/wheel manufacturer's recommendations, even if the tire is approved for a higher load or inflation. Wheels of different diameter, offset, or width cannot be mixed on the same axle. Bead seat tapers cannot be interchanged.**

TIRE PRESSURE MONITORING SYSTEMS

To avoid damaging sensors when mounting and demounting tires, it is beneficial to know where the sensors are located. Sensor assemblies are commonly attached to the valve stem, with the valve stem acting as an antenna to assist with transmitting RF signals. They may also be strapped to the drop center of the wheel. If this is the case, the sensor assembly should be located in-line with the valve stem.

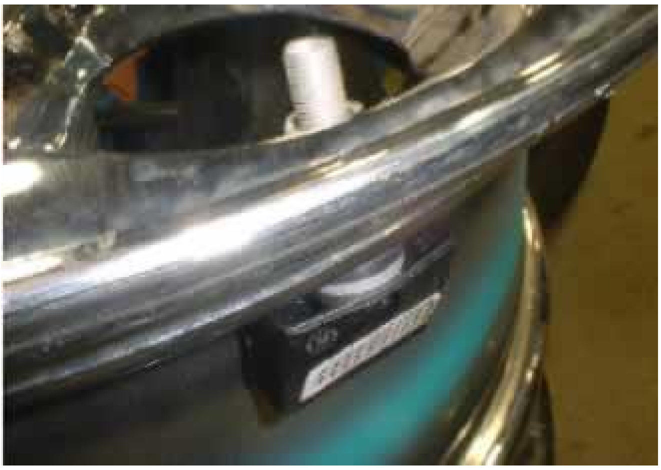

Fig. 16: Valve Stem Mounted Sensor

To avoid damaging sensors when demounting tires, do not break the bead within 45 of either side of sensor assembly locations. Be careful not to damage sensors when mounting tires as well. Sensors are not repairable and require replacement if damaged or when their battery is completely drained. It is recommended that the sensor be carefully "dropped into the tire" prior to demounting to avoid damage.

Fig. 17: Mounting Sensor

When reinstalling the sensor, it is suggested that the locknut, gasket and valve stem be replaced and torgued to the proper specification. It is also necessary to use the proper valve cap as it is also an integral part of the system.

It may be necessary to reprogram the TPMS when the tires are rotated, when a new sensor is installed, or after the vehicle loses power. This usually requires a scan tool and may involve the use of a special magnet. Refer to the vehicle service manual to properly reprogram the TPMS.

NOTE: **Determine and correct cause of irregular tire wear.**		
Load ratings less than OEM specifications	B	Require replacement
Mixed tread types (all season, performance, mud and snow) on same axle	A	Require replacement
Number of punctures exceeds manufacturer's limit	B	Require replacement
Out of balance	B	Require rebalance of tire/wheel assembly
Ply separation	A	Require replacement
Pull or lead, caused by tire	A	Require repair or replacement
Radial and bias or bias-belted ply tires on same axle	B	Require repair or replacement
Radials are on the front and not on the rear	B	Require repair or replacement
NOTE: **If radials and bias or bias-belted ply tires are on the same vehicle, the radials must be on the rear axle, except for high-pressure temporary spares.**		
Run flat damage	A	Require replacement
Shoulder cut	A	Require replacement
Shoulder puncture	A	Require replacement
Shoulder with plug	A	Require replacement
Sidewall bulge	A	Require replacement
Sidewall cut	A	Require replacement
Sidewall indentation	Ã,Â	No service required or suggested
Sidewall puncture	A	Require replacement
Sidewall with plug	A	Require replacement
Speed rating designations different on same axle	2	Suggest rotation or replacement
Tire and wheel assembly has excessive run-out	B	Require repair or replacement of appropriate part
NOTE: **Excessive is defined as enough to contribute to performance problems. Match mounting may correct run-out. If not, require replacement of appropriate part. Refer to manufacturer's specifications.**		
Tires with excessive diameter difference on an all-wheel drive vehicle or four-wheel drive vehicle	B	Require replacement
NOTE: **Excessive diameter difference is defined as exceeding manufacturer's specifications or, if no manufacturer's specifications exist, with more than 1/4"" diameter difference.**		
Tires with excessive diameter difference on the same side of a dual-wheel application	B	Require replacement
NOTE: **Excessive diameter difference is defined as exceeding manufacturer's specifications or, if no manufacturer's specifications exist, with more than 1/4"" diameter difference.**		

Condition	Code	Procedure
Tread area puncture larger in diameter than manufacturer's specifications	B	Require replacement
Tread missing pieces (chunking), exposing cord	A	Require replacement
Tread missing pieces (chunking), not exposing cord	1	Suggest replacement
Tread separations	A	Require replacement
Tube in tubeless tire	3	Suggest removal of tube
NOTE: **Most manufacturers do not recommend tubes in tubeless tires. Inspect tire and wheel . Assembly to determine the reason for a tube in tubeless tire. Recommendation for repair or replacement should be based upon condition of tires and! Or wheel listed in these guidelines.**		
Weather-checking	Ã,Â	No service required or suggested
Worn to tread wear indicators	B	Require replacement

WHEEL ALIGNMENT

NOTE: **Wheel alignment is defined as the measurement, analysis, and adjustment of steering and suspension angles to conform to manufacturer specifications. These angles usually include, but are not limited to: caster, camber, toe, and thrust angle. Where these angles are not adjustable and not in specification, component replacement or correction kits may be required. Errors in set-back and steering axis inclination (SAI) are often attributable to failed or damaged components and must be corrected prior to performing an alignment. Failure to replace or correct suggested parts or service may prevent a proper alignment. Before performing an alignment check, inspect and verify the following: Tire pressure and size . Vehicle loading . Ride height . Steering and suspension parts only if the inspection reveals that all the above are within published specifications, a wheel alignment check and a proper wheel alignment, if needed, may be performed. Under no circumstances should a technician bend or heat any steering or suspension component, unless specified by the vehicle manufacturer. All measurements and specifications must be noted on the inspection report.**

Condition	Code	Procedure
Beyond manufacturer's service interval	3	Suggest alignment check
Dog tracking, shown to be caused by faulty alignment	2	Suggest repair
Drift, shown to be caused by faulty alignment	A	Require alignment
Lead, shown to be caused by faulty alignment	A	Require alignment
Outside manufacturer's specifications	B	Require repair
Part has been changed, affecting alignment	A	Require alignment check
Pull, shown to be caused by faulty alignment	A	Require alignment
Steering wheel off-center	2	Suggest alignment
Tire wear, shown to be caused by faulty alignment	A	Require alignment
Wander, shown to be caused by faulty alignment	A	Require alignment

WHEEL ATTACHMENT HARDWARE

NOTE: **For conditions noted below, also check condition of wheel stud holes. Proper lug nut torque is essential. Follow recommended torque specifications and tightening sequence. DO NOT lubricate threads unless specified by the vehicle manufacturer.**

Condition	Code	Procedure
Bent	A	Require replacement

Condition	Code	Procedure
Broken	A	Require replacement
NOTE: **Some manufacturers require replacement of all studs on that wheel if two or more studs or nuts on the same wheel are broken or missing.**		
Locking lug nut locking groove damaged	A	Require replacement
Loose	A	Require repair or replacement of affected component
Lug nut installed backward	B	Require repair or replacement
Lug nut mating surface distorted	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut missing	C	Require replacement
Lug nut rounded	A	Require replacement of nut
NOTE: **Only required if removing wheel.**		
Lug nut seized	A	Require replacement of nut
NOTE: **Only required if removing wheel.**		
Stud incorrect	B	Require replacement of stud
Stud missing	C	Require replacement
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped	A	Require replacement of component with stripped threads

WHEELS (RIMS)

NOTE: **Mounting a regular tire on a high-pressure compact spare wheel is not permitted. Attempting to mount a tire of one diameter on a wheel of a different diameter or flange type may result in serious injury or death. If the wheel identification stamp is not legible, or cannot be found, do not use the wheel until the size and type have been properly identified. Wheels of different diameter, offset, or width cannot be mixed on the same axle. Bead seat tapers cannot be interchanged.**

Condition	Code	Procedure
Bead leaking, caused by wheel	A	Require repair or replacement
NOTE: **Do not attempt to correct a bent rim.**		
Bent hub mounting surface	A	Require replacement
Bent rim, causing vibration	2	Suggest replacement
NOTE: **Do not attempt to correct a bent rim.**		
Broken	A	Require replacement
Cast wheel porous, causing a leak	A	Require repair or replacement
Clip-on balance weight is incorrect type for rim flange	2	Suggest replacement of weight
Corrosion affecting structural integrity	A	Require replacement
Corrosion build-up on wheel mounting surface	A	Require repair
Cracked	B	Require replacement

Condition	Code	Procedure
Directional/asymmetrical wheels mounted incorrectly	B	Require remounting and/or repositioning
Load capacity less than OEM specifications	B	Require replacement
Mating surface distorted	A	Require replacement
Offset mismatched on same axle	B	Require replacement
Rivets leaking	A	Require replacement
Run-out beyond OEM specs	B	Require replacement
NOTE: **Some wire-spoke wheels may be repaired.**		
Stud holes elongated	A	Require replacement
NOTE: **Inspect wheel attaching hardware for damage.**		
Welded or brazed repair	2	Suggest replacement
Welds leaking	A	Require replacement
Wheel centering (pilot) hole incorrect	B	Require replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

AUTOMOTIVE TERMINOLOGY & DEFINITIONS

ABRASIVE CLEANING

removing contaminants using a cleaning agent containing abrasive material. Cleaning that requires physical abrasion (e.g., glass bead blasting, wire brushing).

ADDITIVE

in automotive terminology, a substance added to a liquid, such as engine oil, transmission fluid, gear oil or coolant to enhance its properties.

AEROSOL

a cloud consisting of particles dispersed in a gas or gases

AFTERMARKET

broad term that applies to any change after the original purchase, such as adding equipment. When applied to AFVs, it refers to conversion devices or kits for conventional fuel vehicles.

ALIGNMENT

an adjustment to bring parts or components into a line or proper coordination.

ALTERNATOR

a belt driven device that provides electrical current for the vehicle's charging system.

ANTIFREEZE

a material such as ethylene glycol which is added to water to lower its freezing point; used in an automobile's cooling system.

AQUAPLANING

the loss of traction that results when a tire loses sufficient grip on a wet roadway, the tire actually loses contact with the road surface and rides on a thin film of water.

AUTOMATIC TRANSMISSION FLUID (ATF)

the oil that is used in an automatic transmission.

BATTERY ACID

the sulfuric acid solution used as the electrolyte in a battery.

BATTERY CELL

the part of a battery made from two dissimilar metals and an acid solution. A cell stores chemical energy to be used later as electrical energy.

BATTERY SAVER

the battery saver system is an effective way to prevent complete battery discharge when the engine is shut down. Based on the preset time-limit, the system automatically disconnects the battery load when the battery is not being charged. Depressing the reset push button will enable the battery to be reconnected for additional periods of time. Critical systems can be set up to have battery power maintained.

BATTERY

batteries are the principal energy storage devices for hybrid electric vehicles (HEVs). Desirable attributes of high-power batteries for HEV applications are high-peak and pulse- specific power, high specific energy at pulse power, a high charge acceptance to maximize regenerative braking utilization, and long calendar and cycle life. Developing methods/designs to balance the packs electrically and thermally, developing accurate techniques to determine a battery's state of charge, and developing abuse-tolerant batteries, and recyclability are additional technical challenges.

BEARING RACE

the machined surface of a bearing assembly against which the needles, balls or rollers ride. The outer race is also called a cup.

BEARING

part that supports and reduces friction between a stationary and moving part or two moving parts.

BLEEDER VALVE

a valve located on disc brake calipers, wheel cylinders and some master cylinders that allows air and fluid to be removed from the brake system.

BOILING POINT

the temperature at which a liquid turns to vapor.

BRAKE DRAG

a condition that occurs when brake pads or shoes are in continuous contact with the disc brake rotors or brake drums.

BRAKE FLUSHING

a procedure to clean the brake hydraulic system with fresh, clean fluid that should be performed whenever new parts are installed, if there is any doubt as to the grade of fluid in the system, if a glycol fluid has been mixed with a silicone-based fluid, or if the fluid has been contaminated with petroleum or mineral based fluids.

BRAKE HOSE

flexible hoses that connect the brake lines on the chassis with the calipers or wheel cylinders, or the junction block on a solid axle.

BRAKE LINE

metal tubing that carries the brake fluid from the master cylinder to other brake system components.

CHARGE

the electrical current that passes through the battery to restore it to full power; to fill, or bring up to the specific level, an A/C system with refrigerant; the required amount of refrigerant for an A/C system.

CHARGING SYSTEM

the system that supplies electrical power for vehicle operation and recharges the battery.

CHEMICAL CLEANING

relies primarily on chemical action to remove dirt, grease, scale, paint or rust.

COLD CRANKING AMPS

the amount of cranking amperes that a battery can deliver in 30 seconds at OÃ,Â°F (- 18Ã,Â°C).

COLD START

difficulty of starting an internal combustion engine in cold weather because of gasoline, which evaporates more slowly when it is cold; oil, which gets thicker in cold weather; and the chemical reactions inside the battery, which progress more slowly in cold weather.

CONDENSER

a device, similar to a radiator, in which the refrigerant loses heat and changes state from a high-pressure gas to a high pressure liquid as it dissipates heat to the surrounding air.

COOLANT

the mixture of water and antifreeze used in an engine's cooling system to maintain the engine's temperature throughout Its operating range.

COOLING FAN

a mechanically or electrically driven propeller that draws air through the radiator.

COOLING SYSTEM

the system used to remove excess heat from an engine and transfer it to the atmosphere. Includes the radiator, cooling fan, hoses, water pump, thermostat and engine coolant passages.

CORE PLUGS

plugs that fill holes in a block or head left from the casting process. Also called freeze, welsh or expansion plugs.

CORE

in automotive terminology, the main part of a heat exchanger, such as a radiator, evaporator or heater. Usually made of tubes, surrounded by cooling fins, used to transfer heat from the coolant to the air.

CORROSION INHIBITORS

additives used to inhibit corrosion (e.g., rust) in the fuel system.

CROSSFLOW RADIATOR

a radiator in which coolant enters on one side, travels through tubes, and collects on the opposite side (see downflow radiator).

DIFFERENTIAL

gear assembly that transmits power from the driveshaft to the wheels; allows the outside wheel to turn faster than the inside when cornering.

DIGITAL VOLT/OHMMETER (DVOM)

an instrument that measures volts, ohms and amps and displays the results numerically.

DIRECTIONAL TIRE

tire with a tread pattern that is designed to give maximum traction by removing water from under the tread in such a way as to minimize the risk of aquaplaning. Directional tires must be installed to turn in a specific direction.

DOWNFLOW RADIATOR

a radiator in which coolant enters the top of the radiator and is drawn downward by gravity (see crossflow radiator).

DRIVETRAIN

all of the components that generate power and transfer it to the vehicle's wheels.

DUAL MASTER CYLINDER

a master cylinder that has one cylinder bore, but two pistons and two fluid reservoirs. Each piston applies hydraulic pressure to two wheels only. In the event one of the hydraulic circuits fails, the other provides enough braking power to stop the vehicle.

DUO-SERVO DRUM BRAKES

a drum brake design that provides increased stopping power due to the servo or self- energizing action of the brake shoes.

EGR VALVE

see 'exhaust gas recirculation (EGR) valve',

ELECTROLYTE

a material whose atoms become ionized (electrically charged) in solution. In automobiles, the battery electrolyte is a mixture of sulfuric acid and water.

ELECTRONIC AIR SUSPENSION

electronic air suspension provides the comfort of riding on air with adjustable spring rates and capability to change ride height and load-carrying ability. Under normal driving conditions, an electronic air suspension vehicle rides at the same height as a traditionally sprung vehicle. With a heavy load, ride height is increased automatically. On current vehicles, the suspension lowers the ride height by 20 mm at highway speeds for improved aerodynamics, with about 2 percent better fuel economy. Lower ride height also can improve on-center feel of steering due to the change in suspension geometry and increased caster angle.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

a sensor which works by a negative coefficient thermistor that loses resistance as its temperature goes up (just like the intake air temperature sensor). When the computer applies its 5-volt reference signal to the sensor, this voltage is reduced through a ground circuit by an amount corresponding to the temperature of the engine coolant.

EVAPORATOR

a heat exchanger, in which low-pressure refrigerant flows and changes state, absorbing heat from the surrounding air.

EXHAUST GAS RECIRCULATION (EGR)

component in the EGR system, used to meter a controlled amount of exhaust gas into the intake air stream.

EXHAUST GAS RECIRCULATION (EGR) VALVE

an emissions control technique that reuses engine exhaust gases as part of the intake air supply to help reduce harmful emissions (especially Nox).

FAHRENHEIT

a scale of temperature measurement with the boiling point of water at 212Ã‚Â°F. In the metric system, water's boiling point is 100Ã‚Â°Celsius.

FAN CLUTCH

a device attached to a mechanically driven cooling fan that allows the fan to freewheel when the engine is cold or the vehicle is driven at speed.

FAN SHROUD

an enclosure that routes air through the radiator cooling fins.

FAN

a mechanically or electrically driven propeller that draws or pushes air through the radiator, condenser, heater core or evaporator core.

FILTER

a screen or filter element that can be made to filter specified sizes of particles from air or liquid.

FLOODING

a condition in which unvaporized fuel in the intake manifold and/or combustion area, prevents the engine from starting.

FOOT POUND

a unit of measurement for torque. One foot pound is the torque obtained by a force of one pound applied to a wrench handle that is 12-in. long; a unit of energy required to raise a weight of one pound, a distance of one foot.

FOUR STROKE CYCLE ENGINE

an engine, either gasoline or diesel that uses four strokes: intake, compression, power and exhaust. A firing impulse occurs every two turns of the crankshaft. When this engine is a gasoline engine it is also called an Otto cycle engine after its inventor. A diesel engine is called a Diesel cycle engine for the same reason.

FREEZE PLUG

another name for core plug.

FRONT WHEEL DRIVE

the entire drivetrain is located at the front of and drives the front wheels of the vehicle.

FUSE

a metal circuit protection device that melts when there is a circuit overload or short.

FUSIBLE LINK

a smaller gauge wire that is included in an electrical circuit to provide circuit protection. The smaller gauge wire will melt when the circuit is overloaded.

GASKET

a material such as artificial rubber, cork, or steel used to seal between parts that would otherwise leak fuel, coolant, lubricants or combustion gases.

GENERATOR

a device that converts mechanical energy into electrical energy; SAE J1930 nomenclature for an alternator; a generating device that uses diode rectifiers to convert ac to dc.

HALFSHAFT

transfers power from the transaxle to the front wheels on a front-wheel drive vehicle. Also used on some vehicles with rear-wheel drive and independent rear suspension to transfer power from the differential to the rear wheels. Consists of a stub shaft that is splined into the differential side gear, another stub shaft that is splined into the wheel hub, an interconnecting shaft, and two CV-joints, which connect the interconnecting shaft to the stub shafts.

HEATER CORE

a radiator-like device used to heat the inside of a vehicle. Hot coolant is pumped through it by the water pump, and heat from the coolant moves from the heater core to the passenger compartment as the blower fan forces air through it.

HUB

mounting point for the wheelan an axle or spindle; the part of the synchronizer assembly that is splined to the transmission shaft; the center part of a wheel, gear, etc., that rides on a shaft.

HYDRAULIC PRESSURE

pressure exerted through a liquid.

HYDROMETER

an instrument used to measure the specific gravity of a solution.

IMPEDANCE

the total resistance of an electrical device measured in ohms.

INCH POUND

one twelfth of a foot pound.

INDEPENDENT SUSPENSION

a suspension in which each wheel can travel up and down without directly affecting the position of the opposite wheel.

INNER BEARING RACE

inner part of a ball or roller bearing that provides a surface for the balls or rollers to rotate.

INTEGRATED CIRCUIT

an electrical circuit containing many interconnected amplifying devices and circuit elements formed on a single body or chip of semiconductor material; diodes, transistors and other electronic components mounted on semiconductor material and able to perform numerous functions.

INTERCOOLER

a component on some turbocharged engines used to cool the compressed intake air.

INTERNAL COMBUSTION ENGINE (ICE)

engine that converts the energy contained in the fuel inside the engine into motion. Combustion engines use the pressure created by the expansion of the gases to do mechanical work.

JAM NUT

a locknut.

KEEP-ALIVE MEMORY

a series of vehicle battery-powered memory locations in the microcomputer that store information on input failure, identified in normal operations for use in diagnostic routines; adapts some calibration parameters to compensate for changes in the vehicle system.

LEAF SPRING

a suspension spring consisting of a single flat plate made of steel or composite material or several steel plates bundled together.

LIGHT-DUTY VEHICLE

passenger cars and trucks with a gross vehicle weight rating of 8,500 or less.

LIMITED SLIP DIFFERENTIAL

a type of differential that uses clutches to supply a major portion of the drive torque to the wheel that has better traction when one wheel is slipping,

LITER (L)

a metric measurement used to calculate the volume displacement of an engine. One liter is equal to 1,000 cubic centimeters or 61 cubic inches.

LUBRICATION

the process of introducing a friction reducing substance between moving parts to reduce wear.

MACPHERSON STRUT

the principal device in the suspension of the same name, in which the spring, shock absorber and sometimes the steering knuckle are combined in a single unit.

MALFUNCTION INDICATOR LIGHT (MIL)

also known as the CHECK ENGINE or SERVICE ENGINE SOON light on many vehicles. The MIL comes on when the ignition is first turned on (to check the bulb) and then goes out once the engine is started, unless a trouble code is stored in the computer. If the MIL is on when the vehicle is running, there has been a malfunction on one of the sensor or actuator circuits monitored by the computer, and a diagnosis will have to be made by retrieving the code.

MASTER CYLINDER

the primary fluid pressurizing device in some hydraulic systems. In automotive use, it is found in the brake and hydraulic clutch systems and is pedal-activated, either directly or through a vacuum assist unit.

MILLIMETER

the base of metric size measurement. One millimeter equals 0.039370-in. One inch is equal to 25.4 m m.

MULTIVISCOSITY OIL

chemically-modified oil that has been tested for viscosity at cold and hot temperatures.

OFF-ROAD

any non-stationary device, powered by an internal combustion engine or motor, used primarily off the highways to propel, move, or draw persons or property, and used in any of the following applications: marine vessels, construction/farm equipment, locomotives, utility and lawn and garden equipment, off-road motorcycles, and off-highway vehicles.

OHM

a unit of electrical resistance of a circuit in which an electromotive force of one volt maintains a current of one ampere, named after German physicist Georg Ohm.

OHMMETER

an instrument that measures electrical resistance in ohms.

OHM'S LAW

a basic law of electricity expressing the relationship between current, resistance and voltage in any electrical circuit. Ohm's law states that the voltage in a circuit is equal to the current multiplied by the resistance.

OIL COOLER

device used to remove heat from the engine or transmission oil. There are oil-to-air coolers and oil coolers that are incorporated into the vehicle's cooling system.

OIL PAN

the part that encloses the crankcase at the lower end of the block.

OIL PRESSURE

the pressure that results from resistance to flow from the oil pump. As the pump turns faster, it produces more flow. A relief valve limits the amount of pressure it can produce.

ON-CAR BALANCING

the practice of spinning a wheel on the car to balance the wheel and all other rotational components together.

ORIGINAL EQUIPMENT MANUFACTURER (OEM)

the original manufacturer of a vehicle or engine.

OSCILLOSCOPE

an instrument that displays electrical activity in the form of line patterns on a screen.

OUTER BEARING RACE

outer part of a bailor roller bearing that provides a surface for the balls or rollers to rotate. Can be integral with the bearing or a separate part.

OXIDATION

the process of combining with oxygen, resulting in rusting or burning. Rust is slow oxidation; fire is rapid oxidation.

PAG

polyalkyline glycol oil (lubricant) used with A/C systems containing R- 134a refrigerant.

PARALLEL CIRCUIT

a circuit with more than one path for the current to follow.

PARKING BRAKE

a system that applies the brakes mechanically through a series of linkages and cables. Depending on the vehicle, the parking brake system will either be actuated using a foot pedal or a hand-operated lever.

PASCAL'S LAW

the law of physics stating that liquids are noncompressible, and that a force applied to the top of a liquid in a closed container is exerted equally in all directions.

PCV SYSTEM

see 'positive crankcase ventilation system'.

PCV VALVE

a part of the positive crankcase ventilation system. Meters crankcase vapors into the intake manifold.

PLAY

the relative movement between or among parts.

POLARITY

the condition of being positive or negative relative to a reference point or object; the particular state (positive or negative) with reference to the two magnetic poles.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

a system that controls crankcase emissions by using a valve to meter crankcase vapors nto the intake manifold.

POWER BRAKES

a system that uses vacuum or hydraulic pressure to assist the driver with brake application.

PSI

measurement of pressure in pounds per square inch.

RADIAL RUNOUT

the out-of-roundness ot a wheel or tire.

RADIATOR CAP

a device that seals the radiator and maintains a set pressure in the cooling system.

RADIATOR

the part of the cooling system that acts as a heat exchanger, transferring heat to atmosphere. It consists of a core and holding tanks connected to the cooling system by hoses.

REAR WHEEL DRIVE

system where the driveline drives the rear wheels of the vehicle. Most often the engine is located in the front of the vehicle and a transmission and drive shaff connect to a drive axle, however there are also systems where the entire drive line is located toward the rear of the vehicle.

REAR WHEEL STEERING

a system used on a some vehicles to change the toe of the rear wheels to either steepen a sharp turn or enhance cornering on a shallower, faster one.

RESISTOR

an electrical device installed in a circuit to lower voltage and current flow.

RIDE HEIGHT

the dimension between a fixed point on the vehicle and the pavement. The fixed point varies according to vehicle and manufacturer. Also called vehicle height.

RUNOUT

wobble or deflection beyond a rotating part's normal plane of movement.

SCAN TOOL

microprocessor designed to communicate with a vehicle's on-board computer system to perform diagnostic and troubleshooting functions.

SEMICONDUCTOR

a material that is neither a good conductor of electricity nor a good insulator.

SENDING UNIT

a mechanical, electrical, hydraulic or electromechanical device which transmits information to a gauge or other receiving unit.

SERIES CIRCUIT

a circuit that has only one path for current to follow.

SERIES-PARALLEL CIRCUIT

a circuit that combines series and parallel circuits.

SERVO

a device, such as an electric motor or hydraulic piston, that is controlled by an amplified signal from a low power command device.

SHOCK ABSORBER

a device used to dampen the oscillation of the suspension caused by irregularities in the road surface.

SHORT CIRCUIT

a condition that occurs in an electrical circuit when the current bypasses the intended load and takes a path with little or no resistance, such as another circuit or ground.

SPECIFIC GRAVITY

the ratio of the weight or mass of the given volume of a substance to that of an equal volume of another substance, e.g. - water for liquids and solids; air or hydrogen for gases, are used as standards.

SPONGINESS

the feel of a soft or mushy brake pedal usually caused by trapped air in the hydraulic system.

SPRUNG WEIGHT

the weight of all the vehicle components that are supported by the springs; see 'unsprung weight'.

STABILIZER BAR

a torsion-bar spring connecting the suspension on either side of the vehicle. When a vehicle rolls to the side in a turn, the suspension at the outside wheel compresses and the suspension at the inside wheel extends. The stabilizer bar that connects them twists to apply a counteracting force to hold the vehicle closer to level. Also called an anti-roll bar or sway bar.

STARTER

the electric motor that is used to start an engine.

STUD

a fastener that has screw threads at both ends.

TECHNICAL SERVICE BULLETIN (TSB)

information published by vehicle manufacturers that describe updated service procedures and service procedures that should be used to handle vehicle defects.

TENSIONER

a device used with a timing chain or belt to maintain its tension.

THERMOSTAT

a device installed in the cooling system that allows the engine to come to operating temperature quickly and then maintain a minimum operating temperature.

TIMING BELT

a toothed reinforced belt used to drive the camshaft from a sprocket on the crankshaft.

TOLERANCE

the difference between the allowable maximum and minimum dimensions of a mechanical part; the basis for determining the accuracy of a fitting.

TORQUE SEQUENCE

a specified order in which a component's mounting bolts should be tightened

TORQUE WRENCH

a breaker bar or ratchet wrench with an indicator that measure the twisting effort applied to a fastener during tightening.

TORQUE

twisting effort on a shaft or bolt.

TWIN I-BEAM SUSPENSION

a type of independent front suspension and used on light trucks and vans. It consists of two I-beams supported by coil springs, and the steering knuckles/spindles, which are connected by king pins or ball joints. The inner end of the axle connects to the vehicle frame through a rubber bushing. A radius arm also connects to the frame through rubber bushings to control wheelbase and caster.

UNIVERSAL JOINT (U-JOINT)

a joint that allows the drives haft to transmit torque at different angles as the suspension moves up and down.

UNSPRUNG WEIGHT

the components of a vehicle that rest directly on the road surface without being supported by the suspension springs.

VACUUM

a pressure lower than atmospheric.

VOLT

unit of electromotive force. One volt of electromotive force applied steadily to a conductor of one-ohm resistance produces a current of one ampere.

VOLTAGE DROP

voltage lost by the passage of electrical current through resistance.

VOLTMETER

an instrument used to measure voltage in a circuit.

WATER PUMP

a device used to circulate coolant through the engine.

WHEEL ALIGNMENT

the adjustment of suspension and steering components to optimize steering control and minimize tire wear.

WHEEL BALANCE

the condition in which a wheel/tire assembly has equal weight around its center, preventing vibration at high speeds. Wheel balance can be static, such as on a bubble balancer, or dynamic, such as with a spin balancer.

WHEEL WEIGHTS

small weights, usually made of lead, attached either mechanically or by adhesive to a wheel/tire assembly to correct its balance.

UNIFORM INSPECTION & COMMUNICATION STANDARDS 2010 - 2011

Steering & Suspension Systems

STEERING & SUSPENSION SYSTEMS

These materials are confidential and are not to be disclosed to, or utilized by, any individual or entity other than participants of the Motorist Assurance Program (MAP).

The Automotive Maintenance and Repair Association (AMRA) and MAP do not warrant these materials or guarantee their accuracy, and AMRA and MAP assume no liability for errors.

MAP STANDARDS OF SERVICE

MAP developed standards of service for shops to follow in working with customers. Written from the point of view of customers, and for the use of maintenance and repair shops, the standards expand on the ideas and promises established in MAP's Pledge to Customer

I. Our recommendations are based upon the following definitions.

System Failure - Parts/system indicated are out of manufacturers' specifications, have failed or are unable to perform their normal function as intended or designed by the manufacturers. Service/replacement is required.

Preventive/Scheduled Maintenance - Parts/system are scheduled for service/ replacement per industry standards or are near the end of their useful life and repair/ replacement is recommended in advance of parts/system failure. Service/replacement is suggested.

Improved System Performance - Parts/ system indicated are recommended for repair/ replacement to enhance/improve the vehicle's ability to perform as intended or designed by the manufacturer, or as requested by the customer. Service/replacement is suggested.

II. Training/Criteria Our personnel have acquired auto repair expertise through formal education or work experience. Where appropriate, personnel are moving toward certification (e.g. vehicle manufacturer, ASE, etc.) for the services performed. Continuing education will be supported by all MAP participants.

III. Appropriate Company Approved Inspection

We will perform an appropriate inspection based on MAP Uniform Inspection & Communication Standards.

IV. Written Estimates

Written estimates based on our inspection, in compliance with state and local regulations, will include parts (dollar amount), labor (dollar amount), and the total estimate.

V. Work Authorization

No work will be performed without the customer's prior approval.

VI. Limited Warranty

A minimum limited warranty will be offered of 90 days or 4,000 miles, whichever comes first, covering parts and labor.

VII. Returned Parts

All customers will be entitled to the return of old parts, or if they choose, they may examine the parts prior to leaving the store. Where failed parts are required to be returned to the manufacturer in order to

honor the warranty, the customer will be allowed to examine the parts.

VIII. Classification of Parts

Replaced parts will be identified as new, remanufactured, rebuilt or used. MAP participants will inform the customer and indicate on the estimate and invoice whether a part is new, remanufactured, rebuilt or used.

THE MAP PROCESS - OVERVIEW

Repair Association, Inc. (AMRA). Participation in the Motorist Assurance Program comes from retailers, suppliers, independent repair facilities, vehicle manufacturers and industry associations.

Our organization's mission is to strengthen the relationship between the consumer and the auto repair industry. We produce materials that give motorists the information and encouragement to take greater responsibility for their vehicles-through proper, manufacturer / recommended maintenance. We encourage participating service and repair shops (including franchisees and dealers) to adopt (1) a Pledge of Assurance to their Customers and (2) the Motorist Assurance Program Standards of Service. All participating service providers have agreed to subscribe to this Pledge and to adhere to the promulgated Standards of Service demonstrating to their customers that they are serious about customer satisfaction.

These Standards of Service require that an inspection of the vehicle's (problem) system be made and the results communicated to the customer according to industry standards. Given that the industry did not have such standards, the Motorist Assurance Program successfully promulgated industry inspection communication standards in 1994-95 for the following systems: Exhaust, Brakes, ABS, Steering and Suspension, Engine Maintenance and Performance, HVAC, Electrical Systems, and Drive Train and Transmissions. Further, revisions to all of these inspection communication standards are continually re-published. Participating shops utilize these Uniform Inspection & Communication Standards as part of the inspection process and for communicating their findings to their customers.

The Motorist Assurance Program continues to work cooperatively and proactively with government agencies and consumer groups toward solutions that both benefit the customer and are mutually acceptable to both regulators and industry. We maintain the belief that industry must retain control over how we conduct our business, and we must be viewed as part of the solution and not part of the problem. Meetings with state and other government officials (and their representatives), concerned with auto repair and/or consumer protection, are conducted. Feedback from these sessions is brought back to the association, and the program adjusted as needed.

We welcome you to join us as we continue our outreach... with your support, both the automotive repair industry and your customers will reap the benefits. Please visit MAP at our Internet site www.motorist.org or contact us at:

THE MAP PROCESS - OVERVIEW OF SERVICE REQUIREMENTS AND SUGGESTIONS

It is MAP policy that all exhaust, brake, steering, suspension, wheel alignment, drive-train, engine performance and maintenance, and heating, ventilation and air conditioning, and electrical services be offered and performed under the standards and procedures specified in these sections.

Before any service is performed on a vehicle, an inspection of the appropriate system must be performed. The results of this inspection must be explained to the customer and documented on an inspection form. The condition of the vehicle and its components will indicate what services/part replacements may be "Required" or "Suggested". In addition, suggestions may be made to satisfy the requests expressed by the customer.

When a component is suggested or required to be repaired or replaced, the decision to repair or replace must be made in the customer's best interest, and at his or her choice given the options available.

This section lists the various parts and conditions that indicate a required or suggested service or part replacement. Although this list is extensive, it is not fully inclusive. In addition to this list, a technician may make a suggestion. However, any suggestions must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval and must be documented. However, any suggestions must be documented and must be based on substantial and informed experience or the vehicle manufacturer's recommended service interval. NOTE: Vehicle manufacturer service intervals are often categorized as either Normal or Severe. Frequently, motorists are unaware that their driving patterns and habits meet the criteria for following Severe Service schedules. Severe Service is generally defined as, but not limited to one or more of the following conditions: Driving in stop-and-go traffic; frequent short trips; high-speed driving; extreme temperatures; towing or hauling.

Some conditions indicate that service or part replacement is required because the part in question is no longer providing the function for which it is intended, does not meet a vehicle manufacturer's design specification or is missing.

- **Example:** An exhaust pipe has corroded severely and has a hole in it through which exhaust gases are leaking. Replacement of the exhaust pipe in this case is required due to functional failure.
- **Example:** A brake rotor has been worn to the point where it measures less than the vehicle manufacturer's discard specifications. Replacement of the rotor is required because it does not meet design specifications.

Some conditions indicate that a service or part replacement is suggested because the part is close to the end of its useful life or addresses a customer's need, convenience or request. If a customer's vehicle has one of these conditions, the procedure may be only to suggest service.

- **Example:** An exhaust pipe is rusted, corroded or weak, but no leaks are present. In this case, the exhaust pipe has not failed. However, there is evidence that the pipe may need replacement in the near future. Replacement of the pipe may be suggested for the customer's convenience in avoiding a future problem.
- **Example:** The customer desires improved ride and/or handling, but the vehicle's shocks or struts have not failed. In this case, replacement may be suggested to satisfy the customer's wishes. In this case, replacement of the shocks or struts may not be sold as a requirement.

A customer, of course, has the choice of whether or not a shop will service his or her vehicle. He or she may decide not to follow some of your suggestions. When a repair is required, a MAP shop must refuse partial service on that system if, in the judgment of the service provider, proceeding with the work could create or continue an unsafe condition. When a procedure states that required or suggested repair or replacement is recommended, the customer must be informed of the generally acceptable repair/replacement options whether or not performed by the shop.

The following reasons may be used for required and suggested services. These codes are shown in the "Code" column of the MAP Uniform Inspection & Communications Standards that follow:

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
A. Part no longer performs intended purpose B. Part does not meet a design specification (regardless of performance) C. Part is missing	1. Part is close to the end of its useful life B - Part does not meet a design specification (regardless of performance) (just above discard specifications, or weak; failure likely to occur soon, etc.) 2. To address a customer need, convenience, or request (to stiffen ride, enhance performance, eliminate noise, etc.) 3. To comply with maintenance recommended by the vehicle's Original Equipment Manufacturer (OEM) 4. Technician's recommendation based on substantial and informed experience 5. To comply with maintenance recommended by AMRA / MAP

Reasons to Require Repair or Replacement	Reasons to Suggest Repair or Replacement
NOTE: **When a repair is required, the shop must refuse partial service to the system in question, if the repair creates or continues an unsafe condition.**	**NOTE:** **Suggested services are *always* optional. When presenting suggested repairs to the customer, you must present the facts, allowing the customer to draw their own conclusions and make an informed decision about how to proceed.**

WHEEL AND TIRE

Steering and suspension are complex systems made up of a variety of interdependent components. For proper vehicle handling, ride, and tire wear, a thorough inspection is required whenever suspension work is being performed. Conditions listed assume that the problem has been isolated to the specific component by proper testing procedures.

NOTE: **When replacing steering and/or suspension components that may affect an alignment angle, you are required to check and adjust alignment as needed. Refer to the OEM specifications.**

CAUTION: **Do not use ride height altering or load compensating components, such as variable rate springs and coil over shocks, on vehicles with height or load sensing proportioning valve-equipped braking systems, unless these components are original equipment.**

NOTE: **Depending on the air suspension design, there are some aftermarket products available to eliminate the air ride suspension on certain vehicles. If the system has been eliminated with one of these products, then no service is suggested or required.**

WARNING: **These guidelines do not apply to split rims.**

TIRES

When replacing tires, it is suggested that the replacement tires match or exceed the OEM speed rating designation. If tires of different speed rating designations are mixed on the same vehicle, the tires may vary in handling characteristics. Do not mix different speed rating designations on the same axle.

Consult the vehicle owner's manual or vehicle placard for correct tire size, service description, load index, speed rating and cold inflation pressure of the original tires. Do not exceed the maximum load or inflation capacity of the tire specified by the Tire and Rim Association (www.us-tra.org)

When replacing fewer than ALL tires on a vehicle, follow the vehicle manufacturer's recommendations as to the placement of the new tires. If it is not possible to follow the vehicle manufacturer's tire replacement recommendations, remember to replace tires on the same axle with the same size, construction, speed rating, and, if possible, similar tread pattern.

Do not mix radials with non-radial tires on the same axle, as this may affect vehicle handling and stability. If radial tires and non-radial tires are mixed on the same vehicle, the radials must be on the rear. If radial and non-radial tires are used on a vehicle equipped with dual rear tires, radial tires may be used on either axle. High-pressure temporary compact spare tires are exempt from this rule.

Do not mix size or type (all season, performance, mud and snow) of tires on the same axle. When replacing only two tires on front or rear drive vehicles, follow the vehicle manufacturer's recommendations concerning placement. If it is not possible to follow OE recommendations, it is preferable to place the two new tires on the rear for greater stability, greater adhesion affecting steering -- on other than dry pavement -- and overall safety, regardless of whether the vehicle is front or rear wheel drive.

It is particularly important to match all tire sizes and constructions on 4-wheel (4x4) and all-wheel (AWD) drive vehicles unless otherwise specified by vehicle manufacturer. Ideally, all four tires should be replaced at the same time. Some vehicle manufacturers restrict replacement of tires to specific brands, types, or sizes.

MOUNTING TIRES

Only specially trained persons should de-mount or mount tires. Explosions of tire and wheel assembly can result from improper mounting, possibly causing serious injury or death. High pressure temporary compact spare tires should not be used with any other rims or wheels, nor should standard tires, snow tires, wheel covers, or trim rings be used with high pressure compact spare rims or wheels.

Mount tires only on same or approved rim widths.

Attempting to mount a tire of one diameter on a wheel of a different diameter , bead taper or flange type may result in serious injury or death.

If any flammable emergency tire inflation product has been used in a tire, consult inflation product manufacturer's product information label for tire deflation procedures to avoid possible serious injury or death.

VEHICLE TIRE PLACARD

Since 1968, cars and light trucks sold in the United States have been required to have a tire information sticker, called a vehicle tire placard. The vehicle tire placard indicates the size of the original equipment tires (including the spare), cold inflation pressure for the tires on both axles as well as the spare, and load index or range. Depending on the vehicle, the vehicle tire placard will either be located on the edge of any door, the doorpost, glove box, fuel door or inside trunk lid. If the tire placard is missing, consult the owner's manual, vehicle manufacturer, or tire manufacturer regarding applicable tire information.

Always refer to the vehicle manufacturer's recommendations before replacing tires. Tires should always be replaced with the same size designation, or approved options, as recommended. Never choose a smaller size with less load carrying capacity than the size on the tire placard. (Some vehicle manufacturers require different-sized tires for either the front or rear axles.)

NOTE: **It is not always possible to select a replacement tire with exactly the same size as shown on the placard. Consult with a vehicle or tire manufacturer for replacement recommendations.**

Fig. 1: Vehicle Tire Placard - Typical

TIRE ROTATION

The front tires on most vehicles tend to wear out faster than the rear tires. This is due to the effects of steering the vehicle and the weight transfer that occurs during braking. To ensure that all four tires wear evenly, it is important to rotate them on a regular basis. Tire rotation helps maintain balanced handling because it allows all four tires to wear at the same rate. Keep in mind, as tire wear reduces tread depth, it increases the tires' response to driver inputs. Consequently, by equalizing tire wear at all four corners, dry road performance is actually enhanced. Another advantage of regular rotation is that it allows the tires to be replaced in complete sets rather than in pairs. This maintains handling continuity. It also enables drivers to take advantage of the latest in tire technology, instead of trying to match a pair of older tires.

Most manufacturers list rotation intervals in the scheduled maintenance section of the vehicle service manual and/or the owner's manual. Tire rotation patterns can also be found in these books. If this information is unavailable for a particular vehicle, rotate the tires every 5-7,000 miles following the appropriate rotation sequence shown in the illustrations. After completing a tire rotation, be sure to reset inflation pressures to the manufacturer's recommended specifications indicated on the vehicle tire placard.

To ensure that the proper amount of clamping force is applied to each fastener, follow these guidelines:

- Make sure the area around the lug holes, as well as the wheel and hub mating surfaces are clean and dry. A wire brush can be used to remove corrosion and other debris. Wipe the areas clean using a shop rag.
- Inspect the bolt holes for damage. Do not use a wheel if the bolt holes are deformed.
- Inspect the wheel studs and lug nuts or lug bolts and bolt holes (depending on the vehicle) for damage. Replace or repair any damaged or worn components.
- Always follow a star pattern when tightening lugs.

WHEEL LUG NUT TORQUE & CLAMPING FORCE

Although proper wheel lug nut torque is important, it does not guarantee that the required clamping force will be achieved. For example, excessive corrosion on the wheel and hub mating surfaces will result in improper clamping force, even when the lugs are tightened with a calibrated torque wrench. Low clamping force can also occur if the threads are dirty. This is because dirt causes interference between the mating threads. As a result, the torque wrench will register the correct reading but the clamping force will be inadequate. To improve the chances of achieving the precise clamping force between the wheel and hub, proper torque must be applied to clean components in good condition. Specifications for wheel lug nut torque can be found in the `Tire and Wheel' section of most vehicle service manuals. When specifications are indicated as a range, adjust the torque wrench to the middle of the range to compensate for normal variations in tool calibration.

Fig. 2: Popular Tire Rotation Patterns - Without Dual Rear Wheels

Never rotate directional tires from side-to-side since this will reverse their direction of rotation. Directional tires can only be rotated from front to rear or vice versa. Directional tires are typically used on high-performance cars and can be identified by the arrows imprinted on the sidewall.

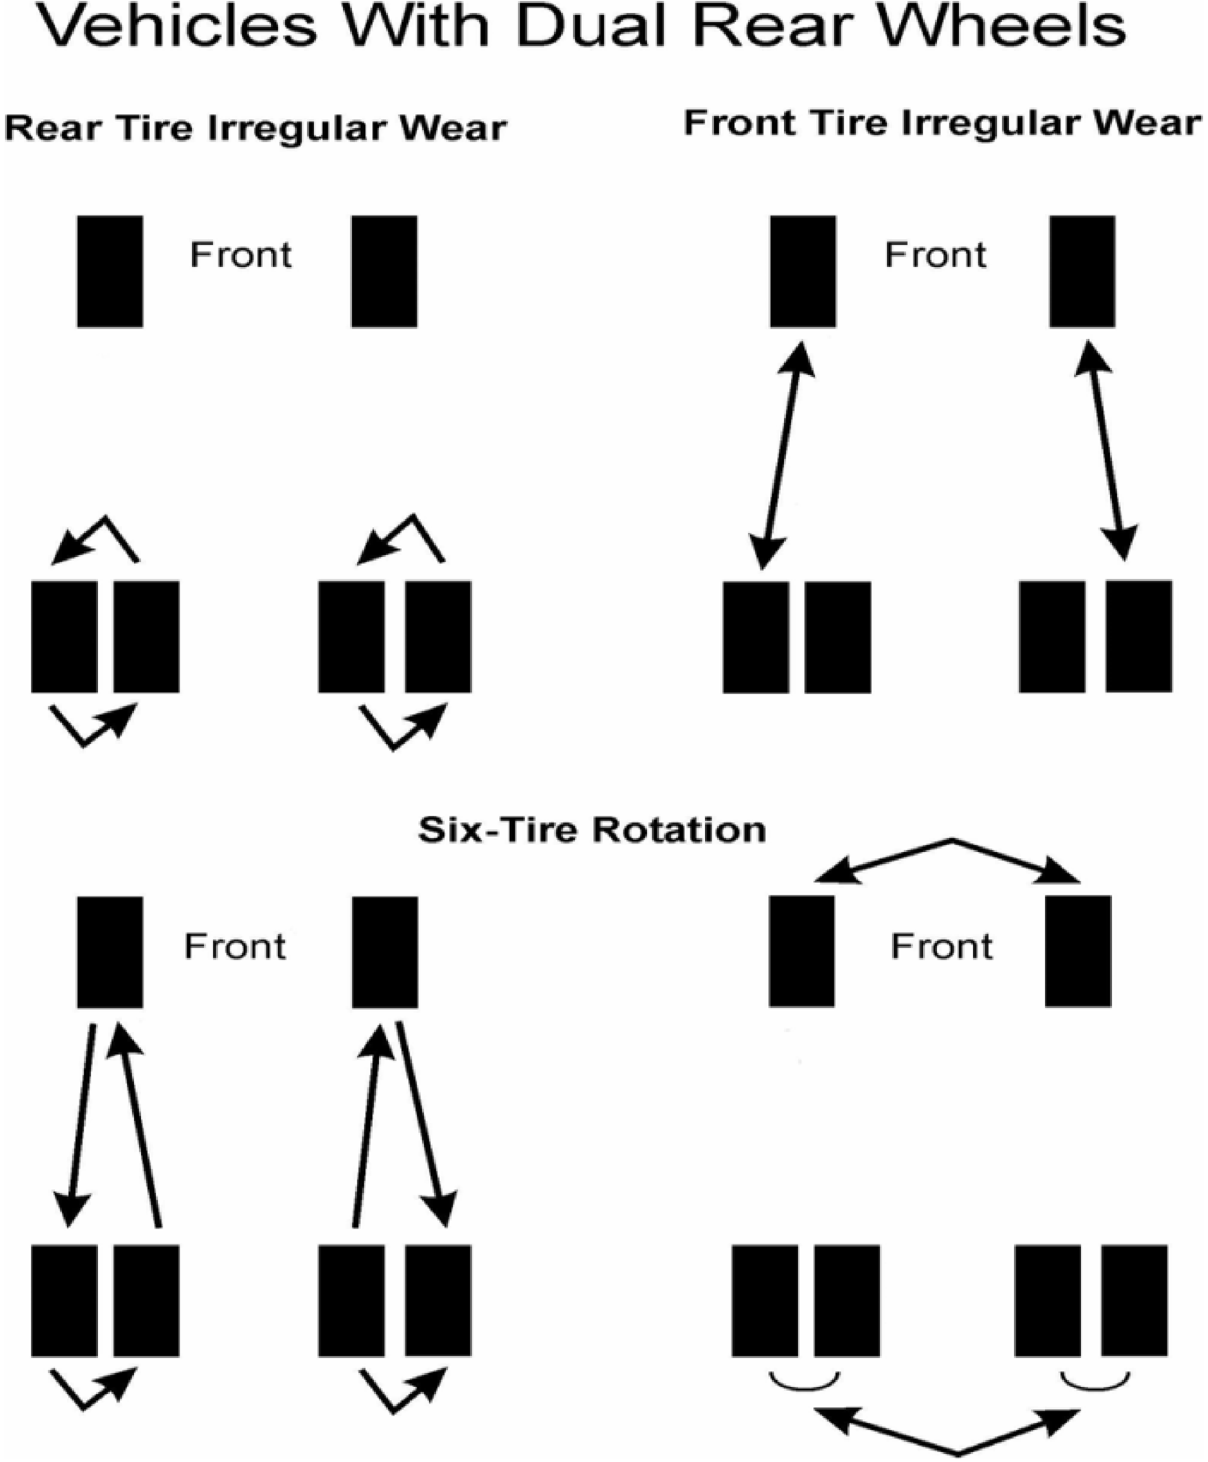

Fig. 3: Popular Tire Rotation Patterns - With Dual Rear Wheels

Some tires cannot be rotated in the manners described. Such tires include uni-directional tires and tires with asymmetric tread designs. Also, some vehicles may have different-sized tires mounted on the front and rear axles, and these different-sized tires also have rotation restrictions. Check your owner's manual or with a tire manufacturer or a tire dealer for proper recommendations for these specific cases.

WHEELS AND RIMS

The wheels on today's vehicles are made of steel, aluminum, or aluminum alloy (a combination of two or more metals). Steel wheels are the least expensive to produce, which is why they come as original equipment on many passenger cars and light trucks. The center section includes the bolt circle, or mounting holes, and is used to attach the wheel to the vehicle. The flange is the outermost lip of the rim, and is the area typically used for attaching wheel (balancing) weights. The rim is formed by rolling a strip of metal and then welding the two ends together. The interior section of the rim has a smaller diameter section called a drop center. This area provides the means for removing and installing a tire, since the bead is not designed to stretch. During removal or installation, most of the tire bead is pushed into the drop center so that the exposed portion can be pulled over the rim. The edges of the rim are flared to form the bead seats, which hold the tire and provide the airtight seal. Many rims include safety humps. These are small elevations on the inside of the bead seats. Safety humps help prevent the tire from falling into the drop center during a blowout. This allows the driver to maintain better directional control of a vehicle running on one or more deflated tires.

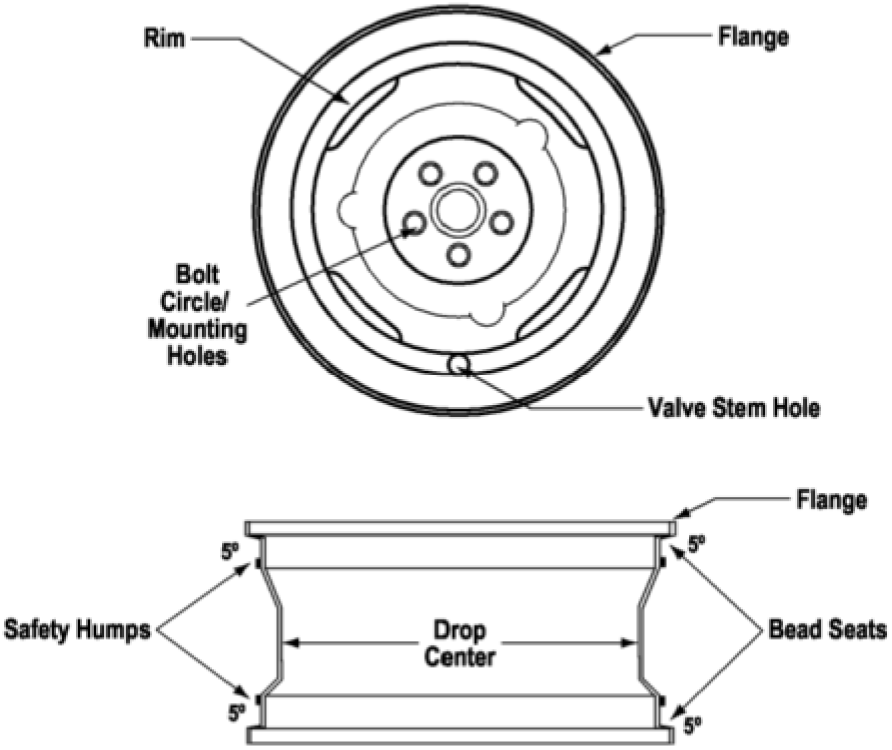

Fig. 4: Steel Wheel

WARNING: **Mounting a regular tire on a high-pressure compact spare wheel is not permitted. Attempting to mount a tire of one diameter on a wheel of a different diameter or flange type may result in serious injury or death. Mount tires only on approved rim widths. If the wheel identification stamp is not legible, or cannot be found, do not use the wheel until the size and type have been properly identified. Load, cold inflation pressure, and tire construction forces imposed on the rim/wheel must not exceed the rim/wheel manufacturer's recommendations, even if the tire is approved for a higher load or inflation. Wheels of different diameter, offset, or width cannot be mixed on the same axle. Bead seat tapers cannot be interchanged.**

TIRE PRESSURE MONITORING SYSTEMS

To avoid damaging sensors when mounting and demounting tires, it is beneficial to know where the sensors are located. Sensor assemblies are commonly attached to the valve stem, with the valve stem acting as an antenna to assist with transmitting RF signals. They may also be strapped to the drop center of the wheel. If this is the case, the sensor assembly should be located in-line with the valve stem.

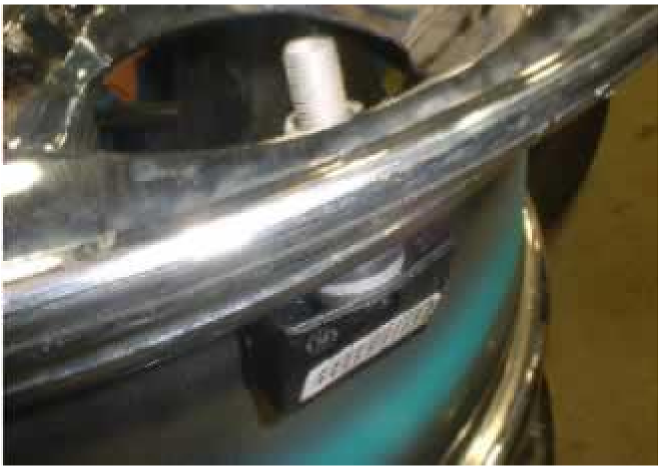

Fig. 5: Valve Stem Mounted Sensor

To avoid damaging sensors when demounting tires, do not break the bead within 45 of either side of sensor assembly locations. Be careful not to damage sensors when mounting tires as well. Sensors are not repairable and require replacement if damaged or when their battery is completely drained. It is recommended that the sensor be carefully "dropped into the tire" prior to demounting to avoid damage.

Fig. 6: Mounting Sensor

When reinstalling the sensor, it is suggested that the locknut, gasket and valve stem be replaced and torgued to the proper specification. It is also necessary to use the proper valve cap as it is also an integral part of the system.

It may be necessary to reprogram the TPMS when the tires are rotated, when a new sensor is installed, or after the vehicle loses power. This usually requires a scan tool and may involve the use of a special magnet. Refer to the vehicle service manual to properly reprogram the TPMS.

Fig. 10: Wheels & Tires Checksheet (2 Of 2)

STEERING AND SUSPENSION, WHEEL ALIGNMENT, WHEELS AND TIRES

NOTE: **Steering and Suspension are complex systems made up of a variety of interdependent components and controls. For proper vehicle handling, ride, and tire wear, a thorough inspection is required whenever suspension work is being performed.**

NOTE: **Listed repair conditions assume that the problem has been isolated to the specific component by proper testing procedures. When replacing steering and/or suspension components which may affect an alignment angle, you are required to check and adjust alignment as needed. Refer to the OEM specifications for both ride height and alignment angle tolerances.**

NOTE: Improper alignment geometry, and/or improper tire/wheel fitment may affect other systems such as Adaptive Cruise Control, Electronic Stability Control, Electronic Traction Control and Variable Ratio Steering. These systems may require attention after an alignment or suspension service is performed. Care must be taken to identify these vehicles/systems before any repair procedures are performed. Failure to follow OEM guidelines when servicing interrelated systems could result in an unsafe condition.

CAUTION: Do not use ride height altering or load compensating components, such as variable rate springs or coil over shocks on vehicles with height sensing or load sensing proportioning- valve equipped braking systems, unless these components are supplied as original equipment.

ACTIVE HANDLING

NOTE: An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.

NOTE: On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.

NOTE: When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.

ACTIVE SUSPENSION CONTROL MODULES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	B	Require repair or replacement

Condition	Code	Procedure
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specifications, or out of range.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

ACTIVE VARIABLE RATIO STEERING

NOTE: **Besides electronically providing variable steering ratios, the computer is linked with the Vehicle Stability Control system to aid in directional stability. As the vehicle travels down the highway, road surfaces and wind gusts can affect the vehicle's directional stability. The vehicle may wander or dart to one side, (as many who have met a tractor-trailer unit on a windy day have experienced). Sensors on the vehicle detect this sudden, unintentional movement and the computer will stabilize the vehicle by moving the Active Steering electric motor and steering gear, all without the driver turning the steering wheel.**

NOTE: **Additionally, if the driver experiences a skid or slide because of poor road conditions, the Active Steering will react to information from the yaw rate and steering angle sensors to modify the steering angle of the front wheels and stabilize the vehicle. This occurs much faster than the driver can react. If the Active Steering correction is not adequate to control the skid or slide, then the Stability Control system is also activated.**

Condition	Code	Procedure
Improper Operation	Â	Â
NOTE: **Refer to manufacturers' service information.**		

ACTIVE YAW CONTROL

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

ADAPTIVE CRUISE CONTROL

NOTE: **Similar to conventional cruise control. It maintains the vehicle's pre-set speed. However, beyond conventional cruise control, this system automatically adjusts speed to maintain proper distance between vehicles in the same lane. This is achieved through use of a radar or laser headway sensor, a digital signal processor and a longitudinal controller. If the lead vehicle slows down, or another object is detected, the system sends a signal to the engine and/or braking system to decelerate. Then, when the lane is clear, the system will re-accelerate the vehicle back to the set speed. Some OEM's require that the radar or laser headway sensor be calibrated to the thrustline of the vehicle.**

ADVANCE TRAC

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

AIR BAGS

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Collar cracked	A	Require replacement
End cap cracked	A	Require replacement

Condition	Code	Procedure
Inner fabric of bag damaged	A	Require replacement
Leaking	A	Require repair or replacement
Outer covering of air bag is cracked to the extent that inner fabric of air bag is visible	1	Suggest replacement
Piston cracked	A	Require replacement

AIR RIDE CONTROL MODULES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specifications, or out of range.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement

Condition	Code	Procedure
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

AIR RIDE SUSPENSION TORSION SPRINGS (COUNTER BALANCING)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Broken	A	Require replacement
Missing	C	Require replacement

AIR RIDE SUSPENSION

NOTE: **Depending on the air suspension design, there are some aftermarket products available to eliminate the air ride suspension on certain vehicles. If the system has been eliminated with one of these products, then no service is suggested or required.**

AIR RIDE TUBES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connected incorrectly	A	Require repair
Insufficient clamping force, allowing hose to leak	A	Require repair or replacement
Leaking	A	Require repair or replacement
Melted	1	Suggest repair or replacement
Missing	C	Require replacement
Protective sleeves damaged	2	Suggest replacement of sleeves
Protective sleeves missing	C	Require replacement of sleeves
Restricted, affecting performance	A	Require repair or replacement
Restricted, not affecting performance	2	Suggest repair or replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Safety clip missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Type incorrect	2	Suggest repair or replacement

AIR SHOCKS AND AIR STRUTS

NOTE: **This section covers the air spring portion of the air shock or strut. For damping portion of shock or strut conditions and procedures, refer to the Shock Absorbers, Strut Cartridges, and Strut Assemblies section.**

Condition	Code	Procedure
Inner fabric of air bag damaged	A	Require replacement
Leaking	A	Require repair or replacement
Outer covering of air bag is cracked to the extent that inner fabric of air bag is visible	1	Suggest replacement

AIR SPRING VALVES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Blocked	A	Require repair or replacement
Connector bent	A	Require repair or replacement
Connector broken	A	Require replacement
Connector loose	A	Require repair or replacement
Inoperative	A	Require repair or replacement
Leaking	B	Require repair or replacement
Restricted	A	Require repair or replacement

AIR SPRINGS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Collar cracked	A	Require replacement
End cap cracked	A	Require replacement
Inner fabric of bag damaged	A	Require replacement
Leaking	A	Require repair or replacement
Outer covering of air bag is cracked to the extent that inner fabric of air bag is visible	1	Suggest replacement
Piston cracked	A	Require replacement

AIR SUSPENSION CONTROL VALVES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require repair or replacement
Output incorrect	B	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

AIR SUSPENSION DRIERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Contaminated, affecting performance	A	Require replacement
Desiccant bag deteriorated	A	Require replacement
NOTE: **Inspect system to determine effects of desiccant bag deterioration.**		
Leaking	B	Require replacement
Restricted	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

Condition	Code	Procedure
Tubing connection leaking	A	Require repair or replacement

AXLE ACCELERATION SENSOR

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
Connector missing	C	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Dust boot missing	C	Require replacement of boot
Dust boot split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Housing cracked	B	Require replacement
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

BALL JOINTS

NOTE: **Before requiring or suggesting ball joint replacement, the approved OEM procedure must be used to measure ball joint wear. The measurement(s) obtained, along with the vehicle manufacturer's specifications, must be noted on the inspection report. Some states require that these measurements also appear on the invoice. The term ""perceptible movement,"" defined as any visible movement in any direction, has been the industry standard for determining the need for replacement of follower (non-load carrying) ball joints. Some vehicle manufacturers are now publishing specifications for follower ball joints that were previously diagnosed by the ""perceptible movement"" standard. Before requiring or suggesting any parts be replaced based on ""perceptible movement,"" consult your repair manual to determine if OEM specifications exist. You are not required to replace ball joints in axle sets. However, when replacing a ball joint due to wear exceeding manufacturer's specification, you may suggest replacement of the other ball joint if its measurement shows it is close to the end of its useful life, for preventive maintenance.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Further inspection required
NOTE: **If greaseable, grease ball joint. If problem persists or joint is non-greaseable, require replacement.**		
Grease boot cracked	2	Suggest replacement
NOTE: **Cracked grease boot will allow contaminants to enter the ball joint and will accelerate wear.**		
Grease boot missing	C	Require replacement

Condition	Code	Procedure
NOTE: **Lack of grease boot will allow contaminants to enter the ball joint and will accelerate wear.**		
Grease boot torn	A	Require replacement
NOTE: **Torn grease boot will allow contaminants to enter the ball joint and will accelerate wear.**		
Grease fitting broken	A	Require replacement of grease fitting
NOTE: **Some vehicles come from the factory with broken fittings. No service is suggested or required on these vehicles.**		
Grease fitting missing	C	Require replacement of grease fitting
Grease fitting won't seal	A	Require replacement of grease fitting
Greaseable ball joint will not take grease	2	Suggest replacement of grease fitting
NOTE: **If the greaseable ball joint still will not take grease after replacing the grease fitting, suggest replacement of ball joint.**		
Nut on ball joint loose	A	Require repair or replacement
NOTE: **Check for bent stud or damaged taper hole.**		
Pre-load adjustment incorrect	B	Require repair or replacement
Seized	A	Require replacement
Stud bent	B	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud broken	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Wear exceeds manufacturer's specifications	B	Require replacement

BODY ACCELERATION SENSOR

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware

Condition	Code	Procedure
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
Connector missing	C	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Dust boot missing	C	Require replacement of boot
Dust boot split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Housing cracked	B	Require replacement
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

BUSHINGS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Deteriorated, affecting performance	A	Require repair or replacement
NOTE: **If condition is caused by oil-soaking, further inspection is required to determine source of oil.**		
Distorted, affecting performance	A	Require repair or replacement
Leaking (fluid-filled type)	A	Require replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **If noise isolated to bushing, suggest repair or replacement. Use only approved lubricant on rubber bushings. Petroleum-based lubricants may damage rubber bushings.**		
Oil-soaked, affecting performance	A	Require replacement
NOTE: **Further inspection required to determine source of oil.**		
Rubber separating from internal metal sleeve on bonded bushing	A	Require replacement
Seized	A	Require replacement
Shifted (out of position)	B	Require repair or replacement
Split	A	Require replacement
Surface cracking (weather-checked)	Â	No service suggested or required

CENTER LINKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent, affecting performance	B	Require replacement
Binding	A	Further inspection required
NOTE: **If greaseable, grease joint. If problem persists or joint is non-greaseable, require replacement.**		
Grease boot cracked	2	Require replacement of boot

Condition	Code	Procedure
NOTE: **If boot is not available as a separate component, suggest replacement of center link (reason code 2). Cracked grease boot will allow contaminants to enter the joint and will accelerate wear.**		
Grease boot missing	C	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of center link (reason code 2). Lack of grease boot will allow contaminants to enter the joint and will accelerate wear**		
Grease boot torn	A	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of center link (reason code 2). Torn grease boot will allow contaminants to enter the joint and will accelerate wear .**		
Grease fitting broken	A	Require replacement of grease fitting
Grease fitting missing	C	Require replacement of grease fitting
Grease fitting won't seal	A	Require replacement of grease fitting
Grease seal missing	C	Require replacement
NOTE: **If seal is not available as a separate component, suggest replacement of center link (reason code 2). Lack of grease seal will allow contaminants to enter the joint and will accelerate wear.**		
Grease seal torn	A	Require replacement
NOTE: **If seal is not available as a separate component, suggest replacement of center link (reason code 2). Torn grease seal will allow contaminants to enter the joint and will accelerate wear.**		
Greaseable center link will not take grease	2	Suggest replacement of grease fitting
NOTE: **If greaseable center link still will not take grease after replacing the grease fitting, suggest replacement of center link.**		
Looseness (perceptible horizontal movement)	1	Suggest replacement
NOTE: **If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check. Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Looseness that is excessive	B	Require replacement
NOTE: **Excessive looseness is defined as being significant enough to affect vehicle handling or structural integrity. If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check.**		

Condition	Code	Procedure
CAUTION: **Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Seized	A	Require replacement
Stud bent	B	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud broken	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud loose in taper hole	A	Require repair or replacement
NOTE: **Check for damaged taper hole.**		
Taper hole elongated	A	Require replacement
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Wear exceeds manufacturer's specifications	B	Require replacement

COMPRESSORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector bent	A	Require repair or replacement
Connector broken	A	Require replacement
Connector loose	A	Require repair or replacement
Does not build pressure	A	Require replacement
Excessive run time	B	Require replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Leaking	B	Require repair or replacement
Missing	C	Require replacement
Noisy (abnormal)	2	Suggest replacement

Condition	Code	Procedure
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

CONTINUOUS DAMPING CONTROL

NOTE: **A semi-active suspension system which continuously adjusts damping levels according to road conditions and vehicle dynamics, (such as speed, turning and cornering, as well as driver inputs). An ECU processes driver inputs and data from sensors. The sensors include accelerometers mounted on the vehicle body and suspension position sensors, which feed steering wheel angle, vehicle speed, brake pressure and other chassis control data to the ECU. The ECU processes sensor data and sends signals which adjust the damping level of each shock.**

CONTROL ARM SHAFTS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent, affecting performance	B	Require replacement
Shaft bushing surface undersized (worn)	B	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

CONTROL ARMS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware

Condition	Code	Procedure
Ball joint hole oversized (loose interference or press fit)	B	Further inspection required
NOTE: **If oversized ball joint is available, require replacement orb all joint. If oversized ball joint is not available, require replacement of control arm.**		
Bent, affecting performance	B	Require replacement
Bushing hole oversized	B	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Holes distorted	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

CONTROL MODULES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specifications, or out of range.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

DISTANCE REGULATION CONTROL MODULE

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Dust boot missing	C	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot split	A	Require replacement of boot

Condition	Code	Procedure
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Dust boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Housing cracked	B	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Malfunctioning	A	Require replacement
NOTE: **includes inoperative, intermittent operation, failure to perform all functions, out of OEM specifications, or out of range.**		
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

DISTANCE REGULATION SENSOR

NOTE: **OEM may require this sensor be calibrated to the vehicle thrustline.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
Connector missing	C	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Dust boot missing	C	Require replacement of boot
Dust boot split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Housing cracked	B	Require replacement
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement

Condition	Code	Procedure
Wire lead shorted	A	Require repair or replacement

DRAG LINKS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent, affecting performance	B	Require replacement
Binding	A	Further inspection required
NOTE: **If greaseable, grease joint. If problem persists or joint is non-greaseable, require replacement.**		
Grease boot cracked	2	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of drag link (reason code 2). Cracked grease boot will allow contaminants to enter the joint and will accelerate wear.**		
Grease boot missing	C	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of drag link (reason code 2). Lack of grease boot will allow contaminants to enter the joint and will accelerate wear.**		
Grease boot torn	A	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of drag link (reason code 2). Torn grease boot will allow contaminants to enter the joint and will accelerate wear.**		
Grease fitting broken	A	Require replacement of grease fitting
Grease fitting missing	C	Require replacement of grease fitting
Grease fitting won't seal	A	Require replacement of grease fitting
Grease seal missing	C	Require replacement
NOTE: **If seal is not available as a separate component, suggest replacement of drag link (reason code 2). Lack of grease seal will allow contaminants to enter the joint and will accelerate wear.**		
Grease seal torn	A	Require replacement
NOTE: **If seal is not available as a separate component, suggest replacement of drag link (reason code 2). Torn grease seal will allow contaminants to enter the joint and will accelerate wear.**		
Greaseable drag link will not take grease	2	Suggest replacement of grease fitting

Condition	Code	Procedure
NOTE: **If greaseable center link still will not take grease after replacing the grease fitting, suggest replacement of drag link.**		
Looseness (perceptible horizontal movement)	1	Suggest replacement
NOTE: **If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check. Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Looseness that is excessive	B	Require replacement
NOTE: **Excessive looseness is defined as being significant enough to affect vehicle handling or structural integrity. If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check.**		
CAUTION: **Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Seized	A	Require replacement
Stud bent	B	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud broken	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud loose in taper hole	A	Require repair or replacement
NOTE: **Check for damaged taper hole.**		
Taper hole elongated	A	Require replacement
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Wear exceeds manufacturer's specifications	B	Require replacement

DYNAMIC STABILITY CONTROL

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

Condition	Code	Procedure
NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**		
NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**		

DYNAMIC STABILITY TRACTION CONTROL

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

ELECTRONIC RIDE CONTROL SHOCKS AND STRUTS

NOTE: **This section covers the electronic damping control portion of the electronic shock or strut. For damping portion of shock or strut conditions and procedures, refer to the Shock Absorbers, Strut Cartridges, and Strut Assemblies section.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector bent	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector loose	A	Require repair or replacement
Electronic valve control inoperative	A	Require replacement
NOTE: **It is acceptable to replace with a non-electronically controlled unit, where available.**		
Terminal bent	A	Require repair or replacement

Condition	Code	Procedure
Terminal broken	A	Require repair or replacement
Terminal corroded	A	Require repair or replacement
Terminal loose	A	Require repair or replacement

ELECTRONIC STABILITY CONTROL

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

ELECTRONIC SUSPENSION SYSTEM

NOTE: **(Typical) A semi-active suspension system which continuously adjusts damping levels according to road conditions and vehicle dynamics, (such as speed, turning and cornering, as well as driver inputs). An ECU processes driver inputs and data from sensors. The sensors include accelerometers mounted on the vehicle body and suspension position sensors, which feed steering wheel angle, vehicle speed, brake pressure and other chassis control data to the ECU. The ECU processes sensor data and sends signals which adjust the damping level of each shock.**

FLEX COUPLERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Flex coupler binding	A	Require repair or replacement of coupler
Flex coupler loose	A	Require repair or replacement of coupler
Flex coupler missing parts	A	Require repair or replacement of coupler
Flex coupler soft/ spongy	A	Require replacement of coupler
Flex coupler tom	A	Require replacement of coupler
Steering coupler shield cracked	2	Suggest replacement
Steering coupler shield missing	C	Require replacement
Steering coupler shield torn	2	Suggest replacement
U-joint binding	A	Require repair or replacement of joint
U-joint loose	A	Require repair or replacement of joint

GASKETS

Condition	Code	Procedure
Leaking	A	Require repair or replacement
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary.**		

HEIGHT SENSORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Dust boot missing	C	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Dust boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Housing cracked	B	Require replacement
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

HYDRAULIC HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Blistered	B	Require replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Secured incorrectly	B	Require repair

HYDRAULIC POWER STEERING PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement

Condition	Code	Procedure
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement
Pulley bent	A	Require repair or replacement of pulley
Pulley missing	C	Require replacement of pulley
Pump output out of manufacturer's specifications	A	Require repair or replacement
Remote reservoir leaking	A	Require replacement of reservoir
Reservoir cap broken	A	Require replacement of cap
Reservoir cap missing	C	Require replacement of cap
Seized	A	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

HYDRAULIC SUSPENSION HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Blistered	B	Require replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Secured incorrectly	B	Require repair

HYDRAULIC SUSPENSION PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Fluid at or beyond service interval	3	Suggest fluid change
Fluid contaminated	B	Require flushing and refilling of the system
NOTE: **Determine and correct source of contamination. OEM specifications must be followed for fluid type.**		
Fluid contaminated	B	Require flushing and refilling of the system
NOTE: **Determine and correct source of contamination. OEM specifications must be followed for fluid type.**		
Fluid level incorrect	B	Require adjustment of fluid level
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement
Pulley bent	A	Require repair or replacement of pulley
Pulley missing	C	Require replacement of pulley
Pump output out of manufacturer's specifications	A	Require repair or replacement
Remote reservoir leaking	A	Require replacement of reservoir
Reservoir cap broken	A	Require replacement of cap
Reservoir cap missing	C	Require replacement of cap
Seized	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

IDLER ARMS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Further inspection required

Condition	Code	Procedure
NOTE: **If greaseable, grease joint. If problem persists or joint is non-greaseable, require replacement.**		
Grease boot cracked	B	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of idler arm (reason code 2). Cracked grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease boot missing	C	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of idler arm (reason code 2). Lack of grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease boot torn	A	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of idler arm (reason code 2). Torn grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease fitting broken	A	Require replacement of grease fitting
Grease fitting missing	C	Require replacement of grease fitting
Grease fitting won't seal	A	Require replacement of grease fitting
Grease seal missing	C	Require replacement of seal
NOTE: **If seal is not available as a separate component, suggest replacement of idler arm (reason code 2). Missing grease seal will allow contaminants to enter joint and will accelerate wear.**		
Grease seal torn	A	Require replacement of seal
NOTE: **If seal is not available as a separate component, suggest replacement of idler arm (reason code 2). Torn grease seal will allow contaminants to enter joint and will accelerate wear.**		
Greaseable joint will not take grease	2	Suggest replacement of grease fitting
NOTE: **If greaseable joint will not take grease after replacing the grease fitting, suggest replacement of idler arm.**		
Looseness at frame bracket end	B	Require repair or replacement
NOTE: **If manufacturer's procedures and specifications exist, use those procedures and specifications; otherwise, use an approved inspection method such as the dry park check.**		
NOTE: **Looseness is defined as movement that creates excessive toe change.**		
Looseness at link end (perceptible horizontal movement)	1	Suggest replacement

Condition	Code	Procedure
NOTE: **If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check. Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Looseness at link end that is excessive	B	Require replacement
NOTE: **Excessive looseness is defined as significant enough to affect vehicle handling or structural integrity. If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check.**		
CAUTION: **Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Mounted out of position (center link not parallel)	B	Require repositioning
Nut on stud loose	A	Require repair or replacement
NOTE: **Check for bent stud or damaged taper hole.**		
Seized	A	Require replacement
Stud bent	B	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud broken	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Taper hole elongated	A	Require replacement
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Wear exceeds manufacturer's specifications	B	Require replacement

INTERMEDIATE SHAFT U-JOINTS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Flex coupler binding	A	Require repair or replacement of coupler
Flex coupler loose	A	Require repair or replacement of coupler
Flex coupler missing parts	A	Require repair or replacement of coupler
Flex coupler soft/ spongy	A	Require replacement of coupler
Flex coupler tom	A	Require replacement of coupler
Steering coupler shield cracked	2	Suggest replacement
Steering coupler shield missing	C	Require replacement
Steering coupler shield torn	2	Suggest replacement
U-joint binding	A	Require repair or replacement of joint
U-joint loose	A	Require repair or replacement of joint

KING PINS

NOTE: **You are not required to replace king pins in axle sets. However, when replacing a king pin due to wear exceeding manufacturer's specifications, you may suggest replacement of the other king pin on the axle if its measurement shows it is close to the end of its useful life.**

Condition	Code	Procedure
Bearing balls pitted	A	Require replacement
Bearing balls worn	A	Require replacement
Bearing races pitted	A	Require replacement
Bearing races worn	A	Require replacement
Bearing rollers pitted	A	Require replacement
Bearing rollers worn	A	Require replacement
Bearing seal bent	2	Suggest replacement of seal or bearing
Bearing seal missing	C	Require replacement of seal if available separately or bearing and seal together
Bearing seal torn	A	Require replacement of seal if available separately or bearing and seal together
Binding	A	Require repair or replacement of affected parts
End caps missing	C	Require replacement of missing part, if available; otherwise, replace king pin
End play exceeds specifications	B	Require repair
Grease fitting broken	A	Require replacement of grease fitting
Grease fitting missing	C	Require replacement of grease fitting
Grease fitting will not seal	A	Require replacement of grease fitting
Locating pins missing	C	Require replacement of missing part, if available; otherwise, replace king pin
Looseness exceeds manufacturer's specifications	B	Require replacement of worn parts
Seized	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Will not take grease	2	Suggest replacement of grease fitting

Condition	Code	Procedure
NOTE: **If king pin will not take grease after replacement of grease fitting, suggest replacement of king pin.**		

MODULES

Condition	Code	Procedure
Application incorrect	B	Require replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require repair
Contaminated	A	Require repair or replacement
NOTE: **Determine source of contamination, such as engine coolant, fuel, metal particles, or water. Require repair or replacement.**		
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation. Some components may be serviceable; check for accepted cleaning procedure.**		
Leaking	B	Require repair or replacement
Malfunctioning	A	Require replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specifications, or out of range.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

Condition	Code	Procedure
Wire lead conductors exposed	B	Require repair or replacement
Wire lead corroded	A	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

PITMAN ARMS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent, affecting performance	B	Require replacement
Binding	A	Further inspection required
NOTE: **If greaseable, grease joint. If problem persists or joint is non-greaseable, require replacement.**		
Grease boot cracked	2	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of pitman arm (reason code 2). Cracked grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease boot missing	C	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of pitman arm (reason code 2). Lack of grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease boot torn	A	Require replacement of boot
NOTE: **If boot is not available as a separate component, suggest replacement of pitman arm (reason code 2). Tom grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease fitting broken	A	Require replacement grease fitting
Grease fitting missing	C	Require replacement of grease fitting
Grease fitting won't seal	A	Require replacement of grease fitting
Grease seal missing	C	Require replacement of seal
NOTE: **If seal is not available as a separate component, suggest replacement of pitman arm (reason code 2). Lack of grease seal will allow contaminants to enter joint and will accelerate wear.**		
Grease seal torn	A	Require replacement of seal

Condition	Code	Procedure
NOTE: **If seal is not available as a separate component, suggest replacement of pitman arm (reason code 2). Tom grease seal will allow contaminants to enter joint and will accelerate wear.**		
Looseness (perceptible horizontal movement)	1	Suggest replacement
NOTE: **If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check. Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Looseness that is excessive	B	Require replacement
NOTE: **Excessive looseness is defined as being significant enough to affect vehicle handling or structural integrity. If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check.**		
CAUTION: **Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Nut on stud loose	A	Require repair or replacement
NOTE: **Check for bent stud or damaged taper hole.**		
Seized	A	Require replacement
Splines damaged	A	Require repair or replacement
Splines stripped (splines missing)	A	Require replacement
Stud bent	B	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud broken	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud loose in taper hole	A	Require repair or replacement
NOTE: **Check for damaged taper hole.**		
Taper hole elongated	A	Require replacement
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
NOTE: **Check for damaged taper hole.**		

POWER STEERING BELTS

Condition	Code	Procedure
Alignment incorrect	B	Further inspection required
NOTE: **Determine cause of incorrect alignment and require repair.**		
Cracked	1	Suggest replacement
Frayed	1	Suggest replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **Determine cause of noise and suggest repair.**		
Plies separated	A	Require replacement
Serpentine belt routed incorrectly	B	Require repair
Tension out of specification	B	Require adjustment or replacement
Worn beyond adjustment range	B	Require replacement
Worn so it contacts bottom of pulley	A	Require replacement

POWER STEERING COOLERS

Condition	Code	Procedure
Air flow obstruction	A	Require repair
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connection leaking	A	Require repair or replacement
Contaminated	A	Require repair or replacement
Corroded	1	Suggest repair or replacement
Fins damaged, affecting performance	A	Require repair or replacement
Fins damaged, not affecting performance	Â	No service suggested or required
Internal restrictions	B	Require repair or replacement
Leaking	B	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require repair or replacement
Tubes damaged, affecting performance	A	Require repair or replacement
Tubes damaged, not affecting performance	Â	No service suggested or required

POWER STEERING FLUID

Condition	Code	Procedure
50,000 miles or greater on OE fluid (in absence of published manufacturer interval)	5	Suggest Replacement
NOTE: **One time only fluid exchange**		
Additive Depletion	A	Require replacement of fluid
Fluid at or beyond service interval	3	Suggest fluid replacement

<table>
<tr><th>Condition</th><th>Code</th><th>Procedure</th></tr>
<tr><td>Fluid contaminated (i.e. fluid other than power steering fluid present)</td><td>B</td><td>Require flushing and refilling of the system</td></tr>
<tr><td colspan="3">NOTE:
Determine and correct source of contamination. OEM specifications must be followed for fluid type.</td></tr>
<tr><td>Fluid discolored</td><td>Â</td><td>No Service Suggested or Required</td></tr>
<tr><td colspan="3">NOTE:
Further testing necessary to determine condition of fluid.</td></tr>
<tr><td>Fluid level incorrect</td><td>B</td><td>Require adjustment of fluid level</td></tr>
<tr><td>Fluid type incorrect</td><td>B</td><td>Require flushing and refilling with correct fluid</td></tr>
<tr><td>Oxidized</td><td>A</td><td>Require replacement of fluid</td></tr>
</table>

POWER STEERING HOSES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Blistered	B	Require replacement
Fitting threads damaged	A	Require repair or replacement
Fitting threads stripped (threads missing)	A	Require replacement
Inner fabric (webbing) cut	B	Require replacement
Leaking	A	Require replacement
Missing	C	Require replacement
Outer covering is cracked to the extent that inner fabric of hose is visible	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Secured incorrectly	B	Require repair

POWER STEERING LINES (STEEL)

NOTE: **When replacing steel power steering lines, be sure to use a replacement product that meets or exceeds OEM specifications.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Corroded, affecting structural integrity	A	Require replacement

Condition	Code	Procedure
Fitting incorrect (for example, compression fitting)	B	Require replacement
Flare type incorrect	B	Require repair or replacement
Leaking	A	Require repair or replacement
Line material incorrect (copper, etc.)	B	Require replacement
Restricted	A	Require replacement
Routed incorrectly (where failure is likely to occur)	B	Require repair or replacement
Rust-pitted, not affecting structural integrity	1	Suggest replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

POWER STEERING PUMPS - ELECTRIC

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement
Pulley bent	A	Require repair or replacement of pulley
Pulley missing	C	Require replacement of pulley
Pump output out of manufacturer's specifications	A	Require repair or replacement
Remote reservoir leaking	A	Require replacement of reservoir
Reservoir cap broken	A	Require replacement of cap
Reservoir cap missing	C	Require replacement of cap
Seized	A	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement

Condition	Code	Procedure
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

POWER STEERING PUMPS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Binding	A	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Fluid at or beyond service interval	3	Suggest fluid change
Fluid contaminated	B	Require flushing and refilling of the system
Fluid level incorrect	B	Require adjustment of fluid level
Leaking	B	Require repair or replacement
Leaking	A	Require repair or replacement
Noisy	2	Suggest repair or replacement
Noisy	2	Suggest repair or replacement
Pulley bent	A	Require repair or replacement of pulley
Pulley bent	A	Require repair or replacement of pulley
Pulley missing	C	Require replacement of pulley
Pulley missing	C	Require replacement of pulley
Pump output out of manufacturer's specifications	A	Require repair or replacement
Pump output out of manufacturer's specifications	A	Require repair or replacement
Remote reservoir leaking	A	Require replacement of reservoir
Remote reservoir leaking	A	Require replacement of reservoir
Reservoir cap broken	A	Require replacement of cap
Reservoir cap broken	A	Require replacement of cap
Reservoir cap missing	C	Require replacement of cap

Condition	Code	Procedure
Reservoir cap missing	C	Require replacement of cap
Seized	A	Require replacement
Seized	A	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

RADAR SENSOR

NOTE: **OEM may require this sensor be calibrated to the vehicle thrustline.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
Connector missing	C	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Dust boot missing	C	Require replacement of boot
Dust boot split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot torn	A	Require replacement of boot

Condition	Code	Procedure
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Housing cracked	B	Require replacement
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

RADIUS ARMS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent, affecting performance	B	Require replacement
Corroded, affecting structural integrity	a	Require replacement
Holes distorted	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

RELAY RODS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware

</table>

Condition	Code	Procedure
NOTE: **If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check. Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Looseness that is excessive	B	Require replacement
NOTE: **Excessive looseness is defined as being significant enough to affect vehicle handling or structural integrity. If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check.**		
CAUTION: **Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Seized	A	Require replacement
Stud bent	B	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud broken	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud loose in taper hole	A	Require repair or replacement
NOTE: **Check for damaged taper hole.**		
Taper hole elongated	A	Require replacement
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Wear exceeds manufacturer's specifications	B	Require replacement

RELAYS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware

Condition	Code	Procedure
Housing broken	A	Require replacement
Housing cracked	2	Suggest replacement
Inoperative	A	Require replacement
NOTE: **Inoperative includes intermittent operation.**		
Missing	C	Require replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

SENSORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent operation or out of specification.**		
Leaking (vacuum/fluid/air)	A	Require replacement
Out of adjustment	B	Further inspection required
NOTE: **Follow OEM recommended adjustment procedures. Repair or replace if out of specification.**		
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement

Condition	Code	Procedure
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

SHOCK ABSORBERS, STRUT CARTRIDGES AND STRUT ASSEMBLIES

NOTE: **You are not required to replace shocks or struts in axle sets. However, when replacing a shock or strut due to the conditions that follow, you may suggest replacement of the other shock or strut on the same axle for one or more of the following: improved performance or preventive maintenance; part is close to the end of its useful life; to extend tire life; to balance ride and handling; or to improve stopping distance. When replacing steering and/or suspension components which may affect an alignment angle, you are required to check and adjust alignment as needed. Refer to the OEM specifications. Under no circumstances should a technician bend struts or strut housings. A vehicle's load-carrying and handling abilities are limited by its suspension, tires, brakes, and driveline. Installing coil over shocks or any other load assist device does not increase the vehicle's load capacity. See the vehicle owner's manual for more details. If vehicle is equipped with OEM coil over shocks, apply the conditions for coil springs from the Springs: Coil, Leaf, and Torsion Bar section of the Steering and Suspension guidelines. If the vehicle is equipped with add-on coil over shocks, you may suggest replacement with standard shocks for a spring-related condition.**

Condition	Code	Procedure
50,000 miles or greater on OEM Shocks or Struts	1	Suggest Replacement
NOTE: **Applies only to OEM hydraulic fluid and/or gas charged shocks and struts, NOT electronically controlled units.**		
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require replacement
Body dented	A	Further inspection required
NOTE: **Require replacement of units where dents restrict shock or strut piston rod movement. If dents don't restrict movement, no service is suggested or required. Especially critical on mono-tube shocks.**		

<table>
<tr><th>Condition</th><th>Code</th><th>Procedure</th></tr>
<tr><td>Body punctured</td><td>A</td><td>Require replacement</td></tr>

</table>

Condition	Code	Procedure
Jounce bumper missing	C	Require replacement of jounce bumper
Jounce bumper split	1	Suggest replacement of jounce bumper
Leaking oil, enough for fluid to be running down the body	A	Require replacement
NOTE: **If the strut cartridge has been replaced previously, the oil on the strut housing may be filler oil. The technician must identify the source of the oil.**		
Noisy	2	Further inspection required
NOTE: **If noise is isolated to shock or strut, suggest replacement.**		
Piston rod bent	A	Require replacement
Piston rod broken	A	Require replacement
Piston rod has surface defect	2	Suggest replacement
Piston rod threads damaged	A	Require repair or replacement
Piston rod threads stripped (threads missing)	A	Require replacement
Seized	A	Require replacement
Shock missing	C	Require replacement
Strut housing bent	A	Require replacement
Strut housing cap (gland nut) is not removable using appropriate tool	A	Require replacement of nut and/or housing
NOTE: **Only required if replacing cartridge.**		
Strut housing cap (gland nut) threads damaged	A	Require repair or replacement of nut
Strut housing cap (gland nut) threads stripped (threads missing)	A	Require replacement of nut
Strut housing severely corroded, affecting structural integrity	A	Require replacement
Strut housing threads damaged	A	Require repair or replacement
Strut housing threads stripped (threads missing)	A	Require replacement
Tire cupping	A	Further inspection required
NOTE: **Although shocks or struts may have contributed to tire cupping, an inspection is needed of the entire suspension system. If the shock or strut is found to be contributing to the tire cupping, require replacement.**		

SPINDLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent	B	Require replacement

Condition	Code	Procedure
Broken	A	Require replacement
Pinch bolt bent	B	Require replacement
Pinch bolt incorrect	B	Require replacement with bolt that meets OEM design
Pinch bolt loose	B	Require repair
Pinch bolt missing	C	Require replacement
Pinch bolt tabs deformed (gap closer together than allowed by OEM specification, typically minimum .032"" gap before clamping)	B	Require replacement
NOTE: **Steering knuckle deformation can cause pinch bolt breakage.**		
Race seat area undersized	B	Require replacement
Scored	A	Require repair or replacement
Taper hole elongated	A	Require replacement
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SPRINGS, COIL, LEAF AND TORSION BARS

NOTE: **When springs are replaced, it is suggested, but not required, that both springs on an axle be replaced to maintain equal height from side to side and to provide a balanced ride and proper handling. When variable rate springs are installed in place of conventional coil springs, they must be installed in axle sets to ensure proper handling, uniform ride, and proper chassis height. Erroneous height measurements may result from: improper tire inflation, non-standard tire or wheel size, and heavy load in vehicle or trunk.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Broken (all springs except secondary leave(s) on multi-leaf springs)	A	Require replacement
Coil clash	Â	Further inspection required
NOTE: **Require ride height check and inspection of strike out Jounce) bumper. If vehicle is within manufacturer's height specifications, no service is suggested or required.**		
Coil spring insulator deteriorated	2	Suggest replacement of insulator
Coil spring insulator missing	C	Require replacement of insulator
Coil spring insulator split	2	Suggest replacement of insulator

Condition	Code	Procedure
Coil spring plastic coating deteriorated - rust present	A	Refer to manufacturer's service requirements
NOTE: **Some manufacturers require replacement under these conditions.**		
Composite spring damaged	Â	Further inspection required
NOTE: **Check vehicle ride height. If ride height is OK, no service is suggested or required.**		
Cracked (all springs except composite leaf and secondary leave(s) on multileaf springs)	A	Require replacement
Installed incorrectly	B	Require repair
Leaf spring insulators missing	C	Require replacement of insulators
Secondary leaf on multi-leaf spring broken	1	Suggest repair or replacement
Secondary leaf on multi-leaf spring cracked	1	Suggest repair or replacement
Torsion bar adjuster bent	A	Require repair or replacement of adjuster
NOTE: **Only required if ride height needs to be adjusted.**		
Torsion bar adjuster seized	A	Require repair or replacement of adjuster
NOTE: **Only required if ride height needs to be adjusted.**		
Torsion bar adjuster threads damaged	A	Require repair or replacement of part with damaged threads
NOTE: **Only required if ride height needs to be adjusted.**		
Torsion bar adjuster threads stripped (threads missing)	A	Require replacement of part with stripped threads
Vehicle suspension height not within OEM specifications	A	Require adjustment or replacement

STABILITRAC

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

STABILITY MANAGEMENT SYSTEM

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

STEERING ANGLE SENSOR

NOTE: **OEM may require this sensor be calibrated to the vehicle thrustline. Sensor must be reset when replacing / servicing steering rack assembly.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
Connector missing	C	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Dust boot missing	C	Require replacement of boot
Dust boot split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Housing cracked	B	Require replacement

Condition	Code	Procedure
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

STEERING ARMS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent	B	Require replacement
Broken	A	Require replacement
Pinch bolt bent	B	Require replacement
Pinch bolt incorrect	B	Require replacement with bolt that meets OEM design
Pinch bolt loose	B	Require repair
Pinch bolt missing	C	Require replacement
Pinch bolt tabs deformed (gap closer together than allowed by OEM specification, typically minimum .032"" gap before clamping)	B	Require replacement
NOTE: **Steering knuckle deformation can cause pinch bolt breakage.**

Scored	A	Require repair or replacement
Taper hole elongated	A	Require replacement

Condition	Code	Procedure
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

STEERING COUPLERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Flex coupler binding	A	Require repair or replacement of coupler
Flex coupler loose	A	Require repair or replacement of coupler
Flex coupler missing parts	A	Require repair or replacement of coupler
Flex coupler soft/ spongy	A	Require replacement of coupler
Flex coupler tom	A	Require replacement of coupler
Steering coupler shield cracked	2	Suggest replacement
Steering coupler shield missing	C	Require replacement
Steering coupler shield torn	2	Suggest replacement
U-joint binding	A	Require repair or replacement of joint
U-joint loose	A	Require repair or replacement of joint

STEERING DAMPERS

NOTE: **The following procedures are only required if the vehicle was originally equipped from the factory with a steering damper. If the steering damper is an add-on unit, then the unit may be removed (and not replaced), based on customer's informed decision.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require replacement
Damper body dented	A	Further inspection required

Condition	Code	Procedure
NOTE: **Require replacement of units where dents restrict damper piston rod movement. If dents don't restrict movement, no service is suggested or required. Especially critical on mono-tube dampers.**		
Damper body punctured	A	Require replacement
Damping (none)	A	Require replacement
Dust boot (bellows) missing	C	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of steering damper (reason code 2). This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Dust boot (bellows) split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of steering damper (reason code 2). This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Dust shield broken	2	Suggest replacement
NOTE: **This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Dust shield missing	2	Suggest replacement
NOTE: **This condition can lead to damage of the piston rod, which, in turn, causes premature piston rod seal wear.**		
Leaking oil, enough for fluid to be running down the body	A	Require replacement
Loose	A	Require repair or replacement
Missing	C	Require replacement
Noise	2	Further inspection required
NOTE: **If noise is isolated to damper, suggest replacement.**		
Piston rod bent	A	Require replacement
Piston rod broken	A	Require replacement
Piston rod has surface defect	2	Suggest replacement
Piston rod threads damaged	A	Require repair or replacement
Piston rod threads stripped (threads missing), affecting performance	A	Require replacement
NOTE: **Only required if condition affects structural integrity or if unit needs to be serviced.**		
Seized	A	Require replacement

STEERING GEARS (EXCEPT RACK AND PINION)

Condition	Code	Procedure

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Fluid contaminated	B	Require flushing and refilling of the system
NOTE: **Determine and correct source of contamination. OEM specifications must be followed for fluid type.**		
Gasket leaking	A	Require repair or replacement of gasket
Housing leaking	A	Require replacement
Hydraulic fittings leaking	A	Require repair or replacement of fittings
Inadequate power assist	A	Further inspection required
NOTE: **If steering gear is source of inadequate assist, require repair or replacement.**		
Lash exceeds manufacturer's specifications	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Seal leaking	A	Require repair or replacement of seal and / or mating part
Splines damaged	A	Require repair or replacement of splines
Splines stripped	A	Require replacement of splines
Steering coupler shield cracked	2	Suggest replacement
Steering coupler shield missing	C	Require replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement

Condition	Code	Procedure
Threads damaged	A	Require repair or replacement of part with damaged threads
Threads stripped (threads missing)	A	Require replacement of part with stripped threads
Unequal power assist	A	Require repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

STEERING GEARS, RACK AND PINION

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Balance tube blocked	A	Require repair or replacement of balance tube
Balance tube missing	C	Require replacement of balance tube
Balance tube restricted	A	Require repair or replacement of balance tube
Bellows boot clamp missing	C	Require replacement of clamp
Bellows boot cracked (not through)	2	Suggest replacement of bellows boot
Bellows boot missing	C	Require replacement of bellows boot
Bellows boot not sealing	A	Require repair or replacement of bellows boot
Bellows boot torn	A	Require replacement of bellows boot
Bellows boot twisted (from toe adjustment)	B	Require repair
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Connector missing	C	Require replacement
Fitting leaking	A	Require repair or replacement
Fitting missing	A	Require replacement of fitting
Fitting threads damaged	A	Require repair or replacement of part with damaged threads
Fitting threads stripped (threads missing)	A	Require replacement of part with stripped threads
Fluid contaminated	B	Require flushing and refilling of the system
NOTE: **Determine and correct source of contamination. OEM specifications must be followed for fluid type.**		
Gasket leaking	A	Require repair or replacement

Condition	Code	Procedure
Housing cracked, affecting structural integrity	B	Require replacement
Housing leaking	A	Require replacement
Inadequate power assist	A	Further inspection required
NOTE: **If steering gear is source of inadequate assist, require repair or replacement.**		
Lash exceeds manufacturer's specifications	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, failure to perform all functions, out of OEM specification, or out of range.**		
Seal leaking	A	Require repair or replacement
Splines damaged	A	Require repair or replacement
Splines stripped (splines missing)	A	Require replacement
Steel line blocked	A	Require repair or replacement of line
Steel line leaking	A	Require repair or replacement of line
Steel line missing	C	Require replacement of line
Steel line restricted	A	Require repair or replacement of line
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement of part with damaged threads
Threads stripped (threads missing)	A	Require replacement of part with stripped threads
Unequal power assist	A	Require repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

STEERING KNUCKLES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent	B	Require replacement
Broken	A	Require replacement
Pinch bolt bent	B	Require replacement

Condition	Code	Procedure
Pinch bolt incorrect	B	Require replacement with bolt that meets OEM design
Pinch bolt loose	B	Require repair
Pinch bolt missing	C	Require replacement
Pinch bolt tabs deformed (gap closer together than allowed by OEM specification, typically minimum .032"" gap before clamping)	B	Require replacement
NOTE: **Steering knuckle deformation can cause pinch bolt breakage.**		
Race seat area undersized	B	Require replacement
Scored	A	Require repair or replacement
Taper hole elongated	A	Require replacement
NOTE: **Check for damaged stud.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

STRIKE OUT BUMPERS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Missing	C	Require replacement
Split	A	Suggest replacement

STRUT BEARING PLATE ASSEMBLIES

NOTE: **When the following guidelines indicate replacement of bearing, only the bearing should be replaced if it is available separately; otherwise, replace the bearing plate assembly.**

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Axial or radial movement exceeds vehicle manufacturer's specifications	B	Require replacement
Bearing binding	A	Require replacement of bearing

Condition	Code	Procedure
Bearing missing	C	Require replacement of bearing
Bearing seized	A	Require replacement of bearing
Bent, affecting performance	B	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Holes distorted	A	Require replacement
Missing	C	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

STRUT RODS

Condition	Code	Procedure
Adjusting nut seized	A	Require repair or replacement of hardware
NOTE: **Only required if an alignment is being performed and adjustment of the strut in question is required.**		
Attaching (mating) hole oversized	A	Require repair or replacement of bracket or frame
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Attaching point on bracket or frame corroded, affecting structural integrity	A	Require repair of bracket or frame
Bent, affecting performance	A	Require replacement
Mating (attaching) hole oversized	A	Require repair or replacement of bracket or frame
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SUSPENSION PUMPS (HYDRAULIC)

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Fluid at or beyond service interval	3	Suggest fluid change
Fluid contaminated	B	Require flushing and refilling of the system

Condition	Code	Procedure
NOTE: **Determine and correct source of contamination. OEM specifications must be followed for fluid type.**		
Fluid level incorrect	B	Require adjustment of fluid level
Leaking	B	Require repair or replacement
Noisy	2	Suggest repair or replacement
Pulley bent	A	Require repair or replacement of pulley
Pulley missing	C	Require replacement of pulley
Pump output out of manufacturer's specifications	A	Require repair or replacement
Remote reservoir leaking	A	Require replacement of reservoir
Reservoir cap broken	A	Require replacement of cap
Reservoir cap missing	C	Require replacement of cap
Seized	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SWAY BAR LINKS

Condition	Code	Procedure
Attaching (mating) hole distorted	A	Require repair or replacement of bracket or control arm
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Ball and socket has looseness (perceptible vertical movement)	1	Suggest replacement
NOTE: **If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method. Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Ball and socket has looseness that is excessive	B	Require replacement
NOTE: **Excessive looseness is defined as being significant enough to affect vehicle handling or structural integrity. If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method.**		
CAUTION: **Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.** Â	Â	Â
Bent	B	Require replacement
Broken	A	Require replacement
Bushing cracked	A	Require replacement

<table>
<tr><th>Condition</th><th>Code</th><th>Procedure</th></tr>

SWAY BAR MOUNTING BUSHINGS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Deteriorated, affecting performance	A	Require repair or replacement
NOTE: **If condition is caused by oil-soaking, further inspection is required to determine source of oil.**		
Distorted, affecting performance	A	Require repair or replacement
Leaking (fluid-filled type)	A	Require replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **If noise isolated to bushing, suggest repair or replacement. Use only approved lubricant on rubber bushings. Petroleum-based lubricants may damage rubber bushings.**		
Oil-soaked, affecting performance	A	Require replacement
NOTE: **Further inspection required to determine source of oil.**		
Rubber separating from internal metal sleeve on bonded bushing	A	Require replacement
Seized	A	Require replacement
Shifted (out of position)	B	Require repair or replacement
Split	A	Require replacement
Surface cracking (weather-checked)	Â	No service suggested or required

SWAY BARS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent	B	Require replacement
Broken	A	Require replacement

Condition	Code	Procedure
Sway bar corroded at point of attachment to frame bushing	A	Require repair or replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

SWITCHES

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Binding, affecting performance	A	Require repair or replacement
Binding, not affecting performance	2	Suggest repair or replacement
Broken	A	Require repair or replacement
Burned, affecting performance	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Burned, not affecting performance	1	Determine cause and correct prior to repair or replacement of part
Cracked, affecting performance	A	Require repair or replacement
Cracked, not affecting performance	1	Suggest repair or replacement
Leaking	B	Require repair or replacement
Malfunctioning	A	Require repair or replacement
NOTE: **Includes inoperative, intermittent operation, or failure to perform all functions.**		
Melted, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Melted, not affecting performance	2	Determine cause and correct prior to repair or replacement of part
Missing	C	Require replacement
Out of adjustment	B	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Won't return	A	Require repair or replacement
Worn	1	Suggest replacement

TIE ROD ENDS (INNER AND OUTER)

Condition	Code	Procedure
Adjusting sleeve bent	B	Require replacement of sleeve
Adjusting sleeve clamps out of position	B	Require repair

Condition	Code	Procedure
Adjusting sleeve corroded, affecting structural integrity	A	Require replacement of sleeve
Adjusting sleeve missing	C	Require replacement of sleeve
Adjusting sleeve seized	A	Require repair or replacement
NOTE: **Only required if toe needs to be adjusted.**		
Adjusting sleeve threads damaged	A	Require repair or replacement of sleeve
Adjusting sleeve threads stripped (threads missing)	A	Require replacement of sleeve
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Bent	A	Require replacement
Binding	A	Further inspection required
NOTE: **If greaseable, grease joint. If problem persists or joint is non-greaseable, require replacement.**		
Grease boot cracked	2	Suggest replacement of boot
NOTE: **If boot is not available separately, suggest replacement of tie rod end (reason code 2). Cracked grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease boot missing	C	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of tie rod end (reason code 2). Lack of grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of tie rod end (reason code 2). Torn grease boot will allow contaminants to enter joint and will accelerate wear.**		
Grease fitting broken	A	Require replacement of grease fitting
Grease fitting missing	C	Require replacement of grease fitting
Grease fitting won't seal	A	Require replacement of grease fitting
Grease seal missing	C	Require replacement of seal
NOTE: **If seal is not available separately, suggest replacement of tie rod end (reason code 2). Lack of grease seal will allow contaminants to enter joint and will accelerate wear.**		
Grease seal torn	A	Require replacement of seal

Condition	Code	Procedure
NOTE: **If seal is not available separately, suggest replacement of tie rod end (reason code 2), wear. Torn grease seal will allow contaminants to enter joint and will accelerate wear.**		
Greaseable tie rod end won't take grease	2	Suggest replacement of grease fitting
NOTE: **If greaseable tie rod end will not take grease after replacing the grease fitting, suggest replacement of tie rod end.**		
Looseness (perceptible horizontal movement)	1	Suggest replacement
NOTE: **If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check. Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Looseness exceeds manufacturer's specifications	B	Require replacement
Looseness that is excessive	B	Require replacement
NOTE: **Excessive looseness is defined as being significant enough to affect vehicle handling or structural integrity. If manufacturer's procedures for inspection exist, use those procedures; otherwise, use an approved inspection method such as the dry park check.**		
CAUTION: **Do not use pliers or pry bar to check ball and socket movement. Use only moderate hand pressure.**		
Noisy	2	Further inspection required
NOTE: **If greaseable, grease joint. If problem persists or joint is non-greaseable, suggest replacement.**		
Nut on stud loose	A	Require repair or replacement
NOTE: **Check for bent stud or damaged taper hole.**		
Seized	A	Require replacement
Stud bent	B	Require replacement
NOTE: **Check for damaged taper hole.**		
Stud broken	A	Require replacement
NOTE: **Check for damaged taper hole.**		
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement
NOTE: **Check for damaged taper hole.**		

TIRE PRESSURE MONITORING SYSTEM

NOTE: **A Tire Pressure Monitoring System (TPMS) is designed to detect and alert the driver should the air pressure level in one or more of the vehicle's tires, up to all four tires, fall below the manufacturer's recommended inflation pressure or another pre-set level.**

NOTE: **NHTSA does not consider installation of an aftermarket or replacement tire or rim that is not compatible with the TPMS to be a "make inoperative" situation under 49 U.S.C. 30122, provided that the entity does not disable the TPMS malfunction indicator.**

TIRE PRESSURE SENSORS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Inoperative	A	Require repair or replacement
NOTE: **Inoperative includes intermittent failure.**		
Loose	B	Require repair or replacement
Missing (Non-OE Wheel and/or Tire Applications)	2	Suggest replacement if appropriate sensor is available
Missing (OE Wheel and Tire Applications)	C	Replacement Reqiuired
Not Responding	Â	Further inspection required
NOTE: **If sensor does not Wake Up, follow manufacturers recommended diagnostic procedure to determine cause**		

TIRES

NOTE: **These guidelines do not apply to split rims. Some vehicle manufacturers restrict replacement of tires to specific brands, types, or sizes. High pressure temporary compact spare tires should not be used with any other rims or wheels, nor should standard tires, snow tires, wheel covers, or trim rings be used with high pressure compact spare rims or wheels. Attempting to mount a tire of one diameter on a wheel of a different diameter or flange type may result in serious injury or death. Only specially trained persons should de-mount or mount tires. Explosions of tire and wheel assembly can result from improper mounting, possibly causing serious injury or death. Consult the vehicle owner's manual or vehicle placard for correct size, speed rating, designation, and cold inflation pressure of the original tires. Do not exceed the maximum load or inflation capacity of the tire specified by the Tire and Rim Association When replacing tires, it is suggested that the replacement tires match or exceed the OEM speed rating designation. If tires of different speed rating designations are mixed on the same vehicle, the tires may vary in handling characteristics. Do not mix different speed rating designations on the same axle. Do not mix radials with non-radial tires on the same axle, as this may affect vehicle handling and stability. If radial tires and bias or bias-belted ply tires are mixed on the same vehicle, the radials must be on the rear. High-pressure temporary compact spare tires are exempt from this rule. Do not mix size or type (Run Flat, all season, performance, mud and snow) of tires on the same axle. If any flammable**

emergency tire inflation product has been used on a tire, consult inflation product, manufacturer's product information label for tire deflation procedures to avoid possible serious injury or death. In some vehicles, changing the tire diameter from factory-equipped size can affect drive ability, as well as the performance of ABS and other vehicle systems. Consult the vehicle manufacturer's specifications.

Condition	Code	Procedure
Air pressure incorrect	B	Require repair
Bead broken	A	Require replacement
Bead leaking, caused by tire	A	Require repair or replacement
Bead wire/cord exposed	A	Require replacement
Cord or belt material exposed	A	Require replacement
Cord ply separations	A	Require replacement
Directional/asymmetrical tires mounted incorrectly	B	Require remounting and/or repositioning
Irregular tread wear, affecting performance	2	Suggest replacement
NOTE: **Determine and correct cause of irregular tire wear.**		
Load ratings less than OEM specifications	B	Require replacement
Mixed tread types (all season, performance, mud and snow) on same axle	A	Require replacement
Number of punctures exceeds manufacturer's limit	B	Require replacement
Out of balance	B	Require rebalance of tire/wheel assembly
Ply separation	A	Require replacement
Pull or lead, caused by tire	A	Require repair or replacement
Radial and bias or bias-belted ply tires on same axle	B	Require repair or replacement
Radials are on the front and not on the rear	B	Require repair or replacement
NOTE: **If radials and bias or bias-belted ply tires are on the same vehicle, the radials must be on the rear axle, except for high-pressure temporary spares.**		
Run flat damage	A	Require replacement
Shoulder cut	A	Require replacement
Shoulder puncture	A	Require replacement
Shoulder with plug	A	Require replacement
Sidewall bulge	A	Require replacement
Sidewall cut	A	Require replacement
Sidewall indentation	Â	No service required or suggested
Sidewall puncture	A	Require replacement
Sidewall with plug	A	Require replacement
Speed rating designations different on same axle	2	Suggest rotation or replacement
Tire and wheel assembly has excessive run-out	B	Require repair or replacement of appropriate part
NOTE: **Excessive is defined as enough to contribute to performance problems. Match mounting may correct run-out. If not, require replacement of appropriate part. Refer to manufacturer's specifications.**		
Tires with excessive diameter difference on an all-wheel drive vehicle or four-wheel drive vehicle	B	Require replacement

Condition	Code	Procedure
NOTE: **Excessive diameter difference is defined as exceeding manufacturer's specifications or, if no manufacturer's specifications exist, with more than 1/4"" diameter difference.**		
Tires with excessive diameter difference on the same side of a dual-wheel application	B	Require replacement
NOTE: **Excessive diameter difference is defined as exceeding manufacturer's specifications or, if no manufacturer's specifications exist, with more than 1/4"" diameter difference.**		
Tread area puncture larger in diameter than manufacturer's specifications	B	Require replacement
Tread missing pieces (chunking), exposing cord	A	Require replacement
Tread missing pieces (chunking), not exposing cord	1	Suggest replacement
Tread separations	A	Require replacement
Tube in tubeless tire	3	Suggest removal of tube
NOTE: **Most manufacturers do not recommend tubes in tubeless tires. Inspect tire and wheel . Assembly to determine the reason for a tube in tubeless tire. Recommendation for repair or replacement should be based upon condition of tires and! Or wheel listed in these guidelines.**		
Weather-checking	Â	No service required or suggested
Worn to tread wear indicators	B	Require replacement

TORQUE SENSOR

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
Connector missing	C	Require replacement
Inoperative	A	Require repair or replacement
Leaking (vacuum/fluid/air)	A	Require replacement
Out of adjustment	B	Further inspection required
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Threads damaged	A	Require repair or replacement

Condition	Code	Procedure
Threads stripped (threads missing)	A	Require replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

TORSION SPRINGS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Broken	A	Require replacement
Missing	C	Require replacement

TRACK BAR BUSHINGS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Binding	A	Require repair or replacement
Deteriorated, affecting performance	A	Require repair or replacement
NOTE: **If condition is caused by oil-soaking, further inspection is required to determine source of oil.**		
Distorted, affecting performance	A	Require repair or replacement
Leaking (fluid-filled type)	A	Require replacement
Missing	C	Require replacement
Noisy	2	Further inspection required
NOTE: **If noise isolated to bushing, suggest repair or replacement. Use only approved lubricant on rubber bushings. Petroleum-based lubricants may damage rubber bushings.**		
Oil-soaked, affecting performance	A	Require replacement
NOTE: **Further inspection required to determine source of oil.**		
Rubber separating from internal metal sleeve on bonded bushing	A	Require replacement

Condition	Code	Procedure
Seized	A	Require replacement
Shifted (out of position)	B	Require repair or replacement
Split	A	Require replacement
Surface cracking (weather-checked)	Â	No service suggested or required

Rubber separating from internal metal sleeve on bonded bushing	A	Require replacement
Seized	A	Require replacement
Shifted (out of position)	B	Require repair or replacement
Split	A	Require replacement
Surface cracking (weather-checked)	Â	No service suggested or required

TRAILING ARMS

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Ball joint hole oversized (loose interference or press fit)	B	Further inspection required
NOTE: **If oversized ball joint is available, require replacement of ball joint. If oversized ball joint is not available, require replacement of control arm.**		
Bent, affecting performance	B	Require replacement
Bushing hole oversized	B	Require replacement
Corroded, affecting structural integrity	A	Require replacement
Holes distorted	A	Require replacement
Threads damaged	A	Require repair or replacement
Threads stripped (threads missing)	A	Require replacement

VALVE STEMS

NOTE: **Most tire manufacturers suggest replacement of non-TPMS valve stems any time a new tire is installed. For TPMS valve stems, the manufacturer may require replacement of the valve stem, o-ring seals, washers, gaskets, valve cores, compression washers and/or locking nut.**

Condition	Code	Procedure
Bent	2	Suggest replacement
Broken	A	Require replacement
Cap seized	A	Require repair or replacement
Cut, but not leaking	1	Suggest replacement
Deteriorated (cracking, dry rot)	1	Suggest replacement
Leaking	A	Require repair or replacement
Missing	C	Require replacement
O-Ring leaking	A	Require replacement of O-Ring

Condition	Code	Procedure
Threads damaged	A	Require repair or replacement
Threads stripped	A	Require replacement
Valve cap missing	C	Require replacement of cap

VEHICLE DYNAMICS CONTROL

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

VEHICLE SPEED SENSOR

Condition	Code	Procedure
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware corroded, affecting structural integrity	A	Require replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require replacement
Connector missing	C	Require replacement
NOTE: **Determine cause and correct prior to replacement of part.**		
Dust boot missing	C	Require replacement of boot
Dust boot split	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure**		
Dust boot torn	A	Require replacement of boot
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		

Condition	Code	Procedure
Housing cracked	B	Require replacement
NOTE: **If boot is not available separately, suggest replacement of sensor (reason code 2). This condition can lead to damage of the sliding magnet, which, in turn, causes premature sensor failure.**		
Lead routing incorrect	B	Require rerouting according to vehicle manufacturer's specifications
Loose	B	Require adjustment to vehicle manufacturer's specifications
Missing	C	Require replacement
Output signal incorrect	B	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Wire lead burned	A	Require repair or replacement
Wire lead conductors exposed	B	Require repair or replacement
Wire lead open	A	Require repair or replacement
Wire lead shorted	A	Require repair or replacement

VEHICLE STABILITY ASSIST

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.**

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

VEHICLE STABILITY/SKID CONTROL

NOTE: **An evolution of ABS and Traction Control. It uses the ABS hardware and two additional sensors: a steering-wheel angle sensor, which measures the position and rate of steering wheel input, and a yaw sensor, which measures the rate at which the vehicle is actually turning. By comparing rates, computer determines if the vehicle is oversteering or understeering.**

NOTE: **On slippery surfaces or during aggressive maneuvers, if the vehicle understeers severely, the computer will actuate the brakes on the inside rear wheel, just hard enough and just long enough to correct the steering**

behavior. When the vehicle oversteers severely, the system will brake the outside front wheel instead.

NOTE: **When servicing this system, OEM may require steering angle sensor be calibrated to the vehicle thrustline.**

WARNING LAMPS

Condition	Code	Procedure
Bulb burned out	A	Require replacement
Warning light does not come on during bulb check	Â	Further inspection required to determine cause
Warning light flashes	Â	Further inspection required to determine cause
Warning light is intermittent	Â	Further inspection required to determine cause
Warning light stays on after initial bulb check	Â	Further inspection required to determine cause

WHEEL ALIGNMENT

NOTE: **Wheel alignment is defined as the measurement, analysis, and adjustment of steering and suspension angles to conform to manufacturer specifications. These angles usually include, but are not limited to: caster, camber, toe, and thrust angle. Where these angles are not adjustable and not in specification, component replacement or correction kits may be required. Errors in set-back and steering axis inclination (SAI) are often attributable to failed or damaged components and must be corrected prior to performing an alignment. Failure to replace or correct suggested parts or service may prevent a proper alignment. Before performing an alignment check, inspect and verify the following: Tire pressure and size . Vehicle loading . Ride height . Steering and suspension parts only if the inspection reveals that all the above are within published specifications, a wheel alignment check and a proper wheel alignment, if needed, may be performed. Under no circumstances should a technician bend or heat any steering or suspension component, unless specified by the vehicle manufacturer. All measurements and specifications must be noted on the inspection report.**

Condition	Code	Procedure
Beyond manufacturer's service interval	3	Suggest alignment check
Dog tracking, shown to be caused by faulty alignment	2	Suggest repair
Drift, shown to be caused by faulty alignment	A	Require alignment
Lead, shown to be caused by faulty alignment	A	Require alignment
Outside manufacturer's specifications	B	Require repair
Part has been changed, affecting alignment	A	Require alignment check
Pull, shown to be caused by faulty alignment	A	Require alignment
Steering wheel off-center	2	Suggest alignment
Tire wear, shown to be caused by faulty alignment	A	Require alignment
Wander, shown to be caused by faulty alignment	A	Require alignment

WHEEL ATTACHMENT HARDWARE

NOTE: **For conditions noted below, also check condition of wheel stud holes. Proper lug nut torque is essential. Follow recommended torque specifications and tightening sequence. DO NOT lubricate threads unless specified by the vehicle manufacturer.**

Condition	Code	Procedure
Bent	A	Require replacement
Broken	A	Require replacement
NOTE: **Some manufacturers require replacement of all studs on that wheel if two or more studs or nuts on the same wheel are broken or missing.**		
Locking lug nut locking groove damaged	A	Require replacement
Loose	A	Require repair or replacement of affected component
Lug nut installed backward	B	Require repair or replacement
Lug nut mating surface distorted	A	Require replacement of nut
Lug nut mating type incorrect	B	Require replacement of nut
Lug nut missing	C	Require replacement
Lug nut rounded	A	Require replacement of nut
NOTE: **Only required if removing wheel.**		
Lug nut seized	A	Require replacement of nut
NOTE: **Only required if removing wheel.**		
Stud incorrect	B	Require replacement of stud
Stud missing	C	Require replacement
Threads damaged	A	Require repair or replacement of component with damaged threads
Threads stripped	A	Require replacement of component with stripped threads

WHEEL BEARINGS, RACES AND SEALS

NOTE: **When replacing or repacking wheel bearings, grease seal replacement is required. You are not required to replace these components in axle sets. Determine the need to replace based upon the individual component conditions that follow.**

Condition	Code	Procedure
Axle seal on drive axle leaking	A	Require replacement of seal and inspection of axle, bearing, housing, and vent tube
Bearing end-play exceeds specifications	B	Require adjustment of bearing, if possible If proper adjustment cannot be obtained, require replacement of bearing and race assembly
Bearing rollers, balls or races are worn, pitted, or feel rough when rotated as an assembly or other damage affecting performance.	B	Require replacement of bearing and race assembly
Seal leaking	A	Require replacement of seal and inspection of bearings
NOTE: **Require inspection of mating and sealing surface and repair or replace as necessary. Check vent. A plugged vent may force fluid past the seal.**		
Seal missing	C	Require replacement

WHEELS (RIMS)

NOTE: **Mounting a regular tire on a high-pressure compact spare wheel is not permitted. Attempting to mount a tire of one diameter on a wheel of a different diameter or flange type may result in serious injury or death. If the wheel identification stamp is not legible, or cannot be found, do not use the wheel until the size and type have been properly identified. Wheels of different diameter, offset, or width cannot be mixed on the same axle. Bead seat tapers cannot be interchanged.**

Condition	Code	Procedure
Bead leaking, caused by wheel	A	Require repair or replacement
NOTE: **Do not attempt to correct a bent rim.**		
Bent hub mounting surface	A	Require replacement
Bent rim, causing vibration	2	Suggest replacement
NOTE: **Do not attempt to correct a bent rim.**		
Broken	A	Require replacement
Cast wheel porous, causing a leak	A	Require repair or replacement
Clip-on balance weight is incorrect type for rim flange	2	Suggest replacement of weight
Corrosion affecting structural integrity	A	Require replacement
Corrosion build-up on wheel mounting surface	A	Require repair
Cracked	B	Require replacement
Directional/asymmetrical wheels mounted incorrectly	B	Require remounting and/or repositioning
Load capacity less than OEM specifications	B	Require replacement
Mating surface distorted	A	Require replacement
Offset mismatched on same axle	B	Require replacement
Rivets leaking	A	Require replacement
Run-out beyond OEM specs	B	Require replacement
NOTE: **Some wire-spoke wheels may be repaired.**		
Stud holes elongated	A	Require replacement
NOTE: **Inspect wheel attaching hardware for damage.**		
Welded or brazed repair	2	Suggest replacement
Welds leaking	A	Require replacement
Wheel centering (pilot) hole incorrect	B	Require replacement

WIRING HARNESSES AND CONNECTORS

Condition	Code	Procedure
Application incorrect	B	Require repair or replacement
Attaching hardware broken	A	Require repair or replacement of hardware
Attaching hardware missing	C	Require replacement of hardware
Attaching hardware not functioning	A	Require repair or replacement of hardware
Attaching hardware threads damaged	A	Require repair or replacement of hardware

Condition	Code	Procedure
Attaching hardware threads stripped (threads missing)	A	Require replacement of hardware
Connector (Weatherpack type) leaking	A	Require repair or replacement
Connector broken	A	Require repair or replacement
Connector melted	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Connector missing	C	Require replacement
Insulation damaged, conductors exposed	A	Require repair or replacement
Insulation damaged, conductors not exposed	1	Suggest repair or replacement
Open	A	Require repair or replacement
Protective shield (conduit) melted	2	Suggest repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Protective shield (conduit) missing	C	Require repair or replacement
Resistance (voltage drop) out of specification	A	Require repair or replacement
Routed incorrectly	B	Require repair
Secured incorrectly	B	Require repair
Shorted	A	Require repair or replacement
Terminal broken	A	Require repair or replacement
Terminal burned, affecting performance	A	Require repair or replacement
NOTE: **Determine cause and correct prior to repair or replacement of part.**		
Terminal burned, not affecting performance	2	Suggest repair or replacement
Terminal corroded, affecting performance	A	Require repair or replacement
Terminal corroded, not affecting performance	2	Suggest repair or replacement
Terminal loose, affecting performance	B	Require repair or replacement
Terminal loose, not affecting performance	1	Suggest repair or replacement
Voltage drop out of specification	A	Require repair or replacement

REASON CODE EXPLANATION

Code	Reason
Required	
A	Part No Longer Performs Intended Purpose
B	Part Does Not Meet A Design Specification (Regardless Of Performance)
C	Part Is Missing
Suggested/Optional	
1	Part Is Close To The End Of Its Useful Life
2	To Address A Customer Need, Convenience Or Request
3	To Comply With Maintenance Recommended By The Vehicle's Original Equipment Manufacturer
4	Technician's Recommendation Based On Substantial And Informed Experience
5	To Comply With Maintenance Recommended By AMRA/MAP

AUTOMOTIVE TERMINOLOGY & DEFINITIONS

ACTIVE SUSPENSION SYSTEM

active suspension systems move each wheel up and down to control body motion in response to road abnormalities. The system responds to inputs from the road and the driver. With an active suspension, a vehicle can simultaneously provide the smooth ride of a soft suspension along with the superior handling associated with a firm suspension.

ACTIVE TILT CONTROL

active tilt control winds up the stabilizer bars in the front and rear suspension to resist body lean while cornering. Because active control is used only as needed, vehicle spring rates and stabilizer bar stiffness can be reduced, improving normal ride characteristics. In addition, this system has potential to increase low-speed, off-road traction on 4WD vehicles.

ACTIVE VARIABLE RATIO STEERING

electronically provides variable steering ratios. A computer is linked with the vehicle stability control system to aid in directional stability of the vehicle. As the vehicle travels down the highway, road surfaces and wind gusts can affect the vehicle directional stability. The car may wander a little or dart to one side, as many who have met a tractor-trailer unit on a windy day have experienced. Sensors on the car detect this sudden unintentional movement and the computer will stabilize the car by moving the Active Steering electric motor and steering gear. The driver doesn't turn the steering wheel at all.

AIR SPRING

a suspension device made up of a flexible bladder containing compressed air. The air spring takes the place of a :onvent;onal coil or leaf spring. Air is supplied by an on-board ;ompressor, usually with auxiliary equipment to sense vehicle leight and modify the pressure in the air spring as needed.

AIR SUSPENSION

instead of steel coil or leaf springs, some vehicles have a bellows-like unit at each corner that contains pressurized air. As a rule, air suspensions can produce a softer ride.

ALIGNMENT

an adjustment to bring parts or components into a line or proper coordination.

ALL-WHEEL DRIVE

the method of providing traction to any of the wheels of a vehicle, as conditions require. Depending on the system, it may be full-time or part-time.

ANTI-ROLL BAR

see 'stabilizer bar'.

ASPECT RATIO

the relationship between the height of a tire from bead to tread, and the tread width, usually expressed as a percentage of the tread width.

AUTOMATIC RIDE CONTROL

automatic ride control adjusts vehicle shock absorber resistance (damping) in response to driver inputs such as steering and braking and for changes in road surface. During maneuvers such as hard braking or quick lane changes, the system increases suspension damping to improve dynamic stability. Damping is automatically decreased during steady driving, so that bumps and potholes are absorbed rather than being transmitted to the occupants. Some systems also allow the driver to select suspension settings: soft, normal or firm (sport).

AXIAL LOAD

a type of load placed on a bearing that is parallel to the axis of the rotating shaft.

AXIAL PLAY

movement of a component parallel to the axis of rotation.

AXIAL

round, on or along an axis; having the same direction or being parallel to the axis of rotation.

AXIS

a real or imaginary straight line on which or around which an object rotates.

BALANCE

a condition of equal weight distribution within a component or among components; the act of equalizing the weight distribution, such as balancing a tire or an engine's reciprocating assembly.

BALL JOINT

a suspension component that provides a pivot point, allowing the steering knuckle to move up and down as well as turn. In response to steering input. The ball fits into a socket housing that is attached to the control arm and the stud on the other end of the ball is attached to the steering knuckle. A dust cover is installed over the ball and socket assembly to keep dirt out and lubricant in.

BEAD

the steel reinforced inner edge of a tire, which fits inside and seals against the wheel rim.

BOOT

protective rubber cover with accordion pleats used to contain lubricants and exclude contaminating dirt, water and grime, located at each end of the rack-and- pinion assembly and FWD CV-joints.

BUMP STEER

a steering problem in which a vehicle tends to the left or the right after a bump, without steering wheel input from the driver. This is usually caused by some steering misalignment or damage that permits change of toe when the suspension works up and down.

BUSHING

a liner, usually removable, for a bearing; an anti-friction liner used in place of a bearing; a type of bearing that is used to support rotating shafts.

CAMBER

the attitude of a wheel/tire assembly in which, when viewed from the front, the distance between the tops and bottoms of the tires are different. If the distance between the tops is greater than between the bottoms, positive camber is present. If the distance between the tops is less than between the bottoms, negative camber is present.

CASTER

angle formed between the kingpin axis and a vertical axis as viewed from the side of the vehicle. Caster is considered positive when the top of the kingpin axis is behind the vertical axis, that is, tilted toward the rear of the vehicle.

CENTER LINK

a steering linkage component which attaches the Pitman arm to the idler arm, tie-rod or crosslink.

COIL SPRING

spring steel rod wound into a coil that supports the vehicle's weight while allowing suspension movement.

COLLAPSIBLE STEERING COLUMN

a steering column that is designed to collapse, to prevent the column from heavily impacting the driver during an accident.

CONSTANT VELOCITY (CV) JOINT

a flexible coupling between two shafts that allows each shaft to maintain the same speed regardless of operating angle.

CONTROL ARM

a suspension component that connects the vehicle frame to the steering knuckle or axle housing and allows the up and down movement of the wheels.

COTTER PIN.

a safety component made from soft steel, used to keep a nut from loosening on a bolt or stud. The cotter pin is inserted through a hole in the bolt or stud and through slots in the nut (see 'castellated nut'), then the ends of the cotter pin are spread to lock it in position.

CROSSMEMBER

part of the vehicle frame structure, arranged transversely and attached to the frame rails at each side of the vehicle. Can be removable or welded in place.

DAMPEN

to slow or reduce oscillations or movement.

DEAD AXLE

a load-supporting axle that does not transmit power; an axle that does not rotate, but merely forms a base on which to attach the wheels.

DIRECTIONAL STABILITY

the ability of a car to travel in a straight line on a flat surface with a minimum of driver control.

DIRECTIONAL TIRE

tire with a tread pattern that is designed to give maximum traction by removing water from under the tread in such a way as to minimize the risk of aquaplaning. Directional tires must be installed to turn in a specific direction.

DOWNFORCE

negative aerodynamic lift.

DRAG COEFFICIENT

drag divided by the product of dynamic pressure and projected area. A factor representing the drag acting on a body (as an automobile or airfoil).

DRAG LINK

a steering linkage component that connects the pitman arm and the steering arm.

DRAG

horizontal aerodynamic retarding force on a vehicle parallel to the relative wind direction.

DYNAMIC BALANCING

balancing a part while it is in motion.

ELECTRICALLY POWERED STEERING

electrically powered steering uses an electric motor to drive either the power steering hydraulic pump or the steering linkage directly. The power steering function is therefore independent of engine speed, resulting in significant energy savings.

ELECTRONIC AIR SUSPENSION

electronic air suspension provides the comfort of riding on air with adjustable spring rates and capability to change ride height and load-carrying ability. Under normal driving conditions, an electronic air suspension vehicle rides at the same height as a traditionally sprung vehicle. With a heavy load, ride height is increased automatically. On current vehicles, the suspension lowers the ride height by 20 mm at highway speeds for improved aerodynamics, with about 2 percent better fuel economy. Lower ride height also can improve on-center feel of steering due to the change in suspension geometry and increased caster angle.

ELECTRONIC LEVEL CONTROL.

a suspension system that uses air springs to maintain vehicle ride height. Height sensors are used to signal a control unit when the vehicle is riding low or high. In response to this signal, compressed air is either sent to or vented from the air springs.

HALFSHAFT

transfers power from the transaxle to the front wheels on a front-wheel drive vehicle. Also used on some vehicles with rear-wheel drive and independent rear suspension to transfer power from the differential to the rear wheels. Consists of a stub shaft that is splined into the differential side gear, another stub shaft that is splined into the wheel hub, an interconnecting shaft, and two CV-joints, which connect the interconnecting shaft to the stub shafts.

HARMONIC VIBRATION

periodic motion or vibration along a straight line. The severity depends on the frequency or amplitude.

HEIGHT SENSOR

a component used in an air suspension system to signal a control unit when the vehicle is riding low or high. In response to this signal, compressed air is either sent to or vented from the air springs.

HUB

mounting point for the wheelan an axle or spindle; the part of the synchronizer assembly that is splined to the transmission shaft; the center part of a wheel, gear, etc., that rides on a shaft.

IDLER ARM

a conventional steering system component consisting of an arm that swivels in a bushing on a shaft, which is attached to the frame. The idler arm is mounted on the right side of the vehicle and is the same length and set at the same angle as the Pitman arm. Its function is to hold the right end of the center link level with the left end, which is moved by the pitman arm, and transfer the steering motion to the right side tie-rod.

INCLUDED ANGLE

the sum of the angle of camber and steering axis inclination; the sum of two intersecting angles.

INDEPENDENT SUSPENSION

a suspension in which each wheel can travel up and down without directly affecting the position of the opposite wheel.

INTEGRAL POWER STEERING

a power steering system in which the power cylinder and control valve are contained in one housing.

INTELLIGENT VEHICLE HIGHWAY SYSTEM (IVHS)

the Intelligent Vehicle Highway System (IVHS) provides a variety of information to the vehicle and driver through cooperation of automotive electronics, communications, controls and systems engineering technologies. IVHS has two areas of interest to car and truck makers: (1)telematics and (2)active safety warning and control systems. Several features are: Telematics: Navigation systems Traffic messaging Emergency messaging and security tracking (e.g. RESCU - Remote Emergency Satellite Cellular Unit) Short range communications/ automatic toll collection Active Safety Warning and Control Systems Collision warning/avoidance - Backup and parking aids - Side vision aid - Vision enhancement - (all weather/night vision) - Adaptive cruise control - Lane departure control

INTERACTIVE VEHICLE DYNAMICS (IVD)

interactive Vehicle Dynamics is designed to minimize loss of vehicle control due to loss of traction. The IVD system could be activated when a vehicle is taking a turn too quickly or when encountering an icy patch.

JAM NUT

a locknut.

KINGPIN

the pivot shaft for the steering knuckle on most early axles and some modern heavy-duty axles.

KNUCKLE

the suspension component that connects the upper and lower control arms or the strut and lower control arm. On rear wheel drive vehicles, it usually incorporates the front wheel spindle and on front wheel drive vehicles it has an opening where the halfshaft passes through. A steering arm is attached to the knuckle, where the tie-rod end is connected. Also called a steering knuckle.

LANE-DEPARTURE WARNING SYSTEM

Issues a warning when the vehicle edges off course and reaches the highway lane markers. Introduced on the 2005 Infiniti FX and available on the 2006 Infiniti M45, the system developed by Iteris can detect lane dividers even in rainy weather. It delivers a noticeable sound when the vehicle starts to move into an adjacent lane, whether due to inattention, drowsiness or distraction.

LATERAL RUNOUT

side-to-side movement or wobble in a wheel or tire.

LEAF SPRING

a suspension spring consisting of a single flat plate made of steel or composite material or several steel plates bundled together.

LOW TIRE PRESSURE WARNING

a low tire pressure warning system alerts the driver if the air pressure in a tire becomes too low. Typically, a light on the instrument panel will be illuminated to warn of the low-pressure condition.

MACPHERSON STRUT

the principal device in the suspension of the same name, in which the spring, shock absorber and sometimes the steering knuckle are combined in a single unit.

MEMORY STEER

a steering condition where the steering wheel and wheels want to return to a position other than center. This can be caused by tightening rubber bonded socket tie-rod ends when the steering wheel is not centered, binding in the upper strut mounts, or binding in a steering component or ball joint.

ON-CAR BALANCING

the practice of spinning a wheel on the car to balance the wheel and all other rotational components together.

PARALLELOGRAM STEERING LINKAGE

a type of conventional steering linkage consisting of a pitman arm, center link, idler arm and tierod assemblies to connect to the steering knuckles. The pitman arm, center link and idler arm form three sides of a parallelogram.

PITMAN ARM

a steering system component mounted on the steering box shaft and transfers the gearbox motion to the steering linkage.

PLUNGER JOINT

the inboard CV-joint on a halfshaft, so called because the joint moves in and out in response to the suspension's up and down movement, which causes the distance between the transaxle and the wheel to change. The movement takes place within the joint, with the tripod rollers or double offset ball bearings moving in and out on elongated grooves in the yoke or outer race.

PRESS FIT

when a part is slightly larger than a hole it must be forced together with a press.

PULL

a steering condition where the vehicle driver has to maintain constant pressure on the steering wheel to keep the vehicle moving straight.

RACK-AND-PINION STEERING

a type of steering mechanism that replaces the pitman arm, center link and idler arm on gearbox steering. The steering column ends in a pinion gear that moves the driven rack to the left and right. The rack ends contain ball studs connected to the outer tie-rod ends and steering knuckles.

RADIAL LOAD

load applied at 90 degrees to an axis of rotation.

RADIAL RUNOUT

the out-of-roundness ot a wheel or tire.

RADIAL

branching out in all directions from a common center; perpendicular to the shaft or bearing bore.

RADIUS ARM

a suspension component that is connected to a twin I-beam or solid axle at one end and to the vehicle frame through bushings at the other. The radius arm braces the I-beam or axle and keeps it at a right angle to the vehicle frame.

REAR WHEEL STEERING

a system used on a some vehicles to change the toe of the rear wheels to either steepen a sharp turn or enhance cornering on a shallower, faster one.

RIDE HEIGHT

the dimension between a fixed point on the vehicle and the pavement. The fixed point varies according to vehicle and manufacturer. Also called vehicle height.

ROLLING RESISTANCE

retarding force, parallel to the direction of travel, caused by tire resistance along the ground.

RUNOUT

wobble or deflection beyond a rotating part's normal plane of movement.

SAI

see 'steering axis inclination',

SCRUB RADIUS

the distance between the point at which the tire's vertical centerpoint intersects the road, and the steering axis inclination (SAI) intersects the road.

SHACKLE

the attachment to the frame for one end of a leaf spring. The shackle allows the spring to change in length as the vehicle encounters uneven road surfaces.

SHIM

thin sheets of material, usually metal, used as spacers to control the distance between parts.

SHOCK ABSORBER

a device used to dampen the oscillation of the suspension caused by irregularities in the road surface.

SHORT AND LONG ARM SUSPENSION

a suspension system in which the upper control arm is shorter than the lower control arm, allowing the wheel to deflect in a vertical direction with minimal change in camber.

SPINDLE

a shaft used to attach the wheel assembly on non-drive axles.

SPRING

a suspension system component that supports the vehicle and absorbs shock caused by uneven road surfaces; a device that returns to its original form after being forced out of shape.

SPROCKET

a toothed wheel used to engage a chain or ribbed belt.

SPRUNG WEIGHT

the weight of all the vehicle components that are supported by the springs; see 'unsprung weight'.

STABILIZER BAR

a torsion-bar spring connecting the suspension on either side of the vehicle. When a vehicle rolls to the side in a turn, the suspension at the outside wheel compresses and the suspension at the inside wheel extends. The stabilizer bar that connects them twists to apply a counteracting force to hold the vehicle closer to level. Also called an anti-roll bar or sway bar.

STATIC BALANCE

balance at rest; still balance; the equal distribution of weight of the wheel and tire around the axis of rotation such that the wheel assembly has no tendency to rotate by itself regardless of its position.

STEERING ARM

the steering system component that links the steering knuckle to the tie-rod assembly.

STEERING AXIS INCLINATION

the angle between true vertical and an imaginary line running through the rotational center of the ball joint(s).

STEERING COLUMN

the housing, steering shaft, bearings and related components between the steering wheel and the steering gear.

STEERING GEAR

the assembly located at the end of the steering column, which contains the gears and other components that multiply the driver turning force.

STEERING KNUCKLE

the suspension component that connects the upper and lower control arms or the strut and lower control arm. On rear wheel drive vehicles, it usually incorporates the front wheel spindle and on front wheel drive vehicles it has an opening where the halfshaft passes through. A steering arm is attached to the steering knuckle, where the tie-rod end is connected.

STEERING LINKAGE

all of the components that connect the steering gear to the front wheels.

STRUT ROD

on vehicles where the lower control arm is attached to the frame at one pivot point, a strut rod is used to brace the control arm against the vehicle frame.

STUD

a fastener that has screw threads at both ends.

SWAY BAR

see 'stabilizer bar',

THRUST ANGLE

the difference between the thrust line and the geometric centerline of the vehicle.

THRUST LINE ALIGNMENT

aligning the front wheels to the thrust line during a wheel alignment, when rear wheel toe cannot be adjusted to specification.

THRUST LINE

an imaginary line that divides the total toe angle of the rear wheels.

THRUST LOAD

load placed on a part that is parallel to the center of the axis.

TIE-ROD END

a ball and socket joint that connects the tie-rod to the steering knuckle arm and to the center link or steering rack.

TIE-ROD

steering linkage member which connects the steering knuckle arm with the centerlink or the steering rack.

TIRE ROTATION

the practice of moving a set of tires to different positions on the vehicle to equalize wear and extend the life of the tires.

TIRE SLIP

see 'wheel slip'.

TOE

the direction in which a wheel tends to roll, a major factor in tire wear.

TOE-IN

a condition that exists if the tire's line of forward direction intersects the extended centerline of the vehicle.

TOE-OUT ON TURNS

the designed angle of the steering arm on the steering knuckle, which causes the inside front wheel to turn at a sharper angle than the outside front wheel during a turn. The specification is checked using the turntables on wheel alignment machine. Toe-out on turns is not an adjustable angle, and if it is incorrect it is most likely due to a bent steering arm.

TOE-OUT

a condition that exists if the tire's line of forward direction and the vehicle centerline are angled apart.

TRACK

the distance between the centers of the treads of parallel wheels.

TRACKING

travel of the rear wheels in a parallel path with the front wheels.

TWIN I-BEAM SUSPENSION

a type of independent front suspension and used on light trucks and vans. It consists of two I-beams supported by coil springs, and the steering knuckles/spindles, which are connected by king pins or ball joints. The inner end of the axle connects to the vehicle frame through a rubber bushing. A radius arm also connects to the frame through rubber bushings to control wheelbase and caster.

UNSPRUNG WEIGHT

the components of a vehicle that rest directly on the road surface without being supported by the suspension springs.

VARIABLE ASSIST POWER STEERING

a power steering system that uses valves and speed sensors to vary the amount of steering assist according to engine or road speed. At slow speeds more steering assist is delivered and steering the wheels is easier; necessary for parking, etc.. At higher speeds, steering assist is reduced and more steering effort is required to steer the car, giving the driver greater feel of the road. Also known as Speed-sensitive power steering.

VEHICLE HEIGHT

see 'ride height'.

WHEEL ALIGNMENT

the adjustment of suspension and steering components to optimize steering control and minimize tire wear.

WHEEL BALANCE

the condition in which a wheel/tire assembly has equal weight around its center, preventing vibration at high speeds. Wheel balance can be static, such as on a bubble balancer, or dynamic, such as with a spin balancer.

WHEEL OFFSET

the dimensional difference between a wheel's centerline and the plane of the axle flange mounting surface.

WHEEL SLIP

a measurement (in percentage) of the friction between the tire and road surface; at zero slip the tire rotates freely, while at 100% slip the tire is locked up and is pushed along the road surface by the moving vehicle. Also called tire slip.

WHEEL SPEED SENSOR

a permanent magnetic sensor that sends information to the computer in an ABS system regarding wheel speed.

WHEEL WEIGHTS

small weights, usually made of lead, attached either mechanically or by adhesive to a wheel/tire assembly to correct its balance.

WORM GEAR

a gear into which teeth are cut, resembling the threads of a screw.
